Nationally Accredited based on the Decree of the Minister of Research, Technology and Higher Education of Indonesia, Number [30/E/KPT/2018](#) as a SINTA 2 journal.

JPBI (Jurnal Pendidikan Biologi Indonesia), ISSN 2442-3750 (print); ISSN 2527-6204 (online), publishes a scientific papers on the results of the study/research and review of the literature in the sphere of biology education in primary education, secondary education, and higher education. Additionally, this journal also covers the issues on environmental education. This journal collaborates with Asosiasi Lesson Study Indonesia (ALSI)/Indonesian Association of Lesson Study. Editor accepts the article has not been published in other media with the writing format as listed on page manuscript writing guidelines.

JPBI (Jurnal Pendidikan Biologi Indonesia) was established in 2015, published three times a year, on March, July, and November. Started by Volume 3, Number 3, November 2017, the journal was only published by using one language namely English. The journal has been indexed in [DOAJ](#), [BASE](#), [Garuda](#), [Google Scholar](#), [SINTA](#), [Asean Citation Index \(ACI\)](#) and others.

JPBI (Jurnal Pendidikan Biologi Indonesia), in English is the "Indonesian Journal of Biology Education". The word "Indonesia" does not mean that the article is only written by an author from Indonesia, but it is more meaningful: (1) the journal publisher is from Indonesia and (2) the article needs to be related to conditions in Indonesia or countries that have the same conditions so that the article is expected to have implications and contributions to overcome Biology Education problems in Indonesia or possibilities to be applied in Indonesia.

## ABSTRACT

Provision of teaching materials in term of module can be an alternative to meet the learning needs of science. The study aimed at describing science module constructed based on Science, Technology, Engineering, Art and Mathematics (STEAM) equipped with valid and effective biotechnology games for learning science in junior high school. This Research and Development (R&D) was developed using the 4D model (Thiagarajan). This research was conducted at MTsN (State of Islamic Secondary School) 2 Jember, involved 30 IX graders. The design used was one group pretest-posttest design as the test of effectiveness. This study used STEAM-based science module equipped with biotechnology games, test, and validation sheets as research instruments. The validation results by experts were converted into categories. The effectivity test data was analyzed using N-gain and paired samples t-test. The average of validation results of material, media, and users was 87.17 (very valid). The effectivity test results showed the increase of students' cognitive learning outcome [N-gain value = 0.72 (high category),  $t(29) = 9.030$ ,  $p < 0.05$ ]. Therefore, the module developed is valid and effective in improving the learning of biotechnology science which means that the use of this module is recommended to be implemented in biotechnology learning process.

## INTRODUCTION

Learning in the 21<sup>st</sup>-century requires teachers and students to be more competitive to be able to compete with the global society. Skills such as the ability to communicate, think creatively, collaborate, think critically, solve problems supported by the mastery of technology are competencies that must be mastered (Barko & Sadler, 2013; Sunwook et al., 2017). Responding to these demands, the government sparked the 2013-Curriculum to prepare Indonesian students to have the ability to live as individuals and citizens who are faithful,

productive, creative, innovative, and practical and able to contribute to the life of society, nation, state and world civilization. One of the contents of the 2013-Curriculum that is taught in secondary schools is science.

The quality of education is associated with the progress of a nation. Science is a scientific family that can be used to measure the progress of education. Indonesian students' scientific understanding is routinely assessed through TIMSS and PISA. The results of a study by the Trends in Mathematics and Science Study (TIMSS) in the realm of science in 2011 found that Indonesia's score ranked 40<sup>th</sup> out of 42 countries (Kim, Gerber, & Kruse, 2016). These results provide evidence that students in Indonesia have difficulty in solving problems related to science. These difficulties include when dealing with problems with indicators analyzing, evaluating, and creating, as well as HOTS aspects that are included in the TIMSS reasoning items (Utomo, Narulita, & Shimizu, 2018). Whereas the results of the PISA survey in 2015 stated that the Indonesian scientific literacy score was 403, with this score, Indonesia occupies 62 positions out of 70 other participants (Weisberg, 2015). This shows that Indonesia is still lagging behind other countries in the field of science or science. Assessments like these play an essential role in improving the education system, curriculum, quality of teaching, and student learning (Wahono & Chang, 2019). Thus, there needs to be a change in strategy to catch up with other countries. The strategy can be in the form of a learning approach that can hone critical thinking skills, be creative, and master scientific concepts and technological literacy.

An approach that can help students to be able to compete in the 21<sup>st</sup>-century by instilling scientific ability in students, namely the Science, Technology, Engineering, Art, and Mathematics (STEAM) approach. STEAM provides learning experiences for students to think logically, mathematically, experimentally, and scientifically (Eastwood & Sadler, 2013). Countries with advanced education, such as Finland, America, Australia, Vietnam, China, Malaysia, the Philippines, have first implemented this approach ten years ago (Pal, Kiran, Rao, & Manimaran, 2016). However, in Indonesia, this approach is not yet well known. Based on the results of the distribution of questionnaires to 90 Teachers of Natural Sciences in Jember region showed that 72% of teachers were not familiar with STEAM-based learning. As many as 69% of teachers expressed the need for the application of the STEAM approach in learning science.

STEAM's approach is the integration of science with technology in a thoughtful way to techniques and arts, in which all of these disciplines contain elements of mathematics as the parent of science (Ni, Qi, & Mu, 2018). STEAM is formed based on a combination of several scientific disciplines, namely science, technology, engineering, arts, and mathematics. According to (Khazaei et al., 2017), STEAM refers to three components: (a) creative design, (b) emotional touch, and (c) content convergence and integration. According to Yakman and Lee (2012) define the elements of art in STEAM in the form of aesthetic values, ergonomics, sociology, psychology, philosophy, and education or, more specifically, can be in the form of language arts, physical/physical arts, social arts, and fine arts. The excess of the element of art in STEAM, according to Sochacka, Guyotte, and Walther (2016), can enrich creative ideas and can better prepare students to overcome the complex socio-technical challenges of the 21<sup>st</sup>-century. Based on the explanation of STEAM it can be said that STEAM is an approach which combines several disciplines in the form of science, technology, engineering, art and mathematics and trains creativity and sensitivity to the surroundings.

The STEAM approach can be applied in learning in various ways, one of which is used as an approach in developing teaching material. Following Government Regulation No.32 of 2013 Article 43 on National Education Standards states that each education unit has the right to develop learning resources other than textbooks according to the characteristics of the material, students, and education units. The need for the teacher's role in helping students in building their knowledge is manifested in ineffective teaching materials (Ningsih, Suratno, & Narulita, 2018). Based on the questionnaire for the preliminary study, 64% of the teachers obtained the teaching materials used were not self-made. Most schools use textbooks (45%) and student worksheet (30%) published by government and local publishers. Some teachers said that they had developed instructional materials, which on average, were student worksheet, but only 11% had developed modules. These results indicate that module teaching materials have not been widely used and produced.

