Collective Learner Deficits as a Function of Predictive Behavior of Young Football Players

Habeeb Shaker Jebur[1], Khalid Oudah Gshayyish[1], Riyadh Hassan Salah[1]

[1]The college of physical education and sport sciences, AL-Muthanna University, Iraq.

Abstract

The change in behavior during the performance of movements and mathematical skills is related to the educational and training principles of most motor sentences. There is no doubt that the movements of players in the game must be coordinated and understand and expect each player moves his teammates in the field of play. Accordingly, the main objectives of the research are as follows:

1. Knowledge of the relationship between collective behavior and collective learning deficits in the research community.
2. Know the percentage of the contribution of the total learner deficit in the conduct of the community in question.
3. Predicting the planning behavior of the research community in terms of collective learning deficit.

To achieve these objectives, the researcher used the descriptive method in his survey method and study of associative relations. The research tools were represented by the 30 young players from the Samawah Sports Club/Iraq, as well as the means of collecting data. After the series of field procedures to verify the validity of the learner's disability scale, the researcher proceeded with the imaging procedures and using the appropriate statistical means to process the results to serve the research and achieve the objectives, the researcher devised a predictive equation through which to predict the behavior of the schematic, in terms of collective learning deficit, that the behavior of the schematic is linked to a real relationship with the disability of the learner collective.

Keywords: *Collective learner, predictive and behavior.*

Introduction

The change in behavior through the performance of movements and mathematical skills is related to the educational and training principles of most motor sentences. There is no doubt that the movements of players in the game must be coordinated and to understand each player expects the moves of his colleagues in the field of play, it is necessary to find out the extent of the deficit learner collective and we find great importance to predict the behavior of the plan, the current study.

The theoretical importance of this study lies in the development of a cognitive framework for trainers on the relationship between the behavior of football and the collective learner disability, the contribution of the collective learner deficit to the behavior of the planner, the predictive behavior of the football players,

The practical importance of this study is illustrated by:[1]

- Their findings and recommendations, which may help to answer some of the questions about the feasibility of predictive behavior in football through the deficit learner collective.
- Define the appropriate objectives and means that contribute to the development of the performance of the behavior of football planners.

Research Aims:

1. Knowledge of the relationship between the behavior

of the planner and the inability of the collective learner, for young football players belonging to the club Samawa Sports/Iraq.

2. Knowledge of the percentage contribution of the deficit learner collective, in the conduct of the planners of football players in the club Samawa Sports - Iraq.
3. Predicting the behavior of the planners of the young football players belonging to the Club Samawah Sports/Iraq, in terms of the deficit learner collective.

Materials and Method

The researcher used the descriptive approach - the study of associative relations - to suit the nature of the study and its objectives.

Search Tools: The researchers used the following research tools to reach the results and achieve the objectives.

Research Community: The research community is represented by young football players from the Samawah Sports Club/Iraq, with a total of (30) players.

Devices and tools used in the search:

- Foot balls.
- Digital video camera type (Sony 560 X Zoom) speed (25) image/Sec.
- Software and applications.
- Football field.
- Manual Calculator.
- Personal computer (Lab Tub).
- Office equipment (sheets and pens).
- Registration test results form.

Field Research Procedures:

Conductive Test:

The purpose of the test: Know the level of knowledge of the players in the conduct of the game during the performance of the game

The Crisis Tools: Test forms on the number of experts (performance evaluation), football field (Diwaniyah Youth Club), video cameras, stopwatch

Test Time: 45 minutes.

Game Performance Assessment System: For the purpose of evaluating the performance of the game we use the system of performance assessment of the game developed by Stephen, Judith and Lida, 2006, which was designed to match the open and individual games (7) paragraphs on the movements of the player technical and planning during the game and includes the system form observation analysis of the game in a manner that makes it easy for the observer to stabilize all cases And variables that occur during the game, for the purpose of giving a real picture of the performance of the game and has divided the cases of play into two main cases:[2]

- Appropriate performance level.
- Improper performance at level.

In order to validate the performance evaluation with statistics in the observation form, the Lakers' test scale can be followed and measured at five levels:

- (5 degrees) Very good, good performance (appropriate).
- (4 degrees) Good performance Good (appropriate).
- (3 degrees) Average performance appropriate (appropriate).
- (2 degrees) Poor performance (inappropriate).
- (1 degree) Very poor performance (inappropriate).

System designers point out that it can be used with football. The researcher or observer can delete or modify or add some paragraphs to suit the requirements of the game.

The rules governing the performance of the game:

- **The right move (adaptation to the requirements of the game) (Adjust):** It moves the player in an aggressive or defensive manner as required in the flow of play and is related to the speed of movement and can also move the player in a smooth, accurate and fast and as required by the state of play, which leads to the implementation of appropriate motor behavior.
- **Decision making: (Decision Making):** Which is the process of making the right decision on what works and in which direction is, which is the scientific guidance of the ball and exploit the weaknesses of the competitor and invest the space to his advantage and score a point or score a goal.

The player must choose the appropriate place and time to make his decision true and on the contrary the performance is inappropriate.

- **Skill Execution: (Skill Execution):** It is intended to assess the performance efficiency of the skill to be performed and the correct technical performance and to certain degrees of appropriate and inappropriate performance (determination of skill level).
- **Support:** It means the appropriate move to support the colleague and receive a ball from him or to lock the opponent or fill the gap to allow the opportunity for a colleague to enter the arena of the opponent or move to maintain the skill.
- **Coverage: (Cover):** It is intended to fill the vacuum of the colleague when the attack or provide defensive assistance to the player who makes the game or move with him on the ball and fill the opposite space and the performance of duty instead of his colleague for a limited time.

In order to obtain the scientific basis for the system used to assess the player's performance, Stephen, Judith and Linda have found the sincerity of the system that measures the player's level and laid the foundations of science through their research in the United States of America on football. They pointed out that there is a high honesty in the use of the system on these games and obtained stability (0.68) in football.

Characterization of the learner's disability test: The collective learning disability measure consists of (55) paragraphs with (7) paragraphs for effort, (7) capacity items, (7) preparation paragraphs, (9) for units, (8) cases for perseverance, (9) for stability.

Pilot Study: The examination of the validity of the procedures used to conduct the collective learning disability tests, the behavior of the schematic and the video filming, the availability of the conditions and the implementation of these conditions, is a basic requirement and its realization necessitated conducting a survey on 25/6/2018 on a sample of (12), Randomly selected players from Al Muthanna Sports Club - Al Shabab.

The results of the researcher revealed the achievement of all the purposes for which the experiment was conducted, indicating the good response of the players and their rush to carry out the test, the appropriate time for him and the best output and organization, how to conduct and apply and record the results, as well as his health in the measurement of learning deficit and collective behavior My plans. The survey also revealed the safety of the procedures used in photography, in terms of distance of the camera.

Main Experience: After the completion of the exploratory experiment and obtaining its results, through which the validity of the measure of (Collective Learner Deficit) and the safety of the imaging procedures to test the dispositional behavior, the researcher conducted his main experiment on 5/7/2018.

Results

The development of the equation of predictive behavior, in terms of the deficit of the collective learner of young football players: Finding the correlation between the learner's collective deficit and the behavior of the young football players:

Table 1: Shows correlation coefficients between search variables

Variables	Coefficient of correlation	Correlation nature	(t) value		Statistical significance
			Calculated	Tabulated	
Acting tactical-Collective Disability	0.935-	Simple	11.185	2.074	Sig.

When reviewing the results of the above table, the correlation coefficient between the two search variables (the dispositional behavior) and the total learner deficit reached (-0.935). In order to verify the significance of the correlation, the t-code was used. The values of (t), calculated (11.185), are greater than the tabular value of (2.074), at the degree of freedom (18) and the significance level (0.05) This gave the researcher the opportunity to include the independent variable under the regression model in order to predict the dependent variable.

"The meaning of a correlation between [two variables] is that they share the measurement of one phenomenon, which means that one of them is different from the other."[3]

Table 2: Shows the correlation coefficients between the investigated variables and the amount of confidence

Variables	Coefficient of correlation	Nature of correlation	Contribution Ratio
Acting tactical - Collective Disability	0.935-	Complex	0.875

Extracting quality indicators of linear regression equation model:

Table 3: Shows the quality indicators of the linear regression equation model

Variables		Contribution Ratio	(F) Value		Statistical significance
Independent	Dependent		Calculated	Sig.	
Collective Disability	Acting tactical	0.875	63.080	0.000	Moral

The value of the explanatory factor (contribution ratio) was (0.875) and this indicates that the collective learning deficit contributed (87.5%) to the variable (the dispositional behavior). It also explains the variance the researcher finds that this ratio is good and this indicates the quality of conciliation model - the remaining percentage (13.5%), due to other factors not included in the model.

The same table indicates that the value of (F), calculated at (63.080), is a function at the level of significance (0.000). This indicates the significance of the simple linear regression model, so the model represents the relationship between the two variables under the best representation.

Extraction of coefficients regression equation:

Table 4: Shows the coefficients of regression coefficients and the significance of model parameters

Transactions		Correlation		(t) value		Statistical Significance
Nature of Factor	Parameter Value	Nature	Amount	Calculated	Sig.	
Fixed limit (A)	24.044-	Complex	0.935-	2.691	0.025	Moral
Fixed limit B1	0.168			7.924	0.000	Moral

Table (4) shows the significance of the gradient coefficient (A), where the value of (T) calculated by (2.691), a function at the level of significance (0.025) and the results of the table to the significance of the intersection coefficient (B1) Which was tested by (t), which came in (7.924) and this value function at the level of indication (0.000). The appearance of the slope parameter (A), as well as the tilt coefficient (B1), reflects the importance of the cumulative learning deficit variables. This indicates the quality of the estimation of these parameters in the regression model, which makes the model highly efficient for the purpose of predicting the measured values.

The development of the equations of predictive behavior in terms of collective learning deficits: From the above, the predictive equation of (the schematic behavior) of young football players belonging to Samawah/Muthanna, in terms of collective learner deficits, can be used using the multiple linear regression equation as follows:

$$Y = A + B\,1 \times X\,1$$

Whereas:

(Y) Represents the expected value of the schematic disposition

(A, b) represent linear regression coefficients, which are constant values

(X1) represents the independent variable (collective learning deficit)

Thus, the main objective of the third research was achieved in part through the development of a predictive equation for the "schematic behavior" in terms of the collective learning disability of young football players belonging to the Samawah Sports Club/Iraq.

Discussion

The results shown in tables (1, 2, 3 and 4) show that there is an inverse relation between the total learner deficit and the schematic behavior. The greater the total learner deficit, the less the behavior of the schematic and vice versa. And the lack of knowledge on the nature of the factors that cause their collective learner deficits and their lack of knowledge and access to the nature of compatibility with the self and with the team as an integrated unit as well as with the surrounding environment and the need to work on the situation of compatibility with all these variables,[4] whether during training or competition, all these factors contribute significantly to the work to provide the appropriate atmosphere in changing their negative and false ideas and responses and understanding the factors affecting the formation of this phenomenon in the players and benefit from it positively,[5] and certainly it was Does not provide the factors that help players to take advantage of their different abilities (physical, technical and psychological) to exploit collectively "Optimal help the athlete to exploit his physical abilities and skills, personal preparations and the possibilities of his environment to the extent that qualify these possibilities (t) which leads to increased compatibility with himself and his society".[6]

And that the behavior of the plan is the exchange of roles between the players and the extent of interaction among them through the collective play in the field of the stadium,[7] whether this in training and competition and any inability to occur for this interaction and roles of the exchange between the members of one team will lead to not show the behavior of the best in the case " To recognize the strength of team building, because the role and status of each player are determined in the light of mutual relations, whether it is dynamic or social and the various phenomena of cooperation and competition and harmony and control and subjugation and alliance also appear in light of the interaction that occurs between members of the team".[8]

Conclusions

Through the results and in light of the objectives and the methodology used and within the sample of the research and from the data collected by the researcher and in the framework of statistical treatments, it was possible to reach the following conclusions:

1. To devise a predictive equation by which to predict (the act of action), in terms of collective learning deficit.
2. The percentage of contribution of the collective deficit in the tactical behavior of the football players in the club Samawah Sports - Iraq, large.
3. The dispositional behavior), is linked to a functional relationship with the collective learner deficits.
4. Collective learner deficits explain an acceptable proportion of the behavior of the young football players belonging to the club Samawah Sports.

Ethical Clearance: The Research Ethical Committee at scientific research by ethical approval of both environmental and health and higher education and scientific research ministries in Iraq

Conflict of Interest: The authors declare that they have no conflict of interest.

Organizational behavior of Camp Leaders from Scout Team Leaders

Haiderfayyadhhamad Alamiri[1], Khalid Hamzah Swadi[1]

[1]The College of Physical Education and Sports Sciences, University of Kufa, Iraq

Abstract

The educational process includes many difficulties between the teacher and the learner and reflect those difficulties, especially in the field of Scout as the Scout leadership has its components and characteristics that make it capable of organizing the behavior of the Scout camps. From here, the researchers set their research goals in order to identify the organizational behavior of the camp leaders from the perspective of the scout teams.

The research community of the officials and officials of Scouts teams participating in the Scouts camps established by the Directorate General of Sports Education/Scouts Department for all governorates for the academic year (2018-2019) of (76) responsible and responsible. After the data collection and processing statistically reached the most important conclusions:

Validity of the measure of organizational behavior, which was prepared by the researcher in measuring the degree of organizational behavior of camp leaders from the perspective of officials Scout teams in Iraq.

Keywords: *Organizational Behavior, scout and team leaders.*

Introduction

The modern era is the era of rapid developments that accompanied scientific knowledge. Education is one of the main pillars of this development because of its interest in the individual as the goal and the means. On this basis, education works to achieve this development for individuals and societies and to promote and promote them better in all fields.

Organizational behavior refers to the interpretation and management of individuals 'attitudes, such as individuals' attitudes towards prevailing management style, satisfaction or job dissatisfaction, employee attitudes towards promotion policies and others. Therefore, the study of organizational behavior is concerned with the interpretation and management of the behavior of individuals in organizations. Since its inception, the scout movement has adopted the principle of non-discrimination between individuals in faith, sex or color. Its activities spread throughout the world. The practice of scouting activities in the educational and social ways affects the individual and gains sound attitudes and values that make him compatible with him and with the members of the society in which he lives. Various scouting activities play an important role in the development of different interests among students of different age groups.[1]

Scout leader is the individual entrusted with the responsibility of leading a group of children or young people in the Scout Movement between the ages of eighteen to thirty-five and many as the scout leader had previously worked in the ranks of the scout movement as a scout or scout or scout or advanced mobile.

Research Aims:

1. Prepare the organizational behavior measure of the

Corresponding Author:
Haiderfayyadhhamad Alamiri
The College of Physical Education and Sports Sciences, University of Kufa, Iraq
e-mail: nab.orth@yahoo.com

leaders of the camp from the viewpoint of scout officials.

2. To identify the reality of organizational behavior among camp leaders from the perspective of officials Scout teams.

Research Hypotheses: The camp leaders are highly empowered in terms of the organizational behavior of the Scouts camp management.

Materials and Method

The researcher followed the descriptive approach in order to achieve the goal of research in the preparation of organizational behavior measures and to identify the reality of organizational behavior among camp leaders from the perspective of scout teams and to achieve the imposition of research enabling the camp leaders to a high degree of organizational behavior of the scout camp management and by describing the views expressed by the individuals involved in the current research variables and analyzing them in order to determine the relations between them. The following is a presentation of the procedures adopted in this regard.

Community and sample search:

Research Community: The current research community consists of the officials and officials of the scouts teams participating in the Scouts camps established by the Directorate General of Sports Education/Scouts Department for all governorates for the academic year 2018-2019 (76) responsible and responsible

Sample of Pilot Study: The sample of pilot study consisted of (10) Scout team officials from outside the application sample

Sample preparation and application: The researcher relied on a sample of participants in the Qatari Scouts Camp for gifted and gifted in the Sunni province of Diwaniyah, according to the General Directorate of Sports Education and school activity from 26-26/2/2019 in the age of (76) official and official of the Scouts teams (Advanced Scout/Advanced Guide).

Sample preparation and application: The researcher relied on a sample of participants in the Qatari Scouts Camp for gifted and gifted in the Sunni province of Diwaniyah, according to the General Directorate of Sports Education and school activity from 26-26/2/2019 in the age of (76) official and official of the Scouts teams (Advanced Scout/Advanced Guide).

Tools, devices and devices used in research: The success of research in achieving its objectives depends on several factors, the most important of which is the proper and appropriate selection of means to obtain data, so choosing the right tools is a key factor in research [(3)].

In order to achieve the research objectives, the researcher used the following tools, tools and devices:

1. Scientific and Arab sources and references.
2. Observation.
3. Questionnaire.
4. Electronic Information Network.
5. Electronic calculator type (ispeero)/2.
6. Personal interviews.
7. Pencils.
8. Data registration form.

Field Research Procedures: To achieve the objectives of the current research requires the preparation of a measure of organizational behavior, so the researcher follow the following steps:

Procedures for the preparation of a measure of organizational behavior[2]: After the researcher was exposed to a number of tests related to organizational behavior. (9), the second area is the organizational conflict and the number of paragraphs (9), the second field (9) the third area is the organizational culture and the number of paragraphs (8). The five-step scale is adopted: ((Strongly agree (5) Degrees _ I agree (4) Degrees _ Neutral (3) Score) for positive paragraphs and negative ones. The total score of the scale ranges from (26-130) degrees.

Preparation of the Organizational Behavior Scale: Since the test was originally intended for an environment other than the sports environment, the researcher had to modify the scale to be appropriate for the current research sample. They were scouting teams. The researcher adjusted the scales to fit the nature of the research sample. The modified scale was then presented to a group of experts and specialists in the field of mathematical management, testing, measurement and mathematical psychology to express their views on the validity of the amendments made on the scale.[3]

Determining the validity of paragraphs of the Organizational Behavior Scale: This procedure

requires obtaining the approval of a group of experts and specialists in the field of sports on the validity of the preparation of the paragraphs of the measure, so the researcher prepared the form of the measure of organizational behavior in its initial form and the preparation of new paragraphs to suit the members of the research sample, was presented to a group of experts and specialists, Then use (Chi square) to identify the differences between the approvers and non-approved experts and keep (26) paragraph according to the opinion of experts and table (1) shows that.

Table 1: Shows the original and revised paragraphs and the value of the Kay box for expert opinions

Sr.No.	Agree	Disagree	Chi Square	Significance
1	15	0	15	Good
2	14	1	11.267	Good

21	15	0	15	Good
22	15	0	15	Good
23	15	0	15	Good
24	15	0	15	Good
25	15	0	15	Good
26	15	0	15	Good

Table (1) shows that all the paragraphs were accepted by the experts (26), because the value of their squares was greater than their numerical value of (3.84) at the level of freedom (1) and the level of significance (0.05).All the paragraphs were accepted by the 26 experts, because the value of their square squares was greater than their tabular value of (3.84) at the degree of freedom (1) and the level of significance (0.05).

Prepare instructions for the measure of organizational behavior: After making the adjustments

to the scale according to the opinions of the experts, the standard was finalized. The researcher prepared the instructions for the measurement paragraphs in the same manner and the instructions based on the organizational behavior measure, which explains to the supervisors how to respond to the paragraphs (I strongly agree, agree, neutral, disagree, disagree) Strongly agree) Weights (5-4-3-2-1) were given respectively positive paragraphs and reversed negative paragraphs.[4]

The main experience of the measure of organizational behavior: After the scale became ready in terms of paragraphs and instructions, the researcher began to apply the scale and the number of paragraphs (26) paragraph on the sample of the (76) officials representing the sample of the preparation on Wednesday, 20/2/2019 at noon for the purpose of completing the preparation and for the purpose of analysis His statistics.

Results

Table 4: The mean, the mean medium and the calculated of(t) value of the research sample of the organizational behavior measure

The scale	Sample	Mean	The mean medium	SD	(t) calculated	sig	Type of significance
Organizational behavior	76	107.23	78	7.85	3.65	0.000	Moral

By comparing the mean with the mean medium of the organizational behavior measure, it was found that there were significant differences. Thus, the t-test was tested to determine the statistical significance of these differences.[5] It was found that the calculated value of the scout teams was (3.65), (0.05). This means that the difference is statistically significant and this result can be explained in light of the fact that organizational behavior is an area that is interested in knowing all aspects of human behavior in organizations through the systematic study of the individual, In organizational positions and the study of manna (1) organizational behavior is one of the areas of human relations that bind a group of people to a particular work and human relationships are important factors in enhancing confidence in the souls of the human being.[6]

To provide an appropriate and encouraging work environment for the exercise of the job with every ability to excellence and high level of achievement, the human nature tends to humanity and wants to be all the atmosphere and transactions in the environment of life and the process is filled with the spirit of humanity away from the spasm and transcendence and the coolness of dealing, Scout camps are part of the human activity of life, which show the effectiveness and vitality in human relations and cooperation in achieving the goal of Sami and it focuses on individuals rather than on machines or techniques, which is normal because individuals are those who have a sense of feeling and others, In addition, individuals are emotionally and morally responsive when an emergency situation occurs in the organization to work together to find the appropriate solutions that emerge from this circumstance.[7] The environment in which the organization meets, These organizations are able to create conditions conducive to the strengthening of human relations, which in turn helps to stabilize the state of work in the spirit of one team or the so-called collective action. One team encourages the organization to increase attention to the workers in a way that will satisfy all their needs and meet their demands because they have shared their dedication to achieving the goals of the organization.

The human relations are increasing and motivating the workers to make efforts beyond the efforts required to achieve the work the results of these efforts will be great because they will result from the collective action that resulted from the positive conditions that human relations have created. It has been confirmed that human relations are clearly manifested in dealing with all levels of the organization's employees. Encouraging others to achieve for the purpose of their reward and can emphasize the performance of social duties outside the work and urged everyone to do so and this is one of the interests of the Scout Movement and so the departments that follow the principle of Humanity will reap the fruits of that nourish by gaining appreciation of others and friendliness in addition to the benefit of their abilities and skills of the highest level and this explains for the camp leaders at a high level of organizational behavior.[8]

Conclusions

1. Validity of the measure of organizational behavior, which was prepared by the researcher in measuring the degree of organizational behavior of camp leaders from the perspective of officials Scout teams in Iraq.
2. The leaders of the Scout camp in Iraq enjoyed a good amount of organizational behavior.
3. Organizational behavior has a significant impact on the leaders of the camp from the perspective of officials Scout teams in Iraq.
4. Predictability of the organizational behavior of the camp leaders from the perspective of the scout teams in Iraq.

The Effect of External Feedback Using (Wilson X) Balls in Improving the Correct Accuracy of Basketball Jumping

Dahir Ghanawi Mohamed[1], Mohammed Rafid Mahdi[1]

[1]The College of Physical Education and Sports Sciences, University of Diyala, Iraq

Abstract

This research aims to identify the effect of external feedback using (Wilsonx) balls in improving accuracy scoring from a specific point during jumping to Karkhbasketball sports club. In addition, the coach participated in putting the training instructions for each player according to (Wilson x) data to improve performance. The researchers used the experimental approach to study the problem of the research. We used deliberate method of selection a sample of twenty applicant players of Al-Karkh Sports Club. About 90 percent of the original research community, 18 players, were divided into two equal groups, experimental and control, whereas the rest are excluded for the purpose of exploratory experiment. After the main experiment and tests were completed, Excel was used for statistical data processing to reach the results, after which the results were presented and discussed. The results show existence of a significant improvement in the accuracy using our suggest method in the scoring of basketball jump compared with the previous techniques. The results also proof that Wilson x balls associated with external feedback is significantly enhanced the scoring skill of basketball jump.

The researchers recommend using the balls (Wilson x) to Iraqi's basketball clubs coaches because of their role in improving the accuracy of scoring skills. Also, they recommend the need to use modern educational tools and equipment in order to keeping up with the corresponding evolution in education and training.

Keywords: *Special exercises, Performance endurance, Ability, Accuracy and jumping.*

Introduction

The long steps of science development and technological revolution are reflected in various areas of life includingsports science. A good planning through using scientific researches with extraordinary unfamiliar results creates new boundless horizons of opportunities in the field of physical education. Identifying new acquisitions of information and skills, with no doubt, contributes in developing and achieving the best results. Research in the field of physical education is so dynamic and demanding since it requires following all what is innovative in the modern technology. Motion learning is one of these important sciences on which both trainers and learners depend on achieving the desired motion.[1]Motor learning deals with human movement in general and sports movement in particular through studying and analyzing andidentifiesdifferent aspect of motion[2].Feedback is one of the most important processes to facilitate motion control[3]. External feedback is the information that learner receives from the trainer or from the training apparatus.[4]

Basketball has been one of the fastest-growing sports in the recent years. It has become increasingly popular, making it one of the most popular games in many countries of the world including our beloved country. It is one of the sporting events that require targeted scientific planning, especially the basic skills, such as aiming the target. "Learning and improving them

Corresponding Author:

e-mail: dr.dhaherghanawi@gmail.com

– aiming target - is important for winning points during matches and hence the key to winning basketball games. The scoring process is the result and the main goal of all basketball player's other skills.[5]Scoring during jumping is one of the most important types of aiming skills since it is effective and influential in the scoring process.Most players maintain and improve on such skill because itis only tool in scoring points in basketball.

The researchers believe that the modern devices start to have prominent and influential role in developing motion performance in most clubs and teams.Hence, the importance of this research is become obvious since we highlight and proof the dominant role of using modern learning method in learning and improving the motion performance of the athletestoward reaching achievement points.

Through the follow-up and observing many games, we noted existence of obvious mistakes in the process of scoring during jumping for most basketball team in Iraq, in particular Karkh Sports Club players. Most of these mistakes are there due lack of using modern educational method in the process of improving and developing motion aiming performances kills. The researcher sought to find a modern scientific learning method which could have a positive impact towards improving players skills of motion control, scoring accuracy skill through using basketball (Wilson x) balls.

Materials and Method

The researchers used the experimental approach in dealing with the research problem as it is more appropriate to the nature of the research and reaching the results.

Research community and Samples: The sample of the research consisted of players from the Karkh Sports Club (for the category of applicants). 20 players were selected in a deliberate manner and divided into two equal groups, experimental group and control group. The members of each one of these groups were selected randomly with their officers by drawing lots according to the test scores of the sample. The research sample was 90% of the original research community where the excluded players were used for pre-test selection.

Table 1: Sample equalization of the experimental and control group

Sample	AM	SD	Calculated (t)*	Significant
Control	20.1	1.3	0.28	Random
Experimental	19.9	1.7		

* At the level of significance (0.05) and the degree of freedom (18).

Tools and Devices are used in the Research:

- Basketball court.
- Wilson x balls number (10(.
- Basketball hoop.
- Whistle.
- Stopwatch.
- Stationery.
- Training cones.
- Measure Tape.
- Dell Laptop Type (1).
- Smart mobile phone (1).

Research Test and purpose: Jumping test from the front-left of the free throw line and then moving semi – circular to the center-right. The purpose of the research is to measure the accuracy of scoring through jumping.

Procedures and performance description: The procedure will start by drawing three points in the form of small circles with diameter of (15cm) as markers of the three areas where the test is performed and as follows:

a. The first mark 30 cm left of the free throw line.

b. The second mark is the middle of the free throw line and the distance (90 cm) from the free throw line towards the three-point line.

c. The third mark 30 cm right of the free throw line

Performance description will be as follows:

a. The player takes the standing position at the first mark scoring point.

b. The player performs scoringduring jumping with one hand towards the basket without touching the board (direct score).

c. Each player shoots 15 throw performed by three groups divided equally and shoot from one of the marked points, five balls for each group.

The recorder calls the players' name and records the results of the shoots and the referee stands near the player to hand the ball and supervisesthe correctness of the performance.

Scoring Method:

- The player is counted two degrees when the ball enters the goal (successful shot).
- The player counts one score for each shot in which the ball touches the ring and does not enter the basket.
- The player's score is equal to the sum of the points he gets in the specified throws.

Note: Maximum test score (30(

Experimental Test: The researchers conducted an exploratory experiment on Friday, June 30, 2017, with the players of Al-Karkh Sports Club, the category of applicants and were later excluded from the same research. The aim of the exploratory experiment was to identify the obstacles and difficulties that may face the two researchers during the sample Pre-test. Furthermore, it is used to identify the quality of the researchers support team, checking the best way to have the test and the process done, in addition to know the time of the application tests and if it is suitable for the sample of our research.

Pre-Tests: The researchers conducted the pre-tests at 7 pm on Saturday, 1/7/2017 and under the supervision of researchers and coaches of Al-Karkh Sports Club. As far as possible, the researchers took into consideration the variables in terms of time, place and the supporting team for their survival in the post-tests. The parity between the control and experimental groups was carried out in the results of the pre-tests of the two groups in order for the researchers to refer the difference in performance level to the variable independent study.

Main Experience: The main experiment included the implementation of the vocabulary of the educational curriculum of the experimental group as of Sunday, 2/7/2017 using exercises based on the data of balls.) Wilson x) under the supervision of the researchers and the control group applied the curriculum followed by the same coach, the number of educational units for the entire period of the research is (40) units of education with a rate of (120) minutes per unit.

Post-Tests: The tests were carried out on the sample of the research at 7 pm on Saturday, 2/9/2017. The researchers ensure same conditions and temporal and spatial circumstances during the pre-tests. We further use the same assistant team to identify the improvement extent in skills under the same study condition and exclusively through independent variable.

Results and Discussions

First we may refer that we have used Excel for statistical data processing to reach the results. Table (2) illustrates the pre-test results for scoring through jumping skills for basketball players for both control and experimental groups. From the table (2) we can see that both the control and experimental groups› members hold almost the same equivalent skills and performance. Hence, both groups will start application of the curriculum from the starting point one.

Table 2: Mean, the standard deviation and the (t) value for the pre-test of the control and experimental groups in scoring during jumping test of basketball

The skills	Control (Pre)		Experimental (Pre)		Calculated (t)*	Significant
	Mean	STD. EV	Mean	STD. EV		
SBTJ*	19.9	1.7	20.1	1.7	0.28	Not-sig

* At the level of significance (0.05) and the degree of freedom (18)., * SBTJ: Shoot of a Basketball Through Jumping

Table 3: Show the mean, standard deviation and the T value for the pre-test and post-test of the control in scoring during jumping test of basketball

The skills	Pre-Test		Post-Test		Calculated (t)*	Significant
	Mean	STD. EV	Mean	STD. EV		
SBTJ*	19.9	1.7	23	1.4	4.29	Not-sig

* At the level of significance (0.05) and the degree of freedom (18)., * SBTJ: Shoot of a Basketball Through Jumping

Table 4: The mean, standard deviation and the (t) value for the pre-test and post-test of the experimental test in scoring during jumping test of basketball

The skills	Pre-Test		Post-Test		Calculated (T)*	Significant
	Mean	STD. EV	Mean	STD. EV		
SBTJ*	20.1	1.3	25.1	1.19	8.68	Sig

* At the level of significance (0.05) and the degree of freedom (18)., * SBTJ: Shoot of a Basketball Through Jumping

Table 5: The mean, standard deviation and the T value for the post-test of the control and experimental test in scoring during jumping test of basketball

The skills	Pre-Test		Post-Test		Calculated (T)*	Significant
	Mean	STD. EV	Mean	STD. EV		
SBTJ*	23	1.4	25.1	1.19	3.58	Sig

* At the level of significance (0.05) and the degree of freedom (18)., * SBTJ: Shoot of a Basketball Through Jumping

The results from Table (3) show that there are slight differences with a statistical significance between the pre and post-test of the control group. The researchers refer these differences to the training period for the players and the training course that was submitted by the coach independently, without any intervene.

Table (4) and table (5) show significant differences with clear statistical significance between the control and the experimental groups with a clear advantage for the experimental group. We attribute this superiority to the large role provided by the modern technology that used in the educational curriculum, Wilson X. This technique significantly improves the accuracy of scoring skill of the players of the experimental sample, especially with the use of external feedback whose characteristics of support, independence and informatics.[6] The functions of the external feedback is to stimulate learners and increases their motivation to continue to achieve their goal of enhancing information about the nature and direction of their mistakes and it proposes ways to correct these errors.[7]

The trainer relied on the received data from the scored balls for each performed player. The trainer develop a specific exercises for each player based on his performance which is in conflict to what usually follow by the control sample by assigning the same exercises for all players. In addition, this technique helps improving the accuracy of scoring for the experimental sample members.[8]

Conclusion and Recommendations

Through the results of our research, we reached the following conclusions and recommendations:

a. The results showed there were significant superior advantages for the post-test compared with the pre-test for the accuracy of the scoring of the basketball during jumping.

b. Wilson x with the external feedback that are used in the research has a great role in improving the accuracy of the skill of the scoring of basketball jumping.

Assessment of the Determinants (Mental-Emotional) and the Level of Referee's Iraqi Handball Under the Program (GRTP)

Ayman Hani Abed Al-Gburi[1], Fadel Kurdi Shalakha[1], Ali Mohammed Jawad Al-Sayegh[2]

[1]The Faculty of Physical Education and Sports Sciences, University of Kufa, Iraq,
[2]Al-Najaf Education Directorate, Fine Arts Institute for Boys, Ministry of Education, Iraq

Abstract

The researchers dealt with part of this problem, namely the study of the assessment of psychological determinants in particular and their relationship with the level of Iraqi rulers according to the system (GRTP). The aim of the research was to identify the (mental-emotional) determinants and the level of Iraqi handball referees according to the GRTP system. (Mental-emotional) assessment and performance of Iraqi governors under the GRTP system.

The research community is determined by the rulers of the Iraqi League of (35) judges and a sample of them (30) was chosen randomly and also (5) referees for the exploratory experiment. After the approval of the validity of the paragraphs and testing by the experts, the researchers set up instructions to answer the paragraphs of the scale, as the correct answer is to develop instructions that facilitate the answer to the correct answer was emphasized in words and clarity of meanings and emphasis on accuracy and honesty by answering and hiding The real purpose of the scale and the flags of the examinees that their answers will be confidential and for the purpose of scientific research only. From the conclusions reached, the following conclusions can be drawn that most rulers have psychological determinants and an average level of assessment.

Keywords: *Assessment, mental, emotional and GRTP.*

Introduction

The evaluation of psychological determinants is one of the scientific topics that many concerned in studying the effective role in the field of sports, especially as they constitute a wide range on which sport depends. These include assessing psychological determinants (mental and emotional) to be present at the handball referees for the speed of the game and the many variables that occur within the stadium, which requires a great mental preparation of the referees.[1]

The assessment of psychological determinants is an important requirement for the referee and all the stimuli that occur to him. For the details of the game, he has to turn his attention from one exciting to the other, so that he will ensure the continuation of the game and thus respond to these stimuli in the course of the game according to the technical position he determines in the decision In the right manner leads a successful match of the game reflects the level, so the importance of the study in the relationship between the assessment of psychological determinants and the level of performance of the rulers to find out the important aspects that raise the level of performance of the rulers.[2]

The success of the match is seen through the success of the referee in its leadership with a high level of performance. By observing the referees and watching the refereeing of the Iraqi handball matches, there is a difference in the performance of the referee to referee between the game and the game in some of the decisions taken, which affects the level of arbitral performance in the referee . This variation, difference and sometimes fluctuation in the arbitral level of the existence of several reasons, including the background of sports governance and follow-up of the game and experience, academic and scientific level and external partnerships and arbitration and development courses as well as the physical and

mental abilities and abilities of each rule compared to others, all these variables can contribute to the success or failure The referee in his leadership of the match.[3]

The researchers will address part of this problem, namely the study of the assessment of psychological determinants in particular and their relationship with the level of Iraqi rulers according to the system (GRTP).

Research Aims:

1. Identify the parameters (mental-emotional) and the level of Iraqi handball referees according to the system (GRTP).
2. Assess the determinants (mental-emotional) and performance level of the Iraqi governors according to the GRTP system.

Hypothesis: There are real differences in the determinations (mental - emotional) and the level of evaluation of Iraqi rulers according to the system (GRTP).

Research methodology and field procedures:

Materials and Method

The nature of the problem to be studied determines the nature of the approach. The researchers used the descriptive approach in both the survey and associative method.

Research Community: The research community is determined by the rulers of the Iraqi League of (35) judges and a sample of them (30) was chosen randomly and also (5) referees for the exploratory experiment.

Devices and tools used in the search:

- Stopwatch number (1).
- Portable type calculator (Dell) number (1).
- Stationery (papers - pens).
- Large sound device type Chinese number (1).
- A legal handball field.

Information gathering method:

- Arab and foreign sources.
- Tests and measurements.

Field Research Procedures:

Test Procedures: Evaluation of the determinants (mental - emotional): The researchers used a measure of the assessment of mental determinants (mental - emotional), which was built and codified Ayman Hani Jubouri (Which do not always occur, do not occur often, sometimes occur, occur often, always occur) and grades (4,3,2,1,5) are given respectively for each positive paragraph and (1,2, 3,4,5) respectively for each negative paragraph, the highest score on the scale is (150) and the lowest score is (30) degrees.[4]

In order to apply the scale, the researcher presented the scale (see appendix 1) to a group of experts and specialists (see appendix 2), for the purpose of evaluating and judging it in terms of its validity in what was put for it. After the experts and specialists were exposed to the paragraphs of the scale and test, (Chi square) calculated for the agreement of experts and specialists and accept the nomination of paragraphs, the value of (Chi square) calculated greater than the value of the (3.84), as shown in tables (1).

Table 1: The number of approbations and the values of (Chi square) and the moral significance of the scales of the psychological determinants assessment

Scale	Number of experts approved	Number of non - approving experts	(Chi square) calculated	Significance
The determinants (mental-emotional)	5	0	5	Moral

After the approval of the validity of the paragraphs and testing by the experts, the researchers have developed instructions to answer the paragraphs of the scale, where the correct answer is to develop instructions that facilitate the respondent the correct answer where it was emphasized the simplicity of words and clarity of meanings and emphasis on accuracy And honesty by answering and hiding the real purpose of the scale and the flags of the examinees that their answers will be confidential and for the purpose of scientific research only.

The pilot study of the assessment of psychological determinants (mental-emotional): After setting up the

instructions for the scale, the researchers conducted the exploratory experiment on Thursday, 15/11/2018 in the Babylonian Education Hall to reveal the following:

1. To ensure that the instructions and the standard clauses of the rulers are clear.
2. Identify the time taken to answer the meter.
3. To identify the conditions of application of the scale and the attendant difficulties.
4. The researcher shall have practical training in order to identify for himself the negatives and positive aspects that he encounters during the main test.
5. Extraction coefficient of stability.

The experiment revealed the following:

1. The instructions were clear by the sample members.
2. The paragraphs were clear and not ambiguous.
3. The scale was suitable for the sample.
4. The application time was between 12-18 minutes.
5. Alternatives to the response were appropriate for the level of the sample members.
6. The stability coefficient has been extracted so that the scale is ready for application and consists of (60) paragraphs.

The Scientific Foundations of Determinants (Mental-Emotional):

A. The standard of truth is the most important factor for test and measurement quality tests. The standard or true test is defined as a test that accurately measures the phenomenon that it is designed to measure and does not measure anything in its place or in addition to it.

Honesty has several meanings that vary according to the use of the test and the truth is that the test measures what is being set for it, that is, the honest test measures the function that it claims to measure and does not measure anything else instead or in addition to it.

1. **Authenticity of content:** This type of honesty aims at knowing the extent to which the test or measure represents the aspects of the attribute or the attribute to be measured, whether the test or the measure measures or measures a specific aspect of the phenomenon, the extent to which its content matches what it wants to measure, Experts in the field that the test tries to measure.[5]

Researchers have verified the validity of the scale through the content or content validity index, which is often made by means of a rationale for the existence of the attribute, capacity or capacity involved to verify whether or not the proposed measurement instrument is actually measuring it. A presentation to a group of experts and specialists,(2) to validate the scale.

B. Stability of the scale: The stability concept is one of the basic concepts in measurement and must be provided in the scale to be valid for use. 2 The stability coefficient of the test was found by testing and re-testing for the test and test on the survey sample. The test was conducted on 15/11/2018. (R) (0.93) for the first section and (0.95) for the second section.

Referee Review (GRTP): The researchers selected the refereeing test (GRTP) approved by the International Federation of Handball and the tests These tests are standardized tests of the experts of the game International Federation is:

1. A set of questions in the handball law.
2. Video cases in handball law.
3. High-capacity physical tests (CHTRL).

The main experience of the Psychological Determinants Assessment (Mental-Emotional) and GRTP: The researchers applied the determinants (mental-emotional) and GRTP test on the 30 sample individuals representing the Iraqi Premier League referees for the 2018-2019 sports season on 5/12/2018 during the refereeing session in Babil Governorate.

Setting Levels for Testing (GRTP): Therefore, in order to evaluate the referees according to a certain level, standard levels of GRTP were established as shown in Table (2).

Table 2: The standard levels and limits of raw grades and their significance in the GRTP test.