The era of 21<sup>st</sup>-century learning is the millennial century when the learning process is more effective, efficient, interactive, broad, and not patterned only in the classroom (Hiepe, Ros, Reichenbach, & Herrmann, 2009; Moran et al., 2020). Teaching materials that are considered capable of helping students and teachers in the learning process are modules. Among the advantages of the module, namely, the module has an independent command that allows students to learn on their own with the module, and the teacher is no longer the only source of learning for students. Also, modules are arranged systematically and attractively, covering the content of the material, methods, and evaluations developed (Bequette & Bequette, 2012; Goh & Sze, 2019; Wahono & Chang, 2019; Watson, Pelkey, Noyes, & Rodgers, 2016). According to Connor, Karmokar, and Whittington (2015) added the learning system with modules will make learning more efficient, effective, and relevant compared to conventional learning, which tends to be classical and carried out face-to-face.

In the digital era, like nowadays, teaching materials such as modules can have a more significant effect on students if accompanied by things that interest students. Middle school students ranging in age from 12-15 years are a transition from children to adolescents. Students still like playing activities; one of them is playing games. In this digital era, teachers can use it to support learning to make it more interesting, fun, and not boring for students. Combining learning with mobile game media is an appropriate breakthrough by assessing the characteristics and developments of the digital age (Conradty & Bogner, 2019; Elder, Franco, Gulley, Hughes, & Infanti, 2019). Based on the needs analysis questionnaire distributed by researchers, students' responses to the use of games in learning 84% of students were very enthusiastic in following it, and 57% agreed with the use of biotechnology games in learning. Research Huizenga, Admiraal, Akkerman, and Dam (2009) mentioned that the game or mobile-based game combined with education needs further research to find out whether mobile games are an excellent, active and can create constructive learning fun. According to Putra and Iqbal (2016) the use of games in previous research can increase student motivation in learning material.

Implementation of game use in biotechnology materials has been implemented in Florida (Barko & Sadler, 2013), and in the United States (Eastwood & Sadler, 2013; Kim et al., 2016). Implementation of the use of STEM has often been used by combining STEM with PBL in Taiwan (Kuo, Tseng, & Yang, 2019), STEM with LBL on biotechnology materials in Jember (Ningsih et al., 2018), STEAM hands-on inquiry-based math module in Finland (Thuneberg, Salmi, & Bogner, 2018), STEAM-LW on biotechnology materials in Jember (Utomo, Novenda, Budiarmo, & Narulita, 2017).

Based on this, it can be seen that research learning using a STEAM module with biotechnology games has never been done. This research will be renewed because the combination of the STEAM module with the biotechnology game will make it easier for students to learn biotechnology materials. Biotechnology material is material that requires an in-depth understanding, so it is necessary to modify the way it is delivered to students. Some of these studies show that the use of games is very effective in learning biotechnology materials. Some of these studies also show that the combination of STEAM with other methods makes learning effective. Some of these studies also show that STEAM plays a role in learning biotechnology materials. Based on this, this research is a combination of STEAM-based modules and games that will make learning biotechnology materials more interesting and effective in learning activities so that educators in Indonesia can print generations of human resources experts in the field of biotechnology.

The study aimed at describing science module constructed based on STEAM equipped with valid and effective biotechnology games for learning science in junior high school. It is hoped that this research can later become a reference for educators in learning biotechnology materials by attracting and easily being understood by students.

## METHOD

This type of research is included in the research and development (R&D) research. The product developed is a STEAM-based science module equipped with biotechnology games for valid, practical, and effective junior high school students. The development model used is 4D (Thiagarajan) with stages including (1) defining, (2) planning, (3) development, and (4) dissemination.

The definition stage is carried out by formulating the problems obtained in the field. Then proceed with the planning stage in the form of design and preparation of products developed, namely the biotechnology science module based on the STEAM approach. Product trials are carried out at the development stage to find out whether the product being developed is suitable for use. At this stage of development, the validity and effectiveness of the biotechnology science modules based on the STEAM approach.

The research subjects used in this study were junior high school students in class IX. The trial product development research was conducted at MTsN 2 Jember, involving the partitioning of 30 IXF grade students. The research instrument in this study consisted of validation sheets, and test questions to find out the effectiveness of N-gain pre-test and post-test student learning. Before testing, the product is first validated to measure product viability. Product validation in this study is based on logical and empirical validation.

The validation results of STEAM-based Science Module with biotechnology games were analyzed by calculations [Formula 1](#) (xi is number of answers from the validator for the i-th aspect of, yi is maximum number of values for aspect i, P is percentage of overall assessment, n is many aspects assessed, and i is 1,2,3, ... n).

$$P = \frac{\sum_{i=1}^n 1x_i}{\sum_{i=1}^n 1y_i} \times 100\% \quad P = \frac{\sum_{i=1}^n 1x_i}{\sum_{i=1}^n 1y_i} \times 100\% \tag{1}$$

Data validation results were analyzed using percentage techniques (Utomo et al., 2017), then converted to quantitative data according to the criteria of Table 1. If the validation results reach 59.26, then the STEAM-based science module equipped with biotechnology games is declared valid and can be continued for effectiveness testing.

Table 1. Validity criteria

No.	Value	Category	Conclusions
1	79.26 to 100	Very Valid	Can be used without repair
2	from 59.26 to 79.25	Invalid	Can be used with little improvement
3	39.26 to 59.25	Invalid Less	to be used with slight improvement
4	19 to 39.25	Invalid	Not applicable

Validity of the STEAM-based IPA module equipped with biotechnology games is accepted if the average score obtained is > 62.51 or in good criteria. The effectiveness of STEAM-based science modules with biotechnology games was analyzed quantitatively based on the data from the pre-test and post-test results at the field test stage. To determine the effectiveness of student learning outcomes, carried out using the Normalized gain (N-gain) formula. Data obtained by analyzing the pre-test and student test posts. The N gain index is calculated using the N gain index Formula 2 and Table 2.

$$N \text{ (gain)} = \frac{\langle \text{posttest score} \rangle - \langle \text{pre-test score} \rangle}{\langle \text{Maximum Score} \rangle - \langle \text{pre-test score} \rangle} \quad (2)$$

Table 2. n criteria (gain)

Gain score	Criteria
G < 0.3	Low
0.3 ≤ g < 0.7	Medium
G ≥ 0.7	High

To determine the effect of modules on improving student learning outcomes, pre-test and post-test data were analyzed with the help of SPSS 25. The t-test technique used was a paired sample t-test with α = 0.05. Guidelines for decision making in paired sample t-test based on the significance value (Sig.) of the SPSS output are as follows: 1) If the value of sig. (2-tailed) < 0.05, then H0 is rejected, and Ha accepted, and 2) If sig. (2-tailed) > 0.05, then Ha rejected, and H0 received.