The level	They set it in raw grades	Scale significance
The first	0-14	Very low
The second	15-28	Low
The third	29-42	Average
The fourth	43-56	High
Fifth	57-70	Very high

Results

Assessment of the determinants (mental-emotional) and the level of evaluation of the referees according to the program (GRTP) and the relationship between them: With regard to the first objective of the research, which is the assessment of determinants (mental - emotional) and the level of referees according to the program (GRTP) of handball referees was calculated the total score of each rule, the highest score obtained by the judgment on the scale of psychological (emotional) is (300) and lower The results showed that the highest score was obtained (271) and the lowest score (168) for the results of the sample. In order to know the nature of the assessment of the psychological determinants of the sample, (21.66) and by standard deviation (0.91), while the second part (21.66) and standard deviation (0.91), or The emotional side that appeared equal to (29.00) and standard deviation (1.05), all of which are higher than the theoretical center of the scale of (180), as shown in Table (3).

The highest score obtained (55) and the lowest score (7) for the results of the adult sample and in order to know the nature of the evaluation reality of the sample The mean of the sample was calculated as 39.29 and with a standard deviation (4.96). When compared to the levels, they were found at the intermediate level.[6]

Table 3: Results of the sample on the scale of assessment of psychological determinants (mental-emotional) and the level of evaluation of referees according to the program (GRTP)

Tests	Mean	SD	(t) calculated	Sig.	Significance
Assessment of determinants (mental)	21.166	0.912	6.79	0.000	Moral
	29.000	1.051	8.81		
Assessing determinants (emotional)	200.23	7.95	6.88		
Evaluation of judges according to GRTP program	39.29	4.96			

Table (3) shows that the value of t calculated at the level of significance (0.05) and the degree of freedom (29), which means that the handball rules have mental and emotional determinants and a good level in the test (GRTP) and can be explained by psychological variables and their importance and impact Because the psychological determinants mean controlling the internal and external emotions that are exposed to them in learning the various skills and situations, especially in daily life, which is almost normal because it. The more rulers can control they bring what they want and delete what they want and reduce many mental disorders of social and functional origin, such as anxiety, depression and stress whenever they give their best in competitive situations and are at best, as well as they seek a high standard for their performance and make achievement a personal goal for them (1), And what we went from is quite likely that the current sample was approximately midpoints in both GRTP.[7]

The researchers see the rulers to be characterized by good psychological determinants to match the arbitral variables in handball that need appropriate mental processes and abilities and must have a state of balanced awareness that avoids individuals slipping in the maze of different and interconnected situations and does not make them follow a clear vision to accept the psychological and emotional phenomenon that they have, Unfortunately, they are not open to the world of ideas, feelings, painful feelings and unpleasant experiences of the individual, so they suffer the reality more than others and cannot experience the experience at the present moment in a balanced manner.[8] They also do not have a flexible range of mental ability that allows a good and open vision of all mental and sensory experiences. "The assessment of psychological determinants requires the person to understand himself and to monitor his negative thoughts and feelings and to open up and live them rather than to hold them in consciousness, as well as not to launch negative judgments of self".[9]

Conclusions

1. Most of the referees have psychological determinants and an average level of assessment.
2. There is a positive relationship between the

assessment of psychological determinants and their performance according to GRTP program.

3. The greater the assessment of psychological determinants and the performance of judges, the better the results.

Complications of Cardiac Catheterization of Congenital Heart Diseases in Pediatrics

Sinan Abdulrazzaq Ibrahim[1], Diea K. khalaf[1], Noor Talib Khorsheed[2]

[1]Department of Pediatrics, College of Medicine, Al-Nahrain University, Iraq,
[2]Madenat al-Emammain Alkademain hospital, Ministry of Health, Iraq

Abstract

The role of the pediatric catheterization laboratory has evolved in the last decade as a therapeutic modality, also remains an important tool for anatomic and hemodynamic diagnosis of heart defects.

The aim is to assess the frequency of complications among children undergo cardiac catheterization and study the profile of complications and their relation with different variables.

Descriptive prospective study was done in Cardiology Center in Baghdad, Ibn Al-Bittar Hospital on children with congenital Heart disease who received cardiac catheterization between 1 May 2018 and 1 February 2019.Data collected for patients (included age, gender, weight, type of congenital heart defect, type of procedure performed either therapeutic or diagnostic, catheterization number, time when complication occurred and type of complication).

Of 612 patients (328 females, 53.6%), complications occurred in 32 (5.2%), with complication frequency increased among patients aged ≤ one year (13.3%). Total 154 (25.2%) of children presented with ventricular septal defect, the most common complications were arrhythmia 5 (15.6%), followed by device emboli zed, cyanotic spell, cardiac standstill and cold right lower limb (thrombosis/ischemia) (each of them was 4, with a percentage of 12.5%) .Death occurred only once (0.16%). Patients who had therapeutic catheterization and developed complication were 28 (8.2%) while 4 (1.5%) who had diagnostic catheterization developed complication. Ninepatients (18.4%) who had more than one catheterization developed complication. The higher proportion of complications seen among children who suffered from aortic stenosis (6.25%) and coarctation of aorta (9.3%).

The frequency of complications is 5.2%.Most common complications were arrhythmia, cyanotic spell,device embolized, cardiac stand still and cold lower limb. There is a significant association between the frequency of complications and patients with age below 1 year. Patients with therapeutic catheterization had higher risk of complication than those with diagnostic catheterization. As the number of catheterization procedures increased in each patient, the patient had a higher risk of complications.

Keywords: *Complications, catheterization, congenital heart disease.*

Introduction

Cardiac catheterization has revolutionized the management of pediatric cardiac disease. Both therapeutic and diagnostic procedures are associated with some risks because of their invasive nature. Cardiac catheterization associated complications including arrhythmia, massive bleeding, heart perforation, cardiac tamponade, thromboembolism, shock, hypoxemia and vessel occlusion remain a major concern for performing the procedure[(1)]. A large multicenter experience with life-threatening events in congenital cardiac catheterization

Corresponding Author:
Sinan Abdulrazzaq Ibrahim
Department of Pediatrics, College of Medicine, Al-Nahrain University, Iraq
e-mail: sinanrazzak@yahoo.co.uk

was reported a low incidence of life-threatening events (2.1%) and mortality (0.28%) despite the complexity of modern patients and procedures[2]. Centers in western countries have reported various complications of cardiac catheterization since the mid-1970s with the overall complication rates ranging from 8.8–24% [3-8]. Over the last decade, the use of cardiac catheterization as a primary treatment modality in children with congenital cardiac lesions has increased. However although there has been a considerable improvement in device design, equipment and the skills of the interventionist, associated risks continue to complicate these procedures. This is particularly true with the expansion of the pediatric cardiac catheterization which has been shifted from a primary anatomic hemodynamic diagnostic tool to therapeutic intervention one. So, the anesthesiologist together with catheterization team needs to be familiar with all types of emergent adverse events and their specific management protocols to maintain a high level of patient care with minimal complications. These adverse events may be catheterization related events, access related events, sedation related events, transfusion related events and events related to special intervention technique. Adverse events were defined as adverse events related to the catheterization procedure, identified during or after the procedure resulting in a change in patient condition, life-threatening if not treated, requiring major intervention, such as invasive monitoring or major transcatheter bailout procedure and resulting in death and emergency surgery or failure to wean from extracorporeal membrane oxygenation [9,10].

Complications encountered in cardiac catheterization laboratory:

- **Cardiovascular complications:** Arrhythmias, cardiac Perforation, low cardiac output & hypotension, embolism, valvular damage, paroxysmal pulmonary artery hypertension crisis (PPHC).
- **Respiratory complication** hypoventilation, pneumothorax.
- **Vascular complications:** Bleeding, hematomas, acute arterial occlusion, vascular thrombosis, retroperitoneal hemorrhage, arteriovenous fistula, pseudoaneurysm, infection: cellulitis at the site of access is rare.
- **Others:** Hypothermia, blood Loss, complications related to contrast injection[11].

Aim of Study:

1. To assess the frequency of complications among children undergone cardiac catheterization.
2. Study the profile of complications and their relation with different variables.

Materials and Method

Descriptive prospective study for children with congenital heart disease who needed catheterization.

The study was done in Ibn Al Bittar Hospital between the period of 1st of May 2018 to the 1st of February, 2019. Informed consents were obtained from the parents of children. Critically ill children, those with circulatory insufficiency symptoms scheduled for examinations on an urgent or emergency basis. After the diagnostic or interventional procedure, patients were sent to the postoperative care unit or recovery room and observed for several hours. Those conscious, with efficient respiration and stable circulation (appropriately to the heart defect and pre-procedure status) were transferred to the cardiac intensive surveillance unit. Procedures were classified as diagnostic or interventional.

Data collection and study design

Data collected for patients with age ranged from 1 day to 16 years.

A questionnaire was performed, in which direct interview was done between the patient and their relative and the doctors involved to collect data, which included the following: Name, Gender, Age, Weight, Date of admission, Diagnosis (type of congenital heart disease), Type of procedure being performed (therapeutic or diagnostic), Catheterization no. (First, second, etc), Time when the complication occurred, Type of complication occurred.

Complications were defined as any anticipated or unanticipated event from which injury could have occurred or did occur, potentially or definitely because of performing the catheterization. Events were recorded at the time of identification, either at the time of the case or later if determined to be related to the procedure (follow up performed for 2 weeks after catheterization).

+Verbal permission was obtained from each patient and family prior to collecting data. Names were removed and replaced by identification codes. All information kept confidential .data used exclusively for the research purposes.

Statistical Analysis: The data analyzed using Statistical Package for Social Sciences (SPSS) version 25. Pearson's Chi–square test was used to assess statistical association between patients' clinical characteristics and complication of catheterization. A level of P – value less than 0.05 was considered significant.

Results

From the 612 patients who had catheterization, only 32 (5.2%) of them developed complications of catheterization. The age of patients was ranging from 1 day to 16 years with a mean of 6.03 and standard deviation of ± 4.33 years. 50% of patients were aged > five years.

Regarding gender, the proportion of female 328 (53.6%) was more than male 284 (46.4%) with female to male ratio of 1.16:1. According to congenital heart defects, 154 (25.2%) of children presented with VSD. ASD seen in 135 (22.1%) and 96 with PDA (15.7%) (figure 1).

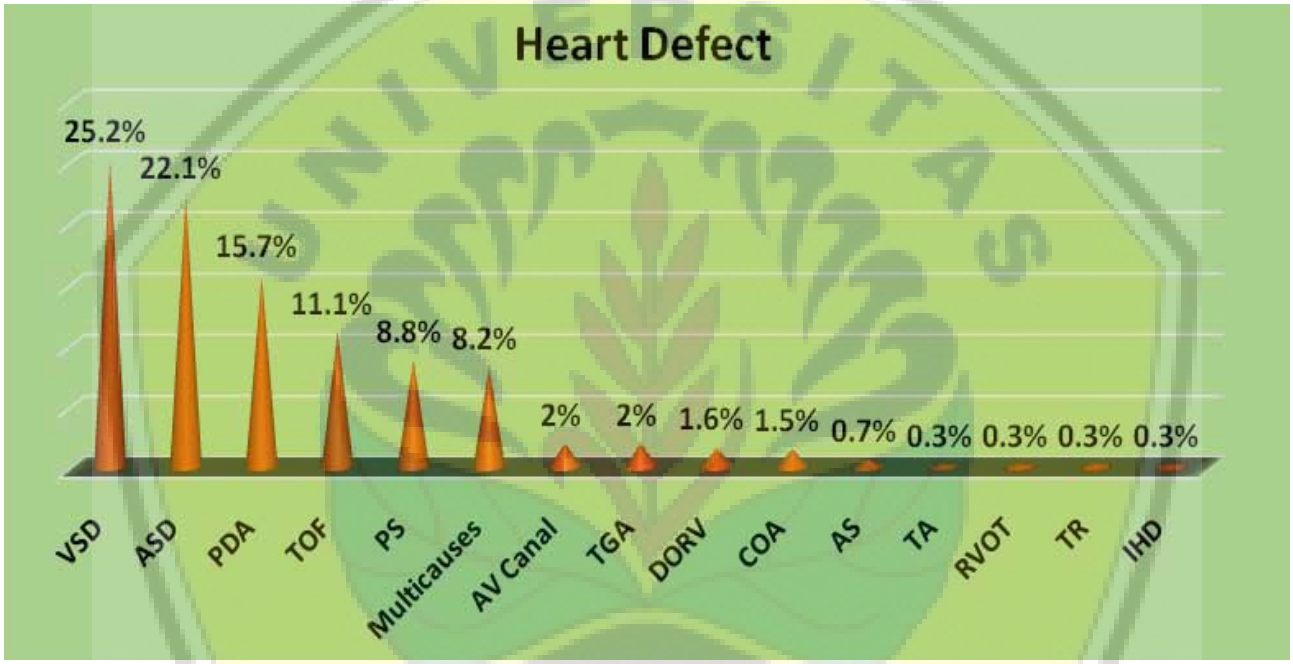

Figure 1: Distribution according to types of heart defects

Therapeutic cardiac catheterization was done for 340 (55.6%), while the remaining 272(44.4%) had diagnostic catheterization. The majority of patients, 563 (92%) required one operation and 48 (7.8%) had two operations, while there was one (0.2%) required three cardiac catheterizations (patient was 14 years old male with coarctation of aorta. Regarding types of complications, the most common complications were arrhythmia,5 (15.6 %), followed by device embolization, cyanotic spell, cardiac standstill and cold right lower limb (thrombosis/ischemia) (each of them was 4, with a percentage of 12.5%) .Death occurred in only one case (0.16 % of all patients). As shown in Figure 2.

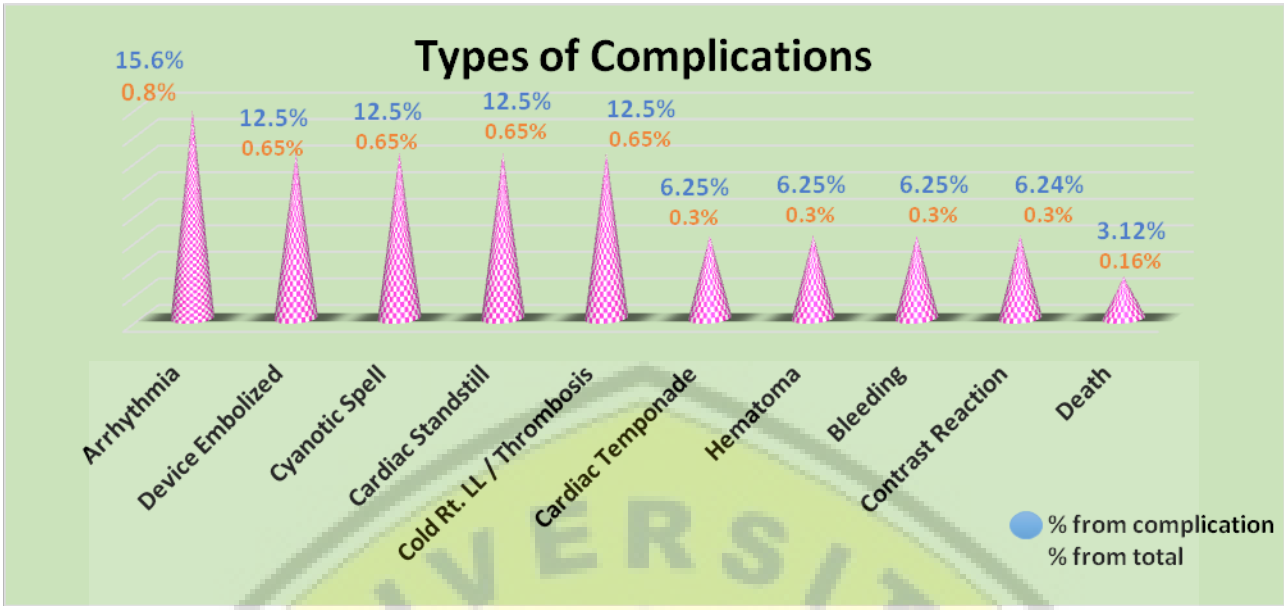

Figure 2: Distribution of study patients according to types of complications

Concerning time of occurrence of complications, 13 (40.6%) of these complications occurred within the 1st 24h after catheterization . The current study showed that in VSD, main complications were (cardiac standstill, contrast reaction, hematoma, valve damage).

In ASD (device embolization, arrhythmia).In PDA (bleeding from site of entrance and cardiac tamponade). As shown in Figure 3.

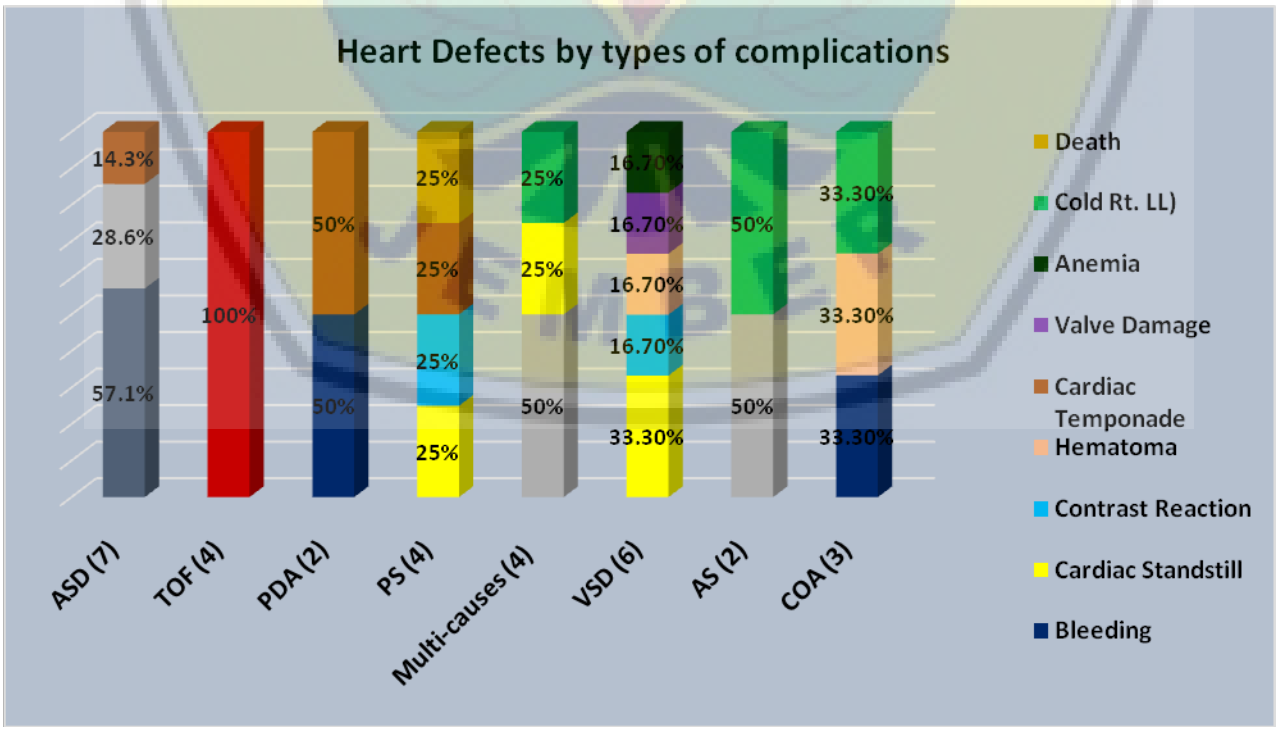

Figure 3: Relationship between heart defects and types of complications

The study showed that complications frequency was among patients aged ≤ one year (13.3%) with significant association (P=0.001). As shown in Table 1

Table 1: Association between complications and age of patients

Variable	Complications		Total (%) n= 612	P- Value
	Yes (%) n= 32	No (%) n= 580		
Age (Years)				
≤ 1	12 (13.3)	78 (86.7)	90 (14.7)	0.001
1 – 5	6 (2.8)	210 (97.2)	216 (35.3)	
> 5	14 (4.6)	292 (95.4)	306 (50.0)	

We found that, the patients who required therapeutic catheterization had a significantly higher risk (P=0.001) of complication than those who required diagnostic catheterization.

As the number of catheterization procedures increased in each patient, the patient had a higher risk of complications (P=0.001). As shown in Table 2.

Table 2: Association of complications with types and number of catheterization procedures

Variable	Complications		Total (%) n= 612	P- Value
	Yes (%) n= 32	No (%) n= 580		
Type of Catheterization				
Therapeutic	28 (8.2)	312 (91.8)	340 (55.6)	0.001
Diagnostic	4 (1.5)	268 (98.5)	272 (44.4)	
Number of Catheterization				
One	23 (4.1)	540 (95.9)	563 (92.0)	0.001
More Than One	9 (18.4)	40 (81.6)	49 (8.0)	

The higher proportion of complications was among children who suffered from AS 2 (6.25%) and COA 3 (9.3%), with significant association (P=0.001) between these two types of heart defect and developing of complications. Insignificant association was seen between complications of cardiac catheterizations and each of ASD, TOF, PDA, PS, VSD and multi-causes heart defect .As shown in Table 3.

Discussion

In the current study, the frequency of Complications of catheterization were 5.2%, the most frequent complications were arrhythmia (15.6%), followed by device embolization, cyanotic spell, cardiac standstill and cold right lower limb (thrombosis/ischemia) (12.5% for each of them).Agreement with Mehta et al study in 2008, incidence of total complications (7.8%), in which most common complications were vascular, which was statistically significant, followed by arrhythmias .Significant complications requiring surgical intervention did occur[12].

Disagreement observed in comparison to Lee et al study in 2016,as noticed the incidence of complications was 16.2%. The most frequent overall complication was fever, followed by gastrointestinal complications such as vomiting, respiratory complication, vascular thrombus and vascular bleeding in which the most common severe complications were arrhythmias requiring cardio version or pacemaker (1.55%)[11]. The documentation of patients follow up plays a role in this discrepancies of results.

Another different results observed in Jayaram et al study in 2017, in which major adverse events occurred in a rate of 1.8%. The most were cardiac arrest, unplanned cardiac surgery and subsequent cardiac catheterization due to a complication during the initial cardiac catheterization procedure[13].

The discrepancies observed among the above mentioned studies in regard to complication may attributed to sample size enrolled in each study, in addition to many factors play an important role in sever complication, as: skill of the doctor, the equipment of the center and the proportion of therapeutic catheterization performed.

In the current study, higher proportion of complications seen in children presented with AS (6.25%) and COA (9.3%) with significant association (P=0.001).

Jayaram et al study in 2015, showed that complication of cardiac catheterization was the highest in patients with history of single ventricle (27%), with a significant association found between complication and the heart defect the patient had (P<0.001)[14].

Lee et al study in 2016 showed that patients with severe underlying structural heart defect had a significantly higher risk of complication than those who had mild to moderate structural heart defect [11].

In the current study, patients aged ≤ one year had the higher proportion of complications (13.3%), which agree with Mehta et al study in 2008, in which 16% of complications occurred in children < 6 months of age[12].

Also in other study, major adverse event after cardiac catheterization in Jayaram et al study in 2015 were significantly observed among patients aged less than one year to 18 years (42.1%) and 26% between one month and one year. A total of 19,608 cardiac catheterizations were performed,over a duration of 2 years and adults were included in this study.[14].

In the current study, Therapeutic cardiac catheterization was done for 55.6% of children. Patients required therapeutic catheterization had a significantly higher risk of complication than those required diagnostic one.

Agreement observed in Mehta et al study in 2008, interventional 58%, in which found that interventional procedures were more commonly associated with a major complication [12] .

Disagree with Lee et al study in 2016, which noticed that cardiac catheterization used for diagnostic purposes in majority of patients (61.7%), while interventional (38.3%)[11].

Difference observed among studies determined by many factors, as: the number of patients included in each study, congenital disease of them, intervention performed and type of procedure accomplished, as found that balloon dilation procedures have been reported to have more complications with aortic valve dilation, ranging from 24 to 50% [15].

Longer procedure time, using anticoagulants, may cause increase risk of complications in interventional catheterization.

The current study showed that as the number of catheterization procedures increased in each patient, the patient had a higher risk of complications (P=0.001).

Agreement with Lee et al study in 2016 which showed that the probability of overall complications in catheterization >3 times was 1.70 times higher than the first or second catheterization (p=0.009) [11].

Conclusion

1. The frequency of complications is 5.2%.
2. There is a significant association between the frequency of complications and patients with age below 1 year.
3. Patients who required therapeutic catheterization had a significantly higher risk of overall complication than those who required diagnostic catheterization.
4. As the number of catheterization procedures increased in each patient, the patient had a higher risk of complications.

Impact of Thyroid Dysfunction on Control of Diabetes Mellitus

Zahraa Abdulaali Al-Mudhafar[1], IsraaNihad Ahmed[2], Mohammed Sami Turki[3], Safaa Ali Khudhair[4]

[1]Department of Physiology, Faculty of Medicine, University of Kufa, Iraq, [2]Al-Manathira Hospital, Diabetic and Thyroid Center, Iraq, [3]Al-Sader Teaching Hospital, Najaf/Iraq, [4]Department of Medicine, Faculty of Medicine, University of Kufa, Iraq

Abstract

Diabetes mellitus (DM) refers to a group of common metabolic disorders that share the phenotype of hyperglycemia. There are two broad categories of DM, designated type 1 and type 2. Thyroid hormones affect glucose metabolism via several mechanisms. Thyroid disorders and DM are the two most common endocrine diseases reported in clinical practice and each can influence the other. During hyperthyroidism, the half-life of insulin is reduced together within crease hepatic glucose production and increase in glucose gut absorption. In hypothyroidism, reduced glucose absorption from gastrointestinal tract is accompanied by diminished hepatic glucose Production.

The aim is to assess effect of thyroid dysfunction on control of diabetes mellitus.

This is a cross sectional study enrolled 60 patients with diabetes mellitus and thyroid disorder; 16 male (26.7%) and 44 female (73.3%) with a mean age of 47.2±13.6. The patients were collected from center of diabetes and endocrine disease in Al-Najaf and Al-Manathera center during the period from April (2018) to December (2018).the effect of thyroid dysfunction on glycemic control has been evaluated using HbA1c as marker of control.

There was a significant relationship between HbA1c and thyroid status in both hyperthyroid and hypothyroid patients. No significant difference was observed in the distribution of thyroid disorder between the two types of DM and among different age groups, but significant difference was reported between female and male diabetic patients.

Thyroid dysfunction inform of hyperthyroidism and hypothyroidism associated with poor glycemic control in diabetic patients.

Keywords: *Diabetes mellitus, thyroid; HbA1c.*

Introduction

Definition of DM: Diabetes mellitus is a clinical syndrome characterized by hyperglycemia due to absolute or relative insulin deficiency. The chronic hyperglycemia of diabetes is associated with long-term complications of various organs, particularly the eyes, kidneys, nerves and blood vessels. Several distinct types of DM result from a complex interaction of genetics and environmental factors [(1)].

Classification of DM:

Diabetes can be classified into the following general categories[2]:

1. Type 1 diabetes (due to absolute insulin deficiency)
2. Type 2 diabetes (due to a progressive β-cell secretory defect on the background of insulin resistance).

Corresponding Author:
Zahraa Abdulaali Al-Mudhafar
Department of Physiology, Faculty of Medicine, University of Kufa, Iraq
e-mail: drzehraa65@gmail.com

3. Gestational diabetes mellitus (GDM)
4. Specific types of diabetes like, such as neonatal diabetes and maturity-onset diabetes of the young (MODY).

Epidemiology of DM: The latest estimates show a global prevalence of 382 million people with diabetes in 2013 and expected to rise to 592 million by 2035. Type 2 diabetes accounting for the majority (>85%) of total diabetes prevalence [3].

Hypothyroidism: Hypothyroidism is one the common endocrine disease caused by deficiency of thyroid hormone. It usually results from primary thyroid disorder with inadequate thyroid hormone production. Subclinical hypothyroidism occurs in the clinical setting of high a serum TSH level and normal serum FT4 concentration[4,5].

With the exception of iodine deficit areas, Hashimoto's thyroiditis is the most common cause of hypothyroidism. The prevalence of hypothyroidism in the developed world is about 4-5%. The prevalence of subclinical hypothyroidism in the developed world is about 4-15 %[6].

Clinical features of hypothyroidism range from asymptomatic patient to life threatening condition. The most common symptoms are decrease alertness, fatigue, cold intolerance, obesity, menorrhagia and hoarseness of voice, but clinical presentation varies with age and sex[7].

Hyperthyroidism: The term thyrotoxicosis and hyperthyroidism are used interchangeably and refer to state of excess thyroid hormone activity. Hyperthyroidism has a prevalence of 1% to 2% in women and 0.1% to 0.2% in men[8].

Graves' disease is the most common Cause of thyrotoxicosis, followed by toxic multinodular goiter (TMNG) and toxic adenoma (TA). Other causes are thyroiditis and gestational hyperthyroidism. Drug-induced thyrotoxicosis has been associated with amiodarone and iodinated contrast [9].

Graves' disease is an autoimmune disease characterized by formation of antibodies that stimulate TSH receptors to cause excess secretion of thyroid hormones. This results in hyperplasia of thyroid follicular cells and goiter. The cause of Graves' disease is not known, but genetic and environmental factors may play role, such as smoking, stress and dietary iodine [10].

Relation between thyroid dysfunction and diabetes mellitus: The prevalence of thyroid disease in diabetic patients was reported to be 13.4% with higher prevalence (31.4%) in female. Type 2 diabetic patients as compared to (6.9%) in male patients [11]. The prevalence of thyroid disorder in T2DM patients was reported to be 16% in Saudi Arabia[12]. Diabetes mellitus and Thyroid disorders are the two most common endocrine diseases reported in clinical practice. Diabetes and thyroid diseases have been shown toinfluence each other [13].

Thyroid stimulating hormone (TSH) level is inversely related to the insulin resistance and function of β cell, this relation can be explained by counter-regulatory effect of thyroid hormones on insulin action. These observations reveal that glucose intolerance is tightly associated with thyroid dysfunction [14].

Aim of the study: To assess the effects of the thyroid dysfunction on glycemic control in diabetic patients.

Materials and Method

This is a cross sectional study enrolled 60 patients with diabetes mellitus and thyroid disorder; 16 male (26.7%) and 44 female (73.3%) with a mean age of 47.2±13.6.

The patients were collected fromthe center of diabetes and endocrine disease in Al-Najaf and Al-Manathera center of diabetes during the period from April to December (2018).

Inclusion Criteria:

(1) T1DMor T2DM

(2) Previousor current diagnosis of thyroid disorder

Exclusion Criteria:

(1) History of thyroid surgery

(2) Pregnancy.

The patients were exposed to the questionnaire about the onset of diabetes mellitus, duration of the diabetes mellitus, type of treatment, the history of the thyroid disorder and type of treatment. Patients were informed about the study and verbal consent was obtained.

All patients were evaluated for glycemic control by HbA_{1c} and for thyroid status by TSH.Venous blood samples were drawn from all patients enrolled in the

study. $HbA1_C$ assay, was tested using NycoCard ™ READER II instruction manual, (NycoCard ™ $HbA1_C$). The TSHassay, was tested using a mini VIDAS assay, companynameis (BIOMETRIEUX).

Statistical Analysis: SPSS® Software (version 23.0 for Linux®) was used to perform statistical analysis. Qualitative data are presented as numbers and percentages, while continuous numerical data are presented as mean ± standard deviation. Comparison of study groups was carried out using chi-square test for categorical data and using Student's t-test for continuous data. Correlations were assessed using Pearson's product-moment correlation coefficient. P value of < 0.05 was considered statistically significant.

Results

The demographic data of the study population are illustrated in table 1.

Table 1: Demographic data of the study population

Gender	Male	16	26.7
	Female	44	73.3
Age	47.2±13.6		
Type of DM	Type 1	20	33.3
	Type 2	40	66.7
Initial thyroid	Hypothyroid	30	50.0
Disorder	Hyperthyroid	30	50.0

There was no significant difference in the prevalence of thyroid disorder between type 1 and type 2 DM as shown in table 2.

Table 2: The relation between types of DM and thyroid dysfunction

Type of DM	Hypothyroid	Hyperthyroid	P-value
Type 1	8 (26.7%)	12 (40.0%)	0.273
Type 2	22 (73.3%)	18 (60.0%)	

Chi-square = 1.20, d.f. = 1, P-vaule = 0.273

There was significant effect of thyroid dysfunction on glycemic control. Hyperthyroid patients had the worst control among the collected patients in this study. Table 3 and figure 1.

Table 3: Comparison between type of DM and thyroid status

Thyroid Status (TSH)	No.	HbA1c (Mean±SD)	P-value
Hyperthyroid (<0.2)	13	10.36 ± 2.28	< 0.001
Euthyroid (0.2 – 4.5)	31 7.67 ± 1.58		
Hypothyroid (>4.5)	16	9.38 ± 2.16	

ANOVA F = 9.76, P-value < 0.001

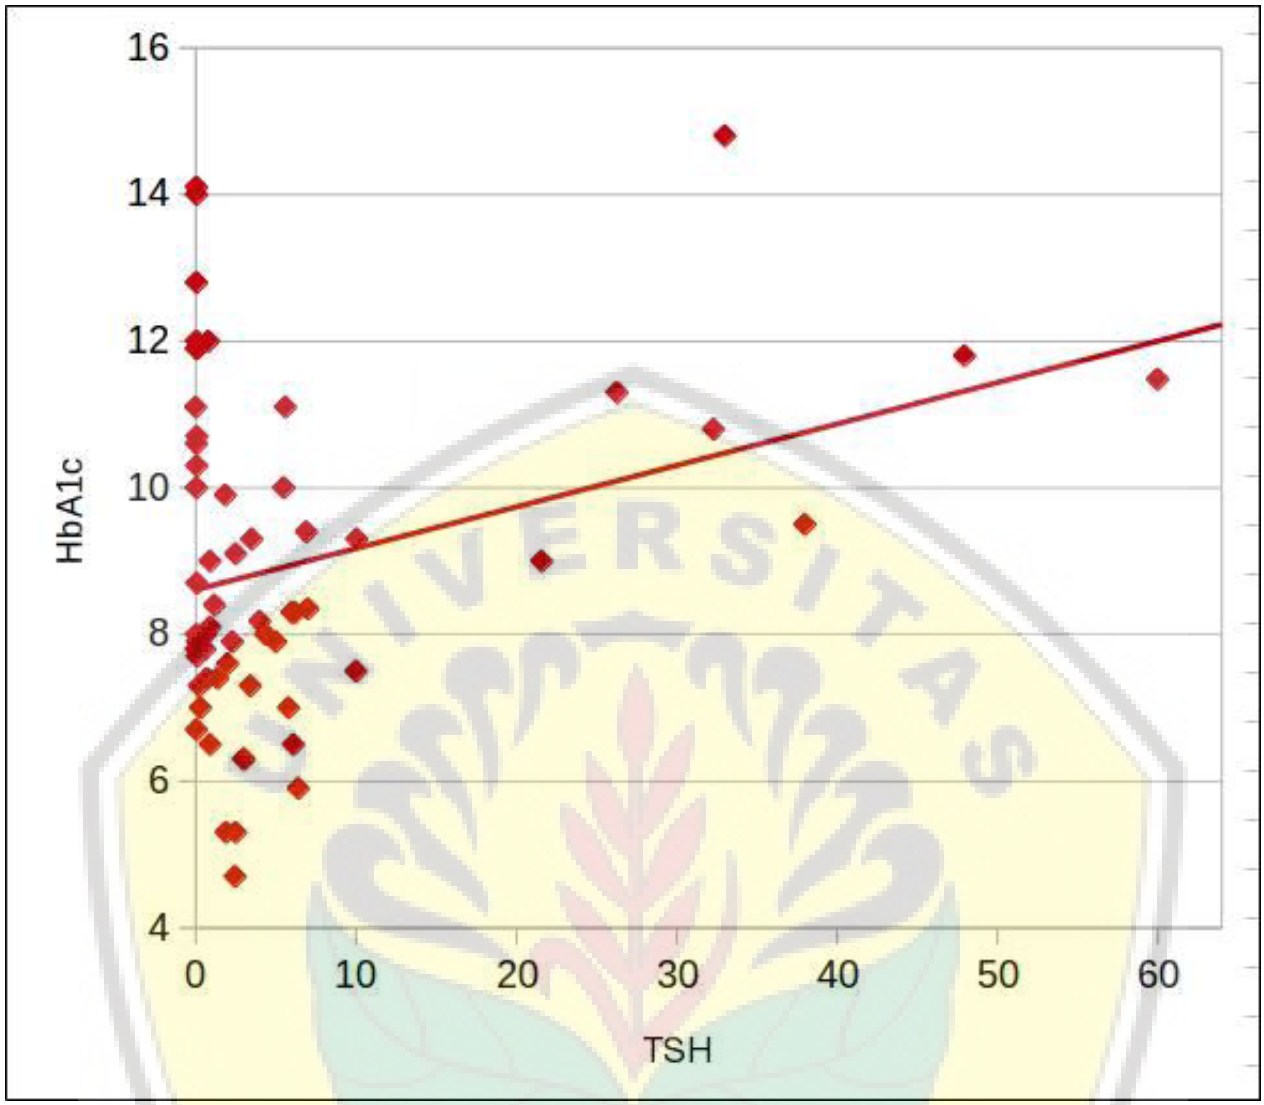

Figure 1: Scatter plot diagram showing the relationship between thyroid function test and HbA1c

In this study there was no significant relation between age of diabetic patients and thyroid dysfunction, however significant relation was observed between the gender and thyroid dysfunction. Table 4, 5.

Table 4: Comparison between age group and thyroid dysfunction

Age Group	Thyroid Disease		Total
	Hypothyroid (n=30)	Hyperthyroid (n=30)	
20 – 45	12 (40.0%)	13 (43.3%)	25 (41.7%)
46 – 65	18 (60.0%)	17 (56.7%)	35 (58.3%)

Chi-square = 0.07, d.f. = 1, P-value = 0.800

Table 5: Comparison between gender and thyroid disorder

Male	12 (40.0%)	4 (13.3%)		16	(26.7%)
Female	18 (60.0%)	26	(86.7%)	44	(73.3%)
Total	30 (100%)	30	(100%)	60	(100%)

Chi-square = 5.45, d.f. = 1, P-value = 0.020

Discussion

The present study revealed that poor control diabetes mellitus is more common among patients with thyroid dysfunction than in age matched patients with diabetes mellitus and euthyroid. These results highlighted the need for further investigations for thyroid dysfunction among patients with poor diabetic control.

Across sectional study done by Maxon et al (2011) in the USA revealed increased hyperglycemia in patients with Hyperthyroidism[15].

Hyperthyroidism has long been associated with hyperglycemia and different mechanisms are suggested including, reduced half-life of insulin due to increased insulin clearance rate, an enhanced release of biologically inactive insulin precursors and increase glucose absorption from the gut[16]. Moreover hyperglycemia, in hyperthyroidism, is aggravated by elevated hepatic glucose production and increased glycogenolysis [17]. These effects are responsible for worsening of subclinical DM and exaggeration of hyperglycemia in T2DM [18].

Evidence supporting glucose impairment in patients with hypothyroidism. Jiang et al. (2011) who studied a total of 1534 Chines adult, and found a higher TSH level in patients with metabolic syndrome compared to those in the non-metabolic syndrome group and concluded that subclinical hypothyroidism may be a potential risk factor for metabolic syndrome [19].

Bhattacharjee R et al (2017) in India, found baseline HbA1c levels were significantly higher in hypothyroid patients compared to control individuals despite similar glucose levels [20].

In hypothyroidism, reduced glucose absorption from gastrointestinal tract accompanied by diminished hepatic glucose production; in addition to reduced renal clearance of insulin, leads to diminished insulin requirements[21].

Lastly recurrent hypoglycemic episodes are reported in patients with hypothyroidism and T1DM and replacement with thyroid hormones reduced the fluctuations in blood glucose levels [31].

Conclusion

Thyroid dysfunction in form of hyperthyroidism and hypothyroidism associated with poor glycemic control in diabetic patients.

Estimation Ferritin Levels and the Correlation with Serum Iron Levels, Enzyme Liver and Excretory Function of Liver in B-Thalassemia Major

Mohammed Abdulridha Ismael[1], Talat Tariq Khalil[1]

[1]*Chemistry department, College of science for women, University of Babylon, Iraq*

Abstract

The study was designed to evaluate the medical relevance of ferritin levels with Iron levels, liver enzymes and Bilirubin levels and alkaline phosphatase (ALP) levels in beta-thalassemia patients. Blood samples were taken from thalassemia departments of a ministry of healthy hospitals. Forty three children with thalassemia (study group) and Forty three healthy controls (group control). We found that significantly increased ferritin level, measured as an index of iron overload, was demonstrated in thalassemia ($p< 0.01$). The mean serum iron level in children with thalassemia was significantly higher than the control group ($p< 0.02$). In addition, the mean serum liver enzymes levels [glutamic-oxaloacetic transaminase (GOT) and glutamic-pyruvic transaminase (GPT)], bilirubin levels, ALP levels in thalassemia patients was significantly higher than the control group. Moreover, a positive connexion was also observed between ferritin levels and iron levels and also, we found a positive connexion between liver enzyme level, bilirubin levels and ALP levels with ferritin levels in the beta thalassemia patients

Keywords: *Ferritin, Bilirubin, alkaline phosphatase, glutamic-oxaloacetic transaminase, glutamic-pyruvic transaminase.*

Introduction

Thalassemias are hereditary anemia due to a lack of production of one of the two protein chains of hemoglobin, alpha and beta-globin, in which the nature of causal mutations is very varied, ranging from point mutation to broad deletions.[1,2] The hemoglobin abnormality is the inhibition (β) or the decrease (β) quantitative synthesis of β chains whose structure remains unchanged. B-thalassemiais widespread in the Mediterranean, but also in South-East Asia, Black Africa, India and China. The prevalence is unknown, but the incidence of severe forms would be 100,000 births per year.[3]

Beta-thalassemia is a genetic disorder of Hb, a substance found in RBC that carries oxygen through the body. Beta-thalassemia are of variable severity: some forms cause no symptoms and others are life-threatening. Severe beta-thalassemia (so-called major and intermediate) are characterized by anemia (lack of red blood cells and hemoglobin).[3,4] This results in pallor, a great fatigability, sometimes vertigo and breathlessness. Anemia can be accompanied by various complications (growth problems, bone deformities...). rely on the riskness of the anemia, the first signs will appear in early childhood (between 6 and 12 months) or later. In major forms, routine regular blood transfusions are necessary to allow normal growth and activity.

Conventional treatment of thalassemia major involves two main therapeutic modalities: blood transfusion and iron chelation treatment.[5] Both of these measures had a major impact on the life expectancy of patients. Transfusions can restore an acceptable amount of red blood cells and thus make the signal of anemia disappear or significantly diminish. However,

repeated transfusions have a serious side effect, hence cumulation of iron in the body of patients. Indeed, with each transfusion, the body receives a quantity of iron (contained in the normal hemoglobin of the red blood cells transfused) important.[6] If the red blood cells received are gradually eliminated, the body eliminates very badly the iron. The latter, accumulating in the organs, becomes toxic, disrupting the normal functioning of the organs affected (heart attack, fibrosis and cirrhosis of the liver) and may be the cause of death (including cardiac arrest). Hormonal disorders are the most common (sex hormones, diabetes, hyperthyroidism).[7]

Iron accumulation in the body (iron overload) occurs in thalassemia individuals. In people with thalassemia intermediate, this overload is mainly related to greater absorption of iron by the digestive system. [8]

The overload is earlier and more severe in thalassemia major, where it is mainly due to regular transfusions. Excess iron in the blood accumulates in different parts of the body (especially the heart, liver and hormone-producing glands) and can lead to complications in adulthood.[9] The accumulation of iron in the hormone-producing glands can lead to diabetes, delayed growth or puberty, early menopause, etc. Several treatments for this overload exist (see the chapter "What are the risks"). Finally, iron overload becomes, with the years, the central problem of the disease and the treatment.[(10,11)]

Therefore, iron overload influence on liver enzyme (AST and ALT) accumulation of iron can be status as reflected serum ferritin.[(12,13)]In my study was undertaken to evaluate theassociation between serum ferritin levels with serum ironlevels, liver enzyme (GOT and GPT) and the ability of excretion liver (ALP and Bilirubin).

Materials and Method

Patients and Sampling: Samples were collected from patients whom consulted the "Thalassemia Center" in the Babylon Hospital – Babylon Governorate – Iraq for the care and treatment thalassemia patients. 43 transfusion dependent beta-thalassemia subjects were selected in the present study during the period of October 2018 to January 2019. Forty three (43) healthy men and women donor were recruited to serve as controls.

Blood Samples: Five milliliters of blood were collected in morning from fasting subjects. The serum was obtained by leaving the blood samples to clot, centrifuged at 3000 rpm for 10 minutes. After centrifugation, aliquots of serum was stored at -20ºC until use for biochemical tests.

Determination of total Iron: The determination of total Ironin the serum was achieved by colorimetric method with the (Randox, UK) kit.

Determination of serum Ferritin: Serum Ferritin concentration was assayed using a commercial kit (Biosystems, Spain). The concentration of serum Ferritin in ng/ml was determined by the following formula.

Serum ferritin (ng/ml)=(A2-A1)sample/(A2-A1) standard x C

Where A1 =first absorbance, A2=second absorbance and C=standard concentration.

Determinations of liver enzyme: Assessment of serum GOT colorimetrically: Serum GOT is measured by a colorimetric method using commercially available kit (Giesse).

Assessment of serum GPT colorimetrically: Serum GPT is measured by a colorimetric method using commercially available kit (Giesse).

Determination of total Bilirubin and ALP: Serum TBil and ALParemeasured by a colorimetric method with Biolabo kit (France)

Statistical Analysis: The results are expressed as mean ± SD (1SD). Statistical analysis was performed using student's *t*-test; *p* values <0.05 were considered significant.

Results

Children with thalassemia had significantly higher Ferritinlevels and serum iron levels ($p<0.01$, $p>0.05$),respectively thancontrols, in table (1), which suggested elevated iron overload and the presence of increased ROS in thalassaemiapatients. In Fig(1), significant positive correlation was found between serum Ferritin levels and serum iron levels ($R^2= 0.90$, $p<0.05$).

The serum liver enzyme (GPT, GOT) level s tended to increase in these patients, the mean value of GPTand GOT in patients were (40.27±15.2 and 38.48±14.1) (U/ml) while the mean value for control were 7.91±1.2and 8.09±2.3 (U/ml), respectively. Liver enzymelevelswere found to be higher in patient group compared withcontrols with P value of less than0.05 as shown in Table (I) and also, shown in Fig (2)and Fig(3),

significant positive correlation was found between serum Ferritin levels and liver enzyme levels. The Total serum bilirubin (STBIL) levels and serum alkaline phosphate (ALP) levels to were elevated in these patients, the mean value of TBILand ALP in patients were 1.94±0.63 mg/dl and 195.09±79.93 U/L while the mean value for control were 0.64±0.03mg/dl and 83.61±37.41 U/L, respectively. TBIL levels were found to be higher in patient group compared with controls with P value of less than 0.05 as shown in Table (I) and also, shown in Fig (4), significant positive correlation was found between serum ferritin levels and TBIL enzyme levels. Also, ALP levels were found to be higher in patient group compared with controls with P value of less than 0.05 as shown in Table (I) and also, shown in Fig (5), significant positive correlation was found between serum Ferritin levels and liver enzyme levels.

Table 1: The mean values of ferritin, Iron, liver enzyme (GOT and GPT), bilirubin and ALP in serum of patients in thalassemia and controls

Variables	Mean of value	Std. Deviation	P<0.05
serum ferritin of controls (ngm/ml)	55.66	41.74	0.01
serum ferritin of patients (ngm/ml)	3131.25	2658.52	
serum iron (umol/L) of controls	19.74	3.2	0.02
serum iron (umol/L) of patients	26.72	4.2	
serum GOT(U/ml) of controls	7.91	1.2	0.01
serum GOT(U/ml) of patients	40.27	15.2	
serum GPT(U/ml) of controls	8.09	2.3	0.02
serum GPT(U/ml) of patients	38.48	14.1	
serum bilirubin (mg/dl) of controls	0.64	0.03	0.04
serum bilirubin (mg/dl) of controls	1.94	0.63	
serum ALP(U/L) of controls	83.61	37.41	0.03
serum ALP(U/L) of patients	195.09	79.93	

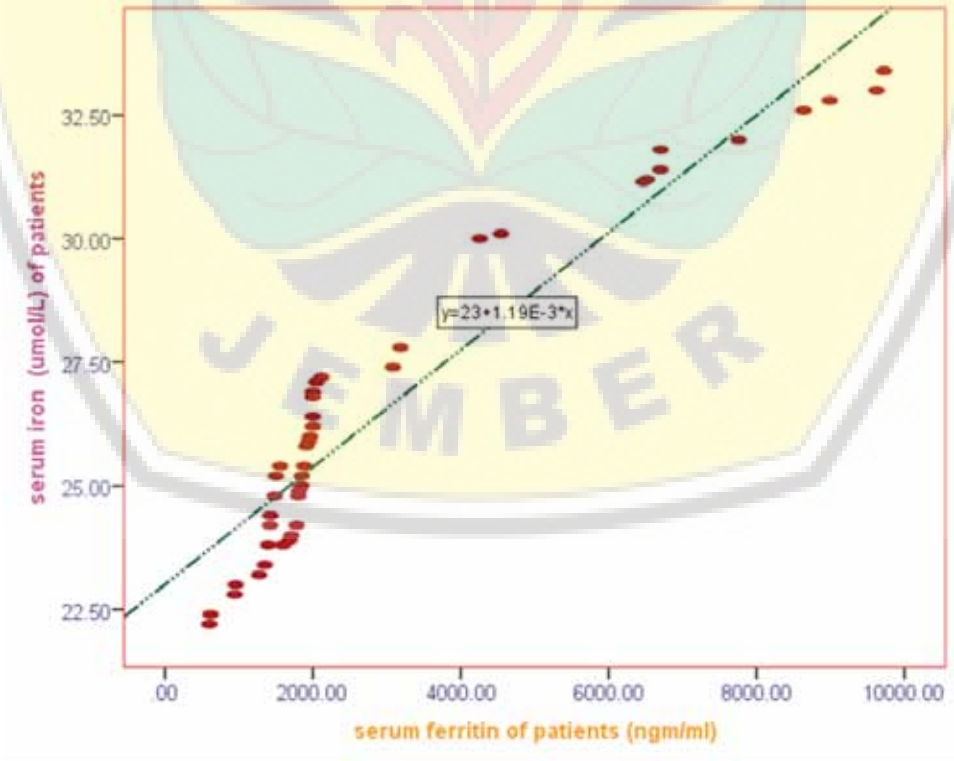

Fig (1): Correlation between serum ferritin and iron levels in thalassemia (n=43, R^2= 0.9, p< 0.05)

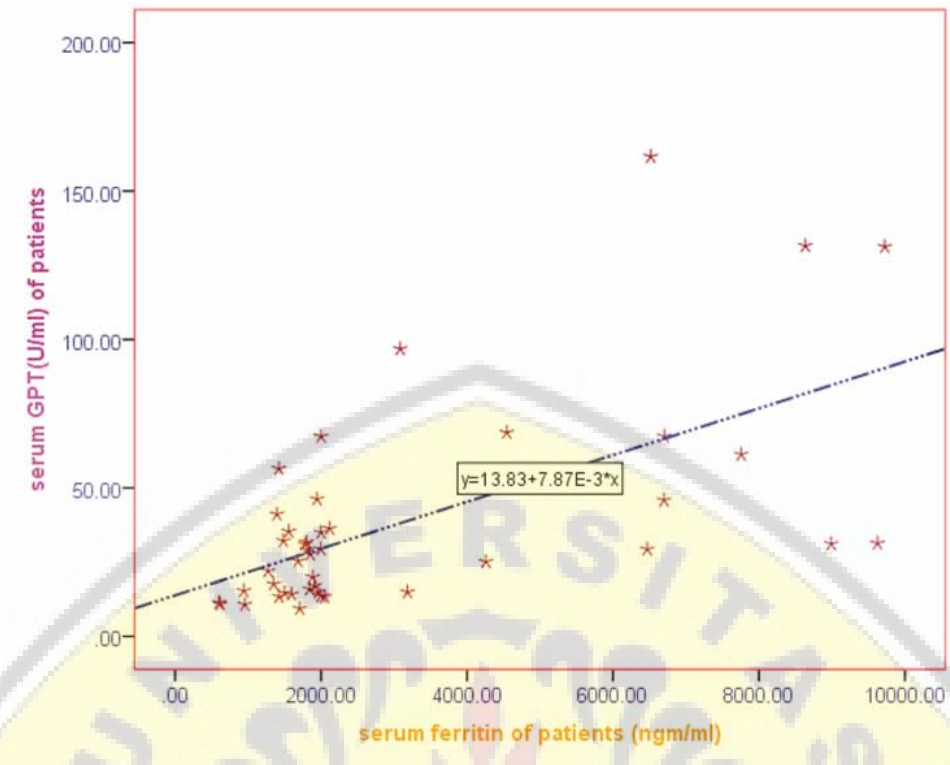

Fig (2): Correlation between serum ferritin and GPT levels in thalassemia (n=43, R^2= 0.7, p< 0.05)

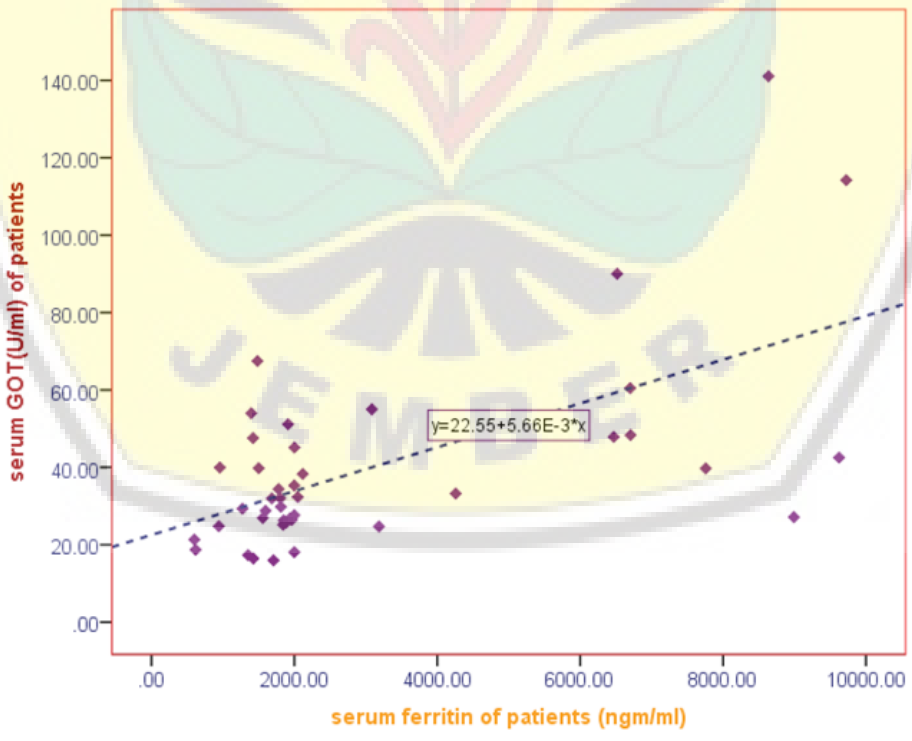

Fig (3): Correlation between serum ferritin and GOT levels in thalassemia (n=43, R^2= 0.59 , p< 0.05).

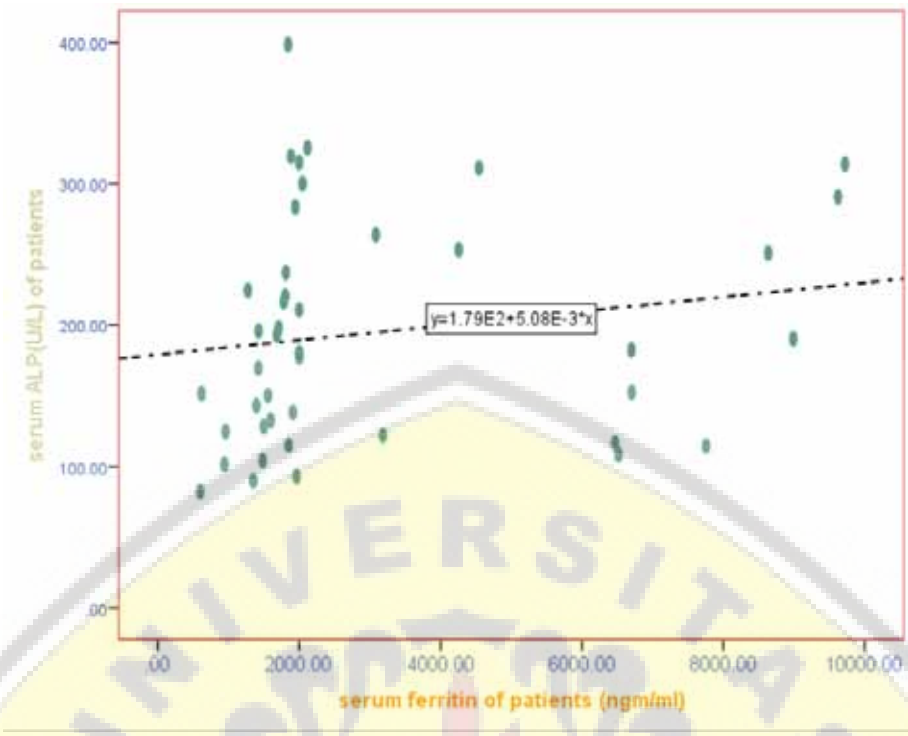

Fig (4): Correlation between serum ferritin and bilirubin levels in thalassemia (n=43, R^2=0.54, p< 0.05)

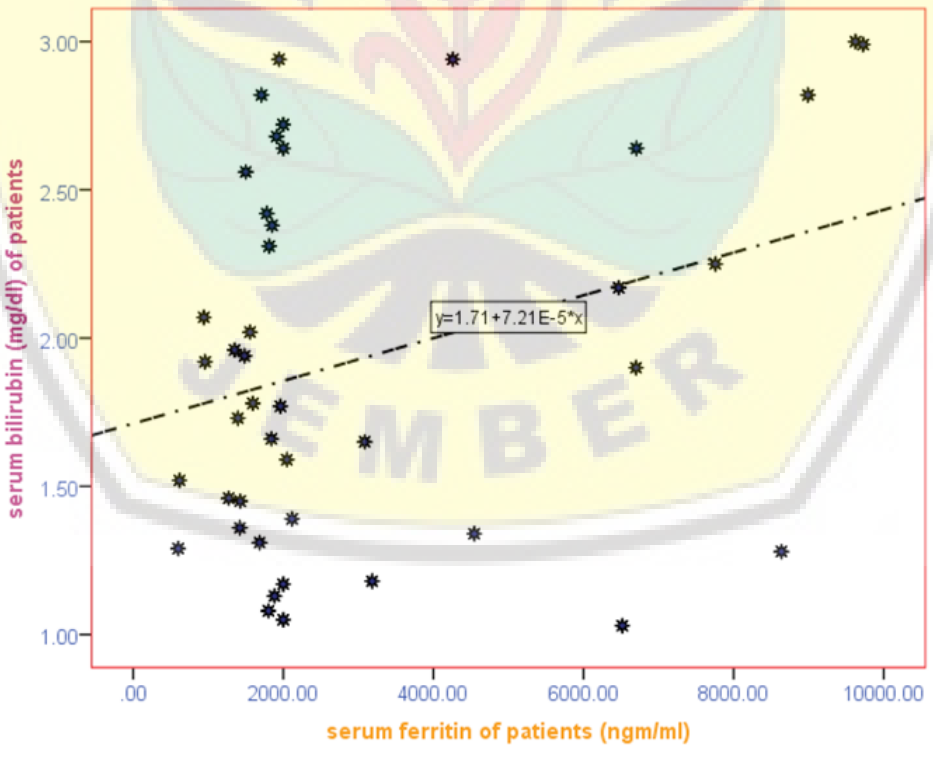

Fig (5): Correlation between serum ferritin and ALP levels in thalassemia (n=43, R^2= 0.52, p< 0.05)

Discussion

Blood transfusions can restore an acceptable amount of red blood cells, making the symptoms of anemia disappear or decrease significantly. However, repeated transfers have a serious side effect: they lead to iron build-up in the patient's body. The latter, accumulated in organs, becomes poisonous and disrupt the normal functioning of the affected organs (heart attack, fibrosis and cirrhosis of the liver, where iron will interact with hydrogen peroxide and free radicals lead to liver damage and reduce its effectiveness.

The suggestion that serum ferritin (SFer) may be taken into account as a biomarker ofiron overload in exposed populations has been recently. Porter JB.is able to demonstrate that in thalassemia patients there were the correction between serum ferritin and levels of body iron withiron overload. In our study, we found theSFer elevated in thalassemia patient with controlIn other report,[14] Nadeem I et alfound SFer in patient thalassemiais very high ferritin levels in tow center of thalassemia.[15] Ameli Metalconducted The mean SFer was significantly higher compare with controls. This study similar finding were seen by Rameshwar L et al who observe SFer were increased in β-thalassaemic children.[16,17]However, repeated transfusions have a serious side effect: they produceto cumulation of iron in the body of patients.

Excess iron is toxic to many tissues, including the liver, endocrine organ and heart, leading to a series of complications which cause morbidity and mortality in this patients.[18]

The iron overload lead to formation of ROS such as superoxide anions ($O^{\cdot}2^{-}$), hydroxide radical($^{\cdot}OH$) and hydrogen peroxide (H_2O_2) which induces oxidative stress in thalassemia major patients via Fenton reaction.[19]

$$Fe2+ + H_2O_2 \rightarrow Fe3+ + OH^{\cdot} + OH^{-}$$

Naithani et al found that markers offree radical injury such as MDAwas significantly elevated in thalassemia compared with control.[20] Similar study by Talat who suggested MDA levels are elevated in serum of patient with thalassemia in Hilla.[21] In our study, A significant increase in serum total Iron concentration (p<0.005) in β-thalassaemia major patients compared to controls and positive correlation between SFer and serum total iron. Our findings are in agreement with the other researchers.[22,23]

In our study, we found the SGOT and SGOT elevated in thalassemia patient with control. This is in agreement with the results of other studies, they found liver enzyme SGOT and SGPT are elevated due to damaged liver byiron overload in liver cells.[24,25] Therefore the cumulation of iron influence on the liver enzyme because the iron have toxic effect on the liver cell.

Salama K et al suggected the correction between liver enzyme with iron overload in major thalassemia.[26] Our study, we found the positive correction between liver enzyme and ferritin because iron over load can be status reflected as ferritin. Israa I. M.et al observed the similar study fromour study, they conducted the positive relationship between SGPT with iron overload.[27] The other report that proposed there are the correction between GOT and GPT in serum of thalassemia patients with ferritin level when the ferritin level are above 1000ng/ml.[28]

The patient of β-thalassemia had dysfunctions of liver led to elevate SBIL and ALP because the liver cell undergo damage by iron accumulation in which the reactive oxidative species are elevated therefor our study observe the BIL and ALP are elevated and positive correlation with ferritin levels. In present study, our findings are in correspond with most ofthe earlier studies suggesting the BIL are raise in β-thalassemia patient compare with control.[28] Sultana N. et al. concluded BIL elevated led tohemolysis of red blood cells in Majored thalassemia.[29] Israa et al found serum BIL and ALP level in patient with major thalassaemia was significantly lower than the healthy group.[26]

From this point of view, our finding suggested that elevated ROS depend onthalassemia progression may be due, at least in part, to the catalyzation of oxidative stress depend on iron load reflected by ferritinled to damage liver cells and then very sensitive indicators for liver function.

Conclusions

Our finding shows that thalassemia is associated not only with elevated iron levels but can be increased ferritin levels. A systematic investigation of factors associated with increased damage of the liverwithin the correlation of ferritin with enzyme liver (GPT and GOT) and the ability of excretion liver. We also suggest that formation of ROS increased present in thalassemia may be resulted from iron levels and ferritin levels as an index of iron overload.

The Effect of Cross-Training Associated with the Technique of (Cryotherapy) in Some Components of Lipids and Hormone Cortisoland the Enzyme (Lipase) in the Female Participants in the Fitness Courses

Rafia Saleh Fathi[1], Abdulrazzaq Jebur Al-Majidi[2]

[1]Department of Applied Sciences/Al_Esraa University College-Ministry of Higher Education and Scientific Research/Iraq

Abstract

The study addressed the topic of training participants in fitness courses without relying on improvement and control of some lipid components and hormones in means of the accompanied cross-training technique of (Cryotherapy). The problem was reflected in the lack of effective improvement of the level of physical fitness of the female participants in these fitness courses. The study, therefore, aimed to see how this program affects both the percentage of fat and body mass (BMI) as well as the hormone cortisol and the lipase.

The researchers used the experimental method to solve the problem and applied the search to an intentional sample of (15) participants in the Green Apple Fitness center, aged between (32-38) years. The researchers used the cross training of the Cryo technique, carried out in three training sessions (45-60) minutes each for (12) weeks. The program is accompanied by four (Cryotherapy) units per week each of (50-70) minutes in coordination with the training program. The researchers arrived at several conclusions, which are appropriate for the cross-training with Cryotherapy technique for female fat loss and stimulating the activity of hormone cortisol and the lipase enzyme.

Keywords: *Cross training, Cryotechnique, hormone and enzyme, some fat ingredients.*

Introduction

The individual health in community is one of the first tasks for researchers and academics in the world. He who plans to make devices or manage the right life is human. So the development of ideas contributes to solving the problems of society based on the evolutionary need of such devices to generate the need first, to test and measure it secondly and to work for prevention third. To achieve this, the process of linking the requirements of the urgent need, such as the use of devices with the correct programs, as a preventive and often therapeutic preventive method has placed physical and health programs and medical devices on social media channels and precisely on the internet in order to be recognized by women and men alike. Work is underway, yet under specialized instructions which a specialist, to achieve the goal that perhaps leads to weight decrease or fat dissolution or assume physical ability, especially for women who need physical strength to sustain life first and to achieve full health that helps achieving accountable life priorities.[1]

In view of what is mentioned, women are no longer receptive to sporting activity or nutritional slimming programmes; this is illustrated in the apparent lack of voluntary participation in the fitness courses. Women,

Rafia Saleh Fathi
Department of applied sciences/Al_Esraa University College-Ministry of higher education and Scientific research/Iraq
e-mail: info@esraa.edu.iq

instead, have headed to beauty shops and clinics hence the problem has become bigger. This problem has to be addressed, as the researchers work to interlink physical and nutritional programs and the use of (Cryotherapy) to contribute together to solve one of the most difficult problems, namely the optimum use of physical, nutritional and health programs. The problem is also associated with the medical work which is subject to the cultural intellectual knowledge that women accept and under which they operate in order not to stumble into the reluctance to participate in the physical fitness and nutrition programs.[2]

Cross-training is one of the most popular and effective method of training in physical capacity development. Moran Wemaglin explains that cross-training has been used in some way in the history of sports. Some studies suggests that cross-training is a method of training that combines two or more activities in the exercise program and is designed specifically for the development of fitness and the provision of necessary comfort for stressful muscle groups, reduce the infection rate, eliminate the boredom in training and reduce the risk of developing combustion resulting from participation in individual training programmes. Also points out that cross-training is a strategy used by trainers to organize the training program and fitness activities. So some studies point out that cross training helps to deliver Substantial improvements for endurance during aerobic exercise, anaerobic as well as for elements of strength, speed, endurance, flexibility and agility, all of which will affect the athletic performance of the specialist activity.[3]

The aim of the study is to develop a cross-training programme based on the scientific basis.And then set suitable periods of time for (Cryotherapy) that is coordinated with the training program. The study also aims to find out the values of each of the search variables (percentage of fat, BMI, body mass, cortisol and enzyme lipas). Finally it attempts to identify differences in the tribal and sediment tests of the search variables. The researchers have imposed statistically significant differences in the research variables (lipid ratio, body mass, BMI). Also, there are statistically significant differences in the hormone cortisol and lipids.

Methodology

The researchers used the experimental method as it suits the nature of problem solving. A sample of 15 volunteer women from Green Apple Center were intentionally. They all were subject to the design of the one group. The sample specifications were the height (1.66 m, ±0.05) whose weights range (86.9+) kg.. The age was (36.8) years. The research tests included the following:

1. Lipid percentage test (gaskill,2007, p167)

The following equation was used to obtain the results as follows:

Percentage of fat = }(body weight – body weight without fat)/body weight{x 100]

2. Body mass index (BMI) test: (andersone. 2011. p164)

The variable results are obtained according to the following:[4]

$$\text{Body mass index} = \frac{\text{Weight}}{\text{Square length in meters}}$$

$$\text{BMI} = \{ M/(l)^2 \}$$

3. Body mass: This indicator is obtained by measurement of the weight and length.

4. Test of obtaining the results of the hormone cortisol and enzyme (lipase)

After the tested sample member sits on a chair in resting status, 5cc blood is transfused in special tubes before and after the completion of the training program. This blood is handed over in a special case to the specialized laboratory by the tester. It is treated to get Values variables in this respect.

The researchers conducted a pilot experiment dated 3/12/2018, which was intended to identify errors and test method, after which the researchers conducted the pretests dated 6/12/2018 with the help of a specialist physician and a specialized physical fitness staff. The main experiment, dated 8/12/2018, lasted until 9/3/2019, as described in the chart below.

Table (1): Shows the training program

T	Week	aim	Time	Target areas for the Ferraio	Training intensity
1	First	Cryo	45 Min.	Buttocks – abdomen – arms	
2	Second	Comfort	-		
3	Third	Fitness	60 Min.	Two Gyro and breathing devices	60-80%
4	Fourth	Comfort	-		
5	Fifth	Cryo	50 Min.	Buttocks – abdomen – arms	
6	Sixth	Comfort	-		
7	Seventh	Fitness	60-80 Min.	Of a comprehensive	60-80%
8	Eighth	Fitness	60 Min.	Oxygen-Roasting	60%
9	Ninth	Cryo	60 Min.	Buttocks – abdomen – arms	
10	Tenth	Comfort	-		
11	Eleventh	Fitness	60-80 Min.	Public and private force	80%
12	Twelfth	Fitness	60 Min.	Oxygen-Roasting	60%

Afterwards post tests were performed on 11/3/2019 under the same time conditions and requirements of the pretests.

Results and Discussion

Table (2): Means, & the standard deviations and the T- value for the tests of the research variables.

Variables	The pair test		Post Test		Mean diff.	SD diff.	Calcu. value (t)	Level of significance	The result
	Mean	SD	Mean	SD					
Lipase Enzyme	121.16	4.26	178.8	7.8	57.64	5.88	9.8	0.000	Sig.
% Fat	0.43	0.02	0.284	1.73	0.144	0.03	3.9	0.000	Sig.
Body Mass	86.9	1.34	77.6	1.77	9.3	1.6	5.8	0.000	Sig.
BMI	37.127	0.783	32.03	0.135	5.09	1.03	4.9	0.000	Sig.
Cortisol	12.7	0.70	16.86	0.91	4.16	1.12	8.7	0.000	Sig.

*Statistical significance under 14(df) and error level ≤ 0.05.

The former table shows that the enzyme (lipase) has improved clearly and for the benefit of the CRTs test as well as the percentage value of fat and body mass and the variable (BMI) well as the (cortisol) variable.[5] In the light of that improvement, the researchers believe that the Cryotherapy was partially influential as in the percentage of fat and body mass and (MBI) due to the effect of freezing and cracking and even the death of fat cells and their non-moving from the place of fat concentration that is targeted in the abdominal area,[6] buttocks and muscle area (triple muscle). Besides, following the instructions for food was also one of the reasons for the appearance of the results (moral) and this is confirmed who says "Obesity management relies heavily on reducing Calories taken by food and drink and wasting more of them in sports ".[7] This is another indication of the emergence of moral differences as the training program and units and the time of each unit and the type of training and its severity increase the leakage of fat.[8] This means Cryotherapy is helpful in freezing, cracking fat cells with the support of sports activity. "Regular exercise of sports," it is believed, "increases energy consumption, resulting in decreased body fat.[9]

Moreover, the appearance of the moral difference of the cortisol hormone is to synchronize the organized sport program which targets and increases "the concentration of cortisol hormone and leads to the speed of metabolism".[10]

As for the appearance of moral differences of the enzyme (lipase) it is known that this enzyme of the analyzer (interference in the interactions within the body and help in the use and analysis of nutrients (lipase) that turns fat into fatty acids and clerrol".[11]

In short, this is the result of the interaction between the response of the sample and assisting them in working with instructions and adhering to the organized sporting activity, which facilitated with that scientific technique the emergence of these results.[12]

Conclusions

The Cryotherapy technique accompanying the training programme contributed to reducing the fat rate and improving the MBI and the body mass. The impact of the training program is the stimulation of the cortisol hormone and the Lipas and contributed to increasing metabolism and lowering the fat ratio. Periods and time of use of the Cryotherapy technique contributed to the improvement and level of scalability of the participants. The researchers recommended the use of modern techniques with the specialized training program that contributes to reducing the level of fat in the body. Adhering to the food regulations with modern technologies and the training program improves the level of women in all directions. and conduct similar research but on other samples and levels.

Study the Impact of Selenium in Women with Osteoporosis in Al-Anbar Governorate

Ehsan H. Rasheed[1], Wajeeh Y. Mohammed Alani[1], Ismail K. Farhan[1]

[1]University of Anbar, College of Science, Department of Chemistry (Biochemistry)/Iraq

Abstract

Osteoporosis is one of the bone diseases that lead to fractures . The aim of this study is the effect of selenium on osteoporosis. This study was conducted on women in Anbar Governorate. The study includes (60) women aged 25-65 years. 15 women were taken as control groups aged 25-35 years and 45 women with osteoporosis.

The results obtained from the measurement of selenium concentration showed significant difference (p£0.05) in the level of selenium in women with osteoporosis is comparing with a control group.

Keywords: *Osteoporosis, Selenium, Bone, Bone mineral density.*

Introduction

Selenium is a chemical element with symbol Se and atomic number 34.Selenium salts are toxic in large amounts, but trace amounts are necessary for cellular function in many organisms, including all animals. Selenium is an ingredient in many multivitamins and other dietary supplements. It is a component of the antioxidant enzymes glutathione peroxidase and thioredoxin reductase.(1)

Selenium plays a role in the action of the thyroid gland and in every cell that uses thyroid hormone. It may also prevent Hashimoto's disease, in which the cells of the body attack the thyroid gland. (2)

In biochemical systems, selenium was found in amino acids selenomethionine, selenocysteine and methylselenocysteine. In these compounds, selenium plays a role similar to sulfur. Another organic compound that occurs naturally is dimethylamine. Selenium is a nutritional component of nutrients that acts as an adjunct to the work of antioxidant enzymes, such as glutathione peroxide.(3) (4)

The group of glutathione peroxidase enzymes (GSH-Px) stimulates certain reactions that act to remove the reactive oxygen in hydrogen peroxide and organic hydrobroxides.

$$2GSH + H2O2 \text{ ---- } GSH\text{-}Px \rightarrow GSSG + 2\ H2O$$

The thyroid gland uses a selenium component, which acts to stimulate the thyroid gland and secrete various thyroid hormones as the T3 hormone is one of the most important thyroid hormones, controlled by the total metabolic rate in the body. Without selenium, the T3 hormone cannot be produced and can be catastrophic to a wide range of body systems.(2)

Selenium is a rare element in the human body. Humans need very little selenium. Only about 50-200 µg is needed. Selenium can be toxic if more than 400 micrograms are taken. Selenium deficiency is rare. Although selenium has some beneficial effects on the human body, it has some harmful effects and should be eaten very little.

Sources of Selenium: Selenium is found in meat and grains. Selenium can be obtained from nuts, brewer's yeast, broccoli, whole rice, chicken, dairy products, garlic, onions, liver, black honey, salmon, tuna, seafood, vegetables, wheat germ and whole grains. Selenium-containing herbs: chamomile, spinach, garlic, parsley, peppermint and others. And best sources Nuts Brazilian nuts.(5)

1	Atomic Absorption Spectrophotometry Analytic JENA NOV AA 350 with Hydrad System Germany 2012
2	Triton x-100
3	Ammonium dihydrogen phosphate
4	(HNO_3) Nitric acid
5	Water

Method

Preparation of Work Solutions:

1. 10% of Triton were prepared by taking 10ml of the material and put in a 100ml volumetric flask or by taking 5ml of the material and put in a 50ml volumetric flask.
2. 20% of the ammonium dihydrogen phosphate were prepared by taking 20 gram of the substance and dissolve it in distilled water (free of ions) and transfer to a 100ml volumetric flask or by taking 5gram the substance and dissolve it in distilled water (free of ions) and transfer to a 25ml volumetric flask
3. In volume flask 500 mL were added 400ml of iodized distilled water and were added 1 ml of concentrated nitric acid and were added 25 ml of 10% Triton x-100 and add 5ml of (20%) ammonium dihydrogen phosphate. The volume was supplemented to the mark by distilled water free of ions and mix well to ensure the homogeneity of the mixture within the volumetric flask and the solution was used to measure the toxic elements in the serum.

Procedure: Were drawed 500µl (0.5ml) of the samples and transferred to a Volumetric flask (10ml). The volume was supplemented to the mark by the pre-prepared dissolving solution (10% Triton x-100 and nitric acid (HNO3) and (20%) of ammonium dihydrogen phosphate and ion-free water).

Were prepared standard solutions of stock Se (1000ppm) and were prepared different concentrations standard solutions for the work of the standard curve. Concentrations of prepared solutions were as follows:25ppb; 50ppb; 75ppb; 100ppb

The samples were measured on the hydrad system at wavelength (196nm) and at 900C° and 10mA (1.0nm) slil width.

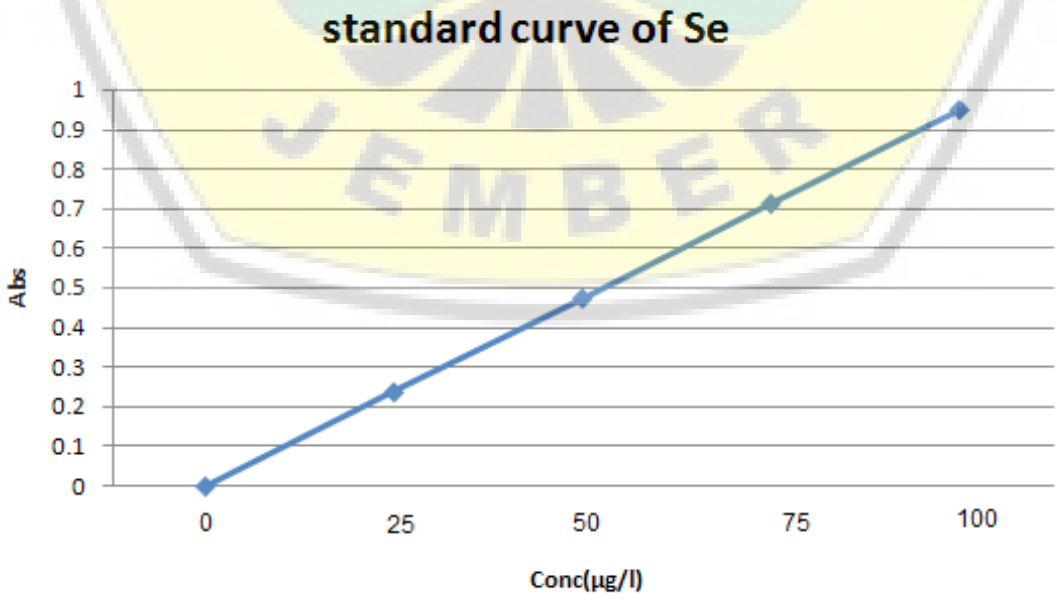

Figure (1): The standard curve for estimating selenium

Results and Discussion

A statistical analysis was performed to compare results of the control group and women with osteoporosis, the following results were obtained.