## RESULTS AND DISCUSSION

Developed modules associated with 2013-Curriculum revision edition and appropriate with the teacher and student need. Module content was biotechnology in accordance with Core competency (or *Kompetensi Inti/KI*) and Basic competency (or *Kompetensi Dasar/KD*). KI include cognitive mastery of students in KI-3 and mastery of skills in KI-4. KD in the form of competencies that must be mastered by students related to the material. In this research, biotechnology material is in KD-3.7 and KD-4.7. In biotechnology material, students are expected to be at least able to master in the realm of understanding (C.2), so students can explain about biotechnology material and its application while the learning objectives in this study are arranged up to the field of creating (C.6).

Module preparation was done by (1) compiling the module framework with the title "STEAM-based Science Module equipped with biotechnology games," (2) the next step is determining the format and design of the module with the module cover design using adobe illustrator, A4 module size (8.27 'x 11.69 '), orange color domination of font type Book Antiqua, font size 12, 1.5 spaces, equipped with games biotechnology on conventional biotechnology sub material created with Android Studio. After determining the format of the module, the next step is to make an outline of the module i.e. the initial part includes: cover, cover page, preface, table of contents, introduction; Core sections include: BC, learning objectives, material description, STEAM activities, understanding tests; the final section includes: competency test, summary, glossary, bibliography, answer key, author profile. The IPA module section, based on the STEAM approach with biotechnology games, can be seen in Figure 1.

The preparation of biotechnology games is adjusted to the applicable KI and KD. The type of game developed is a mobile game. Mobile games are similar to video games but are played on mobile devices (Choi & Morawitz, 2017; Enke, Kraft, & Metternich, 2015). Game Simple biotechnology here discusses fermentation materials or conventional biotechnology. The use of games in the module is done at the beginning of learning

to attract students' interest and instill the assumption that games can be linked to lessons. Students can more easily access this game even though outside the classroom or learning. This video game will provide an interesting social experience, cognitive and emotional. An outline of the appearance of biotechnology games can be seen in Figure 2.

Whether or not a module to be used is obtained from expert validation results before being tested on a small scale. Validation here consists of two validations, namely instrument validation, and product validation, in the form of a STEAM-based biotechnology module equipped with *games* biotechnology. The results of the assessment by the three validators can be seen in Table 3.

Expert validation was done to find out weaknesses, eligibility, and what improvements needed in product development. A validator is a person who is an expert in a field/science to be able to provide an assessment (Biagioli, Kenney, Martin, & Walsh, 2019; Choi & Morawitz, 2017; Feng, Liu, Huang, Qiang, & Chang, 2019). Validation from a material expert in the form of assessments and suggestions for improvements needed so that the material aspects of the product being developed are feasible, both in the material recognition, presentation, and use of language. The validation of media experts and developers was made one, a validator of a Biology Education Lecturer at the Faculty of Mathematics and Natural Sciences, the University of Jember, who was in charge of a development course and learning media that understood the development and manufacture of instructional media including learning games. Aspects assessed in the form of the appropriateness of module graphics and games as well as the suitability of development. The user validators in this study were three science teachers in class IX as a place for large group research. Based on Table 3, it is known that the STEAM-based biotechnology module equipped with biotechnology games is suitable for use in learning activities. They are considered feasible because it fits the validation criteria. Valid products can then be used in development tests (Dhaliwal, Simpson, & Sing, 2018; Haddad & Sepehrnoori, 2017).

**Table 3.** The results of the validation of biotechnology science modules are equipped with the game

No	Validator expert	Average score of	Category
1.	Material	92.95	Very valid
2.	Media and Development	83.18	Very valid
3.	User	85.38	Very valid
Average validation results		87.17	Very valid

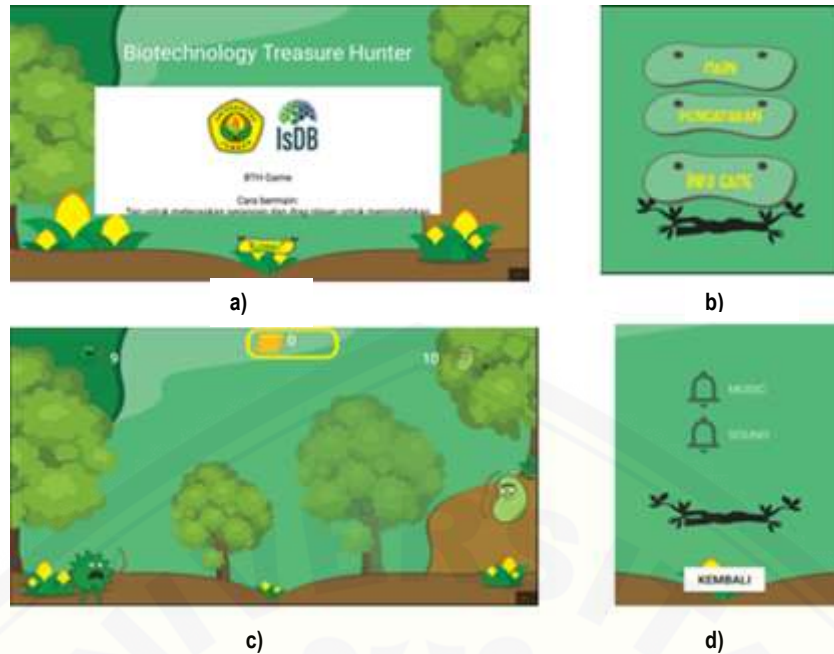

Figure 2. a) Display of info game, b) main menu game, c) display game play, d) settings game

The module effectiveness test is obtained from the pre-test and post-test data. Complete data for student learning outcomes can be seen in Table 4. The effectiveness of modules can be reviewed based on student's N-Gain scores. The results of the effectiveness test showed that student learning outcomes increased with high categories. Before conducting the t-test, the pre-data Test and posttest students must meet the requirements that the data are normally distributed, as in Table 5. The results of the normality of pre-test and post-test data indicate a sig value > 0.05, which means that the data is normally distributed. Furthermore, it can be done paired sample t-test with the help of SPSS, as shown in Table 6.

Table 4. Recapitulation of the results of the small-scale pre-test and post-test gain values

The aspect of	Average the value of the		N-gain	category
	pre-test	post-test		
Cognitive	28.0	80.13	0.72	High

Table 5. Normality test

	Kolmogorov-Smirnov <sup>a</sup>

Table 6. Paired samples test results test

	Paired differences					t	df	Sig. (2-tailed)
	Mean	Std. deviation	Std. error mean	95% Confidence interval of the difference				
				Lower	Upper			
Pair 1 pre_test-post_test	-29.667	17.995	3.285	-36.386	-22.947	-9.030	29	.000

The results of module effectiveness are seen from the differences in pre-test and post-test through a significant level between before and after the use of the Science module based on the STEAM approach. The results of the paired sample t-test analysis showed the value of sig. (2-tailed) = 0.000. Sig value (2-tailed) < 0.05, then H0 is rejected, and Ha accepted, so that the data concluded that the IPA module-based approach include games biotechnology STEAM effect on improving student learning outcomes.