Table (1): Levels of Selenium in patients with osteoporosis and control group

Factor		Mean	Std. Deviation	T Test	P_value
Se (ppb)	Patient	60.27	15.67	-2.283	0.026
	Control	70.56	13.32		

The value of mean ± S.D (60.27±15.67) in (p£0.05) in patients with osteoporosis while the value of mean ± S.D (70.56 ± 13.32) in control group it mean that there was a significant difference in the value of p where (p£0.05) in patient with osteoporosis comparing with control group .Due to the lack of concentration of selenium causes a decrease in selenium proteins. It is known that what is not Less than nine selenoid proteins are Osteoblastic in the human fetus.[6][7][8]

These proteins act to protect bone cells from oxidative stress in the bone the excess in intracellular reactive oxygen species (ROS) are thought to contribute to the development of osteoporosis by inhibiting Osteoblastic differentiation of bone marrow stromal cells (BMSCs).[9][10][11]

There is a relationship between concentration of selenium and bone mineral density (BMD) the low selenium concentration leads to decreased bone mineral density (BMD) and therefore osteoporosis.[12]

Results obtained with previous results.[12][13]

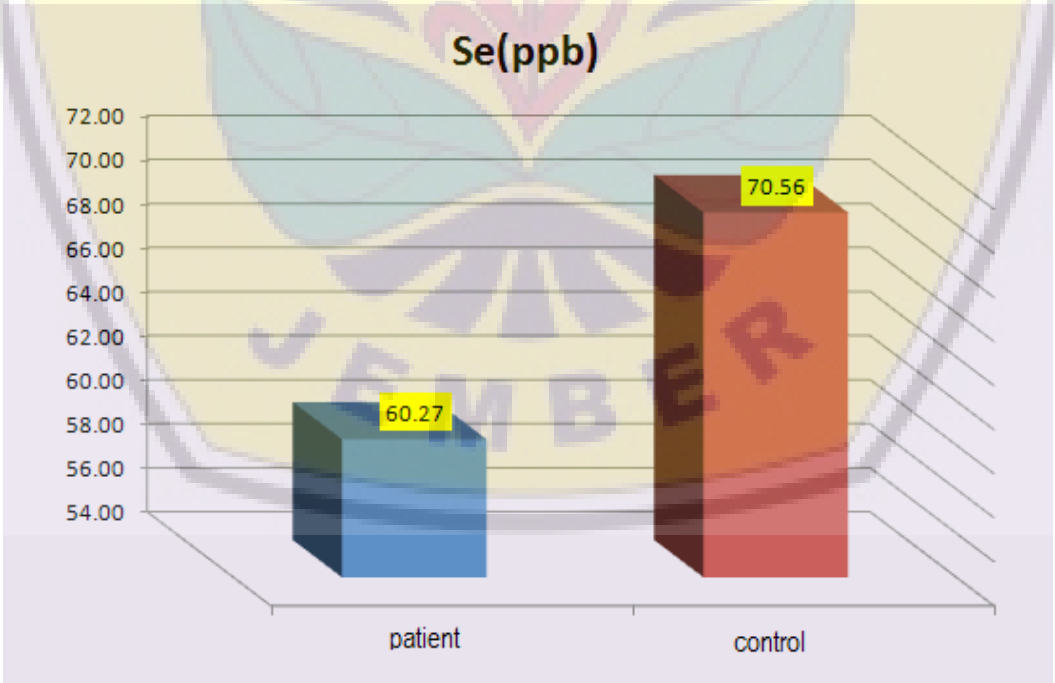

Figure (2): Serum selenium for the group of women with osteoporosis and control group

The Impact of the Method of Teaching the Mediator Different Speed and Mental Training to Teach Some of the Offensive Skills for Beginners in Handball

Manaf Majid Hasan[1], Omar Ahmed Mosleh[1], Fouad Hammad[1]

[1]University of Anbar/Faculty of Physical Education and Sports Sciences/Iraq

Abstract

The aim of this study is to compare the effect of the teaching method (the explanation and the typical presentation) carried out by the control group and the method of the mediator according to the speed of presentation of the motor model and mental training conducted by the pilot group in the education of beginners

The experimental method was used to design the two groups of pre-and post-test tests. The study was conducted over a period of five weeks. After processing the data of the pre and post measurements, the results were obtained. The most important results were: The presentation of the motor model along with the mental training results in superior learning for beginners as a result of the use of the video presentation with different operating speeds of performance, providing learners with an ideal mental vision and integrated mental training before they go to the playroom to apply it practically.

Keywords: *Teaching method, technological medium, speed training, mental training and handball.*

Introduction

We all aspire to reach the beginner learner to the best level of knowledge and skills and requires that continue to search for the best teaching method that fit the capabilities of learners and their needs and the content of education and its objectives, "The adherence to one method or method of learning may not achieve all the objectives and the existence of variance in the level of individual differences And the difference of learners in the ability and comprehension on the perception and perception of motor performance ".[1] and that the best method of teaching are that are very influential and leave the impact of learning in the learner and make it involved and interacting in the educational process, recalling, "A positive only if the learner or interactive".[2]

It is important to make the learner interactive with the lesson material to obtain the integrated motor perception of the skill to be learned and in all its details and then perform the movement with correcting the error and install the correct mental performance through training mentally and thus show performance as physical behavior is true and this is what we seek.

It is noticeable in our work as teachers that we do the dynamic model or to show it using video, the performance is fast and negatively affects the formation of the first image of the learner to hide the fine details, the novice gets a mental image is incomplete and does not achieve the main purpose in education.

In our review of the teaching literature in the Faculty of Physical Education-Anbar University we found missing rings in teaching using the method of order (explanation and presentation of the model) and the model is presented by the same teacher and in the best case is used video tutorial and the speed of the normal presentation, which is equal in how fast the performance of the model from In both cases, the speed of motor performance exceeded the perceptions of junior learners with no interest in mental training, which reflected negatively on the levels of learners when evaluating them. The researchers suggested an assessment of the levels of learners for the last three years and after obtaining them officially from the results of the evaluation were divided between the six official levels of assessment (acceptable, intermediate, good,

very good, excellence) and the largest dispersion ratio (mean - acceptable - average).[3]

The importance of the research is to suggest a method of teaching the different technological medium as well as mental training as a new contribution to teaching as well as in solving the problems of teaching mentioned above.

Research Aim: To identify the effect of the method of teaching using the technology of different speed and mental training and compare its results in a way teaching the matter (explanation and presentation of the model)

Hypothesis:

1. There were significant differences in favor of post measurements of control and experimental research groups.
2. There are significant differences in favor of the results of the experimental group using the different speed and mental training technology.

Research Methodology: The researchers used the experimental approach.

The Research Sample: A random sample of (35) non-practicing students of the handball game from the second stage in the Faculty of Physical Education - Anbar University for the academic year 2017-2018 (23 of Division A - 12 of Division B) by 58.333% of the total research community (60) Learned.

Table (1): Shows the amount of dispersion in the levels of the second stage students in the handball course

Levels of appreciation	2015-2014		2016-2015		2017-2016	
	Number of learners	Ratio	Number of learners	Ratio	Number of learners	Ratio
Good-Excellence	7	30.4%	15	53.572%	36	49.315%
Failed-intermediate	16	69.6%	13	46.428%	37	50.685%
Total	**23**	**100%**	**28**	**100%**	**73**	**100%**

Homogeneity of the Sample: The values of homogeneity were examined and the values of the torsion coefficients within the level (±3) were an acceptable indicator of homogeneity as shown in Table (2).

Table (2): Shows homogeneity of the research sample

Sr. No.	Basic variables	Mean	Medium	SD	Skewness*
1.	Age	20,685	21	0,932	0,233
2.	The weight	66,714	65	4,950	1,121
3.	Length	174,514	174	4,434	0,096
Variables affecting performance					
1.	The explosive power of the arms	5,072	4,950	0,682	0,157
2.	The explosive power of the legs	30,771	30	5,380	0,024
3.	Special compatibility in handball	12,628	13	1,848	0,779
4.	Accuracy of handball shoot	6,257	6	1,291	0,792

* Moderate (±3)

Tests used:[4]

1. Push a medical ball for the farthest distance to measure the explosive force of the arm
2. Vertical jump of stability to measure the explosive force of the upright legs.
3. Test the numbered circuits to measure your compatibility in the handball.
4. Test the accuracy of the shoot of the jump to measure accuracy.

Procedures of the experiment:

Pre Test: Carried out during the period from 11-18/2/2018 recorded homogeneity data and evaluate the pre performance of the main research variables

Execute the experiment:

Control Group: The Spectrum of Teaching Styles introduced by Muston and Ashworth" method was used over a five-week period with two teaching units per week (90 minutes).

Experimental group: The technological medium used the different speed to display the kinetic model to the Gantt training program over a period of 5 weeks and two learning units per week (90 minutes).

Post-test: Was carried out in the period 18-21/4/2018 and recorded the data of performance evaluation skills and the same method of pre testing.

Results

View, analyze and discuss results:

Table (3): Shows the results of the pre and post performance evaluation of the control group

Sr. No.	Variables	Performance evaluation	Pretest		Posttest		Mean diff.	SD.diff.	(t) calculated	Sig.*
			Mean	SD	Mean	SD				
1.	Handling from above shoulder level	10 Min.	2.782	1.085	5.739	1.214	2.956	0.976	14.528	0.000
2.	Simple deception		2.347	0.486	3.782	1.277	1.434	1.471	4.675	0.000
3.	Complex deception		2.217	0.735	3.347	1.495	1.130	1.217	4.453	0.000
4.	Shoot from above the shoulder level		2.826	1.114	6.782	1.380	3.956	1.021	18.575	0.000

* Morality below error level (0.05) in front of the degree of freedom (23-1 = 22)

Table (4): Shows the results of the evaluation of the pre and post-performance of the experimental group

Sr. No.	Variables	Performance evaluation	Pretest		Posttest		Mean diff.	SD.diff.	(t) calculated	Sig.*
			Mean	SD	Mean	SD				
1.	Handling from above shoulder level	10 Min.	2.750	0.965	6.682	0.728	3.932	1.205	11.300	0.000
2.	Simple deception		2.500	0.674	5.900	0.960	3.400	0.722	16.305	0.000
3.	Complex deception		2.250	0.452	4.933	1.263	2.683	1.120	8.294	0.000
4.	Shoot from above the shoulder level		2.500	0.904	7.091	0.473	4.591	0.748	21.239	0.000

* Morality below error level (0.05) in front of the degree of freedom (23-1 = 22)

Table (3) and (4) show that there are significant differences between the evaluation of the pre and post performance of the control group as well as the experimental group and the evaluation of the post-performance of both groups.

The positive results of the effectiveness of both method in teaching are attributed to the fact that each method of teaching has its administrative and organizational aspects and its tools that influence the teaching and motivating the learners.[5]the learners interact with each other according to their ability and inclination to accept the appropriate method in education. They are all aimed at improving the learner's level and imparting the experience and practical knowledge of the that "method and method of teaching are very important in the educational process and that these method and method affect the speed of learning and the degree of saturation in learning",[6] and agree with the results of the research that the method of teaching physical education "regulate the interaction of learners in educational situations to acquire educational and educational experiences related to the goals of physical education".[7]and also agree with the view in "The successful method of teaching is to reach the desired goal and achieve The purposes of the lesson with the least time and effort and the most appropriate means ".[8]

Table (5). Shows the values of the computational environment, the standard deviations and the calculated value (t) and the significance of the differences between the results of the control and experimental research groups to evaluate the post-performance in the main search variables

Sr. No.	Variables	Performance evaluation	Control group		Experimental group		(t) calculated	Sig.*
			Mean	SD	Mean	SD		
1.	Handling from above shoulder level	10 Min.	5.739	1.214	6.682	0.728	2.460	0.019
2.	Simple deception		3.782	1.277	5.900	0.960	5.033	0.000
3.	Complex deception		3.347	1.495	4.933	1.263	3.130	0.004
4.	Shoot from above the shoulder level		6.782	1.380	7.091	0.473	0.748	0.460

* Moral and below error level (0.05) in front of the degree of freedom (23 + 12-2 = 33)

Table (5) shows that there are significant differences in the evaluation of the post-performance between the control and experimental groups and in favor of the results of the experimental group for the large arithmetic mean of their research variables. Thus, the hypothesis of alternative research was achieved: "There are significant differences in favor of experimental group results using the different speed and mental training medium",[9] Zero indicates the effectiveness of the teaching method of the experimental group.

Table (6). Shows the magnitude of the effect

Sr. No.	Variables	Control group	Experimental group
		ETA square	ETA square
1.	Handling from above shoulder level	0.46	0.50
2.	Simple deception	0.22	0,90
3.	Complex deception	0.45	0.73
4.	Shoot from above the shoulder level	0.65	0.88

Table (6) show that Effect size of the teaching method of the control group (0.22-0.65) means that (22-65%) of the effect on the teaching of the search variables is explained by the effect of the order method (explanation and typical presentation) The ratio is not explained by strange factors. It is clear from the same table and shape that Effect size of the experimental group teaching method (0.50-0.90) means that (50-90%) of the effect on the teaching of the search variables is explained by the effect of "The remainder of the ratios are unexplained and due to strange factors and the observed effect size data finds a significant increase in the proposed method And his superiority".[10]

The researchers attributed the positive results of table (5) and (6) to the method of teaching the experimental group to the effectiveness of the administrative and organizational aspects. The effective tools harnessed the available resources for teaching in accordance with the content of the lesson and the requirements of the educational situation and the needs, tendencies and attitudes of the learners. (0.70X) (0.30X). It provided a clear, meaningful and integrated picture of the parts of the skill and its sections. The learner was able to understand the small parts of the skill and to connect them to each other and to form the correct motor image of the performance. Where he confirms whenever the information provided with meaning and purpose has diminished the need for repetition to save them and the division of information displayed becomes a catalyst to increase the learner's capacity to address them and absorbed through the organization of such information.[11]

The positive results of the method of teaching the experimental group are attributed to the good organization and implementation of mental training in terms of the time it is given and the number of times it is implemented in proportion to the learner's need to take the right mental perception and training, thus strengthening and strengthening the mental motor program to show in the form of the correct motor behavior of the performance when performing it that mental training is one of the method used in the educational process of motor skills, which affect positively through the effectiveness of mental training factors in relaxation and training through observation, thus proved an unquestionable success in raising the level of Disease .[12] The results also agree with the reference that "mental training is closely related to learning in general and in the field of learning locomotion in particular, where mental training adds a cognitive aspect of performance in terms of seeing the full performance and then recall the image to return it fully or fragmented and training to correct Performance or increased arousal for optimal performance ".[13]

Conclusions

1. The effectiveness of both the teaching method (explanation and presentation model) and the method of teaching using the medium different speed of the presentation of the motor model and mental training in the education of beginners some of the offensive skills in handball.
2. The emergence of a difference in the results of the evaluation of the post-performance of the control and experimental research groups and for the benefit of the pilot that uses the mediator according to the speed of presentation of the model and motor mental training.
3. The method of teaching using the mediator is different than the speed of presentation of the motor model and the proposed mental training in the differential difference in the size of the positive effect.

Abstract

The Aim study of the physiological and histological effects of olive oil, sesame oil and soybean oil against diabetes on the male reproductive system. In this study, males of local rabbits whose weights ranged from 1500 to 1800 grams were randomly divided into 8 treatments, each of which included five rabbits. The first group consisted of the control treatment, where the standard diet and normal water, the second group, the group of diabetes induced by the aloxane and the third group, the group of sugar-induced aloxane + olive oil (1.25 ml/kg body weight) (And the fourth group is the group of sugar-induced aloxane + sesame oil (5 mg/kg body weight) The sixth group olive oil group (1.25 ml/kg body weight) The Seventh group sesame oil group (0.5 ml/kg body weight) Group Eight soybean oil group (5 mg/kg body weight).

Treatment of male rabbits with aloxane resulted in a significant reduction in the concentration of FSH, LH and testosterone hormones compared with control group. While the dosage of rabbits treated with aloxane sesame oil, soybean oil and olive oil to a significant increase in the concentration of FSH hormones.

The treatment of healthy rabbits with sesame oil, soybean oil and olive oil significantly increased the concentration of LH compared with the control group.

As well as through the histological sections of the testicle in the group of infected diabetic animals shows the ST spermatozoa and the primary PS and secondary sperm cells did not complete the maturation process with the presence of AV grease and necrosis in some seminal tubules. The histological sections of the assay for the group of diabetic animals treated with olive oil show primary PS cells with the cessation of sperm maturation at this stage. The histological sections of the testicular group of animals and the treatment with soybean oil are shown to be normal. The whole sperm S is shown clearly in the testis tissue of the group of animals affected by diabetic and treated with sesame oil. The stages of semen formation appear within the semen.

Keywords: *Diabetes, olive oil, soybean oil, sesame oil.*

Introduction

It is worth mentioning that diabetes has a large share in the trend of researchers to use plants in the treatment of this disease, as the plants used various forms and extracts and recently discovered many of them, especially that has a significant role in the control of diabetes[1] and the focus of researchers on diabetes It is one of the most common diseases.[2,3] The importance of olive oil, health and nutrition through epidemiological studies conducted in different parts of the world can contribute olive oil to maintain the health of patients with diabetes and to protect them from the complications of this disease and the resulting disorders[4,5].

Soybean is one of the most famous legumes. It is a plant that possesses oil seeds. It is spread in many parts of the world. It has many nutritional uses. Chinese people have used it for thousands of years in extracting oil and used it in the pharmaceutical industry. Soybeans have

many benefits and most importantly, are an excellent source of vegetarians, to get their essential amino acid needs. Increases breast size for women,. Protects against osteoporosis. Prevents atherosclerosis and reduces high blood pressure. Reduces the accumulation of body fat[6].Sesame and scientific name Sesamum Indicum is a herbaceous plant belonging to the family Sesame and the length of about 70 cm. The sesame plant has opposite leaves, white and pink flowers, with small, shiny oval-shaped ovary seeds. Sesame seeds are collected in wallets of 3.5 cm each. The sesame grows in India, China, Japan, Egypt and Latin America and is harvested in the middle of the summer. For its taste and aroma, it is a pleasant, odorless plant that can retain its nutritional value for two years. Sesame seeds contain many minerals, Magnesium, calcium, copper, iron and phosphorus at high concentrations, giving it many medicinal and therapeutic properties. It is useful in treating many respiratory problems such as breathlessness, asthma, chest pains.[7]

Materials and Method

Animals Used: In this study, males of local rabbits, whose weights ranged from 1500 to 1800 grams, were placed in metal cages with metal covers and dimensions (120 x 60 x 60 cm). The animals were subjected to laboratory conditions from a light cycle divided by 12 hours of light And (12) hours of darkness

Design of experiment by mouth for 30 days. Each group has 5 animals

1. **Group 1:** The control group
2. **Group 2:** group of diabetes mellitus with aloxane
3. **Group 3:** The group of diabetes induced by the aloxsan + olive oil included were treated by giving the group a standard meal and after 21 days were injected olive oil (1.25 ml/kg body weight) by mouth.
4. **Group 4:** Group of diabetes induced by the aloxsan + sesame oil included were treated with this group given a standard meal and after 21 days were sesame oil (0.5 ml/kg body weight) by mouth.
5. **Group 5:** Group of diabetes induced by the aloxsan + soybean oil. Five animals were treated with a standard meal and after 21 days soybean oil was reduced by 5 mg/kg orally.
6. **Group 6:** Olive oil group. Five animals were treated with olive oil (1.25 ml/kg body weight) orally
7. **Group 7:** Sesame oil group. Five animals were treated with sesame oil (0.5 ml/kg body weight) orally
8. **Group 8:** Soybean Oil Group. (5 mg/kg body weight)

Statistical Analysis: The data were analyzed by SAS method software according to one-way (ANOVA) followed by Duncun multiple range test were used at level of statistical significancy at ($P<0.05$) for comparison of different parameters between the different groups of this study[8].

Results and Discussion

Hormonal Variables:

Table (1): Concentration of LH and FSH and serum testosterone in serum

Standards / Group	LH (mIU/ml)	FSH (mIU/ml)	Testosterone (ng/ml)
Control	4.03±0.32 b	±1.640.25 a	2.42±0.28 a
The control of an infected treatment with aloxane	2.17±0.12 e	0.8±0.19 b	1.18±0.12 b
Controlled control of treatment with aloxane + sesame oil	3.68±0.22 bc	1.62±0.18 a	2.44±0.22 a
Controlled control treated with aloxane + soybean oil	3.07±0.15 d	1.45±0.16 a	2.31±0.17 a

Standards / Group	LH (mIU/ml)	FSH (mIU/ml)	Testosterone (ng/ml)
Controlled treatment treated with aloxane + olive oil	3.56±0.7 c	1.63±0.22 a	2.42±0.32 a
Olive oil	4.61±0.17 a	1.67±0.3 a	2.47±0.31 a
Sesame oil	4.84±0.23 a	1.74±0.26 a	2.48±0.21 a
Soybean oil	4.52±0.27 a	1.69±0.22 a	2.44±0.28 a

- Values represent the arithmetic average ± standard error.
- The vertically different letters mean a significant difference at a significant level ($P \leq 0.05$).
- Number of animals 5 per group.

The results of Table (1) showed that There was a significant decrease level of FSH, LH and testosterone P (0.05) inthe treatment of male rabbits with aloxane (G2)compared to the control group. The study coincided with the study of Eleiwa *et al*. (2010) [9]and the Saha *et al*. (2015)[10] on rats and Shah and Khan (2014)[11] and Mansi et al. (2014) [12] and Trindade et al. (2013)[13]

Moreover that is a disease Diabetes affects the gonads and leads to toxic accumulation leading to dysfunction in the hypothalamus and pituitary gland[14]. Diabetes also affects hormones follicles stimulating hormone-FSH and luteinizing hormone -LH-[15][16] while the treatment of rabbits treated with aloxsan sesame oil and soybean oil and olive oil to a significant increase in the concentration of hormones FSH, LH and testosterone compared to the group treated with Aloxsan where taking a quantity of healthy fats such as olive oil and sesame oil ensure adequate levels of cholesterol to produce testosterone, where there is a strong relationship between the consumption of a high diet in healthy fats and the production of testosterone. And the regulation of healthy rabbits sesame oil, soybean oil and olive oil to a significant increase events In the concentration of LH hormone compared with control group. A study Modaresi *et al*(2011)[17] showed a significant decrease in the hormone testosterone in the group that received 20% of their soybean diet compared with the control group. And a significant increase in the group that received 30% and 50% soybeans in their diet compared with the control group [18].

Histological study of the testicle

Control Group:

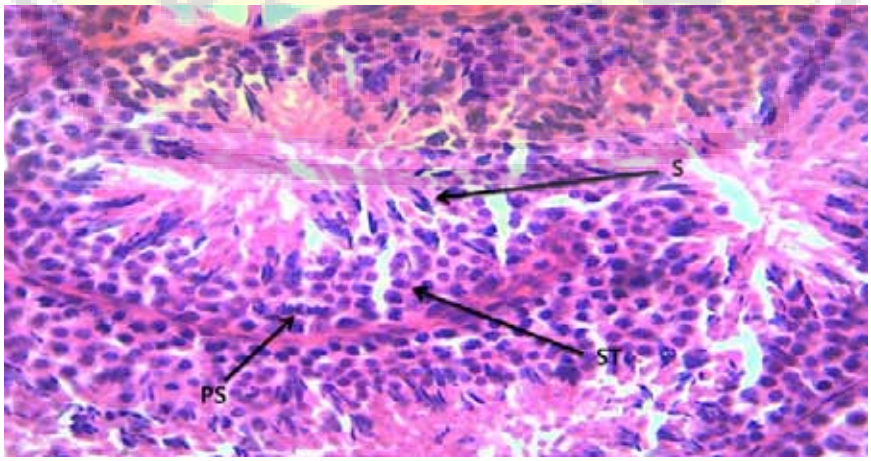

Image (1): A section in the testis of the control group rabbit shows the ST spermatozoa, the mature sperm S and the primary sperm cells PS H & E 400X.

A: Diabetes Group

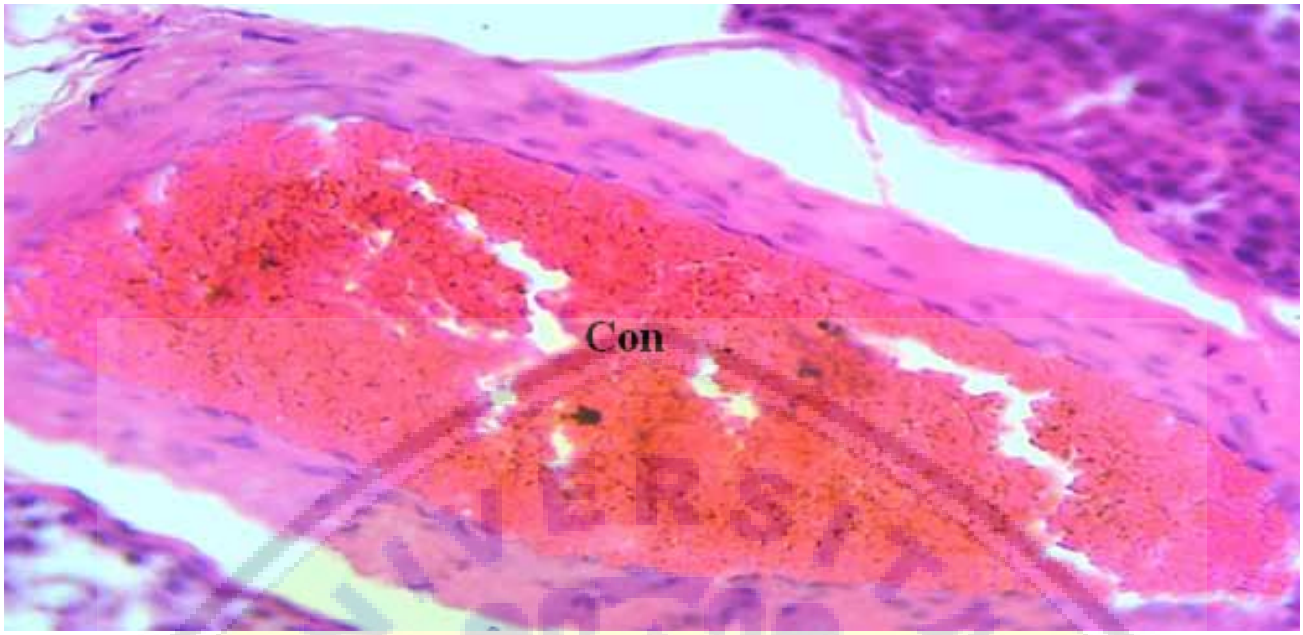

Image (2-A) A section of the testis tissue of a group of animals suffering from diabetes only shows acute blood congestion in a blood vessel Con H & E 400X.

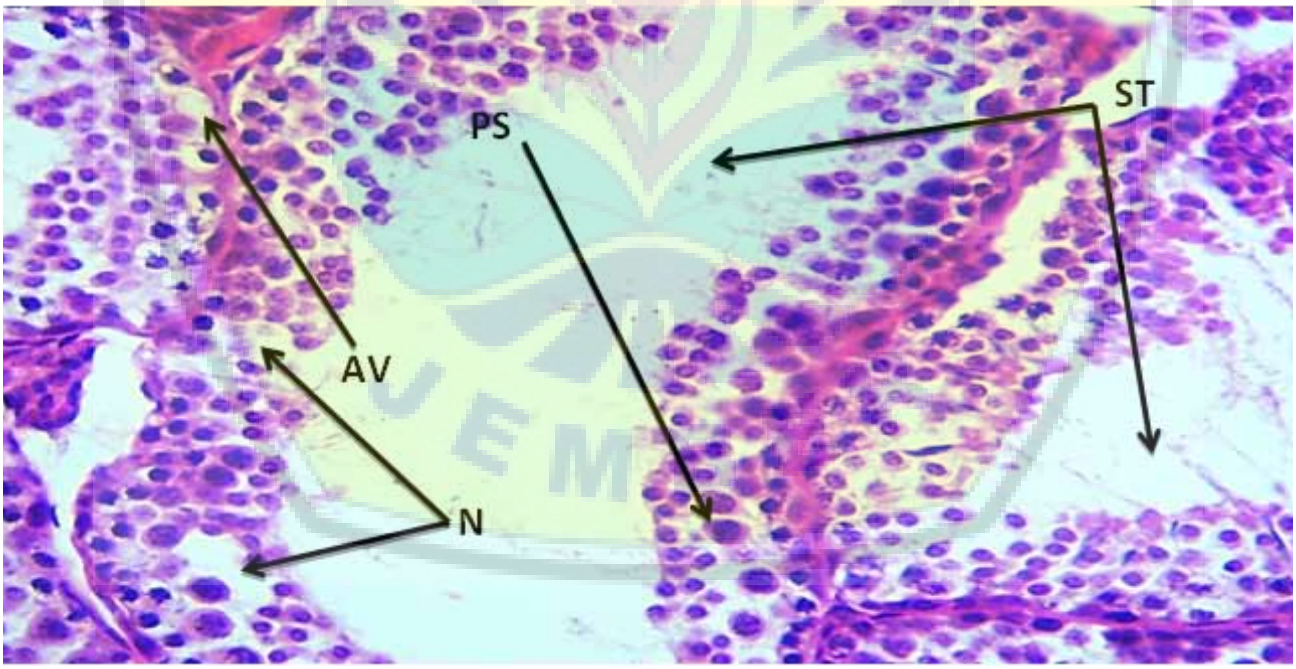
B: Diabetes Group:



(2-B) Sections of the testis tissue of the group of animals infected with diabetes only shows the ST spermatozoa and the primary PS and secondary sperm cells did not complete the maturation process with the presence of AV grease and necrosis in some of the spermatic tissues N H & E 400X.

Diabetes and treated with olive oil group:

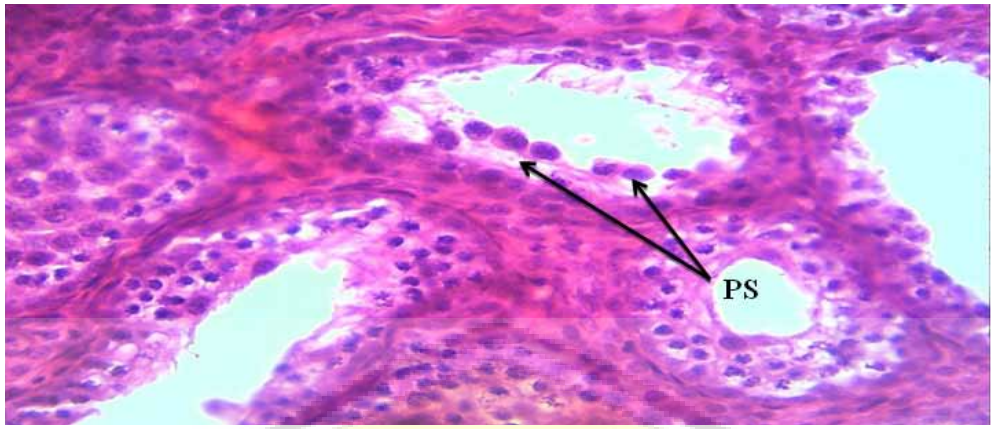


Image (3) Sections of testicular tissue of the group of animals infected with diabetes and treatment with olive oil shows the primary sperm cells PS with the cessation of maturity of the sperm at this stage. H & E 400X

Diabetes and treated with soybean oil group:

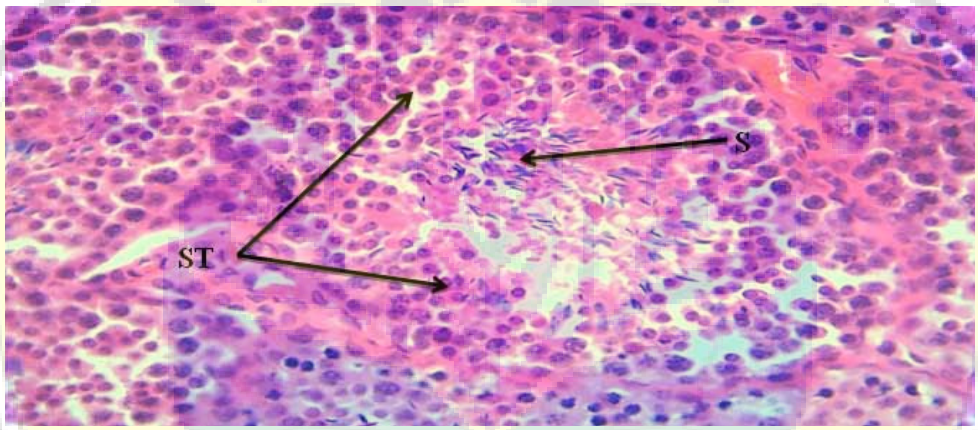

Image (4) Sections of testicular tissue of the group of animals infected with diabetes and treatment with soybean oil. H & E 400X.

Diabetes and treated with sesame oil group:

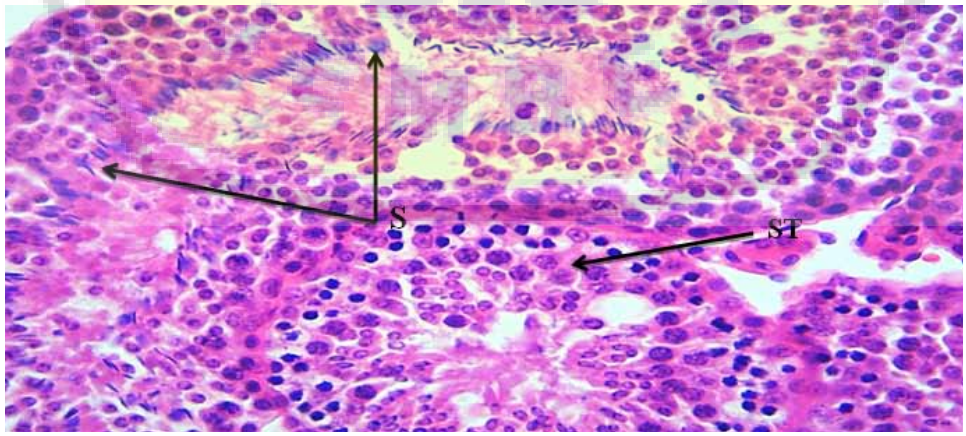

Image (5) Sections of testicular tissue of the group of animals infected with diabetes and treatment with sesame oil shows the spermatozoa ST naturally, showing the full sperm S clearly and the stages of sperm formation can be seen within the semen. H & E 400X.

One of the main effects observed was that the main objective of our study was the occurrence of some of the histopathological conditions of the testicular, as well as the occurrence of disorders in the hormonal regulation, which is important in the productivity of the sperm and thus affect the testicular tissue. The bloodstream is well-formed and has a clear appearance as well as the occurrence of degeneration of testicular cells. As a result, the congestion is likely to result from rupture of some blood vessels in the male reproductive tract tissues in diabetic animals.

Diabetes mellitus effects on the endocrine control of spermatogenesis, sperm quantify and quality and morphological testicular lesions specially degeneration of germ cells in testis by apoptosis [19],

A study showed **Evy** *et al*(2018)[20] ncorporation of sesame oil into the diet may improve the reproductive parameters at the level of the testicular microstructures (germ cell to Sertoli cell ratio) and endocrine function plasma testosterone concentration) without any beneficial effect on the epididymal sperm parameters in induced diabetic rats. Sesame oil supplementation was effective in improving reproductive parameters in normal rats as well.[22]

AL-Ani (2013)[22] study shows that olive oil plays an important role in improving testicular damage while reducing oxidative stress and protecting against genital infection during cadmium toxicity.

A study showed Ekaluo *et al* (2013)[23] results also revealed that the administration of soybean to rats at different doses caused significant dose-dependent toxicity effects to testicular integrity, ranging from mild degeneration of sperm in testicular tubules to excessive necrosis and haemorrhages; which might be the underlying cause of the effects on sperm parameters. Soybean is an endocrine disruptor in males and it is rather probable that soybean may have disrupted the synergy between testosterone and follicle stimulating hormone during the process of spermatogenesis Ikpeme *et al*(2013)[24]. assertively revealed that the distortion in fertility in malemammals is directly correlated with the disruption of spermatogenesis and the hormone regulatory machineries. The reductions in conception rate, sperm viability, sperm count and increase in sperm head abnormality

The Role of Microbiota Fusobacteriumnucleatum as a Possibly Important Etiological Factor in the Initiation and Progression of Colorectal Cancer

Zinah Saad Madhloom[1], Alice Krikor Melconian[2], AqeelShakir Mahmood[3]

[1]Ministry of Science and Technology, Iraq, [2]Biotechnology Department, College of Science, University of Baghdad, Iraq, [3]Department of Surgery, College of Medicine, University of Baghdad, Iraq

Abstract

The search to evidence a link between the microbiota of the guts with colorectal cancer.This study aims to investigate association of microbiota *Fusobacterium nucleatum* (Fn) in tissues of CRC (colorectal cancer) and its correlation with other clinicopathological variables.

The study utilizes qRT-PCR (quantitative real time polymerase chain reaction) technique to detect variable of Fn abundance in CRC and normal tissues; in addition to its association with other clinic-pathological variables (gender and age). In this study, the results demonstrated that Fn has been considerably enriched in CRC tissues of patients compared to controls (neighboring normal tissues of the same patients and the tissues of the healthy individuals) which also indicate Fn infection has been related to the progression of CRC and its metastasis.

The results indicated an over-represented Fn in CRC samples using qRT-PCR technique; Inspite of no significant association was found of Fn with other clinical-pathological variables (age and gender), Fn was enriched in CRC tissues; this may be taken under consideration as a factor of risk for CRC progression and metastasis.

Keywords: *Colorectal cancer (CRC), quantitative real time polymerase chain reactions, Fusobacterium nucleatum, Metastasis.*

Introduction

(CRC) is the 3rd most widespread type of cancer and the 4th main cause of deaths due to cancer all over the world, being responsible for about 1.2 million new instances and 600,000 deaths each year[1]. It was influenced by numerous factors of risk that are related to it which includes; heredity, lifestyle, gut microbiota, smoking, excessive consumption of alcoholic substances, inflammatory bowel disease, diet (increased consumptions of processed and red meat), obesity, in addition to other factors[2,3,4]. The gut microbiota has earned a considerable amount of attention due to its significant impact on risk of CRC via immunity and metabolites in the host[5]. Earlier researches have shown that numerous species of bacteria appear to be involved in CRC pathogenesis[6,7,8,9]. *Fusobacterium* species is the non-spore-forming, Gram negative which grow anaerobically and it is found as normal flora in the mucosa of the mouth and the gut of human and identified as an potentialpathogen in inflammatory infections of both the mouth (cause periodontitis) and gut (cause inflammatory bowel infections)[10,11,12]. Many researches proved enrichment of *Fusobacterium nucleatum* (Fn) in CRC[13,14]. However, the inflammatory bowel diseases showed significant abundance of Fn than in the normal bowels hence it turns into a factor of risk for inflammation-related colorectal cancer[11]. The microbiota Fn could be of a considerable potential for promoting CRC, similarly to promoting stomach cancers by *Helicobacterpylori*[15,16]. Latest researches gave mechanistic proofs that gut bacteria are involved in developing CRC[17]. The researchers also showed that

proliferation of tumors and growth of cancer might be diminished by a decrease in the Fusobacterium load via treating with antibiotic- metronidazole[18]. The goal of this research is assessing the role of colon bacteria (Fn) in colon cancer progression.

Materials and Method

Collection of Samples and Extraction of DNA

Clinical Samples: A total of 42 fresh colorectal cancerous tissue (CRC) samples and 10 healthy normal individuals as well as 28 CRC tissue sample's patients and matched adjacent normal tissue have been intra-operatively obtained from patients that have been lately diagnosed with CRC, collected from : Endoscopy Center of Al-Alosi private Hospital, Al –Arabi Hospital, AL-Masara general Hospital and Baghdad Hospital also Gastroenterology and Liver Hospital, during the period of 2018-2019.

All needed data on clinical and demographic histo-pathological parameters has been obtained from patient's medical records and designed information sheet. The exclusion criteria was patients which included antibiotics utilization within two months, patients who had complications with chronic disorders of the bowel and additional CRC patients' exclusions for included radiation or chemotherapy treatments before surgery also excluded patients who has another malignancies or polyps in another organs . All of the participants have received conventional preparation of bowel with no pre-operative administration of antibiotics. All samples have been transported to the lab as quick as possible frozen the tissues and kept at -80ºC until being used.

DNA Extraction: Bacterial DNA has been extracted for all tissue samples (80 sample) (Presto ^{Tm} Mini gDNA Bacteria Kit/Geneaid/Korea) based on the instructions of the manufacturer then stored at a temperature of -20ºC before steps of amplification or further processing.

Fusobacteriumnucleatum Quantification: Fn Quantification has been accomplished in CRC and the related adjacent normal DNA and Healthy individuals samples tissue via qPCR. Taq ManFusNucdtec-qPCR Test (GPS, genetic PCR solutions™/Spain) with specific probe/primer . The reaction was subjected to temperature of 95º C for 15min, 95º C for 15 seconds, then 60º C for 1min; then the reaction performedfor 40 cycles. The fluorogenic signal was collected during this step by using the FAM channel for the target. After optimization and qualification of RT-PCR standard curve with serial dilutions were made, copy number concentration was calculated; then the standards have been kept at -20ºC with serial dilutions which have been made before RT-PCR assay. qPCR results for every sample (note: the final volume in each qPCR reaction well was 20µl) have been expressed as copy number of bacterial 16-S r DNA for each gram of tissues. Thresholding of the Cycle has been computed with the use of automated settings for RT- qPCR assay was performed in 96- well optical plates run on software version ("Rotor-Gene Q Software 2.3.1.49").

Statistical Analysis: Data analysis has been performed with the use of available statistical SPSS-25 package (which stands for "Statistical Packages for Social Sciences" v. 25). Data were shown in trivial measures of percentage, frequency, standard deviations, average and range (minimum-maximum values).

The importance of different percentages difference (qualitative data) were tested with the use of Pearson test of Chi-square (χ^2-test) via applying Fisher Exact test or Yate's correction whenever applicable. Statistical significance has been taken under consideration in any case where the value of P was ≤ 0.05.

Results

qRT- PCR Determination: According to the standard curves and the CT value of the amplification efficacy of Fn in the tissues of CRC patients and normal tissues; Fn was highly significant in CRC tissues which indicated by the over-representing in 15 out of 42 (35.7%) CRC samples compared with tissues of healthy individuals 0 out of 10 (0%) (Figure 1). The sufficient amount of Fn has been considerably greater in the samples of tumor tissues 12 out of 28 (42.9%) than in the adjacent normal tissues 1 out of 28(3.6%) and another healthy control individual tissue samples 0 out of 10 0% (Figure 2, 3)

No significantly association of Fn infection in CRC patients with other clinic-pathologic features (age and gender).