The Science module based on the STEAM approach equipped with biotechnology games is said to be effective if student learning outcomes have increased with an average N-gain score of  $0.3 \leq g < 0.7$  in the medium category. This is consistent with the average N-gain of a large group of 0.67 so that the module developed can be said to be effective. While learning can be said to be successful if the percentage of individual student learning outcomes reaches 65% and learning is said to be successful classically if student learning outcomes reach  $\geq 85\%$  (Kuo et al., 2019). In line with previous research that the application of the STEAM approach can improve students' mastery of concepts (Firat & Koksall, 2019; Millan, Mauri, & Casey, 2014; Thuneberg et al., 2018). This is because, in the preparation of modules, students are given space to explore the knowledge learned and involved in practical activities so that the knowledge obtained is inherent to students. The composition of the module content is in accordance with Conner et al (2017), which gives students the opportunity to engage in exploration rather than memorizing, have the chance to discuss their ideas and communicate with others. In addition to helping students understand the STEAM approach material can also help build ability, creative students and characters. According to Land (2013) during STEAM-based learning students are trained with questions that require students to solve problems, critical and creative thinking also collaborate with fellow students.

The use of the biotechnology game in the modules also supports the effectiveness of the STEAM-based science module developed. Game in learning can provide a pleasant environment, motivating, and increasing creativity (Abualrob & Shah, 2012; Jun & Ping, 2008; Kulldel, 2007; Loeb et al., 2018; Madden et al., 2013). When students feel happy at the beginning of learning by using biotechnology games, students also become motivated to understand the material. This is in line with research by Quigley and Herro, (2016), which states that using mobile games increases student motivation in learning, which then helps in the achievement of learning objectives. Flexible game access allows students to repeat the material being studied.

Meanwhile, to disseminate the effectiveness of modules, dissemination was carried out, and varied N-gain results were obtained with medium, high, and high categories. This is in line with Georgette and Hyonyong (2012) that teaching using modules must be widely used in classrooms at various levels of education to find out student performance improvement. The results of the distribution showed consistency in the effectiveness of learning using STEAM-based biotechnology science modules equipped with biotechnology games. In accordance with a research by Bartel and Hagel, (2014) that modules are teaching materials that can improve the effectiveness and efficiency of learning in schools. The use of modules in the learning process can activate students so that learning is no longer teacher-centered. Students are able to learn independently with modules because their use is not difficult, delivery in modules is easy to understand, presentation of interesting material, drawings and STEAM activities as well as test comprehension and practice questions that are accompanied by answer keys enable students to assess their own level of understanding. According to Pablos, Pozo, and Repiso (2017) adds that the module is effectively applied to science learning.

## CONCLUSION

STEAM-based science modules equipped with biotechnology games based on the validation results obtained at 87.17 with a very valid category. The effectiveness of the module based on N-gain from the pretest and posttest is categorized very effectively with an N-gain value of 0.72 and sig.  $0.00 < 0.05$ . So it can be concluded that the STEAM-based science module is equipped with biotechnology games that are feasible and effective to be used in improving the learning of Biotechnology Science.

## ACKNOWLEDGMENT

Thank to LP2M University of Jember for the funding through *Hibah Penelitian Dosen Pemula* (Beginner Lecturer Research Grant) in 2019 academic year.

## PUBLICATION ETHICS

### Publication ethics

JPBI (Jurnal Pendidikan Biologi Indonesia) is dedicated to following best practices on ethical matters, errors and retractions. The prevention of publication malpractice is one of the important responsibilities of the editorial board. Any kind of unethical behavior is not acceptable, and the JPBI (Jurnal Pendidikan Biologi Indonesia) does not tolerate plagiarism in any form. Authors submitting articles to the JPBI (Jurnal Pendidikan Biologi Indonesia) affirm that manuscript contents are original. Furthermore, they warrant that their article has neither been published elsewhere in any language fully or partly, nor is it under review for publication anywhere.

The following duties outlined for editors, authors, and reviewers are based on the COPE Code of Conduct for Journal Editors.

### Publication decisions

The editor of the journal is responsible for deciding which of the articles submitted to the journal should be published. The editor may be guided by the policies of the journal's editorial board and constrained by such legal requirements as shall then be in force regarding libel, copyright infringement and plagiarism. The editor may confer with other editors or reviewers in making this decision.

### Fair play

An editor will at any time evaluate manuscripts for their intellectual content without regard to race, gender, sexual orientation, religious belief, ethnic origin, citizenship, or political philosophy of the authors.

### Confidentiality

The editor and any editorial staff must not disclose any information about a submitted manuscript to anyone other than the corresponding author, reviewers, potential reviewers, other editorial advisers, and the publisher, as appropriate.

### Disclosure and conflicts of interest

Unpublished materials disclosed in a submitted manuscript must not be used in an editor's own research without the express written consent of the author.

### Duties of Reviewers

#### Contribution to Editorial Decisions

Peer review assists the editor in making editorial decisions and through the editorial communications with the author may also assist the author in improving the paper.

#### Promptness

Any selected referee who feels unqualified to review the research reported in a manuscript or knows that its prompt review will be impossible should notify the editor and excuse himself from the review process.

#### Confidentiality

Any manuscripts received for review must be treated as confidential documents. They must not be shown to or discussed with others except as authorized by the editor.

#### Standards of Objectivity

Reviews should be conducted objectively. Personal criticism of the author is inappropriate. Referees should express their views clearly with supporting arguments.

#### Acknowledgment of Sources

Reviewers should identify relevant published work that has not been cited by the authors. Any statement that an observation, derivation, or argument had been previously reported should be accompanied by the relevant citation. A reviewer should also call

to the editor's attention any substantial similarity or overlap between the manuscript under consideration and any other published paper of which they have personal knowledge.

---

### Disclosure and Conflict of Interest

Privileged information or ideas obtained through peer review must be kept confidential and not used for personal advantage. Reviewers should not consider manuscripts in which they have conflicts of interest resulting from competitive, collaborative, or other relationships or connections with any of the authors, companies, or institutions connected to the papers.

---

### Duties of Authors

#### Reporting standards

Authors of reports of original research should present an accurate account of the work performed as well as an objective discussion of its significance. Underlying data should be represented accurately in the paper. A paper should contain sufficient detail and references to permit others to replicate the work. Fraudulent or knowingly inaccurate statements constitute unethical behavior and are unacceptable.