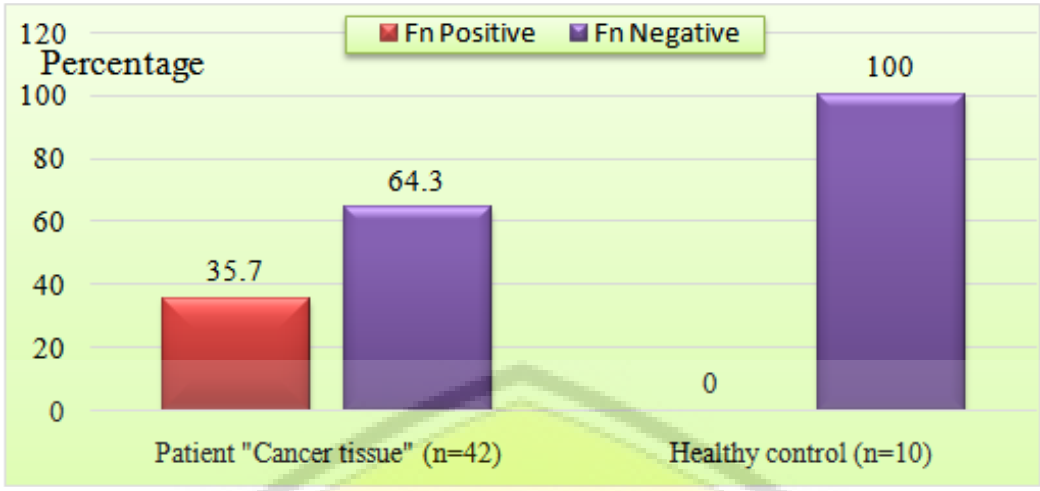

Figure 1: The analysis data of Fn abundance in patients that have CRC compared to healthy control persons

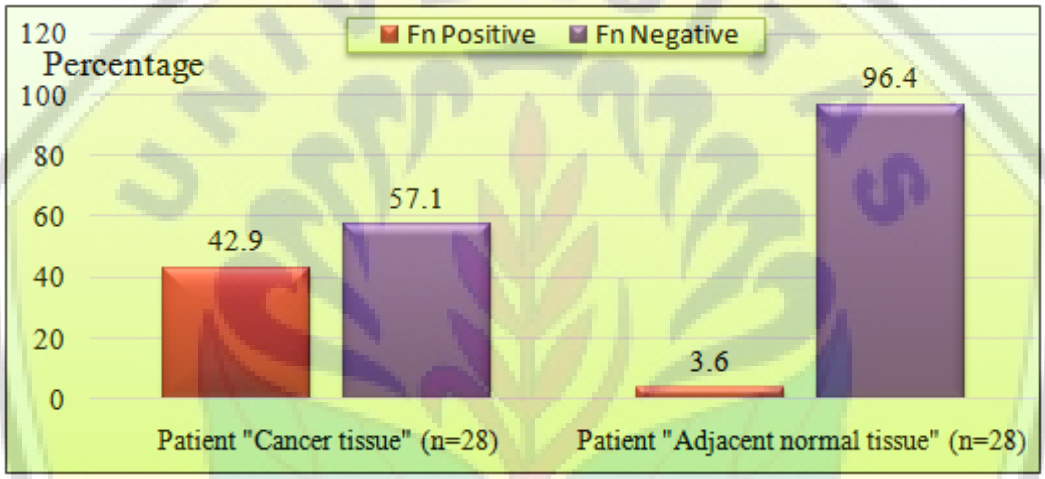

Figure 2: The analysis data of the over-represented Fn in tissues of CRC patients compared to adjacent normal tissues.

Data regarding no significant association (P value=0.545) between adjacent normal tissues of the patients and healthy control individuals

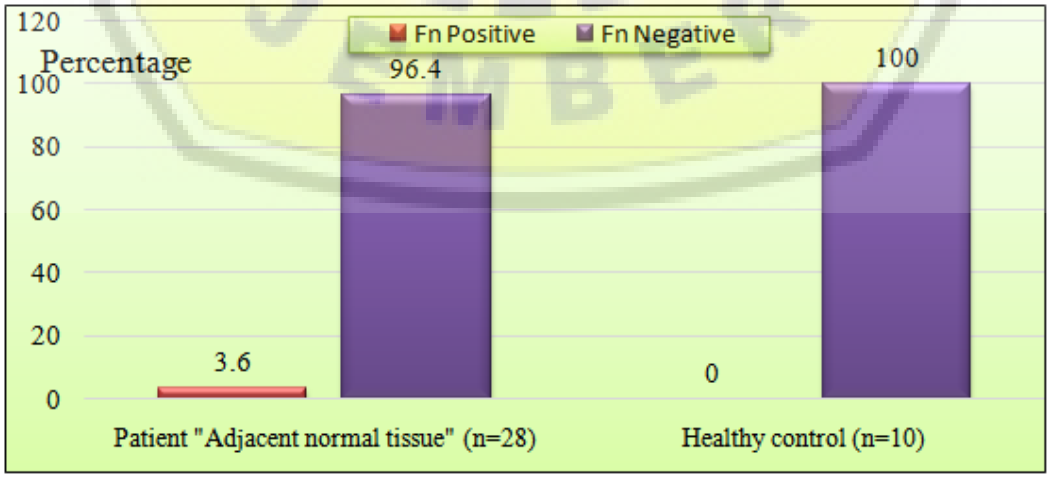

Figure 3: The analysis data of no significant association between the adjacent healthy tissues of the cancer patients compared to normal control persons

The result of this study may provide evidence supporting using bacteria for microbiota-related prognosis, diagnoses, treatment and prevention from CRC.

Disscussion

More than 1000 bacterial phylotypes are present in the human gastrointestinal lumen which populated by an estimated 10^4 microbes[19], which are advantageous and deleterious to hosts; the higher is the abundance of *Streptococcus*, *Bacteroides-Prevotella*, *Enterococcus*, *Klebsiella* and low abundance of *Clostridia* which is detected in the CRC patients' guts compared to controls of normal individuals. Many of that bacterial dysbiosis plays a role in various colorectal diseases and that includes CRC, but there was not any confirmed results with specific bacterium being a key for the virulence factor[20,21]. There are many factors determined by the composition of these microbiota including environment, diet hygiene and host genetics[22,23]. Notably, the study finding being Fn significantly highly overabundant in tissues of colorectal cancer versusthe control of adjacent normal tissues and control of healthy people, those results have been inconsistency with earlier studies[24] in which they have detected enrichment of DNA sequences of *Fusobacteriumspp*.in CRC in comparison to control samples by using the whole genome sequencing technique andothers[25] who found a positive correlation between high-level colonization via Fusobacterium and metastases of the regional lymph nodes.Castellarin*etal*.[13] they identifiedthe association between inflammationof microbiota and gastrointestinal cancers. Another similar confirming results were reported by[26,27,28]. The species of anaerobic bacteria *Fusobacterium* might stimulate host pro-inflammatory response[29] and had virulence properties, which might indorse their adhesiveness to the cells of the host[7]. The genus *Fusobacterium* is an anaerobic obligate, gram negative bacteria which always colonizes in oral cavities of almost every human, some of the strains play a role in the progression of dental plaques and the periodontal diseases[30]. *Fusobacterium* are poor healthy colon mucosa colonizers and are not capable of breaching the intact wall of the colon; in the case that adenoma, carcinoma inflammations are developed, the weakened colon cell wall micro-environment allows those microbiota which also include *Lactococcus* and *Peptostreptococcus* to reach and adhere base of the membrane.[31] No significant association of Fn infection was found with other clinic-pathological variables such as, patient's age and gender. The same was observed by others.[32]

Conclusion

Our results indicated that the presence of Fn was highly more in tissue of CRC compared with control tissue and it's abundance was positively indicated by the bacterial association with CRC. Hence may be considered as a factor of risk for CRC and metastasis progression. Furthermore the results revealed that was no significant association between the abundance of the bacteria Fn and other clinic-pathological variables like age and gender. Also, there was no significant association between the adjacent normal tissues of the CRC patients compared with another healthy control tissue of the individuals. To our knowledge, this is the first report exposing the relationship between Fn and CRC in Iraqi patients.

Estimation of Anti-Thyroid Peroxidase and Anti-Thyroglobin Antibodies Levels among Thyroiditis Patients in Baghdad

May. Y. Al-ma'amouri

Institute of Medical Technology, Middle Technical University, Baghdad- Iraq

Abstract

Anti-thyroid peroxidase antibody (anti-TPO antibody ATPO) and anti-thyroglobulin antibodies (ATG) are a part of the thyroid gland antibodies which is valuable in the creation and identification of autoimmune thyroid diseases. Autoimmune of thyroid gland can cause numerous forms of thyroid gland inflammation and abnormal function, ranging from low to high activity of thyroid gland.

Objective:

1. Estimation of anti-thyroid peroxidase antibodies, anti-thyroglobulin antibodies and thyroid gland function tests including Free T3 and Free T4.
2. Highlight the effect of age and gender on the levels of auto antibodies in thyroiditis patients.

Seventy patients with thyroid disease attending Al-Yarmouk Teaching hospital from the (comparison, 26 control samples (respiratory disease and healthy) matched by age and gender were also included. The study included estimation of the serum levels of Anti-peroxidase antibodies, anti-thyroglobulin antibodies and thyroid disease function tests in thyroid disease patients and control by a sandwich ELISA test using commercially available kits.

The present study revealed significant difference in ATPO and ATG ($P<0.05$) among study groups, also there was significant differences among age groups in ATPO and ATG levels ($P<0.05$).

High levels of ATPO and ATG among thyroiditis patients indicate main role of this parameters in the pathogenesis of disease as well it has the possibility to use them in the diagnosis and follow up of it.

Keywords: *Thyroid disease, Anti-peroxidase antibodies, Anti-thyroglobulin antibodies.*

Introduction

Autoimmune diseases have a high commonness in the populace, caused by irritation of organs because of generation of antibodies against self-structures[1]. Autoimmune diseases thyroid malady (AITD) is a standout amongst the most widely recognized delegates, incorporate a few inflammatory thyroid infections with Graves' ailment (GD) and Hashimoto's thyroiditis (HT)[2]. Thyroid peroxidase antibodies (ATPO) are particular for the autoantigen TPO, a 105kDa glycoprotein that catalyzes iodine oxidation and thyroglobulin tyrosyl iodination responses in the thyroid[3]. It had been named microsomal antigen dependent on its intracellular limitation. Antibodies respond against conformational epitopes at the surface of the atoms and against direct epitopes[4]. Polyclonal antibodies from healthy people and patients are coordinated against similar epitopes. Anti TPO antibodies from healthy subjects did not block TPO movement or meddle with the blocking action of hostile to TPO antibodies from AITD patients[5] while anti TPO antibodies from AITD patients can

e-mail: may_yahya6@yahoo.com

settle supplement, devastate thyrocytes and go about as aggressive inhibitors of enzymatic action[6]. While against TPO antibodies may act cytotoxic on thyrocytes in HT they do not have an established role in GD[7].

Thyroglobulin is a huge (600 kDa) glycoprotein comprising of dimers and containing overall 2– 3 atoms of T4 and 0.3 particles T3. The particle is heterogeneous in regards to hormone substance, glycosylation and size [8]. The generation of antibodies against Tg can be prompted by the enormous devastation of the thyroid organ. Antibodies against Tg vary between healthy subjects and AITD patients in that polyclonal antibodies are found in typical subjects and oligoclonal antibodies in AITD patients. Against Tg antibodies don't settle supplement in light of the fact that the epitopes are too broadly separated to permit cross-linking [9]. The absence of cytotoxicity in GD is a considerable difference to HT and other AD. Location and immunogenicity of the antigen and prevailing class of the antibodies may contribute to these differences.

Materials and Method

The study was conducted at Al-Yarmouk Teaching Hospital from February to May 2017. Ninety six specimens were collected in this study, 70 (73%) of them were from thyroiditis while other 26(27%) of total specimens were from control groups. A full history was taken from each case, including the sex, age, residency, occupation and history of disease.

Blood samples were collected from all patients by venipuncture to measure study parameters which include serum ATPO antibodies, ATG and thyroid function tests (FT3 and FT4).Serum ATPO, ATG, FT3 and FT4 were determined by using Bioactive ELISA Kits (Germany).

Statistical analyses were performed using Chi-Square and Pearson correlation tests. P-values less than 0.05 were statistically significant.

Results

Distribution of patients' samples studied according to FT3, FT4, ATPO and TG: Estimation of FT3 concentration shown an elevation in its mean value among thyroiditis patients (2.364 ± 0.25), in comparison with healthy control group (1.445 ± 0.24) ((P<0.05).as shown in Table 1.

The mean value of FT4 concentration was elevated significantly among thyroiditis patients, in comparison with healthy control group(0.831 ± 0.10), (0.412 ± 0.04) respectively as shown in Table .1, as well as the level of ATPO which significantly increased (194.90 ± 18.23) in patients in comparison with healthy control group (111.78 ± 29.08), (P<0.05), as shown in Table 1, while the mean value of ATG concentration was elevated significantly (P<0.05) among patients (52.82 ± 9.88) in comparison with healthy control group(25.81 ± 6.97).

Table 1: Comparison between control and patients in the studied parameters

The Group	No.	Mean ± SE			
		FT3 ()	FT4 ()	ATPO ()	ATG ()
Patients	70	2.364 ± 0.25	0.831 ± 0.10	194.90 ± 18.23	52.82 ± 9.88
Healthy (Control)	26	1.445 ± 0.24	0.412 ± 0.04	111.78 ± 29.08	25.81 ± 6.97
T-Test	----	0.898 *	0.342 *	73.52 *	15.356 *
P -value		0.0449	0.0206	0.0491	0.0511

* (P<0.05).

Effect of Age on FT3, FT4, ATPO and ATG among patients: The patients in ageless than 30 showed the highest level of ATPO, the mean value of concentration (285.76 ± 62.55), (P<0.05), as shown in Table 2, while the patients in age more than 40 showed the highest (P < 0.05) level of ATG with mean value (99.19 ± 24.44).There was insignificant differences between age and the serum levels of FT3 and FT4, as

shown in Table 2.

Table 2: Effect of Age in study parameters of patients.

Age Group (Year)	No.	Mean ± SE			
		F-T3 ()	FT4 ()	ATPO ()	ATG ()
Less than 30	13	2.067 ± 0.46	0.546 ± 0.09	285.76 ± 62.55	73.39 ± 22.95
30-40	41	2.126 ± 0.27	0.780 ± 0.12	140.97 ± 27.32	20.20 ± 5.43
More than 40	16	2.11 ± 0.36	0.645 ± 0.06	192.51 ± 40.65	99.19 ± 24.44
LSD value	----	1.214 NS	0.468 NS	116.90 *	42.641 *

*(P<0.05), NS: Non-Significant.

Effect of gender in FT3, FT4, ATPO and ATG among patients: From table .3 it seems to be that the concentrations of parameters were non-significantly higher among males rather than females. Insignificant difference between genders was detected while the mean value of FT3 concentration was (2.42 ± 0.35) among males and (1.814 ± 0.18) among females (Table 3). The mean value of FT4 concentration was (0.764 ± 0.12) among males and (0.670 ± 0.09) among females with no significant difference between genders. In males the mean value of ATPO was (184.65 ± 32.48) and (160.13 ± 23.81) among females, while the mean value of ATG was (54.58 ± 12.29) among males and (36.43 ± 7.09) among females, as shown in table3 with no significant difference between genders.

Table 3: Effect of Gender in study parameters of patients

Gender	No.	Mean ± SE			
		F-T3 ()	F4 ()	ATPO ()	ATG ()
Male	35	2.42 ± 0.35	0.764 ± 0.12	184.65 ± 32.48	54.58 ± 12.29
Female	35	1.814 ± 0.18	0.670 ± 0.09	160.13 ± 23.81	36.43 ± 7.09
T-Test	----	0.815 NS	0.314 NS	71.872 NS	28.617 NS

NS: Non-Significant.

Discussion

The current study showed a significant increase in serum ATPO, ATG, FT3 and FT4 levels in patients with thyroiditis compared to control, these results are agreement with (A. Sridevi et al 2018)[11] and (Anjalia et al 2011)[12] who demonstrated that ATPO, ATG, FT3 and FT4 levels were increased in patients more than control groups. Raghunath et al 2015[13] and Ioannis et al 2012[14] showed that ATPO levels were highly significant less than 30 yrs.old and this agreement with our results. Yushu Li et al 2008 [15] and Yue-Rong Yan et al 2015 [16] showed that levels of ATG were highly significant with age more than 40 years old these results agreed with our data. H. Nawaz et al 2018[17] has determined different findings that thyroid profile, ATPO and ATG levels were highly significant in female than male. The results of the current investigation were in agreement with A Amouzegar et al 2017 [18] who revealed that levels of ATPO and ATG were highly significant in female more than male.

Conclusion

From this study we conclude that the levels of thyroid

profile, ATPO and ATG correlate with age, gender and the status of disease and we recommend more studies to focus the role of ATPO and ATG in the identification of thyroid cancer in the early stages.

Evaluation of the Oxidative Stress Status in the Girls with Hyperprolactinemia Through Some Biochemical Parameters

Ali M.A. Al-Kufaishi

Al-Furat Al-Awsat Technical University College of Health and Medical Techniques, Department of Medical Laboratory Techniques, Kufa, Iraq

Abstract

Recently Hyperprolactinemia (HPrl) is a common phenomenon in girls and this problem may be one of the infertility causes in the future, the high prolactin hormone levels may be associated with the presence of polycystic ovaries syndrome (PCOS) or the presence of a pituitary tumor. In this study, focus on the relationship between HPrl and oxidative stress as an important factor in among girls. Where it was found that the value of prolactin (11.63±1.52) in healthy, while (31.82±13.51) in patients.

Also, has been evaluated the state of oxidative stress by conducting a comparative study between patients and healthy values of both DPPH, lipids peroxidation, GSH and total thiol groups.

Keywords: *Hyperprolactinemia, TSH, DPPH, total lipids peroxidation, GSH, oxidative stress.*

Introduction

Hyperprolactinemia (HPrl) is widespread (0.4%-5%) among the girls and can be considered from a frequent endocrinopathy, despite its rarity in childhood. Prolactin from the anterior pituitary gland hormones and has an important role in the reproductive functions. The normal value of serum prolactin level in girls and adolescents between (5 - 20) ng/ml [1,2]. This hormone create in the lactotropic cells of the anterior pituitary lobe due to stimulatory signal TRH (thyrotropin-releasing hormone or called prolactin releasing hormone) and regulate within the normal level by an inhibitory signal from dopamine [3].

From the causes of HPrl due to obstruction or interruption of the peduncle of the portal venous system that causes loss the inhibitory action for dopamine. There are numerous factors act as stimulants to prolactin release by the direct effect to the anterior lobe or reduce the inhibitory action (dopamine) such as stress, highproteindiet, insomnia, hypoglycaemia, TRH, suckling, estrogens, oxytocin and vasoactive intestinal polypeptide (VIP)[3,4].

The lactotrophic effect is the essential role of prolactin by given its action on the epithelium cells of the mammary glands and regulating the gonadal function through the inhibiting Gn RH excretion that responsible about secretion of Luteinizing hormone (LH) and Follicle stimulation hormone (FSH)[5,6]. Interestingly, prolactin plays a regulatory role in the adipose tissue, lactation, immune system and insulin secretion [7–9]. The prolactinoma in pediatric maybe associated with hormonal deficiencies or defect in growth hormone (GH) or thyroid stimulating hormone (TSH) that is frequently in macroadenomas (10- 40 mm)[10].In the cases with the polycystic ovarian syndrome (PCOS) usually related to hyperinsulinaemia that causes inhibition the catabolism of androgen and leads to hyperandrogenaemia. Then, the androgen conversion to estrogen by aromatase (estrogen synthetase). The hyperproduction of estrogen stimulates prolactin secretion either by a direct effect on lactotropic

e-mail: kuh.ali@atu.edu.iq

cells or due to inhibiting dopamine signal [6]. In children, the primary hypothyroidism causes more TRH release, which also has an endogenous trophic effect for the lactotropic cells and raises prolactin levels in the blood [11–13]. The clinical symptoms of HPrl in adolescence is easy to recognize but in childhood-onset, the symptomatology is neurologic with headache and visual shortfall. Generally, there are three major causes of HPrl in childhood and adolescent: pathological, iatrogenic and physiology. The clinical symptoms of HPrl in adolescence is easy to recognize but in childhood-onset, the symptomatology is neurologic with headache and visual shortfall. Generally, there are three major causes of HPrl in childhood and adolescent: pathological, iatrogenic and physiology [1,2]. Also, must be done a physical examination for the patients (gynaecological examination) to the skin (acne, hair growthindicative for PCOS), mammary glands (galactorrhea) or any clinical sign can be related with a medical disorder[10].

Material and Method

The required materials are prolactin and TSH kits, 1,1-diphenyl-2-picrylhydrazyl radical (DPPH), Fe SO4, methanol, ethanol, "thiobarbituric acid (TBA), trichloroacetic acid (TCA), 5,5¯-Dithiobis (2-nitrobenzoic acid)(DTNB)", EDTA and n-butanol.

Study Design: The study design is case-control, dependent on the comparison between the healthy unmarried girls and with those who have hyperprolactinemia within age stage (18-30).

Sample Collection: The sample collection from the Iraqi girls in the hospitals with excluded the patients with pituitary mass, married women and smokers.

Sample Size Determination: The sample size determines according to the following equation [14]:

$$n = Z^2P(1 - P)/d^2$$

The number of samples represented by (n), Z-Score (1.96), (P) refer to population and (d) is an absolute marginal error (equal 5%), so the number of samples were collected is 140.

Prolactin Determination: Has been measured of prolactin by VIDAS according to BIOMERIEUX kit company.

TSH Determination: Has been measured of TSH by VIDAS according to BIOMERIEUX kit company.

DPPH Assay: The DPPH scavenging assay at 517 nm, where the lowering degree in absorbance values refer to higher scavenging by samples antioxidants [15].

Total Lipids Peroxidation Assay: Lipids peroxidation assay determined by the reaction of malondialdehyde (MDA) with thiobarbituric acid and comparison the lipids peroxidation in samples with peroxidation of total lipids in egg yolk that used as a source for lipids, then measured the color of the sample at 532 nm [16].

Reduced Glutathione (GSH): Can be determined by the Ellman method [17].

Total Thiol Group: Can be determined by the Ellman method [17].

Results and Discussion

The current study shows the results for girls with elevated prolactin hormone (HPrl) that is not associated with pituitary mass by relying on the selection of samples on specific criteria (Table 1).

Table 1: Prolactin, TSH and oxidative stress results for the patients and healthy girls.

Parameters	Healthy	Patients
	Mean ± SD	Mean ± SD
Number of cases	140	140
Age/year	27.43±5.23	27.20±5.21
BMI	19.56±3.33	21.15±3.97
Prolactin (ng/ml)	11.63±1.52*	31.82±13.51
TSH(µIU/l)	2.16±0.53	1.90±0.58
GSH (µmol/l)	25.60±6.03*	11.42±5.56
Total thiol groups (mmol/l)	1.20±0.03*	0.90±0.08
DPPH scavenging percent %	65.87±5.11*	44.62±5.34
Total lipids peroxidation percent %	15.85±3.06*	36.20±9.00

* It is mean significant values between healthy and patient groups where the p-value ≤ 0.05.

From the factors that related to HPrl is the oxidative stress were which we want to focus in this study. The importance of measuring the thyroxine hormone (TSH) as shown by the above results is to demonstrate the integrity of the pituitary gland from any tumor in addition to relying on the results of the CT-Scan, therefore there are no significant differences between patients and healthy group.

However, the results showed significant differences between the values of the oxidative stress tests through DPPH, total lipids peroxidation, reduced glutathione and total thiol groups this means the stress is an important factor to elevated HPrl and this occurs maybe to Lack of sleep hours, sleep late at night, a lot of use of mobile and Internet, depression, lack of eating fruits and vegetables and increased caffeine intake. These factors play an important role to regulate hormonal levels and maintain the integrity of the body antioxidants system also, enhanced the immunity.

In addition, increase in the values of DPPH and lipids peroxidation and reduced the values of GSH and total thiol groups refer to increase the free radical levels and this can be caused dopamine receptor damage or called dopamine resistance and this lead to inhibitory effect to dopamine action.

Funding: Personal funding.

Conclusion

In conclusion, the oxidative stress from the important factors that lead to elevated prolactin levels in the adolescents and unmarried girls, with excluded pituitary mass for these cases. Therefore must be controlled on the factors that increase free radical in girls by enhancement theantioxidants in the intake foods and follow a better lifestyle by staying away from depression.

Conflict of Interest: There is no conflict of interest with authors.

Ethical Clearance: This research got on the approval of the scientific committee of my university and health ministry of Iraq.

Abstract

Because of the nature and speed of performance in the game of handball, where the liberation of energy in accordance with the anaerobic system (Lactic) and leave this system of remnants in the muscles and blood, which lead to fatigue and decrease the physical abilities of players. The hand that they are involved and interested in this game in the lack of use of the means of recovery during the game and daily exercises, which prompted the researcher to use and experiment method of healing (cooled suit and reflexology) to get rid of the accumulation of lactic acid.

The objective of the research was to identify the effect of the healing process on the concentration of lactic acid in the Karbala club for the students of the Karbala Club.

The aim of the research was to identify the effect of the two therapeutic method (the refrigerated suit and the reflexology) in speeding and eliminating the accumulation of lactic acid for the research sample and the researchers used the experimental method in the style of the two experimental groups corresponding to the nature of the problem and the research community was determined by players Karbala club handball and the number of (14) players “without goalkeepers and were all selected as a sample to search in the style of the researchers concluded that the use of the cooled suit is better than the reflexology reflex in the process of rapid recovery and elimination of the accumulation of lactic acid.

Keywords: *cooled suit, reflexology and lactic acid.*

Introduction

The game of handball is one of the games of the collective, which is characterized by the strength and speed of performance in this requires that the energy release in accordance with the anaerobic system, which is the result of leaks or residues of lactic acid is caused by not supplying the body with sufficient oxygen and necessary for heavy muscle work, There is a lot of functional and biochemical changes on the body. This requires a great deal of pressure on the trainers to try to get rid of the players and get back to normal in order to increase the concentration of the player as well as his ability to continue the same efficiency Which started the training or competition and this represents the second part of the training process, which is recovery to rebuild the destroyed cells in the period of work and compensate for the energy sources needed to perform and the desired adaptations of the training process, which is reflected positively in achieving high sporting achievements, The training process is very much in the process of after recovery and used many of the means of after recovery that help and accelerate the return to normal or soon, including (cold suit and reflexology).[1]

Many athletes use cryotherapy to recover and muscle strength after vigorous exercise. Putting ice at -135 degrees for three minutes will stimulate muscle and re-load. Studies have shown that cooling therapy reduces muscle pain by 10.15%. Significant impact on athletic performance.[2]

The reflexology technique is the practice of using pressure on certain points on the hands and feet to influence the health of the corresponding parts of the body. Reflective therapy techniques alert these points and release waves of relaxation. To the entire body, for example there is a nerve that starts from the middle of the toe and climbs up to reach that part of the brain responsible for control of movement and breathing and accelerate the heart. Here is the importance of research in the use of the method of healing (cooled suit and reflexology) and knowledge of their impact and is faster in the process of recovery, which helps to restore the player to normal and as soon as possible.[3]

Research Aims:

1. Recognition of the effect of healing (cold and reflexological equation) in the concentration of lactic acid for players Karbala club handball for applicants.
2. Recognition of the advantages of the two therapeutic method (cooled and reflective reflexology) in speeding up and eliminate the accumulation of lactic acid for players Karbala club handball for applicants.

Research Hypotheses:

1. There are positive differences of the two medical facilities in the accumulation of lactic acid before and after recovery and in favor after the after recovery of players Karbala club handball for applicants.
2. The superiority of after recovery with cooled formula for after recovery with reflexology in the concentration of lactic acid for players of Karbala club handball for applicants.

Materials and Method

The researchers used the experimental approach in the style of the two experimental groups to match the nature of the problem.

Search community and design: The research community was determined by the players of Karbala Club in the handball number (16) players, "and a sample was chosen in a comprehensive inventory method after the exclusion of players and goalkeepers and were divided into two equal groups each group of (7) players.

Search tools and devices:

- Handball.
- Ice bags.
- Cooled Suit.
- Medical Cotton.
- Abby Drill.
- Sterile materials.
- Lattice for the measurement of the concentration of lactic acid in the blood.
- Lactate pro LT-710, a measure of the concentration of lactic acid in the blood of Japanese origin (3).
- Laptop type (hp).

Search Procedures:

Tests Used In Research:

Measure the concentration of lactic acid in the blood.[4]

Objective of the test: To measure nonacidic oxygen capacity.

Tools Used: Three Lactate Pro LT-1710 devices manufactured by Japanese company Arakray, 3-pin drill (3), Check Strip (3), striped bar Calibration Strip (3), Test Strips, Medical Cotton, Sterile Materials, Assistant Team and Handballs No. (4), Registration Form.

Performance Description: A formal game is played. The level of lactic acid concentration in the blood is measured after the first half and the second half of the game is completed. The telemetry is given after 8 minutes of the first measurement.

The researchers followed all recommended steps and instructions for using the device and extracting readings from it.

Registration: The reading that the device shows after the measurement for each laboratory is recorded in the registration form.

Pilot Study: The exploratory experiment was conducted on Friday 26/2/2016 at 4:00 pm in the closed martyr hall in the holy governorate of Karbala to control the test method and its contents.

Pre Test: The pre-test was carried out on the research sample and with the help of the auxiliary team in a friendly match with the Kufa sports team in handball, which was held on the closed martyr hall in the

holy governorate of Karbala. The test was conducted on Saturday 5/3/2016.

Main Experience: The researchers tested the cooled and reflective coil on the research sample in the friendly match between Karbala and Kufa handball clubs held on the closed martyr hall in the holy province of Karbala, after the lactic was measured in the pretest immediately after the first half and the second half, Wearing the cooled suit by members of the first experimental group, while the second group was applied reflexology by the auxiliary team, for a period of eight minutes while hearing the directions of the coach (between the two halves) or after the end of the game, The two bags are pre-equipped by the team with the right place. The suits are packed with ice bags covering the muscles of the chest, abdomen, back, buttocks, forearms, hip, thighs and legs. After this period, the post-test is measured and the test results are installed in a form prepared for this purpose. Warm up before the second half.[5]

Post-test: The post-test was carried out on Saturday, March 5, 2016. The researchers followed the same procedures as in the pretest in terms of measurement, method of implementation and the auxiliary team.

Results and Discussion

Presentation of the results of the tests in the pre and post measurement of the two groups of research, analysis and discussion:

Table 1: The computational circles, standard deviations, the calculated value (t) and the level and type of significance of the experimental groups in the pre and post tests

Tests	Unit	Groups	Half	Pre (After Effort)		Post (After Recovery)		(t) Calculated	Sig.	Type of significance
				Mean	SD	Mean	SD			
Concentration of lactic acid	Milli Mall	1	First	4.540	0.530	2.986	0.265	5.215	0.000	Moral
			Second	7.446	1.430	4.684	0.620	5.637	0.000	Moral
		2	First	4.220	0.360	3.541	0.301	3.129	0.002	Moral
			Second	7.941	1.101	5.934	0.430	4.000	0.001	Moral

Table (1) shows the statistical indicators of the results of the tests in the pre and post measurement of the research variable that the members of the experimental groups underwent.

The results showed that the mean values of the variable studied were less in the post-test than the pre-test and both groups and there was a significant difference between the tests and for the benefit of the dimension that the lower the mean, the better the level of dealing with the concentration of lactic acid, (0.05), indicating significant differences between the two tests.

Discuss the results of the tests in the pre and post measurement of the two research groups: The researchers attributed the reason to the use of the appropriate means of recovery to eliminate the causes of fatigue incident of the effort of the game, which is mainly the accumulation of lactic acid in the muscles and blood,[6] through disposal and transfer to the heart or kidneys or liver or skin, which confirmed That the elimination of the body of lactic acid during the period of recovery and return to the normal state of the ways, "several of which used as fuel by the heart muscle, or oxidation of the inside of the same muscle or in other tissues, or transmitted to the liver to convert to the classic, or the exit of lactic acid with urine And sweat.[7]

The relaxation process accompanying the refrigeration method and the reflective reflexology functioned as an external assistant which facilitated the flow of blood through the blood vessels. Therefore, the lactic acid was removed and turned into a chemical agent to glycogen.[8] As the process of recovery during the rest period is very important in training, which is producing energy to compensate for energy consumed at the time

of effort and the use of medical means to restore the balance of energy vehicles and adaptation of the body.[9]

The use of Reflexology reflex in the process of healing works on the sense of relaxation and relaxation, which leads to the expansion of blood vessels and in turn leads to the flow of arterial blood to all parts of the body, which helps to distribute blood in the body and helps this method also to remove any sense of indigestion and activates the vitality of the body, Muscular, increased nervous alert, improve blood circulation.[10]

Table 2: The significance of the differences between the results of the measurement of the post tests of the two experimental groups

Test	Unit	Half	Group 1		Group 2		(t) Calculated	Sig.	Type of significance
			Mean	SD	Mean	SD			
Concentration of lactic acid	Milli Mall	First	2.986	0.265	3.541	0.301	3.101	0.003	Moral
		Second	4.684	0.625	5.934	0.430	3.709	0.002	Moral

Table (2) shows the computational dynamics, standard deviations and the significance of the differences between the results of the tests of the two experimental groups. When reviewing the results of the tests, it is clear that there are significant differences between the measurement of the post tests and the benefit of the first experimental group (0.05) this is consistent with what came in the second hypothesis of the research.

Discussing the results of measuring the post tests of the two research groups: The researchers attributed the reason to the use of cooled suit as a means of healing because of the physiological effect of alerting the nervous system and stimulate the circulation of the blood, through the player's comfort during the cooling of muscles and skin where the blood to carry lactic acid to the heart and liver to use as energy,[11] The removal of the muscle from lactic acid leads to the elimination of the state of fatigue, the arrival of the player to the stage of recovery and thus enable him to return to the normal state that was before the game or close to them and work as efficiently as it started.[12]

This is confirmed by the the use of medical means to improve the return of venous blood, which works to quickly remove metabolic waste and remove the causes of fatigue and the speed of the composition of energy stocks exhausted during the activity, as well as it has an effective role in calming the device Central nervous system and peripheral nervous system.[13]

In addition, the lactic acid, which is deposited in blood during the duration of the effort, can be converted into pyruvic acid when sufficient oxygen is available, at rest. 4 In this aspect, Brian indicates that the lactic acid deposited in the blood, to all parts of the body will cause the reduction of the effectiveness of the muscles, but when oxygen is available again, this acid turns to pyruvic, which in turn combines with oxygen to produce carbon dioxide, water and (ATP).[14] This is what the healing process works by cooling the oxygen through the blood flowing in large quantities to the muscles, due to increased respiratory rate and increase the volume of breathing and that the process of recovery after the competition helps to increase the capabilities of the player through the renewal of stores muscle energy. Ice bags (in the cooled suit) activate the blood circulation in the deep tissue and the cooling of a part of the body for a long time decreases "in the blood flow in that part and thus the brain sends signals to the heart to increase blood to that area and these quantities Eliminates waste from activity by increasing the transferred oxygen.[15]

The coldness of the ice in the cooled suit works to shrink the blood vessels that exist under the skin and in the muscles around it. The blood inside it, which contains the residues of the metabolism, including lactic acid towards the blood and to the heart, the heart is pumped back to the body parts to get rid of them, as the bulk of it is transferred to the glycogen by special enzymes and becomes a source of energy and the other part is put out and these changes do not occur in natural conditions as effective as the existence of snow, so it is used not only to treat the aches and swelling, inflammation and tissue damage and stimulate muscle cells to begin repairing

any rupture in, but works to accelerate and shorten the time period for the restoration of recovery through waste disposal and renewal of energy sources and provides optimal conditions for the body to achieve the recovery and recovery.

Conclusions

1. The use of cooled suit after the first half and the second run to accelerate the disposal of the accumulation of lactic acid and healing.
2. The use of reflex after the first half and the second run to accelerate the elimination of accumulation of lactic acid and healing.
3. The use of refrigerated suit is better than reflexology in the process of rapid recovery and elimination of the accumulation of lactic acid.

The Effect of Repetitive Technique in the Rapid Defense Coverage of the Attack and Some Biochemical Variables of Young Handball Players

Ghassan Mohammed Abdul Sada[1], Samer Mahdi Mohammed[1], Ali Mohammed Jawad Al-Sayegh[2]

[1]University of Kufa/The college of Physical Education and Sport Sciences/Iraq,
[2]Ministry of Education/Al-Najaf Education Directorate/Fine arts institute for Boys/Iraq

Abstract

The importance of research in the use of exercises in the method of repetition to develop the speed of defensive coverage of young handball players. Where the problem of research was the weakness of defensive coverage and the speed of return to the defensive situation, which is appropriate to the speed of movement of the opponent's attack. The aim of the research study is to

1. Use the repetitive method in the training of the speed of defensive coverage.
2. To identify the effect of the method of refining in the proportion of lactic acid and CPK.

The researcher used the experimental method in the style of the two groups with the pre and post test to suit the nature of the research. The researcher identified the research community with the young players in the club of Kufa and the 10 players and then the researcher divided the sample into two groups equally and the researcher used repetitive exercises with The experimental group, while the control group used the exercises prepared by the coach where the researcher codified the training stressed physical exercise by extracting the percentage and intensity of (90-10%).

After the completion of the exercise, the tests were carried out after the use of the appropriate statistical treatments to reach the results after the results were presented, analyzed and discussed the researcher reached the conclusions of machines:

1. There is a clear effect of exercise in the method of repetition in the speed of defense coverage.
2. Exercise also affected the enzyme CPK and lactic acid.

Keywords: *Biochemical variables; young handball players; rapid defense.*

Introduction

Handball defense is one of the important elements that represent the real engine of handball performance which consists of defense and attack. There is no doubt that the modern offensive play in modern handball has become dependent on the use of various offensive plans, including rapid attack hijacking, in addition to the high level of players in their offensive abilities as a result of the development of their physical and skill.

Therefore, it is necessary to develop defense plans and their speed so that they can overcome the various offensive plans. It is therefore important to follow effective defensive plans suited to the circumstances of the game and the way of playing the opposing team's capabilities and the team's abilities on the other hand. "The discovery of kinetic abilities and physiological characteristics each player is an important and necessary factor in directing him to the appropriate performance of duty in the development of defensive or offensive play plans."[1] The defense in general is a work must be in coordination and cooperation between the players of one team and the coach has to explain to the players the importance of defense work and the defensive effort of

the players is appreciated if the defense is individual or collective, as is the value of offensive action.

The defense is of obvious importance in modern handball, by working without the attacking team being able to carry out its offensive vision and to be able to achieve goals resulting in winning the game, so that the team can ensure victory against the opposing team or at the minimum minimize the seriousness. It is very important to pay attention to the defensive aspects, whether individual or collective or differential and there are important duties must be determined by the coaches of their players and must be learned and trained defenders to perform these duties on the face of the game.[2]

The handball games in the regional, continental, and Olympic and World Cups have seen a significant change in the defense of the majority of the teams at the individual level. The issue here is not limited to the defensive formation system, but rather depends on the speed to cover the attacker. In how players apply to individual defense actions during coverage that fully controls the opponent.

Hence the importance of research through the use of the method of repetition in the training of the speed of the defensive movements of the method of flash for young handball players.

Research Aims:

The research aims at:

1. Prepare repetitive exercises to improve the speed of defensive coverage of the attack.
2. To identify the effect of exercise in the method of repetition in the speed of defense against the attack and some of the biochemical variables of young players handball.

Research Hypotheses: There is a positive effect of exercises in the method of repetition on the defensive coverage of the attack and some of the biochemical variables.

Research methodology and field procedures:

Research Methodology

The researcher used the two-group experimental approach to suit the nature of the research problem.

Search community and sample: The research community was determined by the young Kufa club players of 18 players were selected sample of them by 10 players, a ratio and in a simple random way.

Means of gathering information:

- Arab and foreign references and sources.
- Testing and measurement.
- Personal interviews.
- Experimentation.

Devices and Tools:

- Digital electronic stopwatch (1/100) of a second for measuring time and calculating it for tests that need time (German industry) 2.
- Leather measuring tape with a length of 40 meters.
- Whistle, Colored ribbons, Lace band, Chalk.
- Handball field.

Search Procedures: After reviewing several sources and scientific references and conducting many personal interviews, to determine the special tests in measuring the research variables studied by the experts interviewed.

Tests used in research:

Test defensive moves to cover the attack:[3]

Objective of the test: Measure the speed of the performance of defensive moves to cover the attack.

Tools: Handball, bar to bar, standard bar, stopwatch.

Performance characteristics: Eight of the five signs (A, B, C, D and E) are drawn near a 6 meter line, each is 3 meters wide and two marks (and g) are drawn on the first 9 meter line in the middle distance between the two markers A, B) and the second in the middle distance between the signs (C, D) and draw another mark (H) on the other 6 meters line.

The laboratory stands above the mark (H) and when it is given the starting signal, the enemy moves forward to the middle of the field, then changes its direction to face the goal with the back and the fast backward retreat until it reaches the mark (E) Until the mark (g), then back with a tilt to the mark (C) and through the side moves of the sign (B), then (f) and finally doing the back-back movements with a tendency to reach the sign (A).

Performance Requirements: The movement of the laboratory is similar to the movement of the defense

in terms of movements of the two men and the shape of the arms and hands.

Calculation of Grades: The time of the distance from the mark (h) to the mark (A) is recorded to the laboratory.

1. Measurement of lactic acid in the blood.[4]

Purpose of the Test: Measure the level of lactic acid concentration in the blood after the effort

The test was conducted to measure the concentration of lactic acid by taking a drop of blood from the thumb of the player five minutes after the end of the training unit to know the movement of the increase and decrease the amount of lactic acid blood after physical effort to ensure the transfer of the largest amount of lactic acid from the muscles to the blood is withdrawn The amount of lactic acid is measured after 13 second of the drop of blood drop. The number shown on the screen of the device, which is a measurement of 100 mL/100L, is read. The normal rate of the time of rest is 1 mm Work has been carried out under the supervision of a specialist in pathological analysis.

2. Measurement of creatinine phospho-cyanase (cpk).[5]

The Purpose of the Test: Measuring the creatine phosphorus kinase enzyme

Test Specification: A blood sample was taken from each player by 5 cc after 3 minutes of effort and by a specialist in the analyzes and then transferred to Al Shahad laboratories in India for the purpose of extracting the enzyme level. Note that the normal ratio of the enzyme (mm) of the type (mm) of the muscles range from (20-200) Milli Mall.

Pilot Study: The researcher conducted two surveys on the sample (6) players from outside the sample of the research and the goal of conducting the following exploratory experiment:

1. Verification of the accuracy and safety of the devices and tools used.
2. The extent of appropriate and appropriate tests for the sample and identify the difficulties faced by the sample and researcher during application, as well as calculate the time taken to perform tests.
3. Training assistants how to apply tests and how to register grades.
4. Taking into account the safety of players when performing tests.
5. To create the scientific conditions for tests in terms of sincerity, stability and objectivity.

The second exploratory experiment was for the purpose of knowing the time of application of the exercises prepared by the researcher for the research sample.

Pre Tests: The researcher carried out the physical and physiological tests of the control and experimental research samples on Thursday 23/1/2019 at 2:00 pm and at the Kufa sports club hall.

Sample homogeneity and equivalence of the two groups: In order to complete the experimental design requirements, the researcher verified the homogeneity of the research sample in the studied variables using the Levine test in which the SIG value was greater than (0.05) and for all the research variables, Shown in Table (1).

In order for the researcher to attribute the differences to the experimental factor, the parity between the two research groups was carried out prior to the start of the exercise. The appropriate statistical method was used to test (t) for independent samples of equal number in which the sig value was greater than (0.05) the tests confirm the equivalence of the two sets of research and as shown in Table (2).

Table (1). Shows the homogeneity of the sample and the equivalence of the two research groups in the investigated variables

Tests	Units	(F) value	Level of significance	(t) calculated	Value calculated for the level of significance	Statistical significance
Speed of defense coverage	Second	0.01	0.92	0.11	0.91	Random
Enzyme Ck	Milli Mall	0.18	0.68	0.27	0.79	Random
Lactic acid		1.95	0.20	0.42	0.96	Random

The Main Experience: The researcher conducted the main experiment, where the exercises were prepared by the researcher on the experimental group and using the method of repetition and for four weeks by three units per week, while the control group has used the exercises prepared by the coach.

Phosphate exercises in the training curriculum as follows:

1. The total number of training units included special exercises (24) doses.
2. The number of weekly training modules that special exercises (3) units and for a period of (8) weeks.
3. Special exercise time in one module (45-50) minutes (main section only)
4. The researchers adopted the method of repetitive training in all training units.
5. Training days during the week are (Sunday, Tuesday and Thursday).
6. The goal of special exercises is to develop the physiological variables (the concentration of lactic acid in blood, the concentration of CPK in blood).
7. The objective of the diamond-style exercise is to develop defensive coverage of the hand-held attack.
8. Considering the exchange of labor between the muscle groups.
9. The rate of work rest for exercises is (10: 1 18: 1).

Posttests: The researcher carried out the physical and physiological tests of the control and experimental research samples 15/05/2019 at 2:00 pm and at the Kufa sports club hall.

Results

Table (2): Shows the mean, the standard deviation, the calculated (t) value and the level of significance of the results of the physical and physiological tests

Tests	Units	Pretest		Posttest		(t) calculated	Level of significance	Statistical significance
		Mean	SD	Mean	SD			
Speed of defense coverage	Second	12.31	1.41	7.93	0.62	5.87	0.004	Sig.
Enzyme CPk	Milli Mall	180	36.74	272	44.94	2.94	0.04	Sig.
Lactic acid		9.02	2.97	13	0.70	3.53	0.02	Sig.

Table (3) shows that there are differences between the results of the pre and post measurements of the experimental group in the investigated variables. It was found that the value of the mean level of the defense coverage rate of 0.004 is less than the significance level (0.05), indicating that there is a difference between the tests and for the post test.[6]

Table (3): Shows the mean, the standard deviation, the calculated (t) value and the level of significance of the results of the physical and pretests of the control group.

Tests	Units	Pretest		Posttest		(t) calculated	Level of significance	Statistical significance
		Mean	SD	Mean	SD			
Speed of defense coverage	Second	12.20	1.58	9.24	0.42	5.30	0.00	Sig.
Enzyme CPk	Milli Mall	187	43.24	201	42.48	0.62	0.56	Non sig.
Lactic acid		9.12	4.41	10.6	2.07	0.77	0.4	Non sig.

As for the variable lactic acid in the blood, the value of (t) calculated (0.77) and the level of significance (0.4), which is greater than the level of significance (0.05), indicating no significant difference between the tests.[7]

Table (4). Shows the arithmetic mean, the standard deviation, the calculated (t) value and the sig value of the results of the physical and physiological tests of the experimental and control groups in the post tests

Tests	Units	Experimental group		Control group		(t) calculated	Level of significance	Statistical significance
		Mean	SD	Mean	SD			
Speed of defense coverage	Second	7.93	0.62	9.24	0.42	3.88	0.04	Sig.
Enzyme CPk	Milli Mall	272	44.94	201	42.48	2.56	0.03	Sig.
Lactic acid		13	0.70	10.6	2.07	2.44	0.04	Sig.

Table (4) shows that there are differences between the results of the post-dimensional measurements of the experimental and control groups in the investigated variables. The mean value of (t) calculated (2.56) and the level of significance (0.03) is smaller than the level of significance (0.05), indicating the existence of a significant sign between them and this is the result of the increased effectiveness of the enzyme for the experimental group due to the impact of exercises intensity In the increase in the number of motor units participating in the performance, that the effectiveness of the enzyme increases according to the requirements of performance and this was confirmed by the supporter of a local improvement in the activity of the enzyme active muscles.[8]

What we notice in the results of the tests of the dimension of the concentration of the enzyme (CPK) is the reduction of the proportion of members of the control and experimental groups and this decrease led to significant differences of the members of the two groups and that is attributed to the researchers that when the low concentration of lactic acid in the blood as a result of adaptations taking place In the body as a result of regular and continuous training prepared by the trainer helped the control group members to make physiological adjustments.[9]

The researchers found that the development of the enzyme (CPK) was reflected in the level of accumulation of lactic acid, which was in large quantities in the blood before the exercise by the researcher who prepared it, which dropped to large levels and this is a good indicator of the improvement of the physical condition and functional of the players as the trainee athlete well can eliminate the accumulation of lactic acid in the blood.[10]

Conclusion

1. There is a clear effect of exercise in the method of repetition in the speed of defense coverage.
2. Exercise also affected the enzyme CPK and lactic acid.
3. The special exercises prepared by the researchers helped to develop the concentration of lactic acid in the blood.

Effect of Dietary Supplement (Turmeric) in the Level of Concentration of Lactic Acid and Lactic Acid Dehydrogenase in the Players of the University of Babylon Futsal

Adil Ali Abbas[1], Anees Hussein Ali[2], Hameed Fayyadh Abid Ali[3], Raad Ali Abbas[4]

[1]University of Babylon/The College of Physical Education and Sport Sciences/Iraq,
[2]New Cross Hospital, Wolverhampton West Midlands WV10 0QP UK

Abstract

The importance of research in the use of dietary supplement extracted from plants and their impact on the physiological indicators of players The problem of research that players are exposed to high physical stress depending on the specificity of the game with a random diet, which negatively affects the performance of the player in addition to delay the process of hospitalization and speed The aim of the research is to identify the effect of dietary supplement (turmeric) in the level of lactic acid concentration and lactic acid dehydrogenase in the players of the University of Babylon futsal. The researchers hypothesized that there is a positive effect of dietary supplement (turmeric) on the variables under study in the research sample. The researchers selected the research sample represented by the players of the team of the University of Babylon in futsal for the academic year (2018 - 2019) and the number of (12) players were distributed into two groups equally by random (lot) and after the provision of food supplement and the pilot experiment, The experimental group used the supplementary food supplement in addition to the instructor's method. The control group used the instructor's training curriculum only. After eight weeks, the post-tests were carried out. After the results were presented and processed by the appropriate statistical means Researchers reached the most important findings of the study and the conclusions reached by researchers are having a positive effect of food complement (turmeric) in the acid concentration level of lactic enzyme lactic Dehydrogenase the team players Babylon University futsal.

Keywords: *Turmeric, lactic acid and dehydrogenase.*

Introduction

It is known that most athletes at the upper levels take supplements with natural substances and elements as being not prepared and safe to use. In view of the global trend of expanding the use of plant raw materials instead of chemical substances with harmful side effects in the manufacture of pharmaceuticals, the use of plant raw materials with active substances and appropriate doses are more useful and safe in the treatment and prevention of many diseases. Turmeric powder is one of the nutritional supplements useful for increasing the vitality and activity and resistance to fatigue of players both in exercises or competitions. Turmeric has a wide range of preventive and therapeutic possibilities for many diseases in addition to containing a high percentage of antioxidants.[1]

High-intensity aerobic exercise leads to a lot of chemical changes within the cells of the body, especially as a result of metabolic processes. The higher the voltage, the higher the proportion of metabolic wastes, including the increase of the proportion of lactic acid and the difference of the concentration of the enzyme Lactate dehydrogen (LDH) The halls have a lot of specialties in terms of the small area of the stadium and not restricting the players specific duties as well as the movement of fast and continuous with a few breaks and this requires the trainers and cadres help work a lot to create functional and physical adaptations when players enable them to the importance of research in the use of natural dietary supplements (turmeric) to determine the effect of the concentration of lactic acid and the concentration of lactate dehydrogen in the blood of the players in the research sample.[2]

Research Aims:

1. Identification of the effect of dietary supplement (turmeric) in the level of lactic acid concentration in the players of the University of Babylon futsal.
2. Identification of the effect of dietary supplement (turmeric) in the level of concentration of the enzyme lactic dehydrogenase in the players of the University of Babylon Futsal.

Research Methodology and Field Procedures:

Research Methodology: It is the nature of the problem that determines the methodology used, so researchers used the experimental approach in the design of equal groups, which is compatible with the nature of the problem of research as experimentation is one of the most efficient means to access reliable information. The researchers also chose to design the experimental group and control method with pre and posttests.

Community and Sample Research: The researchers identified the research community with the players of the University of Babylon futsal team (15) and the exploratory experiment was conducted on (3) players and excluded after their participation in the exploratory experiment. The rest of the players were divided into two groups with (6) players per group.

Field Research Procedures:

Specify Search Variables: After reviewing several scientific sources and consultation between the researchers, the variables of the research were identified and were presented to the specialists in the field of sports and sports training, as agreed upon in accordance with the problem of research and were as follows:

- Concentration of lactic acid in blood after the effort.
- The concentration of LDH enzyme in the blood after the voltage.

Tests Used in Research: After studying the relevant studies and the sources related to the research problem, the researchers chose a standardized test to measure the performance of the futsal players and presented them to the experts in the field of physiotherapy and sports training. The researchers presented the test to (11) experts to determine the validity of the test.

Performance Test: Long-range performance test based on scoring and scrolling on both sides of futsal. Short anaerobic tests approach between (60-120) seconds.

Pilot Study: The pilot study is a mini-experiment of the basic experience and the conditions and conditions in which the basic experiment is to be possible should be available so that its results can be taken.

The researchers conducted a pilot study for the tests used in the study on Thursday, 8/11/2018 on a sample of (3) players from the research community, in the closed hall of the Faculty of Physical Education and Sports Sciences/University of Babylon.

Main Experiment Procedures:

Pretests: The researchers conducted the pretests on the research community on Monday 12/11/2018 at 12 noon in the closed hall at the Faculty of Physical Education and Sports Sciences/University of Babylon.

Application of the supplementary food program and the trainer's training curriculum: After completion of the experimental experiment, the researchers started implementing the supplement program for the experimental group and the training curriculum for the instructor for both groups starting from Sunday 13/11/2018 for 8 weeks and 3 training units per week.

Posttests: The researchers carried out the tests after the completion of the main experiment (dietary supplements, turmeric and training curriculum for the instructor) on Tuesday, January 15, 2019. The tests were conducted under the same conditions as the pretests in the same order of tests where each group tested the same of tests.

Results

Table (1). Show the results of pre and posttests of the experimental group of the test group

Variables	Units	Pretests		Posttests		(Wilcoxen) calculated	Tabulated	Level of test indication	Type of significance
		Median	SD	Median	SD				
Lactic acid in blood	Mmol/l	10.29	0.42	7.04	0.54	2.2	0	0.028	Sig.
LDH enzyme in blood	Unit/l	501.44	22.94	385.65	10.2	2.2	0	0.028	Sig.

The results showed significant differences between the two mediators, which indicates the decrease in the accumulation of lactic acid in blood. Turmeric with the exercises of the trainer worked to find this difference between the pre and posttests of the variable ratio of accumulation of lactic acid in blood.

The researchers attributed the reason for the apparent decrease in the accumulation of lactic acid to the presence of sodium in abundant amounts in turmeric and in the effectiveness of the training method. They worked together to speed up the process of lactic acid degradation and convert it into a glycogen to be re-exported as a source of energy through a series of quick chemical reactions. Anise narrator confirmed that lactic acid is a compound resulting from the representation of sugary substances. It can then be converted into sugars (glucose or glycogen) inside the muscle or liver. The hydrogen atoms adhered to lactic acid are united again with NAD and then oxidized Wen acid which energy source is used and then configure the ATP as well as converted to glucose in the blood or glycogen in the liver by Korean cycle .[3]

Returning to Table (1) of the experimental group, we note that the results showed significant differences of statistical significance between the two mediators and this is a sign of a decrease in the proportion of the secretion of the enzyme LDH in blood, that the intake of turmeric capsules with training according to the program prepared by the coach worked to find this difference in Between the preterm and post-test trials of the LDH enzyme in blood.

The researchers explain that the reason for this apparent decrease in the concentration of the enzyme (LDH) for members of the first group is due to compounds consisting of turmeric and in particular vitamins (B6, E, B9, C, K) as these vitamins act as antioxidants needed by cells to continue to perform This is what believes that the protective function of antioxidants is considered as one of the chemical control and balance systems in the body through which the metabolic activity related to the production of the enzyme is controlled. Power of during the reverse action (reverse adaptation) by antioxidants in stopping the work of harmful free radicals during physical exertion .[4]

Table (2). Shows the results of the pre and post testing of the control group and of the control group

Variables	Units	Pretests		Posttests		(Wilcoxen) calculated	Tabulated	Level of test indication	Type of significance
		Median	SD	Median	SD				
Lactic acid in blood	Mmol/l	10.26	0.4	8.39	0.5	2.2	0	0.028	Sig.
LDH enzyme in blood	Unit/l	502.83	20.35	426.68	5.34	2.2	0	0.028	Sig.

By noting the results in Table (2) which showed that there are significant differences of statistical significance between the two mediators, which indicates the decrease in the proportion of accumulation of lactic acid in blood, which is that the training curriculum of the coach worked to find this difference between the tests Pre and post-variable ratio Accumulation of lactic acid in blood.

The researchers attribute this to the efficiency of the training curriculum in relieving the body of physical exertion, including lactic acid. Some studies indicates that the body gets rid of lactic acid faster if the athlete performs moderate exercises during the period of recovery rather than complete rest.

Also, when the LDH secretion rate was observed in Table (3), the researchers attributed the low LDH concentration of the control group to the effective training method, which improved the enzyme responsible for converting into lactic acid during the anaerobic physical exertion Which is reflected in the ability of the muscle to get rid of lactic acid and thus decrease the concentration of the enzyme (LDH), whose relationship is positive with the concentration of lactic acid and then increase the time of anaerobic synthesis. The speed of LDH reactions starts to increase gradually after the first minute of the reaction and the amount of the increase is associated with the high concentration of lactic acid.[5]

Table (3). Shows the results of the post tests of the Crosscal Wallis test for both groups

Variables	Units	Experimental Group		Control Group		(Crosscal Wallis) calculated	Tabulated	Level of test indication	Type of significance
		Median	SD	Median	SD				
Lactic acid in blood	Mmol/l	7.04	0.54	8.39	0.5	10.71	5.99	0.005	Sig.
LDH enzyme in blood	Unit/l	385.65	10.19	426.68	5.34	15.15	5.99	0.01	Sig.

By observing the results of Table (4), which show the Wilcoxon test coefficient, we found significant differences between the tests of pre and post and for the benefit of posttests and when using the test Crosscal Wallis showed significant differences between the two groups, which requires the use of the test (Mann Whitney) to see the smallest difference between Groups in order to indicate the preference of one of the two research groups.

Table (4). The results of the post-test tests of the Mann Whitney test mix between the control and experimental groups in the level of lactic acid concentration in blood and lactate dehydrogenase

Test Mann Whitney between the control and experimental groups				
Variable	Median	SD	Test Mann Whitney	Level of significance
Lactic acid in blood	7.72	0.86	2.72	0.006
LDH enzyme in blood	406.17	22.78	2.88	0.004

In the table (4), we see statistically significant differences between the two groups for the benefit of the experimental group. This indicates that the experimental group showed superiority over the group. This is attributed to the researchers that the use of turmeric capsules and the training curriculum of the trainer together can reduce the concentration of lactic acid in blood faster than the group that used the trainer's training curriculum.[6] And the fact that supplement Turmeric contains many elements that improve the metabolism within cells and thus produce more energy and the most prominent of these elements (sodium, potassium, magnesium and calcium) and thus the experimental group showed a difference from the control group and therefore these elements affect the cells of the body of the athlete,[7] And this is consistent with the study Eating sodium reduces the concentration of lactic acid in the blood when measuring the peak of the collection of lactic at the time of hospitalization.[8]

In addition, the reason for the decrease in the concentration of lactic acid is due to the adaptation of the working muscles and internal organs of the body of the player in the rapid disposal of the accumulation of large amounts of lactic acid in the blood during physical effort and this physiological adjustment due to the quality of the exercises that the players continuously,[9]some studies suggests that the recent training proposals proved that the use of modern means of training can lead physiologically to the full impact on organic organs, which develops from the ability of the athlete to resist fatigue in a wide variety of fatigue complex and pleasing aspects, which requires the need for multiple method of training and the resulting multi-dimensional impact in the functional machinery .[10]

Back to table (4), there are statistically significant differences between the two groups for the benefit of the experimental group in the concentration of LDH in blood, which is attributed to the researchers that supplemented Turmeric contains many vitamins and elements that improve the metabolism and analysis of amino acids (B6, C, K, B9, Sodium, Potassium, Magnesium and Calcium). These elements have also influenced the cells of the body of the athlete.[11]

The researchers believe that the decrease in the level of the concentration of lactic acid was clearly reflected

in the ratio of the enzyme (LDH) in blood, which means that the enzyme is very important in the activation of the interaction of the front and back and the relationship between the two and this confirms to increase the activity of the enzyme (LDH) This helps with the metabolism of lactic acid, so any increase in the activity of this enzyme is accompanied by an increase in the elimination of lactic. When performing a high physical effort, lactic acid will accumulate, causing muscular fatigue, as energy houses cannot form glucose of the lactic so the enzyme works on LDH Yale Lactic acid to Berovk.[12]

Conclusions

1. There was a positive effect of the use of dietary supplement (turmeric) in low level of lactic acid concentration in the players of the University of Babylon futsal.
2. There was a positive effect of the use of dietary supplement (turmeric) in the low level of the concentration of the enzyme Lactic dehydrogen in the players of the University of Babylon Futsal.

Cycosomatic and its Correlation to the Mentally Retarded Athletes of Al-Furat Al-Awsat Technical University

Hameed Shamkhi Ghazi

Al-Furat Al-Awsat Technical University/Directorate of Student Activities/Iraq

Abstract

The aim of the study was to identify the scales of psychosomatic and mental regression and to find the correlation between the cycosomatic and mental regression of the teams of the Middle Euphrates University and Al-Furat Al-Awsat Technical University. The researcher hypothesized that there are no statistically significant differences between psychosomatic and mental retardation. The study sample consisted of (96) athletes representing Al-Furat Al-Awsat Technical University for the 2016-2017 sports season, 12 of whom were excluded for participating in the exploratory experiment. The researcher used statistical means (percentage, arithmetic mean, standard deviation and global analysis).

Through the results obtained by the researcher, they derived the following:

- The correlation that emerged is a negative correlation between the psychosomatic and mental retardation University of the Euphrates Middle Tech
- Plane players enjoy varying degrees of cycosomatics and under conditions of competition and low grades during the training modules.

Keywords: *Cycosomatic, mentally and athletes.*

Introduction

The correlation between psychology and sports and physical games is an interrelated and dialectical correlation that is characterized by live interaction and cannot be separated from this link as psychology generally addresses the problems experienced by individuals in their lives that appear in the form of acute and abnormal emotions and not in the form of deviations, disorders and diseases and psychological contract. Psychological problems are always the result of the poor compatibility of the individual with himself on the one hand and poor compatibility of the individual with his environment and the environment on the other, this causes failure to achieve the individual's goals and satisfy his psychological needs. And social and social.[1]

"Mathematical psychology plays an important role in the lives of individuals, as it directly affects their behavior and therefore we see its effects in many of their actions. Sports psychology can be seen as a kind of motivation, desires, mental and physical abilities, attitudes, psychosomatics, fear, anxiety, concentration and attention. And control and stability and other cases are acquired and fungus and develop experiences in the first case and since birth in the second case can be developed the individual must strive for success and that "feeling inferior is normal for people and can lead to a state of creativity and that the goals are Move to overcome the problems by the inherent creative power within the human being that helps to achieve his natural talents for self-realization".[2] The importance of this research is to find the correlation between the cycosomatic and mental state of volleyball athletes as it attempts to shed light on the nature of the correlation between two variables the first is related to the psychological aspect of the cycosomatic of athletes. The other variable is mental reflexology. In addition, the study comes in the field of the university and mental retaliation urges the player to be advanced and distinguished among his peers in the team as the player's need for achievement and excellence It works to

motivate and stimulate the potential of the environment and works to redouble and direct its efforts and energies towards achieving the desired goal of high achievement. As a result of the above, the importance of research lies in the level of recognition of the level of psychosomatic athletes, as well as the level of mental response and thus know the type of correlation and influence between the cycosomatic and mental retardation.[3]

Research Aims:

1. Recognition of the psychosomatic and mental retardation in the athletes of the University of Middle Euphrates technical.
2. To identify the type of correlation between the cycosomatic and mental retardation in athletes.

Methodology

Research Community: Is "all individuals, objects or persons who constitute the subject of the research problem, which is all elements related to the problem of the study to which the researcher seeks to generalize the results of his study". Thus, the research society included the 96 athletes of Al-Furat Al-Awsat Technical University as shown in Table (1).

Table (1). The names of institutes and faculties of the Euphrates Middle East Technical University show the technical and technical Euphrates University

Name of institute or college	Technical Institute Kufa	Najaf Technical Institute	Technical Institute of Diwaniyah	Technical Institute of Samawah	Karbala Technical Institute	Technical Institute Musayib	College of Administrative Kufa
Number	12	12	12	12	12	12	12
Total	96						

Search Tools: The researcher used the research tools to access the research information, questionnaire form and interviews, which included the construction of the scales of psychosomatic and mental retardation in the athletes of the University of Middle Euphrates technical.[4]

Scientific steps of the measures of psychosomatic and mental retardation:[5]

1. The initial preparation of the special scale formula for psychosomatic and mental retardation requires a lot of procedures, including the process of formulating the paragraphs of the standard that are appropriate to the study society, as well as setting instructions on how to answer them and method of correction. The procedures were: - access to sources and references.
2. The study of previous studies, standards and questionnaires in physical education and self-employment, which relate to personality, psychosomatic and mental retardation.

Formatting the paragraphs of the scale: The "building conditions of psychological standards that the instructions to answer them are clear to those who prepare the scale, in addition to hiding the real purpose of the scale is (not to write the name of the scale) to obtain true data" (3). (4) A paragraph was prepared for the measure of the cycosomatic and it was presented to the experts and specialists to indicate their validity to measure the purpose that was developed and excluded. (75%). Thus, the paragraphs agreed upon (17) paragraphs and by agreement (80%) and 48 paragraphs were prepared for the mental regression and were presented to the experts and specialists also for the statement (24) of the scale of the cycosomatic scale This is because they do not get the agreement rate (75%), so the agreed paragraphs (24) and the proportion of agreement (80%), "Bloom notes that (the rate of reliance on the consent of experts is 75% and more in such kind of honesty".[6]

Stability of the scale: "The stability tests are necessary indicators and the researcher used the half-way method because it requires a one-time test".[7]The data obtained by the researcher regarding the scores of the responses of (12) players were adopted. This method depends on splitting the test into two parts, the first part contains the individual numbers and the second

part contains the even numbers. The simple correlation coefficient (Pearson) was calculated between the scores indicated between the scores which reached (0.841). This method represents the stability coefficient of half the test., So the researcher used constant stability Measuring (0.945) is a good standard that can be relied on.[8]

Table (2). Correlation coefficients between the degree of each paragraph in the total sum of the construction sample of the cycosomatic scale

Item	Factor	Item	Factor	Item	Factor
1	0.376	13	0.055*	25	*0.109
2	0.353	14	0.651	26	*0.154
3	0403	15	0.411	27	0.398
4	0395	16	0.541	28	*0.123
5	0611	17	*0.143	29	0.290
6	*1.009	18	0300	30	0.306
7	0491	19	0518	31	0.299
8	0.439	20	*0.155	32	0.421

3	1.432	15	*1.691	27	4.091
4	2.339	16	1.432	28	3.221
5	3.710	17	1.904	29	2.321
6	2.833	18	3.110	30	1.295*
7	2.621	19	*1.772	31	3.120
8	*1.652	20	3.100	32	2.432
9	*1.711	21	*1.502	33	1.481*
10	3.320	22	4.132	34	3.911
11	3.200	23	6.087	35	2.330
12	3.108	24	2.332	36	3.118

Table (4). Value (t) of psychosomatic scales using the method of the two extremes

Paragraph	(t) value	Paragraph	(t) value	Paragraph	(t) value
1	2.249	13	3.008	25	3.111
2	*1.550	14	3.184	26	2.092
3	1.737	15	*1.604	27	4.910
4	2.098	16	2.123	28	3.231
5	3.265	17	1.720	29	2.076
6	2761	18	3.090	30	*1.218
7	2.187	19	*1.700	31	3.305
8	*1.603	20	3.103	32	2.907
9	*1.375	21	*1.522	33	2.900
10	3.410	22	4.045	34	*1.401
11	3.100	23	4.208	35	2.701
12	3.012	24	2.002	36	3.052

Correction of Scale: After completion of the scientific transactions by the researcher for the paragraphs of the scale of the cycosomatic, based on the previous procedures, the final form of the measure is made up of (24) paragraphs see Annex (1). The answer will be answered by choosing one of two alternatives, namely (yes) or (no), with two degrees of response (yes) and one score for the answer (no) and the total score of the scale ranged between (48 - 96).[9]

Mental Retardation Scale: The researcher used the same steps to build the psychosomatic scale.

Table (5). Value (t) of psychosomatic scales using the method of the two extremes

Paragraph	(t) value	Paragraph	(t) value	Paragraph	(t) value
1	2.246	17	3.581	33	3.438
2	*1.552	18	3.482	34	2.532
3	1.731	19	*1.691	35	4.438
4	2.549	20	1998	36	3.711
5	3.321	21	1.844	37	2.539
6	2.975	22	3.095	38	*1.295
7	2.199	23	*1.772	39	3.270
8	*1.652	24	3.129	40	2.982
9	*1.711	25	*1.542	41	*1.481
10	3.310	26	4.192	42	3.751
11	3.183	27	6.237	43	2.709
12	3.622	28	2.593	44	3.055
13	2.129	29	2.700	45	3.731
14	*0.654	30	3.218	46	2.052
15	3.099	31	5.172	47	3.194
16	3.183	32	*0.799	48	2.841

In view of the fact that paragraphs (6/10/12/17/21/24/26/27/29/30/33/34/36/48) were adopted in an internal consistency and paragraphs (2/8/9/14, 19/23/25)/32/41) in the manner of extreme groups on the coefficient of discrimination is weak so excluded from the scale, so the number of paragraphs deleted is (24) paragraph for both method, as the standard is composed in its current form after the statistical analysis of the paragraphs of (24) paragraph.

Main Experience: This was done during the volleyball championship of Al-Furat Al-Awsat Technical University for the period 6-11/1/2018 and in the collective manner and the hall of the Technical Institute Kufa, where the forms were distributed on the survey sample of (96) players and after marking the standards by the players were collected forms to obtain the results search.

Results

View and discuss results: After the application of the scales of psychosomatic and mental retardation to the research community, data acquisition and processing are statistically and quantitatively shown in Table (6).

Table (6). The correlation coefficient between the cycosomatic and mental retardation of the athlete of Al-Furat Al-Awsat Technical University

Tests	Mean	SD	Correlation coefficient	(r) value	df
The cycosomatic	46.84	2.68	-0.165	0.178	82
Mental Retaliation	51.57	3.57			

Table (6) shows that the correlation coefficient value (- 0.165) is less than the (t) value of (0.178) and the degree of freedom (82) below the significance level (0.05). The mean and standard deviation of the sample of the study and there is no significant difference between the cycosomatic and the mental regression. The higher the score on the psychosomatic scale, the higher the results were on the mental regression scale and vice versa.[10]

The researcher attributed these results that whenever players have a lack of stability and stability and anxiety and tension whenever there is a lack of relaxation and calm as a result of the personality disturbed physically and psychologically during training and this means that there is psychological pressure is exposed to players and therefore their performance is unacceptable due to lack of stability and stability,[11] What is supported by the impact of anxiety and tension and physical and psychological (cycosomatic) and low level of stability and varies from one individual to another depending on the type of pressure and size and strength and extent and nature of the psychological construction of the athlete and his ability and efficiency of his muscular and nervous systems and the safety of personality The force will on the resistance and not to succumb to these pressures and the extent of his sense of control events".[12]

Behavioral psychologists assume that schizophrenia occurs because of reinforcement, either by increasing attention to or reducing certain responses. Cognitive psychologists believe that cycosomatic disorders focus people too much on internal physiological processes and shift natural susceptibility to disorders accompanied by pain, aches, tension, anxiety and anxiety.[13]

The term "psychosomatic" refers to the physical disorders of the psyche. The physical aspect is the response to emotional pressure, which takes the form of physical disorders such as high blood pressure, anxiety, physical tension, joint pains, etc. and physical pains with a real organic sensation, especially emotional distress. It is a group of disorders that appear on individuals and their physical symptoms with the absence of an apparent organic cause. Psychosocial factors are therefore the loss or change in bodily functions without apparent physical cause. Any appearance or change of the physiological functions of one or more members of the body, That all mental disorder is an emotional conflict not feeling and physical disorders as a result of stress or psychological stress of the individual.[14] This is the close contact between the body and the soul, it reflects the continuous interaction between personality and emotional conflict on the one hand and the independent nervous system on the one hand others are due to the individual's struggle

between his ambitions and goals and his ongoing attempts to achieve them.[15]

Conclusions

1. The correlation that emerged is a negative correlation between the psychosomatic and mental retardation University of the Euphrates Middle Tech
2. Plane players enjoy varying degrees of cycosomatics and under conditions of competition and low grades during the training modules.

Ethical Clearance: The Research Ethical Committee at scientific research by ethical approval of both environmental and health and higher education and scientific research ministries in Iraq

Role of Tissue Doppler in Early Detection of Left Ventricular Dysfunction in β Thalassemic Patients of Pediatric Age Group

Zainab F. Hassan[1], Mohanad K. Shukur Alghanimi[1], Ahlamkadhim Abbood[1]

[1]*College of medicine, University of Babylon, Iraq*

Abstract

Objective: Heart failure due to increase serum iron level is a major fatal cause in patients with Beta thalassemia. Echocardiography is a non invasive tool that play a major role in detection of cardiovascular disease. the aim of the study is Early detection of cardiac impairment in beta thalassemia by bed site technique (advanced echocardiography) in order to overcome the time and cost of other technique (T2 CMR).

Method: This is a case control study included 51 thalassemic patients maen age (11 ±2.8 year), 40 control (mean age 10± 2.7 year) they had attended to thalassemic center in obstetric and pediatric hospital in Hilla from 1 January 2019 to 4 march 2019. All pt and control underwent conventional echocardiography and tissue Doppler image (TDI).

Results: βThalassemic Patients (β-TM) had significantly higher left ventricular end diastolic and systolic diameter index, LVEDDI (41.5±13.7vs. 31.8±7.5; P = 0.000) and LVESDI (25.7±6.2 vs. 20.9±6.7;P = 0.000) (On the other hand there are no differences in ejection fraction and systolic fraction between patients and control (P>0.05). Additionally pulmonary capillary wedge pressure are more in patients than in control (11.6 ± 4 vs. 9.7 ± 1; P = 0.000).

Conclusions: Advanced echocardiography including tissue Doppler imaging has important role for early detection of cardiac dysfunction in β-TM patients

Keywords: *Thalassemia, Tissue Doppler image (TDI).*

Introduction

Usually thalaseemia major is presented in early life between the age of 6-24 months. Patients may complain from feed problem, failure to thrive, abdominal expansion due to hepatosplenomegally .Also changes of skeleton and deformation of the long bone, the maxilla is hypertrophied leading to upper teeth protrusion [1]

Complication of thalassemia depends myocardial iron deposition with high reproducibility with magnatic resonance scan. In later adult life with development of diabetes which affect endotheliam and more cardiovascular function detorioration . so the need for more safsticatedtechnigues for early detection to improve the prognosis [2] .

There is dramatic improvement of thalassemic patients with blood transfusion and iron chelating agent to decrease excess iron that is loaded in endocrine organs with presentation could ocurr from childhood to adulthood [3]. Iron deposition mostly in hepatic and cardiac tissue [4]. Main complications from iron overload include osteogenses abnormalities, retarded growth, diabetes mellitus (DM) and endocrine deficiency (thyroid & adrenal glands) [5]

Cardiac damage of these patients due to iron and free radicals effects, endocrine abnormalities, infectious and drugs effects, coagulopathy and valvulopathy[6] . Volume over load in thalessemic patients progressively impaired heart function with the development of heart failure due to high volume ejected with the presence of abnormal valves due to increased thickening and calcification[7] .

Moreover, There are many mechanisms for iron deposition in the body these include transfusion of blood

and early destruction of RBCs and increase absorption of iron through gastrointestinal tract [8]

Materials and Method

This is a case control study included 51 thalassemic patients maen age (11 ±2.8 year), 40 control (mean age 10± 2.7 year) they had attended to thalassemic center in obstetric and pediatric hospital in Hilla from 1 january 2019 to 4 march 2019. All patients and control underwent conventional echocardiography and TDI. This study was done in Echo Department in Obstetric and Pediatric hospital and in Marjan teaching Medical City.

The following patients were not involved in this study:

1. Patients with respiratory tract infection (RTI)
2. Congenital heart disease
3. Diabetes mellitus
4. Cardiomyopathy.

Echocardiographic study was done in a supine and lateral decubitus position . parasternal long and short axis view and then the apical view[9]. Doppler study included pulse wave and tissue Doppler study for the left sided assessments was done

Vivid 5 GE medical ultrasound instruments was used with a probe of 2.5 MHz .Imaged were stored for all the patients and control for offline analysis.

Body surface area was measured by this formula

Body surface area (BSA)= (height *weight)/3600[2]

The M-mode echocardiographic measurements included left ventricular end diastolic diameter (LVEDD) and left ventricular end systolic diameter (LVESD)were measured and indexed for body surface area . The M-mode measurement was taken between the tip of the mitral valves and the tips of the papillary muscles with a correct angle (90). If a correct angle cannot be obtained either the option of automated M mode was used or measurements was taken by 2 D echocardiography .In addition to that interventricular septal thickness in diastole and ejection fraction and fractional shortening were measured .

Diastolic function of the left ventricle was determined by using pulse wave and tissue Doppler imaging.

Pulse wave Doppler included the following:

a. E-wave velocity of early mitral flow

b. A- wave velocity of late mitral flow

c. E/A ratio

d. Deceleration time

By taking apical 4 chamber view (4CV), PWD was putted atrial the tip of the mitral valve and then the peak velocity of E and A wave was calculated in addition to measurements of deceleration time and E/A ratio

Statistical Analyses: SPSS 17.0 was used (SPSS Inc, Chicago, IL, USA). In this study Chi square was used .T- test was used for comparison between the mean and SD . Correlation between variables was calculated by using Pearson correlation. P value <0.05 is the cutoff value for testing significancy.

Results

The results of this study were shown and expressed as two groups; Thalassemic major patients (TMP) and normal control groups.

There were no significant changes in age, tall and weight between the study groups (P>0.05) . On the other hand, there is a significant difference in the heart rate between patients and control (P<0.05) (Table 1).

Table 1: Distribution of the study groups according to their demographic data.

Variables	Patient (50)	Control (41)	P value
Age	11±2.8	10±2.7	0.07
Weight	46±30	40±32	0.2
Tall	46±132	37±133	0.6
BSA	1.02±2.3	1.02±0.36	1
HR	103±15.9	93±16.7	0.003*
S F	2534.9±1443		
HB	22.5±3		

BSA = Body surface area, HR = Heart rate, SF = Serum ferritin, HB = hemoglobin, Values are expressed in mean±standard deviation. *P<0.05

Additionally, history was taken from the patients from the patients about intake of iron chelating, presence of hepatomegally and splenomegally.

Furthermore, there was no significant differences in the number of male and female in the study group (P>0.05). (Figure 1 & 2).

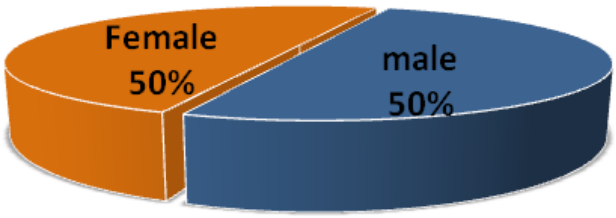

Figure 1: Gender distribution in patients group

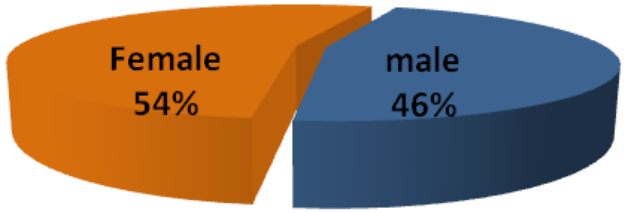

Figure 2: Gender distribution in control group

Highly Significant differences of LVEDDI and LVESDI were shown between thalassemic patients and control groups . On the other hand, there was no significant change in the IVS and EF between the study groups (Table 2).

Table 2: 2D and M mode echocardiographic parameters between patients and control groups .

Parameters	Patients	Control	P value
IVS(mm)	8.1±1.02	7.9±1	0.5
EF(%)	67.8 ±5.7	67.2±5	0.5
FS(%)	37.4±4.6	36.4±4.2	0.3
LVEDDI (mm/BSA)	41.5±13.7	31.8±7.5	0.000**
LVESDI (mm/BSA)	25.7±6.2	20.9±6.7	0.001**

IVS= Interventricular septum, EF= ejection fraction, FS=fractional shortening, LVEDDI= left ventricular diastolic diameter index, LVESDI= left ventricular systolic diameter index, Values are expressed in mean ± standard deviation.

The results showed that the level of E, A, E/A ratio were significantly higher in patients than in control groups (P<0.05) (Figure 3).