---

### Data Access and Retention

Authors are asked to provide the raw data in connection with a paper for editorial review, and should be prepared to provide public access to such data (consistent with the ALPSP-STM Statement on Data and Databases), if practicable, and should in any event be prepared to retain such data for a reasonable time after publication.

---

### Originality and Plagiarism

The authors should ensure that they have written entirely original works, and if the authors have used the work and/or words of others that this has been appropriately cited or quoted.

---

### Multiple, Redundant or Concurrent Publication

An author should not in general publish manuscripts describing essentially the same research in more than one journal or primary publication. Submitting the same manuscript to more than one journal concurrently constitutes unethical publishing behavior and is unacceptable.

---

### Acknowledgment of Sources

Proper acknowledgment of the work of others must always be given. Authors should cite publications that have been influential in determining the nature of the reported work.

---

### Authorship of the Paper

Authorship should be limited to those who have made a significant contribution to the conception, design, execution, or interpretation of the reported study. All those who have made significant contributions should be listed as co-authors. Where there are others who have participated in certain substantive aspects of the research project, they should be acknowledged or listed as contributors. The corresponding author should ensure that all appropriate co-authors and no inappropriate co-authors are included on the paper, and that all co-authors have seen and approved the final version of the paper and have agreed to its submission for publication.

---

### Disclosure and Conflicts of Interest

All authors should disclose in their manuscript any financial or other substantive conflict of interest that might be construed to influence the results or interpretation of their manuscript. All sources of financial support for the project should be disclosed.

---

### Fundamental errors in published works

When an author discovers a significant error or inaccuracy in his/her own published work, it is the author's obligation to promptly notify the journal editor or publisher and cooperate with the editor to retract or correct the paper.

---

### Authors of work

Author of the paper should be the person who made the greatest contribution to the creation of the work. All those who contributed to the making of the work should be listed in the paper and as co-authors. If there are other contributors who took part in the preparation of making the same work should be listed or admitted as associates. Before accepting a final version of the paper for publication is necessary that the author and all co-authors approved the final version.

### Changes in authorship

Privacy change in authorship relates to the addition, deletion, or rearrangement of author names in accepted version of the paper. An amendment to the data on the authors or co-authors is not possible after acceptance and publication in the online version.

If there is a need to amend the information on the authors, it is necessary to state the following:

1. The reason for the addition or deletion of author,
2. A written confirmation (send it scanned by e-mail) where all the authors agree that the notified operation is a named person is added or removed from the list of authors.
3. The editor will notify the author that needs to be added or removed from the list and will ask for his consent.

Requirements that are not sent by the respective author (corresponding author) will not be considered.

### Originality and plagiarism

Authors are required to submit original written article. If other work necessary to work properly quote according to the instructions on the citation of work. If you use ideas of other authors require their written consent and using the same.

Plagiarism in all its forms constitutes unethical behavior and will be severely punished, and as such is unacceptable. The author or authors are required before reporting to work in the journal checking their work through some of the programs for testing against plagiarism. The Editorial Board reserves the right to verify each work through the test of plagiarism and if the same occurs notify the author.

### Disclosure and conflicts of interest

Disclosure and conflicts of interest can be multiple. If the author or institution where the author has a financial assistance in project design or research is needed to adequately cover letter to inform the editorial and the public. Publication in journal person or institution that is financially supported by the making of the work or project is the best way to protect against conflicts of interest.

At the end of the text, under a subheading " Conflicts of interest ", all authors must disclose any actual or potential conflict of interest including any financial (direct or indirect), personal or other relationships with other people or organizations within three years from the commencement of any work.

### Fundamental errors in published works

If the author detects an error in the published paper is obliged to instantly inform journal editors or publishers and that as soon as possible the same document. The author shall, in the event of an error, to cooperate with the editorial board to remove the same.

### Copyright

The Author(s) warrant that their manuscript is their original work that has not been published before; that it is not under consideration for publication elsewhere; and that its publication has been approved by all co-authors, if any, as well as tacitly or explicitly by the responsible authorities at the institution where the work was carried out. The Author(s) affirm that the article contains no unfounded or unlawful statements and does not violate the rights of others. If copyrighted works are included, the Author(s) bear responsibility to obtain written permission from the copyright owners. The Corresponding author, as the signing author, warrants that he/she has full power to make this grant on behalf of the Author(s).

By signing this agreement, the Corresponding author grants to the Publisher the following rights to the Manuscript, including any supplemental material, and any parts, extracts or elements thereof:

- the right to reproduce and distribute the Manuscript in printed form, including print-on-demand;
- the right to produce prepublications, reprints, and special editions of the Manuscript;
- the right to translate the Manuscript into other languages;

- the right to reproduce the Manuscript using photomechanical or similar means including, but not limited to photocopy, and the right to distribute these reproductions;
- the right to reproduce and distribute the Manuscript electronically or optically on any and all data carriers or storage media – especially in machine readable/digitalized form on data carriers such as hard drive, CD-Rom, DVD, Blu-ray Disc (BD), Mini-Disk, data tape – and the right to reproduce and distribute the Article via these data carriers;
- the right to store the Manuscript in databases, including online databases, and the right of transmission of the Manuscript in all technical systems and modes;
- the right to make the Manuscript available to the public or to closed user groups on individual demand, for use on monitors or other readers (including e-books), and in printable form for the user, either via the internet, other online services, or via internal or external networks.

Articles published in the Journal are Open-Access articles distributed under a [Creative Commons Attribution-ShareAlike 4.0 International License](#).

The Journal allows Author(s) to deposit Author's Post-print (accepted version) and Publisher's version/PDF in an institutional repository and non-commercial subject-based repositories, such as PubMed Central, Europe PMC, arXiv, DOAJ, ERIC, and other repositories, or to publish it on Author's personal website and departmental website (including social networking sites, such as ResearchGate, Academia.edu, etc.), at any time after publication. Publisher copyright and source must be acknowledged and a link must be made to the article's DOI.

Upon receiving the proofs, the Author(s) agree to promptly check the proofs carefully, correct any typographical errors, and authorize the publication of the corrected proofs.

The Corresponding author agrees to inform his/her co-authors, of any of the above terms.

## AUTHORS GUIDELINES

### BEFORE YOU BEGIN

Please read carefully the Author Guidelines, and make sure you have adhered closely to the rules before submission. Only submissions that conform to the guidelines and that include all required components, which are described in Author Guidelines, can be sent out for peer review.

Manuscripts which do not fully comply will be returned to authors. Before submitting be sure that you have complied with all the requirements for submission of manuscripts. That will help to ensure that we can consider your work quickly and give you a prompt decision.

### Types of contributions

Original Research and Review Articles.