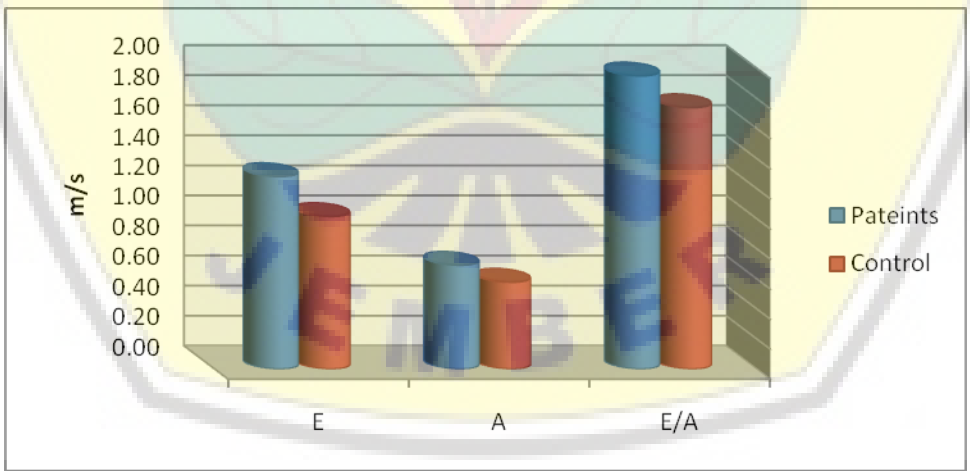

Figure 3: Mitral valve Pulse Doppler parameters in patients and control groups

Also, there were highly significant differences in tissue Doppler parameters included E/e^ and IVRT, IVCT, ET, MPI (P<0.01). Also, the PCWP that detected from lateral and septal wall was significantly higher in patients than in control group. ON the other hand, there were no significant in other tissue Doppler parameters included E^, S^ of the septum (P>0,05) while the s^ from the lateral wall is significantly loer in patients than in control groups (P<0.05). (Table 3).

Table 3: Tissue Doppler parameters between patients and control groups .

Parameters	Patients	Control	Pvalue
e^ (m/s)septum	0.17±0.02	.16±0.02	0.4
E/e^ septum	7.6±1.4	5.9±0.9	0.000**
PCWP septum	11.6±1.4	9.8±1.02	0.000**
S^ septum (m/s)	9.8±1.69	9.6±1.9	0.5
S^ Lateral (m/s)	10.6±1.7	12.3±2.7	0.006**
e^ (m/s) lateral	21±3	20±3.4	0.2
E/e^ lateral	6.2±1.1	5±1	0.001**
ET(ms)	252.8±26.9	281.8±24.5	0.000**
IVRT(ms)	45.1±9	36±9	0.000**
IVCT(ms)	45.7±11	33.6±6.6	0.000**
MPI	.36±0.08	.24±0.08	0.000**

ET= ejection time, IVRT= Isovolumetric relaxation time, IVCT= Isovolumetric contraction time, MPI= Myocardial performance index, ms= millisecond, Values are expressed in mean ± standard deviation.

Discussion

Most of thalassemic patients in this study had serum ferritin (SF) more than 2500 mg/dl this is due to recurrent blood transfusion Additionally, our study showed that there are a significant differences in the heart rate between thalassemic patients and control which occurred due to physiological compensation of chronic anemia.[10]

This result was agreed with Mohammed and his co-workers in 2013 who found that most of the patients with TM had a sinus tachycardia.[11](4)

Also in this study there are in significant differences of systolic EF and FS of the LV between patients and controls . these results is consistent with many other studies.[12,13,14]

There are two major factors that affected the cardiac chambers and function in thalassemic these are :ferritin level and high cardiac output .

Hemodynamic changes that occurred in thalassemic patients is due to anemia which lead to bone marrow expansion causing volume overload and high cardiac output .subsequently, this lead to dilatation of the chamber and chronic maintenance of this state lead to heart failure[15,16,17]. Additionally the myocardium will affected by iron deposition this is results in impaired function of the left ventricle .

A current study found that there are no significant differences in the septal thickness between patients and control while there was a significant increase in LVEDDI and LVESDI between thalassemic and control groups . These parameters were analyzed by many other studies and the results of this study agreed with most of them[18]

On the other hand, Bay and his coworker found that there is no significant differences in the LVEDD between the control and patients groups [19]

Doppler measurements in a current study revealed high E, E/e^ ratio in thalassemic patients than in control groups .

This result was agreed with Mozhgan and his co-workers in 2017 who found that the patients with thalassemia had a higher E and E/e^ Doppler parameters than control groups [20] .This findings are agreed with other studies and explained a that chronic state of anemia and increase preload will lead to high cardiac output that cause a higher E velocity [13,21].

Also there is a significant increament of PCWP in thalassemic patients than in control groups which indicate a high ventricular filling pressure and left ventricular dysfunction and this resukt was coincide with another study who had a similar finding [22]

Myocardial performance index (MPI) is directly related to IVRT and IVCT and inversely related to ET.[23]

So MPI is measured the systolic and diastolic function of the heart . Additionally MPI is less affected by the heart rate.

In this study there are significant increase in MPI, IVRT, IVCT and this results were agreed with other study [24], that found a significant increase in MPI when serial evaluation was done to a children thalassemic patients

Effect of TIVA with Propofol Versus Inhalational Anathesia Plus Ketamine on Fertilization and Clinical Pregnancy Rate in ICSI

Raad Ghazi Reshan[1], Bashar Ghanim Ameen[2], Asmaa Abulrazzaq Hassan[3]

[1]High Institute for Infertility Diagnosisand ART's/Al-Nahrain University, Baghdad-Iraq, [2]Senior Anesthetist in Salah-al-Deen Directorate of Health/Ministry of Health, Iraqi, [3]Lecturer in the Department of Obstetrics and Gynaecology, Collage of Medicine/Mosul University, Iraq

Abstract

Background: *In vitro* fertilization is an important advancement in the treatment of infertilityin the late forty years and it has become available on outpatient bases in day care surgical units, however, pain is expressed during aspiration of oocytes and adequate pain relief is required. Various anesthetic modalities and analgesics have been tested in different studies. Theseanesthetic agents have been found in the follicular fluid and may have detrimental effects on oocyte fertilization and embryonic development. The aim of current study was to investigate the effect of type of anesthesia on fertilization and pregnancy rate in patients undergoing ICSI.

Method: The study was held at the High Institute of Infertility and ART's in AL-Nahrin University, Baghdad, Iraqfrom 1st of April 2018 to the 1st of February 2019. The study involved 80 patients during their ICSI course were randomized blindly at time of oocyte retrieval anesthesia into two groups:Group 1 included 40 patients subjected to TIVA(total intravenous anesthesia) with midazolam and propofol (group1) and Group 2 included 40 patiesnt subjected to inhalational anesthesia (isoflurane) with ketamine and Midazolam. Evaluation of fertilization,cleavage, grade 1 embryo and pregnancy rate were done to determine the most beneficialand less toxic anesthesia for *in vitro* fertilization patients.

Results and Conclusion: TIVA with midazolam and propofol had better reproductive outcomes on fertilization rate, cleavage and grade 1 embryo rate with significant higher pregnancy rates than inhalational anesthesiawith midazolam and ketamine.

Keywords: *IVF, anesthesia, propofol, ketamine, pregnancy rate.*

Introduction

*In vitro*fertilization (IVF) is animportant advancement in the treatment of infertilityin the late forty years and it has become available on outpatient bases in day care surgical units [(1)]. In general, IVF techniques includeovarian stimulation, ultrasound-guided oocyte retrieval, intra-cytoplasmic sperm injection (ICSI), embryo culture and embryos transfer [(1)].

Transvaginal oocyte retrieval was introduced in assisted reproductive technologies (ARTs) since 1981 avoidingmore invasive previous laparoscopic use [(2)]. Pain expressed during aspiration of oocytes is produced by the needle inserted through the vaginal wall and ovarian capsules [(3)]. Adequate pain relief is required to ensure immobilization and to eliminate the danger of piercing any vessel and to reduce the stress of the procedure [(2)]. Various anestheticmodalities and analgesic regimens have been tested in different studies, but no definite conclusion so far been made regarding the preferred technique for anesthesia and pain relief for these procedures [(1)]. In addition, these anesthetic agents have been found in the follicular fluid and may have detrimental effects on oocyte fertilization and embryonic development[(4)]. Exposure to the anesthetic drugs should

be the least possible time with least penetration to the follicularfluid [1].

Various anesthetic modalities have been used for trans-vaginal oocyteretrieval such as monitored anesthesia care, conscious sedation,general anesthesia (GA), regional anesthesia, local injection as paracervical block(PCB), epidural block, subarachnoid block, total intravenous anesthesia (TIVA), patient-controlled analgesia (PCA) and alternative medicine approach (acupuncture)[5]. Allmay be potentially toxic to the oocyte. Studieson GA may be conflicting and few studies related it to lower pregnancy rates. There was disagreement about the results mainly due to theuse of different anesthetic techniques with different anesthetic agents. The presence of detectable amounts of anesthetic drugs in the follicular fluid still not strongly indicates toxicity to oocytes [6].

GA has been used with propofol and 50%oxygen–air mixture. Previous trials showed no toxic effects on DNA of the oocyte, on fertilization rate and embryo quality despite its cumulative effect in the follicular fluidin high concentrations [7]. Ketamine was presented commercially in 1970with the manufacturer's description as a "rapidly acting nonbarbiturate general anesthetic". With the help of its old unique pharmacological properties and newly found beneficial clinical properties, it has survived the strong winds of time and it currently has a wide variety of clinical applications. It is a specific intravenous anesthetic agent with a wide range of effects associated with bronchodilatation and sympathetic nervous system stimulation [8]. Ketamine is excreted asnorketamineinurine and faeces and accumulates with a gradual resistance that emergeson repeated dosages. Generally, ketamine nowadays (0.75mg/kg) is accepted asan alternative to general anesthesia in oocyte retrieval [9]. The aim of current study was to investigate the effect of type of anesthesia on fertilization and pregnancy rate in patients undergoing ICSI.

Materials and Method

The study was double-blind randomized clinical trial held at the High Institute for Infertility and Assisted Reproductive Technique in AL-Nahrin Medical University, Baghdad, Iraq. The study was started at the 1st of April 2018 tillthe 1st of February 2019. The study involved 80 patients subjected to ICSI for infertility treatment after taking a written informed consent from them for their participation in the study.

Inclusion criteria were patients' age between 20 and 40 years, body mass index (BMI) of 22-27 kg/m^2, healthy patients with ASA grade I(Healthy, non-smoking, no orminimal alcohol use)[10], normal AFC, AMH, FSHandLH, normal seminal fluid analysis or mild male factor infertility, no genital tract anomalies and female factor infertility with adequate ovarian reserve. On the other hand, exclusion criteria included those without the above criteria, those with empty follicle syndrome, those refused to participate in the study and those not subjected to embryo transfer.

The 80 patients were evaluated initially during their IVF/ICSI cycle for hormonal and ultrasound examination and started their controlled ovarian stimulation with gonadotrophin. The response to treatment was monitored by repeated ultrasound and estradiol level measurements. When the largest follicle was 14mm in size, antagonist 0.25mg was administered daily until at least three follicles reach 18mm in size whenoocyte maturation was triggered by 10000IU subcutaneous HCG.

Generalanesthesia During Oocyte Retrieval: Oocyteretrieval guided by ultrasound under general anesthesia was done after 34-36 hours. All80 patients included in the study were healthy with ASA grade 1 according to the American society of anesthesia and they were breathing spontaneously with oxygen face mask. They wereblindly randomized to two groups;Group 1 included 40patients managed with total intravenous anesthesia (TIVA) starting with IVmidazolam0.05mg/kg with fentanyl 0.015mg/kg followed after 5 minutes by IVpropofol 2mg/kg total infusion dose. Infusion was started at a rate of 100-150µg/kg/min in the first 15 minutes then 50-100µg/kg/min, then turned off the propofol infusion 5-10 minutes before the desired time of emergence. Group 2 included 40 patients started with midazolam 0.05mg/kg and ketamine 2mg/kg with maintenance on inhalational anesthesia by isoflurane (mac 1.1)withisofluranewas turned off about 5 minutes prior to the desired time of emergence. Monitoring was achieved with measurements of vital signs including pulse rate, blood pressure and respiratory rate.At the embryology laboratory, assessment of total number of oocytes, oocyte denudation, number of MII and MI was assessed as well as abnormal oocytes including GV. In addition, mature oocytes were inseminated by ICSI 18 hours after assessment for fertilization and assessment for grade of pronuclei, then daily follow up for number of blastomeres,degree of fragmentationand grading of embryo. Embryo transfer after 48-72 hours,all patients

have one or two Grade 1 embryo transferred, this is determined according to the grade and number of embryos available, then luteal phase support by cyclogest suppositories twice daily and primolut depot ampoules 250µg IMtwice weekly. Two weeks later checking for pregnancy was done by serum measurement of h CG and subsequently by ultrasound for assessment of fetal node and viability.

Outcome Measures: Fertilization ratewas defined as total number of fertilized oocyte numberby total number of embryo transferred.Cleavage ratewas defined as total number of day 3 embryos by total number of fertilized oocytes [11]. Pregnancy rate is the number of pregnancies by patients subjected to ICSI embryo transfer attempt[12].

Statistical Analysis: The Statistical Analysis System (SAS) [13] program was used sis. Chi-squared test was used to compare between percentages and least significant difference (LSD) test was used to compare between means in this study [13].

Results

In this study, there was a tendency for higher pulse rate, higher blood pressure and respiratory rate in group 2 compared to group 1 with significant difference (Table 1).

Total oocytes retrieved in our study were 313 in group 1(TIVA + propofol-treated group) and 299 in group 2 (inhalational + ketamine-treated group). MII oocytes formed about 45% of oocytes in group 1(142/313) which is lower than MII oocytes ratio in group2 (57.85%; 173/299)with statistically significant difference between the two groups. MI oocytes were not statistically difference between both groups, while abnormal oocytes (Germinal vesicle,ruptured abnormal oocyte) in group 2 were statistically lower than group 1 (100/313 compared to 59/299).

Table 1: Physical findings for ICSI patientsof both groups of patients treated with TIVA or inhalational anesthesia

Physical finding	TIVA (Propofol) group 1 (Mean±SD)	Inhalational Anesthesia + Ketaminegroup2 (Mean±SD)	*t*-test
Heart rate (beat/minute)	102.45±5.38	111.62±7.82	7.819 *
Systolic blood pressure (mmHg)	125.62±7.07	135.42±9.61	28.51 NS
Diastolic blood pressure (mmHg)	66.5±2.66	81.40±4.27	13.73 *
Respiratory rate (breath/minute)	14.47±0.52	17.02±1.06	2.16 *

*: Significant at P<0.05. NS: Non-significant.

The total number of oocytes inseminated in group 1 was 198 compared to 203 oocytes in group 2. The insemination rate was 4.95 oocytes/patient in group 1 and 5.07 oocytes/patient in group 2 (Table 2).

Table 2: Laboratory findings of oocytes of both groups of patients treated withTIVA or inhalational anesthesia

Laboratory Finding	TIVA:Propofol group 1 No.	TIVA:Propofol group 1 Percent/ ratio	Inhalational + Ketamine group 2 No.	Inhalational + Ketamine group 2 Percent/ratio	Chi-Squared (χ^2)
Total oocytes number	313	7.8/patient	299	7.47/patient	---
MII	142/313	45.36%	173/299	57.85	4.52 *
MI	71/313	22.86%	67/299	22.40%	0.074 NS
Abnormal oocytes	100/313	31.94%	59/299	19.73%	4.85 *
MII:MI ratio	142/71	2.00	173/67	2.58	---
Inseminated oocytes	198	4.95/patient	203	5.07/patient	---

* (P<0.05). NS:Non-Significant.

The fertilization rate, cleavage rate and grade 1 embryo were higher in group 1 than group 2 (75.25% compared to 71.42%,76.51 compared to 75.86% and 73.46% compared to 67.27%, respectively) although statistically were not significant. With a statistically significant difference between the pregnancy rate between both groups with higher pregnancy rate in group 1 patients than group 2(35% compared to 17.5%, respectively, Table 3).

Table 3: Reproductive outcome resultsfrom ICSI patients treated with TIVAor inhalational anesthesia

Reproductive Outcome	Propofol group No.	Propofol group Rate/ratio	Ketamine group No.	Ketamine group Rate/ratio	Chi-Squared (χ^2)
Fertilization rate	149/198	75.25%	145/203	71.42%	0.793 NS
Cleavage rate	114/149	76.51%	110/145	75.86%	0.793 NS 1.602 NS
Grade1embryo	75/114	73.46%	74/110	67.27%	2.526 NS
Pregnancy rate	14/40	35%	7/40	17.5%	7.194 *

*: Significant at P<0.05. NS: Non-Significant.

Discussion

Infertile patients managed with ICSI when subjected to anesthesia they may suffer from stress, anxiety depression and obesity. Theymight be taking a lot of drugs like aspirinand metformineand they might be subjected torepeated interventions and pain especially at time of retrieval of the oocytes and discomfort from hyperstimulated ovaries and from associated ascitis[14]. The type of anesthesia should be suitable to the patient clinical state and satisfactory for relieving her anxiety and pain,keeping in mind that these drugs might be eliminated in the ovarian follicular fluids and may affect the oocytes and their DNA, interfering with their fertilization, embryo grading and subsequent pregnancy.

TIVA by Propofol is the most commonly used agent for general anesthesia,with fast onset and short elimination time. It is beneficial in oocyte retrievaland it may cause cardio-respiratory depression which can be improved by addition of fentanyl [15] andthe patient should be monitored with anesthesiologist or personnel skilled with air ways management. In this study the group received TIVA with propofol (group 1) had higher fertilization rate, cleavage rateand higher percentage of good quality grade 1 embryowith significant higher pregnancy rate and this was also evident in previous study by [16]. Accordingly, TIVA with propofol can bemore suitable for GA in oocyte retrieval since it has less effect on fertilization rate, embryo quality and pregnancy rateespecially if prolonged anesthesia is avoided. Till now there is still a concern on oocyte quality comes from accumulating concentration of propofol in the follicular fluid especially for the last aspirated follicles supported by ahuman study by [17] although this damaging effect is not confirmed till now but itis still possible.

Ketamine with its long use in general anesthesia,can be regarded as ideal anesthetic agent and it is a good alternative to TIVA with propofol, especially when used with midazolam (minimize its well knownpostoperative CNS and psychological side effect[18]. Ketamine as in our study, it was known togive lower fertilization rate, embryo grading and significantly lower pregnancy rate. This could be due to its effect on increasing prolactin and β-endorphin levels[18] or due todirect toxic effect on oocyte and its DNA. Inaddition, isoflurane inhalational anesthetic agent used with ketamine (as in our study) might also be responsible for lower reproductive outcome and pregnancy rate in group 2,as it was found from a previous study due to directembryo- toxic effect[19]. Midazolam was used in both groups in our study and it is known to accumulates in the follicular fluid without affecting pregnancy rate [20] .In this study there was higher number of abnormal oocytes (mainly GV) in group 1 than in group2, with relative decrease in MII with similar total number of inseminated oocytes/ patient. In our study, this difference in the ratio of MII to the immature MI and abnormal oocyte may have resulted from the operator tendency to aspirate all the remaining

small follicles towards the end of the procedure to avoid OHSS in patients with large number of follicles. Inspite of this higher rate of inseminated MII in group 2(MII: 173), the fertilization, cleavage and embryo transfer rates were still higher than in group 1(MII:142)with significantly higher pregnancy rate.

It was found that significant higher fertilization,cleavage and grade 1 embryo and pregnancy rate in propofol-treated group than ketamine-treated group[21], similar to the results of our study although the pregnancy rate was clearly significantly different, but the pregnancy rate was higher than in our study in the group 1. This might be due to difference in the pregnancy rate between that center and ours.

There was an observed negative effect on fertilization, cleavage and Grade 1 embryo rate in inhalational anesthesia plus ketamine-treated group compared to TIVA with propofol. Also, there was significant effect of isoflurane and ketamine on ICSI outcome and specificallyon pregnancy rate compared to propofol. Thelatter should be regarded as first-line anesthetic agent to be used for oocyte retrieval.

Studies on the effects of anesthetic drugs level in the follicular fluid on the oocyte retrieved at early, mid and late in the procedure, give better confirmation of toxicityand whether it depends on duration of exposure or not.

Abstract

Background: Colorectal cancer is one of the most common cancers in mortality and morbidity worldwide. Single nucleotide polymorphismsin microRNAs may be used as specific markers of predisposition for colorectal cancer diagnosis and prevention. The aim of current study was to investigate the role of miR-196a2 gene polymorphisms in the development of gastric cancer.

Method: A total of 40 hospitalized gastric cancer patients and 20 control subjects were collected between August 2015 and October 2016. The genotyping of miR-196a2 were performed using polymerase chain reaction coupled with restriction fragment length polymorphism.

Results: We observed significant differences in the genotype frequencies of miR-196a2 between patients with gastric cancer and controls (P=0.009, OR =6.92(1.52-31.37).

Conclusion: Our study found that miR-196a2 polymorphism was associated with gastric cancer development.

Introduction

Colorectal cancer (CRC) is the third most frequently diagnosed malignancy in men and the second among women. In 2012, approximately 1.4 million cases were diagnosedand 693,900 CRC-related deaths occurred (1). The International Agency for Research on Cancer estimated that there were 952,000 new gastric cancer cases in 2012, making it the firth most common malignancy in the world, after lung, breast, colorectal and prostate cancers (2). Infection with Helicobacter pylori is a proved risk factor for gastric cancer (3,4) and some environmental factors have been indicated to have a critical role in the development of gastric cancer, such as consumption of preserved food containing carcinogenic nitrates, lifestyle, tobacco and alcohol as well as obesity (5). CRC is a multi-factorial disease. Genetic background, environmental factors and gene-environment interactions all contribute to its etiology. Many studies have been carried out to identify genetic variations that might be used for CRC diagnosis and prognostic assessment. MicroRNAs (miRNAs) are well known classes of small noncoding RNAs and they are responsible for promoting messenger RNA (mRNA) degradation, inhibiting mRNA translation and affecting transcription through binding to the 3'-untranslated regions (3'-UTR) of their target mRNA [6,7]. Experimental studies indicated that miRNAs are involved in a variety of biological processes such as cell proliferation, differentiation and apoptosis through regulating approximately 60% of the human protein coding genes [8,9]. Single-nucleotide polymorphisms (SNPs) are the most common sequence variation in human genome. SNPs in miRNAs genes may influence the expression of the respective miRNAs. Such as rs11614913 is identified and implicated in the development of multiple-type cancerssuch as colorectal, lung, breast and renal cell cancers as well as head and neck [10]. SNPs in miRNAs can affect hundreds of mRNAs, since it is estimated that mature miRNAs regulate around 30% of human genes. Since the first report of their existence, several studies have been carried out to identify these variants and

explore their associations with cancer. In current study, we conducted a case-control study to investigate the role of miR-196a2 gene polymorphisms in the development of gastric cancer.

Material and Method

Sampling: Forty blood samples were collected from patient with colorectal cancer who visited different hospitals in middle and south of Iraq and twenty samples from healthy subjects as controls.

DNA Extraction: Genomic DNA from whole blood cells was extracted and purified using extraction and purification Kit from Favergencompany (Taiwan).

Genotypic identification using RFLP- PCR amplification: The targeted sites of DNA were amplified using specific primers: One primer was used to identify miR-196a2, obtained from Bioneer, IDTDNA (USA). Primer: Forward sequence was 5- CCCCTTCCCTTCTCCTCCAGATA -3 and the reverse sequence was 5- CGAAAACCGACTGATGTAACTCCG -3.

Final product of 20µl reaction volumes containing 1.5µl of forward and reverse primer,12.5µl of Green Master Mix,3µl of Genomic DNA and the volume of reaction was completed up to 20µl by adding 1.5µl of nuclease free water. Amplification was carried out in a thermo-cycler (Eppendorf) programmed for five minutes at 94°C; for 30cycles; one minute at 94°C, one minute at 57.8°C and one minutes at 72°C; and a final extension of five minutes at 72°C. Amplification products were electrophoresed in 1% agarose gels and then visualized by staining with ethidium bromide. Standard molecular markers were also included in each electrophoresis run. Ultraviolet trans-illuminated gels were photographed.

The PCR product was cut using *MSPI* restriction enzyme, the PCR-RFLP technique was accomplished according to Promega Company Protocol. The digested *MSPI* products were electrophoresed through 3% agarose gels at 75V for 1 hour.

Statistical Analysis: All the statistical analyses were done with the SPSS statistical software (version 17.0; SPSS Inc., Chicago, IL), *P*-values <0.05 were considered statistically significant.

Results

Genotyping Study: Figure (1) showed miR196a2 amplification product, whereas Figure (2) showed gel electrophoresis of RFLP-PCR of miR196a2 amplified product.

Figure 1: Agarose gel electrophoresis of amplified products of MirRNA196a2(145bp).

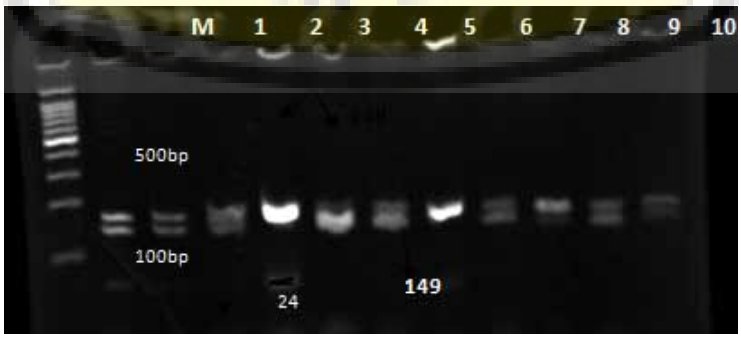

Figure (2): RFLP- PCR DNA polymorphisms of MirRna196a2. M: size marker, Lines (1,2) heterozygous 3 band TC (149,125 and 24bp). Lines (4,7) homozygous 1 band (149bp). Lines (3,5,6,8,9,10,11) homozygous 2 band (149 and 125bp).

Table (1): Genotyping distribution of pre-microRNA-196a2 (rs s11614913) polymorphism and their association in control and patients groups

Genotype	PatientsNo.(%)	Control No.(%)	P-Value	OR (95%)
TT a	9(22.5)	11(55)	0.009*	6.92(1.52-31.37
TC	17(42.5)	3(15)		
CC	14(35)	6(30)	0.100	2.85(0.77-10.46)
Total	**40**	**20**		

*: P≤0.05; OR=(95%CI); [a] reference.

The MicroRNA gene polymorphism was studied in CRC cases and controls. MiR196A2 T>C(rs11614913). The distribution observed in MicroRNA gene polymorphism in control and patients groups were showed in Table (1)**.** Thehighest genotype in control group was TT homozygote genotype (55%) followed by heterozygote genotype TC(30%) and mutant homozygote genotype CC(15%). In CRC disease, the highest genotype was TC heterozygote (42.5%). Also, the genotyping distribution pointed out that mutant homozygote CC (35%) was more than normal homozygote TT(22.5%).

Discussion

MicroRNAs (miRs) are noncoding RNAs that are transcribed from endogenous DNA molecules. Most miRs span about 22 nucleotides, but have negative regulation on its target mRNAs in the post transcriptional processes [(11)]. Cellular processes that involve miRs include development, differentiation, proliferation, apoptosis and stress response [(12)]. MiRs break the structure of target mRNAs or inhibit translation to down-regulate the expression of target mRNAs.

It is well known that polymorphism in miRNAs region plays a critical role in the expression and transcriptional regulation of miRNAs. The rs11614913 polymorphism in miR-196a-2 has been associated with susceptibility to various cancers. The molecular basis for this remains obscure; however, it has been speculated that the T to C mutation in the pre-miRNA stem region may alter the expression level of mature miR-196a-2 and influence its binding to target mRNA[(13)]. Therefore, the genetic variations of pre-miR-196a2 could influence the expression of mature miR-196a2 and binding activity of target mRNAand thus alter the gene function.

As elevated expression of miR-196a (the mature miRNA encoded by miR- 196a-2 gene) can promote CRC cell migration and invasion, sequence variations leading to such increased transcription might raise CRC risk [(14)]. We retrieved nine studies concerning the association between rs11614913 and this disease. Three of them reported that the TC genotype increased CRC risk compared to the TT genotype, whereas three others demonstrated that it decreased susceptibility. Six studies showed individuals with the CC genotype to be at increased risk in comparison to those with the TT genotypeand one investigation established the opposite effect.

Another study [(15)]reported that miR-196a expression is significantly higher in patients carrying CC or TC genotypes than in TT carriers. In our analysis of the association between this miR-196a-2 polymorphism and CRC risk, eight studies comprising 2264 cases and 3199 controls were included (one study was excluded because the genotype distribution data of control was lacking). We found no relationship between rs11614913 and CRC under any genetic model (CC *vs*TT: OR = 0.852, 95%CI = 0.479-1.515; CT *vs*TT: OR = 0.946, 95%CI = 0.735-1.216; CC+CT *vs*TT: OR = 0.945, 95%CI= 0.689-1.298; C *vs*T: OR = 0.962, 95%CI = 0.752-1.230) [(16,17,18,19,20,21,22)].

Conclusion

Our study found that miR-196a2 polymorphism was associated with gastric cancer development.

Abstract

Background: Cancer is one of the most important diseases of concern worldwide. The advanced in nanotechnology were focused in many scientific researches on the formation of nanoparticles and their application in cancer treatment. The aim of current study was to synthesize Au-Ag bimetallic nanoalloys with tunable localized surface plasmon resonance frequency for use in photothermal therapy for MCF7 breast cancer cell line.

Method: In this work, nanoparticles were made of silver: gold alloy with different gold ratio for use in phototherapy with tuned plasmon resonance peak between 405 to 526nm using UV-visible absorbance.

Results: From the comparison between FTIR spectrum of controlled breast cancer cell line (MCF7) before and after the addition of metal nanoparticles, was found essential difference due to the conjugated of cell protein with added metal nanoparticles. There was a selectivity of metal nanoparticles effects on the band where the N–H braches of the protein are directly involved in its interaction with the metal surface due to surface enhanced infrared absorption.

Conclusion: Growth inhibition of cancer cell line treatment using phototherapy employed metal nanoparticles and UV radiation illustrates good results with best GI ratio when use silver nanoparticles with 67.06% ratio before irradiation and 82.02 % after irradiation. This percentage decreases with increasing the gold ratio.

Keywords: *Plasmon effect, phototherapy, breast cancer, laser ablation, silver: gold alloys, nanoparticles.*

Introduction

The electronic structure of nanoparticles is strongly size-dependent. This effect is known as quantum confinement. A strong confinement regime occurs for particles with radius smaller than exciton Bohr radius (a_0), where the confinement potential becomes larger than the Coulomb interaction. There are two most important consequences of quantum confinement. The first is that the band gap of a semiconductor becomes larger with decreasing size and the second is that discrete energy levels arise at the band-edges of both the conduction and valence band[1].

That plasmon resonance coupling between nanoparticles and electromagnetic radiation is one of the most interested behaviors to many researchers. Controlling the local surface plasmon region (LSPR) sensitization amplifies its potential in the selection of effective wavelength by particle size, shape and components. Further control of the plasma frequency range can be achieved by using nanoparticles from a metal alloy or as core shell structure. The plasmon frequency produced in general with wavelength between the two values of the pure component with a value dependent on the ratio of the constituents[2].

Laser ablation is the process of removing the material from a solid surface by irradiating it using a laser beam. When the falling laser energy of the time unit is large and for a small space, the material is usually converted into plasma. The amount of material removed by a single laser pulse affects the depth of the penetration, the optical properties of the material, the length of the laser wave and the pulse time [3].

Phototherapy is a method involves the use of electromagnetic radiation to destroy abnormal tissue cells during heat-thermal management that is sufficient to induce cell damage due to high temperature in the tumor area. The small size and heating capacity of metal nanoparticles (NPs), within a very small area higher than 313K by a suitable light source, led to the concept of phototherapy heat treatment. Gold nanoparticles (AuNPs) can enable highly targeted phototherapy to reduce undesirable side effects and has been widely used, either alone or in combination with chemotherapy and radiation therapy. Hyperthermia causes shrinkage in living cells, rupture of cellular membranes and release of cellular contents as well as alters the nature of enzymes and eventually leading to cell death. AuNPs have high absorption in the surface plasmon frequency region (SPR), enabling them to convert absorbed light into heat during picoseconds while leaving normal cells intact [4]. The core-coated AuNPs were also used as a probe for near-infrared heat (NIR). The SPR region can be adjusted to alter the optical properties of the nanoparticles. On the other hand, antimicrobial activity in nanoparticles was studied in combination with irradiation laser in *in vitro* human cancer cell line, while individual treatments showed little effect on cancer cells [5].

Silver nanoparticles (AgNPs) were focused with much interest due to their unique properties for antimicrobial activity against a wide range of microorganisms [6]. Photothermal therapy is an approach involving utilization of radiation exposure to induce cytotoxic damage of cells in tissues by sufficient heat for hyperthermic cellular responses in the tumor area [5].

The aim of current study was to synthesize Au-Ag bimetallic nanoalloys with tunable localized surface plasmon resonance frequency for use in photothermal therapy for MCF7 breast cancer cell line.

Materials and Method

Five samples were prepared; two of them were gold and silver, whereas the other three were alloys of both metals, with different weight percentages of Ag: Au (75:25, 50:50 and 25:75). The alloys were melted in graphite crucibles at sufficient melting point for both metals which is 1473 K, then poured molten into small molds until cool. Nd:YAG lasers with infrared wavelength of 1064nm has 900mJ pulse energy at 9 nanosecond pulse duration laser energy in distilled water.

The prepared metal nanoparticles were characterized using UV-visible absorbance and Fourier-transform infrared spectroscopy (FTIR). Also the cancer cell lines were examined by the FTIR before and after treatment with different metal nanoparticles ratio (Ag: Au) to study the effect of nanoparticles on IR band for cancer cell lines.

The prepared nanoparticles were examined in phototherapy of MCF7 breast cancer cell line *in-vitro* using UV irradiating for 24 hour after cells treatment with metal nanoparticles suspension. Briefly, MCF7 cancer cell lines were cultured in RPMI media containing 10% serum [One liter medium was supplemented with L-glutamine, 10% Hepes 10mM, 10% FBS, sodium bicarbonate (4.4%) 5–10ml, benzyl penicillin solution 0.5ml (1000000IU) and streptomycin 0.5ml] at 37°C under 5% CO_2. Cells were incubated in 96-well plate (104 cells per well) for 24h. Then, metal nanoparticles suspensions were introduced in the 96-well plates with different weight percentages of Ag: Au (100:0, 75:25, 50:50, 25:75 and 0:100) and incubated for another 24h at 37°C under 5% CO_2. Thereafter, the mixture was treated with and without irradiation by ultraviolet radiation. After that, cytotoxicity was determined by the MTT assay. Cells that were exposed to irradiation in absence of metal nanoparticles or in converse were regarded as controls. MTT reagent (2.5mg/ml) was added (50µl/well) and incubated at 37°C for 3h. The formazan crystals were dissolved in 100µl of dimethyl sulfoxide (DMSO) for 10min. The plate was subsequently read in the spectrophotometer at 620nm. Cells cytotoxicity was calculated as the ratio of the absorbance of the treated and control wells. On the other hand, the growth inhibition ratio (GI) was determined according to the following formula: Inhibition (%) = [(Optical density of control wells - Optical density of test wells)/Optical density of control wells] x 100 [7].

Results and Discussion

Figure 1 illustrated UV-visible absorption spectra of the aqueous solution of the produced AgNPs, AuNPs

and their composite at different (Ag: Au) ratios which were prepared by pulse laser ablation in distilled water. The peak appeared at 405nm was the specific peak of AgNPs plasmon resonance .This result was in agreement with results of[8], while the peak at 526nm was the specific peak of AuNPs which was in agreement with results of[10]. The excitation of quantum size is confined electron with its resonance frequency. This effect occurs when the particle size diameter is a part of the wavelength. These peaks confirm the formation of NPs in the solution.

Increasing the gold ratio leads to shift of absorbance peaks, from 405nm in pure Ag to 526nm in pure Au sample, corresponds to variation in plasmon resonance due to the alteration in the dielectric constants of the two metals which changes its resonance energy and the absorbance value at this plasmon peak wavelength is slightly decreased. These absorbance peaks can be used as a selective absorbance peak for irradiation treatment. These results agreed with [10] who reported for Ag:Au nanoparticle composites.

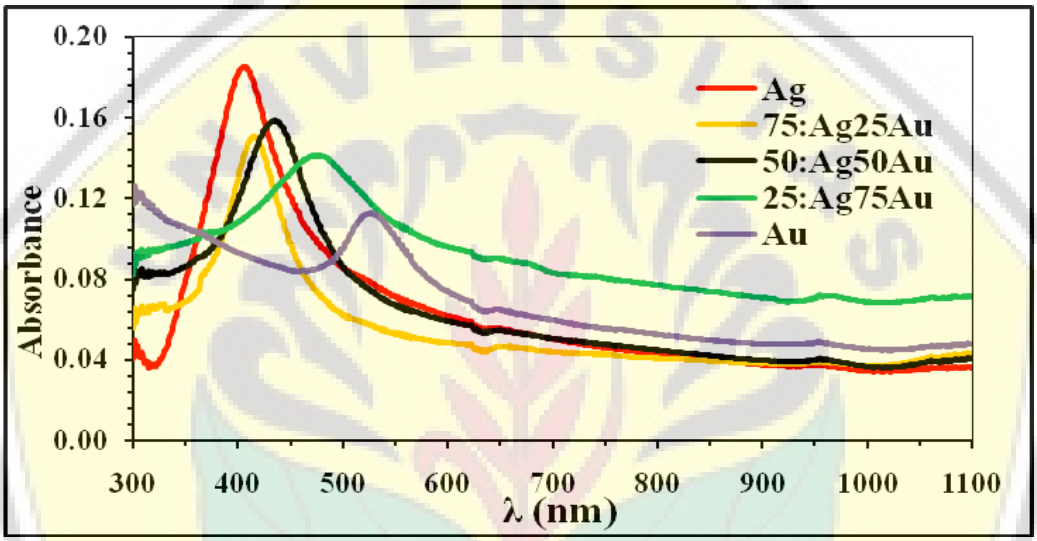

Figure 1: UV-VIS spectra for AgNPs, AuNPs and their composite sample at different Au ratios in water prepared by PLD.

Figure 2 showed the FTIR spectra for Ag: AuNPs composite at different Au ratios in the range 4000-400cm^{-1}. The characteristic absorption bands for AgNPs samples were 780.56 and 465.61cm^{-1} corresponded to the Ag-O stretching and bending vibration, respectively, [10,11]. Also, there were additional bands at 3431.35 and 1051.76cm^{-1} corresponded to stretching –OH group and for C-O comes from adsorbed gases on sample surface.

Decreasing the Ag ratio reduced the Ag-O band intensity till it's vanished at pure Au sample. Also, it can be noted that the C-O peak reduced its intensity due to the variation of sample ability to adsorb carbon oxide gases. The decrement of Ag-O band after mixing Au ratio with Ag was due to prevention of silver oxidation by Au shell.