### Authorship of the Paper

Authorship should be limited to those who have made a significant contribution to the conception, design, execution, or interpretation of the reported study. All those who have made significant contributions should be listed as co-authors. Where there are others who have participated in certain substantive aspects of the research project, they should be acknowledged or listed as contributors. The corresponding author should ensure that all appropriate co-authors and no inappropriate co-authors are included on the paper and that all co-authors have seen and approved the final version of the paper and have agreed to its submission for publication.

### Authors of work

The author of the paper should be the person who made the greatest contribution to the creation of the work. All those who contributed to the making of the work should be listed in the paper and as co-authors. If there are other contributors who took part in the preparation of making the same work should be listed or admitted as associates.

Before accepting a final version of the paper for publication is necessary that the author and all co-authors approved the final version.

### Changes in authorship

Privacy change in authorship relates to the addition, deletion, or rearrangement of author names in accepted version of the paper. An amendment to the data on the authors or co-authors is not possible after acceptance and publication in the online version.

If there is a need to amend the information on the authors, it is necessary to state the following:

1. The reason for the addition or deletion of author,
2. A written confirmation (send it scanned by e-mail) where all the authors agree that the notified operation is a named person is added or removed from the list of authors.
3. The editor will notify the author that needs to be added or removed from the list and will ask for his consent.

Requirements that are not sent by the respective author (corresponding author) will not be considered.

### Originality and plagiarism

All accepted papers will be tested with **Turnitin** software.

Authors are required to submit original written article. If other work necessary to work properly quote according to the instructions on the citation of work. If you use ideas of other authors require their written consent and using the same.

Plagiarism in all its forms constitutes unethical behavior and will be severely punished, and as such is unacceptable. The author or authors are required before reporting to work in the journal checking their work through some of the programs for testing against plagiarism. The Editorial Board reserves the right to verify each work through the test of plagiarism and if the same occurs to notify the author.

### Disclosure and conflicts of interest

Disclosure and conflicts of interest can be multiple. If the author or institution where the author has a financial assistance in project design or research is needed to adequately cover letter to inform the editorial and the public. Publication in journal person

or institution that is financially supported by the making of the work or project is the best way to protect against conflicts of interest.

### Fundamental errors in published work

If the author detects an error in the published paper is obliged to instantly inform journal editors or publishers and that as soon as possible the same document. The author shall, in the event of an error, to cooperate with the editorial board to remove the same.

### Copyright

Submission of an original manuscript to the Journal will be taken to mean that it represents original work not previously published, that is not being considered elsewhere for publication; that the author is willing to assign copyright to the journal as per a contract that will be sent to the author just prior to publication and, if accepted for publication, it will be published in print and online and it will not be published elsewhere in the same form, for commercial purposes, in any language, without the consent of the publisher.

The journal allows readers to *read, download, copy, distribute, print, search, or link to the full texts of its articles* and allow readers to *use them for any other lawful purpose*.

### Copyright Agreement

For open access articles, permitted third party (re)use is defined by the following Creative Commons user licenses:

[Creative Commons Attribution-ShareAlike 4.0 International License](#). **(CC BY-SA 4.0)**

For non-commercial purposes, lets others distribute and copy the article, and to include in a collective work (such as an anthology), as long as they credit the author(s) and provided they do not alter or modify the article.

### Language (usage and editing services)

Please write in good English (American or British usage is accepted, but not a mixture of these). For non-native English speakers, and perhaps even for some native English speakers, the grammar, spelling, usage, and punctuation of the text are very important for an effective presentation. Hence, manuscripts are expected to be written in a clear, cogent, and readily understandable by an international readership. To avoid unnecessary errors, you are strongly advised to use the 'spell-check' and 'grammar-check' functions of your word processor.

Authors who feel their English language manuscript may require editing to eliminate possible grammatical or spelling errors and to conform to correct scientific English may wish to use the English Language Editing.

### Reviewing of manuscripts

Every submitted paper is independently reviewed by at least two peer-reviewers. The decision for publication, amendment, or rejection is based upon their reports/recommendation and made by Editor. If two or more reviewers consider a manuscript unsuitable for publication in this journal, a statement explaining the basis for the decision will be sent to the authors.

### Revision of manuscripts

Manuscripts sent back to the authors for revision should be returned to the editor without delay. Revised manuscripts can be sent to editorial office through the Online Submission Interface. The revised manuscripts returned later than three months will be considered as new submissions.

---

### NEW SUBMISSIONS

Manuscripts must submit only online, proceeds are totally online and you will be guided stepwise through the creation and uploading of your files. Electronic submission reduces the editorial processing and reviewing times and reduces the time of submission to publication.

You have to use **JPBI template** to prepare your article. Manuscripts written in English will be reviewed by editorial boards with related study competency.

1. Registration and login are required to submit items online and to check the status of current submissions.
2. Submission online in <http://ejournal.umm.ac.id/index.php/jpbi>
3. In case of any difficulties, please send your manuscript to e-mail: [journal.educationalbiology@gmail.com](mailto:journal.educationalbiology@gmail.com) or [jpbi@umm.ac.id](mailto:jpbi@umm.ac.id)

4. Personal contact: Diani Fatmawati, +628123353005

### Formatting requirements

The prepared article should be formatted with JPBI template. There are some parameters for authors.

If your article includes any Videos and/or other Supplementary material, this should be included in your initial submission for peer review purposes.

Divide the article into clearly defined sections.

### Manuscript Preparation Guidelines

The manuscript texts are written in English (see [JPBI Template](#)). Manuscripts in English will be first reviewed by editorial boards. The main text of a manuscript must be submitted as a Word document (.doc) or Rich Text Format (.rtf) file.

The manuscript well-typed in single column on A4 size paper, use 11 pt of Arial Narrow. The manuscript contains an original work and have potentially contribute to the highly scientific advancement.

The manuscript should contain the following section in order:

#### a. Title

The title should describe the main content of article, be informative, concise, be accurate, unambiguous, specific, not too wordy (12-14 words only), does not contain formulas, and infrequently-used abbreviations. This is your opportunity to attract the reader's attention. Remember that readers are the potential authors who will cite your article. Identify the main issue of the paper. Begin with the subject of the paper. The title should and complete.

The title describes the conducted research, Arial Narrow, Font size 19, single line spacing, 0 pt after spacing.

#### b. The author name

Full name without academic degrees and titles, written in capital letters. Manuscript written by groups needs to supplemented by complete contact details.

#### c. Name of affiliation for each author

The author name should be accompanied by complete affiliation address, email, and corresponding email.

#### d. Abstract

**Abstract**, which comprised of approximately 200 words, provides a brief description of research problems, aims, method used, results, and conclusion. An abstract should stand alone, means that no citation in the abstract. Consider it the advertisement of your article. The abstract should tell the prospective reader what you did and highlight the key findings. Avoid using technical jargon and uncommon abbreviations. You must be accurate, brief, clear and specific. Use words which reflect the precise meaning. The abstract should be precise and honest.

It emphasizes research results in which written in single line spacing with left and right margin are 0.5 cm narrower than main text. 3-5 keywords must be written to describe the research scope observed as well as the main terms undergirding the research.

These keywords can be single and/or combined words.

**Key words:** Written in English 3-5 words or groups of words, written alphabetically. Keywords are the labels of your article and critical to correct indexing and searching. Therefore the keywords should represent the content and highlight of your article. Use only those abbreviations that are firmly established in the field.

#### e. Introduction

This section could also provide the expected results. The introduction must be written in single line spacing. The introduction comprises of: (1) research problem; (2) insight and problem solve planning; (3) summary of theoretical studies and the results of the present study (state of the art), related to the observed problems (gap analysis), and (4) research aims.

In Introduction, Authors should state the objectives of the work at the end of introduction section. Before the objective, Authors should provide an adequate background, and very short literature survey in order to record the existing solutions/method, to show which is the best of previous researches, to show the main limitation of the previous researches, to show what do you hope to achieve (to solve the limitation), and to show the scientific merit or novelties of the paper. Avoid a detailed literature survey or a summary of the results. **Do not describe literature survey as author by author, but should be presented as group per method or topic reviewed which refers to some literatures.**

Example of novelty statement or the gap analysis statement in the end of Introduction section (after state of the art of previous research survey): "..... (short summary of background)..... A few researchers focused on ..... There have been limited studies concerned on ..... Therefore, this research intends to ..... The objectives of this research are ....."

According to Armagan (2014), the introduction section comprises the first portion of the manuscript, and it should be written using the simple present tense. Additionally, abbreviations and explanations are included in this section. The main goal of the introduction is to convey basic information to the readers without obligating them to investigate previous publications and to provide clues as to the results of the present study (references should be selected from updated publication with a higher impact factor, traceable, and prestigious source books). To do this, the subject of the article should be thoroughly reviewed, and the aim of the study should be clearly stated immediately after discussing the basic references.

The body articles must be written in Arial Narrow, font size 11, 0 pt before spacing, and 0 pt after spacing.

#### f. Methods

Methods should make readers be able to reproduce the experiment. Provide sufficient detail to allow the work to be reproduced. Methods already published should be indicated by a reference: only relevant modifications should be described. Do not repeat the details of established methods.

Basically, this section describes the way the research was done. The main materials must be written here: (1) research design; (2) population and samples; (3) sample collection techniques and instrumental development; (4) data analysis techniques.

The specification and type of tools and materials must be written in case the researches have been conducted by using them.

The qualitative research, such as classroom action research, case studies, and so forth, need to mention the researcher attendance, research subject, and participated informants, as well as the methods used to explore the data, research location, research duration, and the description of research results validation.

It is suggested that the authors avoid to organize the article content into the smaller parts than second subheading in this section. However, in case of unavoidable factors, the writing style must follow the "Results and Discussion" section.

#### g. Results and Discussion

This section is the main part of the research result article in which the "fix" results are served. The data analysis processes, such as statistical computing and hypothesis testing, are not necessary to be served. The materials reported are the analysis results and hypothesis testing results. In addition, tables and graphics are also can be showed to enunciate the verbal narration. Tables and images must be given a comment or discussion. The details of qualitative research written in some sub-topics which directly related to the focused category.

The discussion of article aims to: (1) answer the problems and research questions; (2) show the ways the findings obtained; (3) interpret the findings; (4) relate the finding results to the settled-knowledge structure; (5) bring up new theories or modify the exist theories.

In discussion, it is the most important section of your article. Here you get the chance to sell your data. Make the discussion corresponding to the results, but do not reiterate the results. Often should begin with a brief summary of the main scientific findings (not experimental results).

The following components should be covered in discussion: How do your results relate to the original question or objectives outlined in the Introduction section (*what/how*)? Do you provide interpretation scientifically for each of your results or findings presented (*why*)? Are your results consistent with what other investigators have reported (*what else*)? Or are there any differences?

Research results must be clearly concluded in answering the research questions. Interpreting the findings should be done by using logics and present theories. The findings in form of facts found in the research fields are integrated to previous researches or present theories. This must be supported by reliable references. In case the researchers bring a new theories, the old theories can be confirmed or rejected, or modify the old theories.

In some cases, it is unavoidable to organize an article by making sub-headings. Thus, this is the format to write JPBI manuscripts with sub-headings. In this section, there are specific rules which cannot be separated in an articles.

#### h. Conclusion

This part provides the summary of results and discussion which refers to the research aims. Thus, the new principal ideas, which are essential part of the research findings, are developed.

Conclusions should answer the objectives of the research. Tells how your work advances the field from the present state of knowledge. Without clear Conclusions, reviewers and readers will find it difficult to judge the work, and whether or not it merits

publication in the journal. Do not repeat the Abstract, or just list experimental results. Provide a clear scientific justification for your work, and indicate possible applications and extensions. You should also suggest future experiments and/or point out those that are underway.

The suggestions, which are arranged based on research discussed-findings, are also written in this part. These should be based on practical activities, new theoretical development, and/or advance research.

### i. Acknowledgement

This section can be written in case there are certain parties need to be acknowledged, such as research sponsors/funding supporter. Include individuals who have assisted you in your study: Advisors, Financial supporters, or may another supporter, i.e. Proofreaders, Typists, and Suppliers, who may have given materials. Do not acknowledge one of the authors names. The acknowledgement must be written in brief and clear. In addition, avoid the hyperbole acknowledgment.

### j. References

Citation and referencing must be written based on **APA style 6<sup>th</sup> Edition** which is organized by using Mendeley software latest version (**See Mendeley User Guidelines**).

Citing an article written by two authors, both of authors should be mentioned, however, for three and more authors only the first author is mentioned followed by et al., for example: Husamah and Pantiwati (2015) and Husamah et al. (2017). A series of references should be presented in ascending alphabetical order (Fatmawati et al., 2011; Hudha et al., 2014; Miharja, 2010). Different publications with the same author(s) and year will be presented separately, as follows 2015a, 2015b. References of unpublished data and personal communication should not appear in the list but should be cited in the text only (e.g., Pantiwati 2014, pers. com. (personal communication); Susetyarini 2014, unpublished data). In the reference list, the references should be listed in an alphabetical order. Names of journals should be abbreviated. Always use the standard abbreviation of a journal's name according to the **ISSN List of Title Word Abbreviations** ([www.issn.org/2-22661-LTWA-online.php](http://www.issn.org/2-22661-LTWA-online.php)). More or less 80% references for literature reviews should be the recent (up to date) journals published in the last 10 years, but the rest of 20% references can be cited from research reports and or articles.

The following is an example of order and style to be used in the manuscript (These guidelines are based on the sixth edition (2010) of the Publication Manual of the American Psychological Association and the FAQs on the APA website [[www.apastyle.org/faqs.html#3](http://www.apastyle.org/faqs.html#3)]):

#### 1. Journal articles:

*How to cite:* First author, Second author., & Third author. (20xx). The title. *JPBI (Jurnal Pendidikan Biologi Indonesia)*, Vol(No), xx-yy. doi: <https://doi.org/10.22219/jpbi.vxiy.xxyy>

## INTRODUCTION (*Heading 1*) (bold, 12pt)

This section could also provide the expected results. The introduction must be written in single line spacing. The introduction comprises of: (1) research problem; (2) insight and problem solve planning; (3) summary of theoretical studies and the results of the present study (state of the art), related to the observed problems (gap), and (4) research aims.

According to Armagan (2014), the introduction section comprises the first portion of the manuscript, and it should be written using the simple present tense. Additionally, abbreviations and explanations are included in this section. The main goal of the introduction is to convey basic information to the readers without obligating them to investigate previous publications and to provide clues as to the results of the present study (references should be selected from updated publication with a higher impact factor, traceable, and prestigious source books). To do this, the subject of the article should be thoroughly reviewed, and the aim of the study should be clearly stated immediately after discussing the basic references.

This template format was made in MS Word (.doc) which then been saved in Rich Text Format (.rtf) and can be downloaded in <http://ejournal.umm.ac.id/index.php/jpbi>. It enables the authors to prepare their manuscripts which meet the JPBI conditions properly.

The body articles must be written in Arial Narrow, font size 11, 0 pt before spacing, and 0 pt after spacing.

## METHOD

Basically, this section describes the way the research was done. The main materials must be written here: (1) research design; (2) population and samples; (3) sample collection techniques and instrumental development; and (4) data analysis techniques.

The specification and type of tools and materials must be written in case the researches have been conducted by using them.

The qualitative research, such as classroom action research, case studies, and so forth, need to mention the researcher attendance, research subject, and participated informants, as well as the methods used to explore the data, research location, research duration, and the description of research results validation.

It is suggested that the authors avoid organizing the article content into the smaller parts than second subheading in this section. However, in case of unavoidable factors, the writing style must follow the "Results and Discussion" section.

## RESULTS AND DISCUSSION

This section is the main part of the research result article in which the "fix" results are served. The data analysis processes, such as statistical computing and hypothesis testing, are not necessary to be served. The materials reported are the analysis results and hypothesis testing results. In addition, tables and graphics are also can be showed to enunciate the verbal narration. Tables and images must be given a comment or discussion. The details of qualitative research written in some sub-topics which directly related to the focused category.

The discussion of article aims to: (1) answer the problems and research questions; (2) show the ways the findings obtained; (3) interpret the findings; (4) relate the finding results to the settled-knowledge structure; and (5) bring up new theories or modify the exist theories.

Research results must be clearly concluded in answering the research questions. Interpreting the findings should be done by using logics and present theories. The findings in form of facts found in the research fields are integrated to previous researches or present theories. This must be supported by reliable references. In case the researchers bring a new theory, the old theories can be confirmed or rejected, or modify the old theories.

In some cases, it is unavoidable to organize an article by making sub-headings. Thus, this is the format to write JPBI manuscripts with sub-headings. In this section, there are specific rules which cannot be separated in an article.

### Abbreviations and Acronyms

The extensions of common abbreviation, such as UN, SI, MKS, CGS, sc, dc, and rms are not necessity to be described. However, it is crucial to give the extension for uncommon abbreviations or acronyms which made by authors. For instance: OIDDE (Orientation, Identify, Discussion, Decision, and Engage in behavior) learning model can be used to train mastering solving problem skills. It is suggested to not using abbreviation or acronyms in the manuscript title, unless unavoidable.

### Units

Units in articles must be written by considering the below conditions.

- (a) Use SI or CGS as main units in which SI is the priority.
- (b) Avoid mixing SI and CGS in order to eliminate biases and inequivalence of equation dimensions.

It is not suggested to mix abbreviation of units with unabbreviated units. For example, instead of using "Webbers/m<sup>2</sup>", the author should use "Wb/m<sup>2</sup>" or "Webbers per meter per square".

### Equations

The authors are suggested to write the equations used by using Arial Narrow font or symbol. In case there are more than one equation, it must be given equation numbers. The number must be placed in the right side of the equations and given in order i.e. (1), (2) and so on. Italic font is used for variable; while bold font is used for vector.

$$\frac{\partial \rho}{\partial t} = -\nabla \cdot (\rho \mathbf{u}) \tag{1}$$

$$\rho \left( \frac{\partial}{\partial t} + \mathbf{u} \cdot \nabla \right) \mathbf{u} = -\nabla P + \rho \mathbf{g} + \frac{1}{c} \mathbf{J} \times \mathbf{B} \tag{2}$$

$$\rho \left( \frac{\partial}{\partial t} + \mathbf{u} \cdot \nabla \right) e = -P \nabla \cdot \mathbf{u} + \rho \mathbf{u} \cdot \mathbf{g} + \frac{1}{c} \mathbf{J}^2 \tag{3}$$

*Images and Tables*

Place the labels above for tables and below for images. Write the table label specifically, for example Table 1, in case the author refers the Table 1 mentioned. The example of writing table and figure information is as below.

**Table 1.** Table format

Table Head	Table Column Head		
	<i>Table column subhead</i>	<i>Subhead</i>	<i>Subhead</i>
copy	More table copy <sup>a</sup>		

<sup>a</sup> Sample of a Table footnote. (*Table footnote*)

**Figure 1.** Example of image information

**Citation**

Citation and referencing must be written based on APA style 6<sup>th</sup> Edition which is organized by using Mendeley software latest version. References used at least 30, 80% primary sources (reputable journals and research reports including thesis and dissertation) and 5 (five) years of publication.

**CONCLUSION**

This part provides the summary of results and discussion which refers to the research aims. Thus, the new principal ideas, which are essential part of the research findings, are developed.

The suggestions, which are arranged based on research discussed-findings, are also written in this part. These should be based on practical activities, new theoretical development, and/or advance research.

**ACKNOWLEDGMENT**

This section can be written in case there are certain parties need to be acknowledged, such as research sponsors. The acknowledgement must be written in brief and clear. In addition, avoid the hyperbole acknowledgment.

**REFERENCES**

Citation and referencing must be written based on APA style 6<sup>th</sup> Edition which is organized by using Mendeley software latest version.

**Supplementary Material**

Supplementary material that may be helpful in the review process should be prepared and provided as a separate electronic file. That file can then be transformed into PDF format and submitted along with the manuscript and graphic files to the appropriate editorial office.