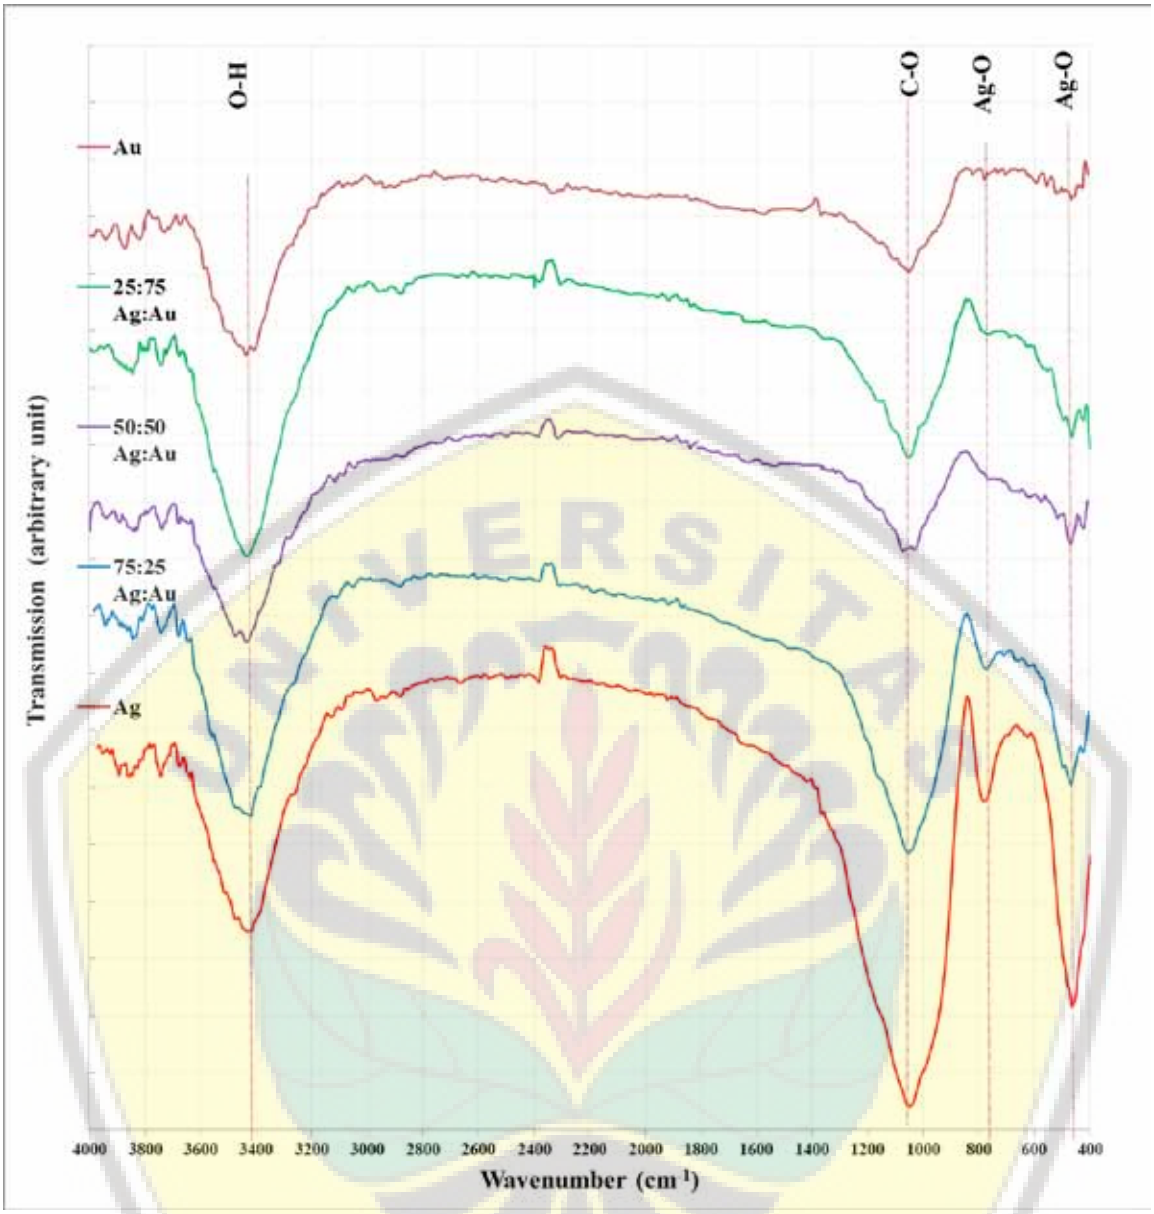

Figure 2: FTIR spectra for Ag NPs, Au NPs and their composite at different Au ratios.

The FTIR spectrum of controlled cancer cells line, which was shown in Figure (3) illustrated characteristic IR absorption bands of proteins. These absorption bands were including the amide N–H bond at 3848.74 and 3737.04cm^{-1}; very broad peak of carboxylic O–H groups centered at about 3439.17cm^{-1}. Symmetric and asymmetric vibration bands were seen for C-H stretch of amino acid within 2924.89cm^{-1}; strong typical amide I and amide II bands (representing mainly the stretching C=O and bending N–H modes) of peptide moieties at 1644.99 and 1514.67cm^{-1}, respectively. As well as peak of C–O band was shown at 1067.87cm^{-1} [13-15].

The comparison between the spectra of controlled sample of cancer cells line before and after the addition of metal nanoparticles was essentially different due to the conjugated cell protein with added metal nanoparticles (AgNPs, AuNPs and their composite at different Au ratios). It should be noted that the peaks of proteins in the conjugated samples with metal nanoparticle were less than that of pure proteins, whereas other peaks values with nearly same intensity were comparable to control sample, indicated the Dipole-Quadrupole effect that caused vibration bonds surface which enhanced infrared absorption (SEIRA) due to conjugation between

cell proteins and metal nanoparticles which caused selective surface enhancement of certain functional groups according to surface selection rules [16].

Note that, according to the SEIRA theory, only those molecular vibrations which appeared perpendicular to the metal surface were enhanced accounting for the selectivity of enhancement. Thus, the FTIR for samples of the nanoparticle–protein conjugate accounts for the absence of amide groups [15].This effect corresponded largely to the electrostatic and hydrophobic nature of the gold and silver nanoparticle surface conjugated with bio-materials due to the net effect of non-covalent interactions. The FTIR spectra for treated samples showed that the amide N–H band at 3848.74 and 3737.04cm^{-1} disappeared and instead of the amide I and amide II bands, in the metal nanoparticle–protein conjugate, there appeared as a single intermediate strong peak centered at 1638cm^{-1}. These changes might indicate that the N–H braches of proteins are directly involved in their interaction with the metal surface, in addition to enhance the regions of bending C–H vibration modes around 1400cm^{-1}. The extreme changes in cell proteins spectrum induced by metal nanoparticles upon conjugation can provide evidence that protein molecules are attached directly to the metal nanoparticle surface. This conjunction is of primary importance for the irradiative treatment [17].

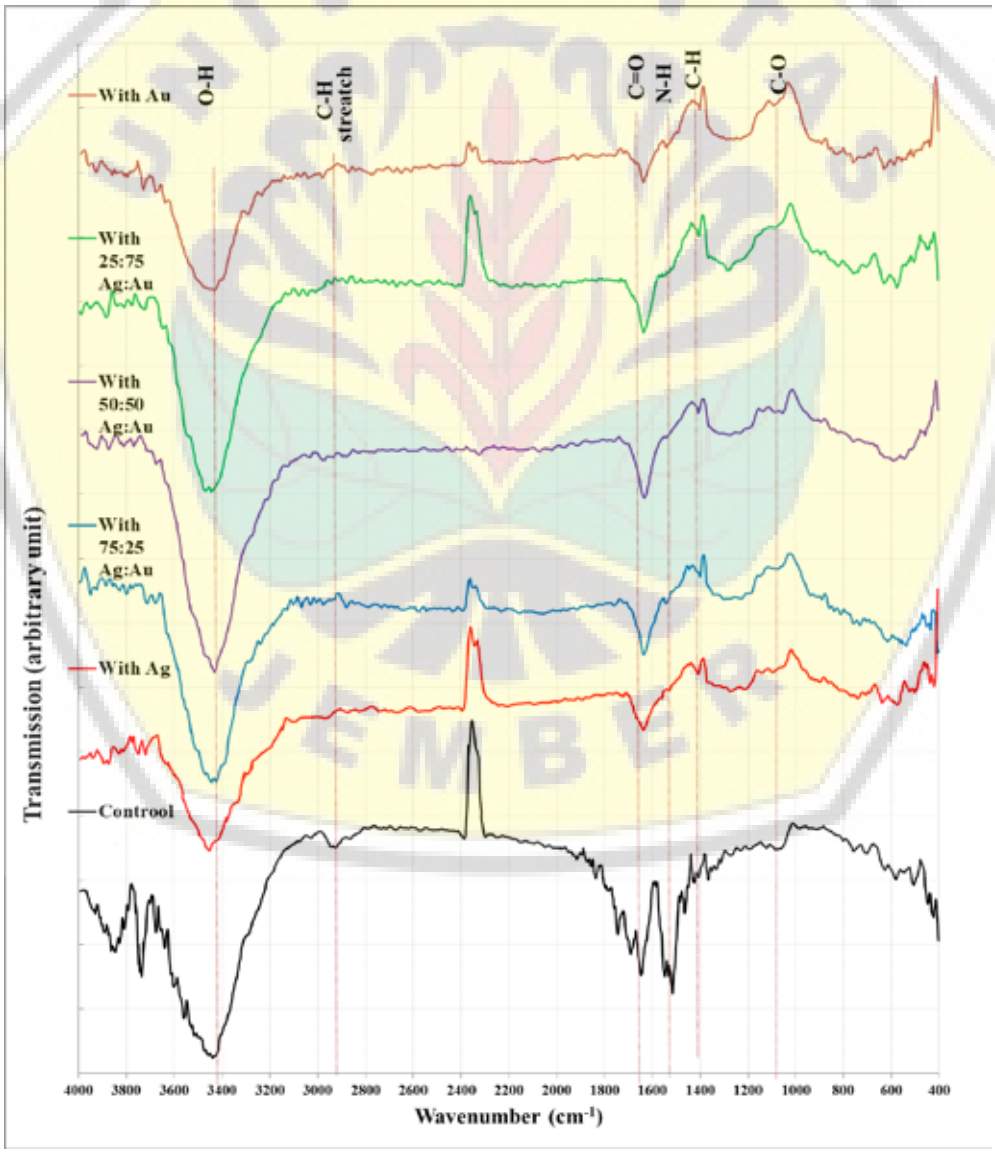

Figure 3: FTIR spectra for controlled cancer cells and samples treated with AgNPs, AuNPs and their composite at different Au ratios.

In-vitro MCF7 breast cancer cells line growth inhibition ratio (GI) using metal nanoparticles, without and with irradiation by ultra violet radiation, were shown in Table (1) and Figure (4). It seemed that the growth inhibition was reduced with decreasing Ag NPs in Ag: Au i.e. increased in AuNPs ratio. It was reduced from 82.02% for the controlled sample treated with AgNPs to 76.12% for AuNPs. The reduced growth inhibition due to red shift of plasmon peak of AgNPs with decreasing Ag in Ag: Au ratio as shown in UV-Visible absorption part. This shift reduced the overlap area between the absorption spectrum of the plasma peak and the spectrum of radiation applied onto the samples. Also, it was clear that growth inhibition after irradiation was greater than samples inculpated without irradiation in all Ag:Au ratios due to the effect of selected heating of cancerous cells treated with nanoparticles. The higher cytotoxic action of metal nanoparticles could be due to slow cellular uptake and intracellular distribution of nanoparticles because of its slow release behavior. Nanoparticles may be relying on cancer cells line and exposure conditions can stimulate apoptosis, DNA damage, diminish the invasive potential and reduce NF-jB activity [18,19].

Table 1: Growth inhibition% for MCF7 cancer cells line treated with metal nanoparticles before and after UV-irradiation

Ag:Au	Growth inhibition%	
	Before UV exposure	After UV exposure
100:0	67.06	82.02
75:25	65.88	81.50
50:50	64.82	81.18
25:75	62.35	80.34
0:100	61.65	76.12

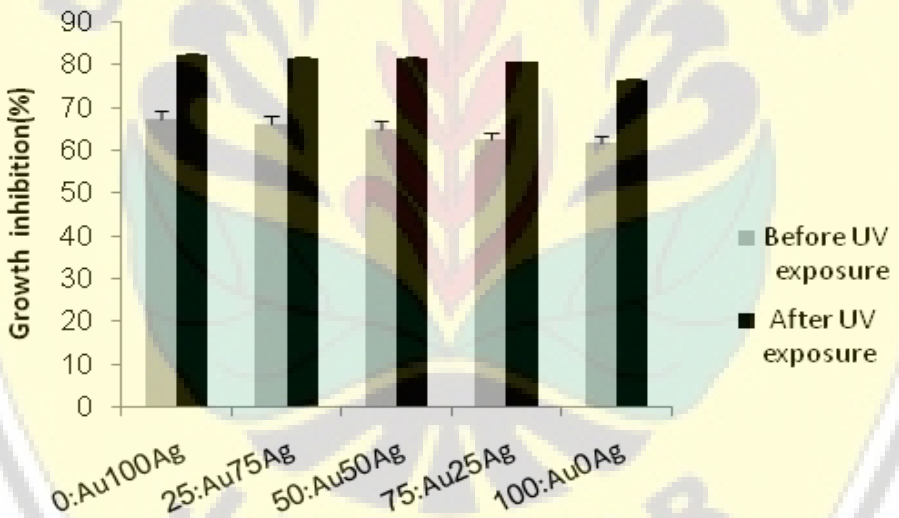

Figure 4: Cytotoxicity of MCF7 breast cancer cells line treated with the metal nanoparticles before and after UV-irradiation

Conclusions

Nanoparticles from the Ag: Au alloy were successfully generated by a simple way with the control of wavelength of the plasmonic peak between 405 and 526nm by variation of metals ratios, which were demonstrated in both the absorption spectra and the FTIR measurement. The FTIR measurement of cancer cells line before and after treatment with metal nanoparticles illustrated a conjugate between metallic nanoparticles and the cell proteins. The conjugation between proteins and metal nanoparticle, induced largely by the specific and selective surface enhancement of certain functional groups, due to surface selection rules for vibrations of surface plasmon resonance. Finally, growth inhibition (GI) of cancer cells line treatment using phototherapy employed metal nanoparticles and UV radiation illustrated good result with best GI ratio when we used AgNPs with 67.06% ratio before irradiation and 82.02% after irradiation. This percentage decreases with increasing the Au ratio.

Association between Irisin and Obesity

Leana Alaa Abbas[1], Saad Merzah Hussein[1], Wathiq Essam Hameed[1]

[1]College of Medicine, University of Babylon, Iraq

Abstract

Objective: To observe the relationship between serum Irisin and obesity. Background: One of the top worldwide health problems is obesity. Many causes have been implicated for developing obesity such as: excessive food intake, lack of physical activity, genetic susceptibility, endocrine disorders, medications, or mental disorder.

Material and Method: One hundred and five individuals were participated in this study visiting Al-Imam Al-Sadiq Teaching Hospital from October 2017 to June 2018. A 50 normal non-obese and 55 obese. They were classified according to body mass index after measuring their weight, height. Blood and data were collected from patients and control to detected Irisin.

Results: The highest percentage of obese patients were female, the highest percentage of obesity was recorded among 20-30 age group, the majority of the obese patients were from urban areas and largest group of obese patients were unemployed.

Regarding Investigation: Irisin, there is significant difference ($p \leq 0.05$) between case and control for Irisin. There is also a significant positive correlation between irisin and body mass index(p value≤ 0.05; $r = 0.44$) and with the waist circumference (p value≤ 0.05;$r = 0.407$).

Conclusion: Serum irisin levels were higher in obese patients than in control. Moreover, serum irisin levels were correlated positively with anthropometric markers of obesity (BMI, Waist Circumference).

Keywords: *Obesity, Irisin, Body Mass Index, Waist Circumference.*

Introduction

Obesity is "a chronic, relapsing, multifactorial, neurobehavioral disease, where there is an increase in body fat adversely effects on adipose tissue function and physical forces of fat mass, resulting in abnormal biomechanical, metabolic and psychosocial health consequences", it is more common in women [(1-3)].

There are many types of obesity depending on where fat cells are stored. Abdominal obesity (excessive accumulation of fat cell in adipose tissue of the abdomen) is associated more strongly with meta-inflammation [(4)].

Irisin is a plasma myokine/adipokine that is produced by the proteolytic cleavage of fibronectin type III domain containing 5 (FNDC5) [(5)].

There are many reports of the positive, negative and no correlations between serum irisin and body mass index (BMI)[(6-9)].

The aim of This Study is To observe the relationship between serum Irisin and obesity

Materials and Method

Subjects: A case-control study was conducted in the obesity unit in Al-Imam Al-Sadiq Teaching Hospital at Babylon Governorate/Iraq, from October 2017 to June 2018.

Corresponding Author:
Leana Alaa Abbas
College of Medicine, University of Babylon, Iraq

Inclusion Criteria: A convenient sample of one-hundred five individuals were included in this study (55 obese and 50 control) according to body mass index, with age range from 18 to 51 years old. All individuals subjected to the same clinical examinations and biochemical tests. The obese persons were taken from the obesity unit in the hospital while the control group individuals were friends, medical staff, medical students and relative to the patients. Informed consent must be taken from all people.

Exclusion Criteria:

1. Free of significant medical illnesses {diabetes mellitus (DM) (type I or II), cardiac disease, hypertension (HTN), hypothyroidism, poly cystic ovarian syndrome (PCOS), acromegaly and any congenital abnormalities} that known to impact body weight.
2. History ofdrugs administration that cause obesity or increase in body weight such as Antiepileptic drugs, anti-Diabetic drugs, Oral contraceptive pills, steroids and Chemotherapy.
3. Post-menopause women.
4. Pregnant women.

General History: Socio-demographic traits such as: age, gender, occupation, educational level, residency. Past medical history: thyroid disease (hyper: tremor, heat intolerance,palpitation; hypo: cold intolerance, previous unexplained obesity, etc.). Past surgical history: history of bariatric surgery, gynecological history: menstruation, fertility, pregnancy history and dietary history.

General Examinations:

Weight Measurement: Patient is weighed with minimum clothes and bared feet by digital scale with 0.1 kg as degree of error[10].

Anthropometric Measurements:

Height: Is measured by graded scale firmly fixed on the wall when participant is standing against the wall while feet are bared and the legs are held close to each other, no bending, the shoulders are straight in parallel line, the height is measured from the ground to the top of the head [11].

Waist Circumference: Is measured by flexible tape measure graded to 0.1cm at the midline between the last rib and the upper part of iliac bone [12].

Body mass index (BMI): Is calculated by dividing the weight in kilograms by the square of the height in meter[13].

Results

Socio-Demographic Characteristics of Study Groups:

The highest percentage of obese patients (89.09%) were female as shown in figure 1:

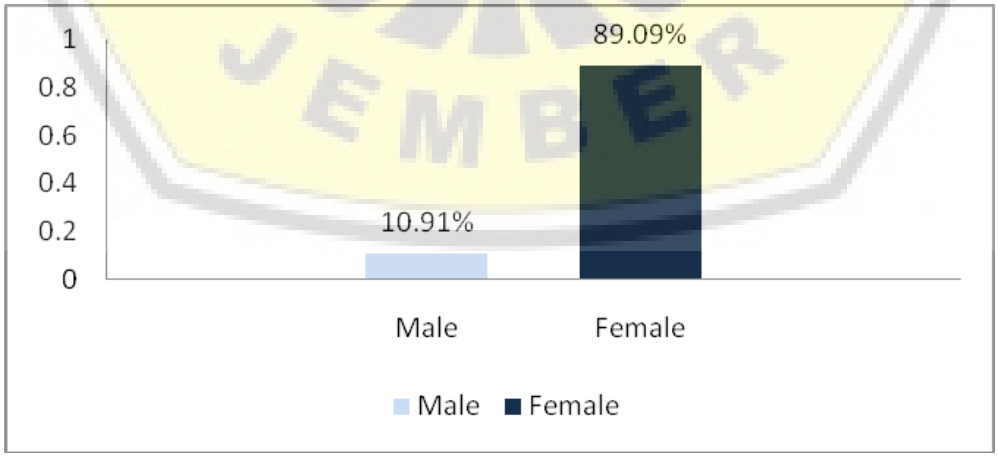

Figure 1: Distribution of obese patients according to the gender

The highest percentage for obesity was recorded among 20-30 age group, while the lowest percentage for obesity was recorded below 20 years old as shown in Figure 2.

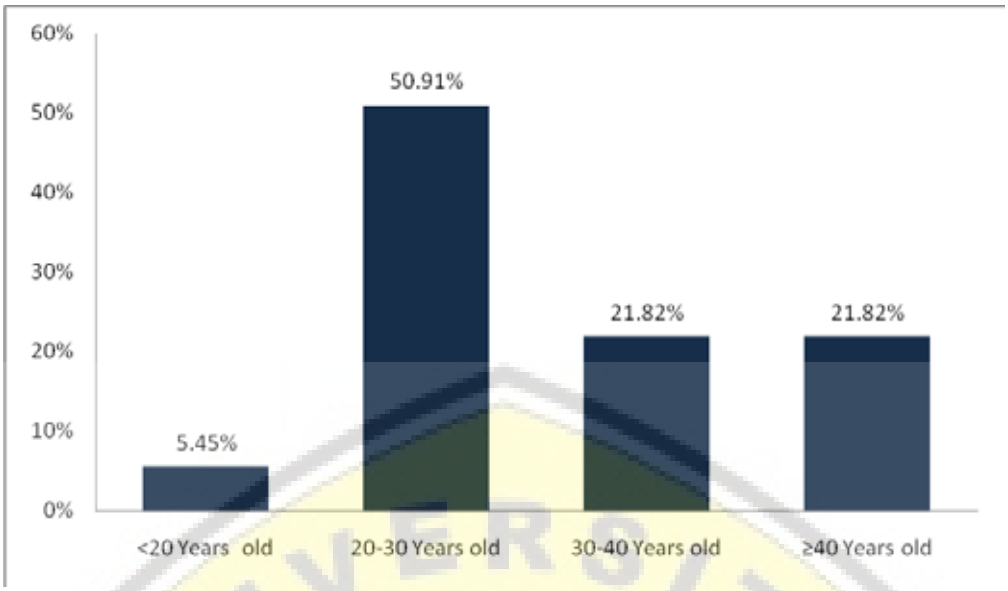

Figure 2: Distribution of obese patients according to age groups.

The majority of the obese patients (63.64%) were from urban areas. Minority of obese patients were from rural area as shown in figure 3.

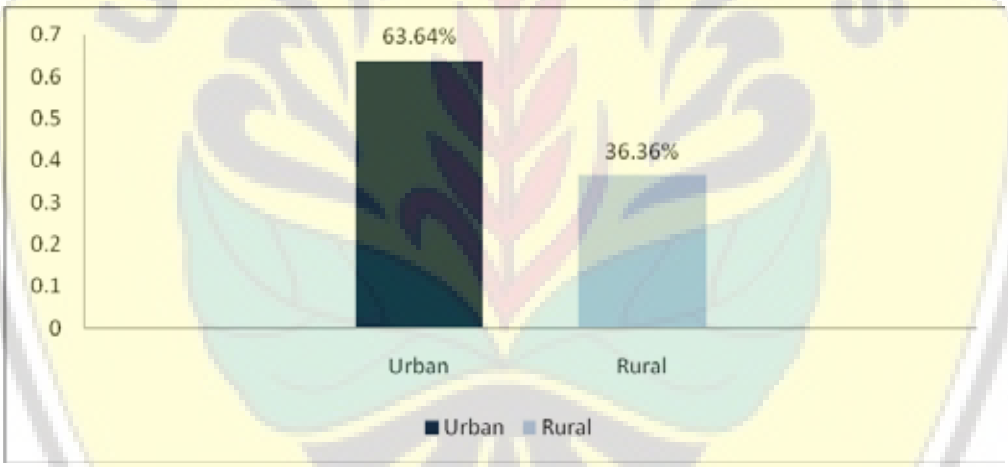

Figure 3: Distribution of obese patients according to residence.

Largest group of obese patients were unemployed as shown in figure 4.

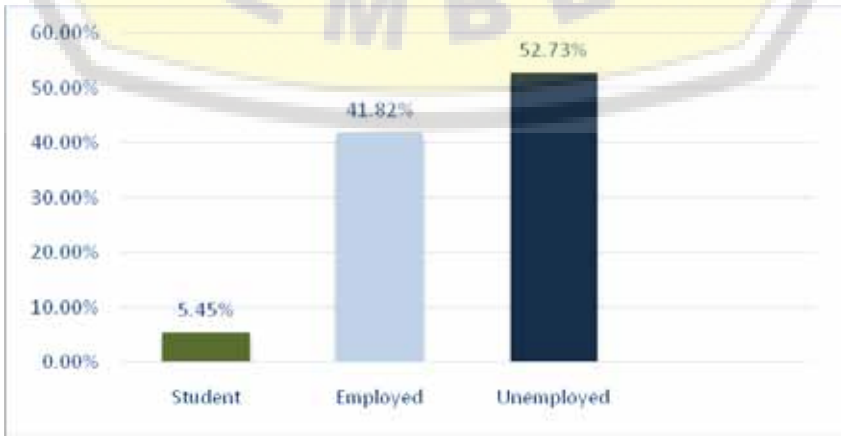

Figure 4: Distribution of obese patients according to occupation.

Figure 5 shows mean differences of irisin (ng/ml) for control and obese patients. There were significant differences between means of irisin for both study groups. **(t=9.435, P= <0.001*).**

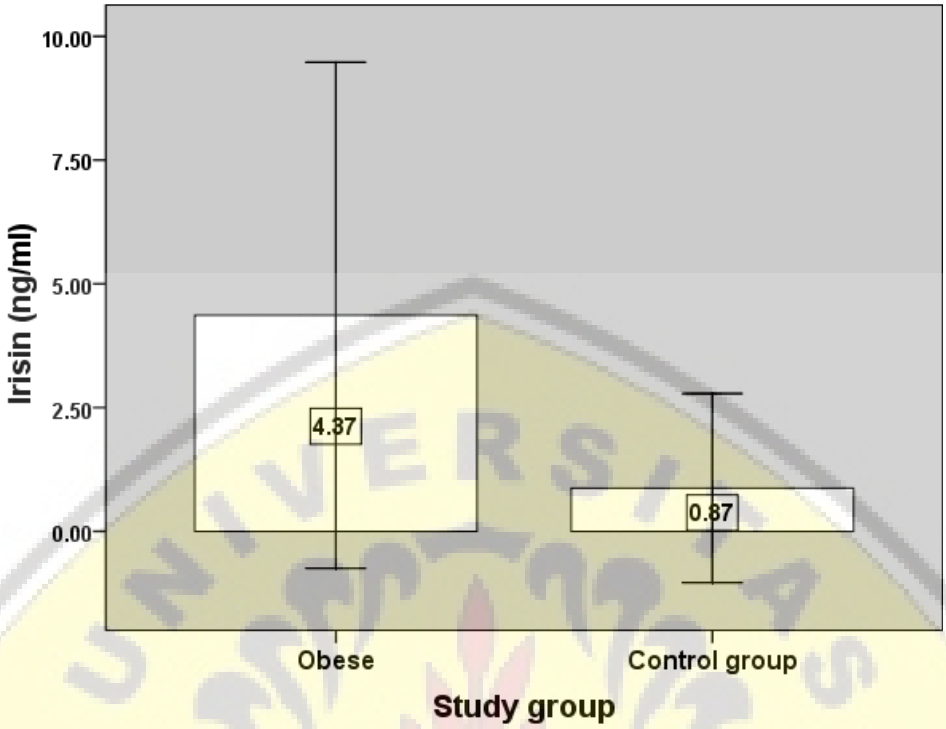

Figure 5: Meandifferences of Irisin (ng/ml) according to study groups

Figure 6 shows the correlation between Irisin (ng/ml) and body mass index (kg/m^2) among obese patients. There was significant positive correlation between irisin and BMI(p value≤0.05). **(r = 0.441, P = 0.002*).**

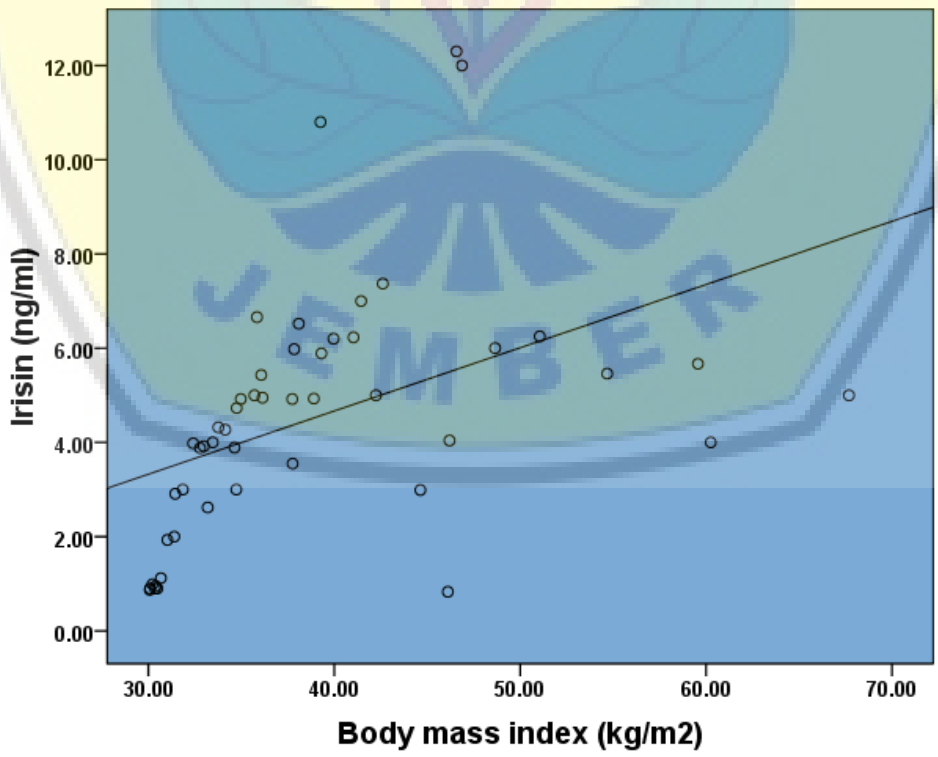

Figure 6: The Correlation between Irisin (ng/ml) and BMI among Obese patients (Correlation is significant at the 0.05; r: correlation coefficient)

Discussion

Regarding to the gender of obese patients shows in figure 1, the highest percentage of obese patients (89.09%) were female. This result agree with findings of other researchers [14-20]. The suggested reason for this result is presence of Traditional/cultural restrictions in lifestyle of women in Iraq are one source for increased rates of obesity among females than males, females have limited access to sports and exercise activities, also multiple pregnancies is an important factor as women gain 4.5 kg or more in one year postpartum, due to a combination of factors such as gestational weight gain, decreased physical activity and increased food intake.

Regarding the age of obese patients shows in Figure 2 the greatest increase of obesity was seen among 20-30 age group and this result agree with the findings of [21-24], this may be due to sedentary life-style and dietary habits. Also young adult people who live in countries making the socioeconomic shift, are particularly affected by the social and environmental factors such as financial independence, the easy availability of 'ready to eat' food stuffs, the increasing numbers of fast food chain shops, which are all part of adopting western life culture.

Regarding the residence of obese patients shows in Figure 3, the majority of the obese patients (63.64%) were from urban areas, this result agree with [25-29]. Urban populations are more exposed to a sedentary lifestyle and the high-fat fast food consumption are common and it is clear that those populations are at a higher risk of developing obesity compared with rural populations, which have a higher level of physical activity such as fishing and agricultural work.

Figure 4 showed distribution of obese patients according to occupation. Largest group of obese patients were unemployed, this result agree with the findings of [29-31]. Unemployment is more strongly associated with adiposity outcomes. Also, psychosocial stress and financial restriction associated with unemployment could have heterogeneous effects on energy balance .

Figure 5 shows mean differences of irisin (ng/ml) for control and obese patients. There is significant difference between control and obese patients (p value ≤ 0.05), the resulted data shows higher level of Irisin in obese patients compared with control, These findings confirmed the results of a previous study which demonstrated that obese patients had higher circulating levels of irisin than normal weight individuals [9, 32,33], in contrast with other studies that found lower irisin levels in obese patients[34].

Figure 6 shows the correlation between Irisin (ng/ml) and body mass index (kg/m^2) among obese patients. There is significant positive correlation between irisin and BMI(p value≤ 0.05). ($r = 0.441$, $P = 0.002$), in accordance with our findings, several studies have revealed a positive correlation between serum irisin levels and BMI[6,32,33,35,36]. Contrastingly, some studies found a significant negative correlation between circulating irisin and BMI[34,37]. Moreover, one study reported that irisin was not related to BMI[38].

Conclusion

Serum Irisin levels are higher in obese than in non-obese people.

Recommendations:

1. A community-based multiple prevention and intervention strategies should be implemented to combat with increasing level of obesity.
2. Study the gene expression of irisin, leptin, ghrelin associated with obesity.
3. We may push for the increasing medicalization of obesity.
5. Routine cardiac checkup for obese patients by a cardiologist doctor.

Assessment of Knowledge about Venous Thromboembolism Prophylaxis among Sample of Iraqi Residents

Abdul Munem Y. Al-Dabbagh[1], Najwa Ahmed Mohammed[2]

[1]Prof., MBChB, DM, FICMS (FAMCO)/Iraqi Board for Medical Specialization/Iraq,
[2]Lecturer, MBChB./Alkarkh Health Directorate/Ministry of health/Iraq

Abstract

Background: Venous thromboembolism is defined as the inappropriate formation of a blood clot in a vein. Among hospitalized and non-hospitalized patients, considered a global health concern which includes deep vein thrombosis and pulmonary embolism.

Objectives: To assess the knowledge of Iraqi resident doctors from different specialties regarding thromboembolism prophylaxis.

Subjects and Method: The survey was conducted at Medical City teaching Complex in Baghdad, among four medical specialties; Surgeons, Internists, Gynecologists & obstetrics and Family medicine residents.

Results: Total of 200 residents were handed a copy of the questionnaire with response rate of 94.3%. The mean age of the participants was 31.4±2.6, the residents were of four specialties; Internal Medicine 25.5%, Family Medicine 33%, Gynecology & Obstetrics 21% and General Surgery 20.5%. The majority of the participants (69%) had a an experience less than 5 years. The vast majority of the participants (96.5%) did not participate in any training about VTE prophylaxis. the knowledge questionnaire response showed that the highest score was among the faire/acceptable score (54%), good score represented 30.5% and the poor score represented only 15.5%.

Conclusion: Although the overall knowledge score of all specialties were faire/acceptable, the knowledge regarding prophylaxis and treatment were poor indicating the need for indulging comprehensive training courses regarding VTE prophylaxis and treatment within the residency programmes

Keywords: *Knowledge, VTE (Venous thromboembolism),resident doctors.*

Introduction

Venous thromboembolism (VTE) manifests as deep-vein thrombosis (DVT), which occurs in the legs and to a lesser extent as pulmonary embolism. The terms 'thrombosis' and 'embolism' were coined by the German physician Rudolf Virchow, who was the first to demonstrate a mechanistic link between DVT and pulmonary embolism [(1)]. However, the so-called Virchow's Triad was attributed to Virchow only 100 years after the publication of his work in 1856. Virchow's Triad describes three groups of thrombogenic factors: hypercoagulability, changes in blood flow (stasis and turbulence) and endothelial dysfunction. In 2014, the International Society of Thrombosis and Haemostasis initiated "World Thrombosis Day" on 13 October_ the date of Virchow's birth [(2)].

The worldwide incidence of VTE is difficult to quantify and not simple to be predictable, as clinical symptoms can be nonspecific and screening techniques can fail to properly assess asymptomatic patients. Even so, it is thought that at least 5–15% of hospitalized patients will develop VTE, making it one from most common preventable cause of in-hospital death [(3,4)].

The good knowledge of VTE pathophysiology and how each risk factor contributes to the development of the condition forms the basis for the optimum use of prophylaxis, many of VTE risk factors have been documented with the varying degree of effects. The most common individual risk factors are age above 70 years, history of VTE, immobility, cancer, congestive heart failure, obesity and many othermedical conditions [5]. Surgical patients are at risk for developing VTE depending on the type of the surgery and patient characteristics, hip orknee surgery carry the highest risk for developing VTE, prophylaxis thatincludes mechanical prophylaxis like patients with prolonged immobility following long-distance travel and surgical procedures, early and frequentmobilization is recommended [6-8]

Kashani et al;2015 found that The mean annual prevalence of DVT among the hospitalized Iranian adult patients not receiving prophylaxis is high. They also found that appropriate prophylaxis was provided for less than half of the patients in need [9].

In Saudia Arabia, Kharaba et al;2017 found as per the American College of Chest Physicians (ACCP) criteria, 375 (90.5%) patients were at risk for VTE and qualified forprophylaxis. Although 227 (60.5%) received some form of prophylaxis,only 144 (38.4%) of them received ACCP-recommended VTE prophylaxis [10].

In Iraq, Alhilali*et al*. 2016 reported in their study that Only 25% of the prescribed prophylaxis was ordered according to the ACCP recommendations and found that high prevalence of the risk of VTE among hospitalized Iraqi patients with an underestimation of the problem and terrifying under utilization of effective prophylaxis for at-risk patients [11].

Subjects and Method

Survey was conducted at Medical City teaching Complex in Baghdad for the period extending from 1st of March to the end of May 2018.

Two hundred resident doctors were recruited in the research who had completed at least one year in their residency program of the following specialties; Surgeons, Internists, Gynecologists & obstetrics and Family medicine residents.

A well-constructed self-administered questionnaire was used for data collection which consisted of three parts: 13 questions for knowledge to assess definition, risk factors, mechanisms, prophylaxis, guidelines, treatment and complications.

Response to these questions was in form of: Yes, No and Don't know, 3 points were assigned for correct answer, 2 for don't know and 1 for incorrect answer. Accordingly, total score for knowledge ranged from (13-39). Then the sum of scores were categorized into three levels of knowledge: Good knowledge defined by a score of ≥33; acceptable/fair knowledge level (26-33) and poor knowledge level (<26 knowledge) according to the quartile in which poor were assigned for less than <50% "first and second quartile", fair for 50-74% "corresponding to the third quartile" while 75% and above were categorized as good knowledge score [12,13,14].

Statistical Analysis: Analysis of data was done using the available software of Statistical Packages for Social Sciences- version 25 (SPSS-25). Simple measures of data which include the mean, standard deviation, frequency, percentage and range (maximum- minimum values).

The statistical associations of qualitative data were tested using Pearson Chi-square test (X^2-test). Statistical significance was considered when the P value was equal or less than 0.05. [15]

Ethical Consideration: The researcher directly interviewed all participants after obtaining their verbal consent and they were informed that their identity will not be revealed and the work is done only for research purpose.

Results

In this survey, 200 residents correctly filled the questionnaire; giving a response rate of 94.3%.. The mean age of the participants was (31.4±2.6), the age range was from 25 to 39 years. The majority of participants were in age group 30-34 years which represent 62.5% of the participants; followed by age group 24-29 years then the age group 35-39 years which represents 24.5% and 13% respectively.

Regarding the specialty, the residents were of four specialties; Internal Medicine 25.5%, Family Medicine 33%, Gynecology & Obstetrics 21% and General Surgery 20.5%. The majority of the participants (69%) had a work experience less than 5 years following graduation.

The vast majority of the participants (96.5%) did not participate in any training about VTE (table 1).

Table (1): The specific characteristics of study sample (n=200).

		No	%
Age (years)	24---29	49	24.5
	30---34	125	62.5
	35---39	26	13.0
	Mean±SD (Range)	31.4±2.6 (25-39)	
Specialty	Internal Medicine	51	25.5
	Family Medicine	66	33.0
	Gyn & Obstetrics	42	21.0
	General Surgery	41	20.5
Years of experience	1	17	8.5
	2	25	12.5
	3	36	18.0
	4	60	30.0
	5 & more	62	31.0
Years of experience	<5years	138	69.0
	5 & more	62	31.0
Participated in any training about VTE* prophylaxis	Yes	7	3.5
	No	193	96.5

In the current study, the knowledge questionnaire response showed that the highest score was among the faire/acceptable score (54%), good score represented 30.5% and the poor score represented only 15.5%.

The results in table 2 illustrates physicians' knowledge in the four medical specialties, out of 13 questions used to assess physicians' knowledge of participants; the majority had correct knowledge answers for both of the definitions and mechanisms (91.0%), about risk factors and diagnosis of VTE with percentages of (86.0%,74.5%,83.5%) respectively.

The notable correct answers was mainly regarding the prophylaxis 22.0% then treatment 40.0% and complications 41.5%. The participants showed fair/ acceptable answers about the questions regarding epidemiology, diagnosis and guidelines.

Table 2: The distribution of study sample according to their response to knowledge questionnaire (N=200)

Knowledge (Q13)	Correct		Incorrect		No response	
	No	%	No	%	No	%
Deep vein thrombosis (DVT) is a medical condition that occurs when a blood clot forms in a deep vein.	182	91.0	10	5.0	8	4.0
Deep Vein Thrombosis and Pulmonary Embolism (DVT/PE) are often under diagnosed and preventable medical conditions.	167	83.5	27	13.5	6	3.0
DVT is the most common source of PE	172	86.0	20	10.0	8	4.0
Pulmonary embolism is a medical condition that is unpreventable cause of mortality in hospital	142	71.0	34	17.0	24	12.0

Knowledge (Q13)	Correct		Incorrect		No response	
	No	%	No	%	No	%
The most important mechanisms of VTE risk are: Hypercoagulability, Stasis and Vascular injury	182	91.0	10	5.0	8	4.0
DVT does not cause heart attack or stroke while arterial thrombosis can cause heart attack or stroke	83	41.5	84	42.0	33	16.5
Diagnosis of VTE is based on Simple hematological tests	149	74.5	39	19.5	12	6.0
Wells criteria is important in the scoring of VTE	129	64.5	15	7.5	56	28.0
If the D-dimer test is positive, it means that the patient probably does have a blood clot	135	67.5	55	27.5	10	5.0
Recent or recurrent malignancy is not included in Wells criteria	109	54.5	30	15.0	61	30.5
Warfarin is only method for DVT prophylaxis	44	22.0	139	69.5	17	8.5
Inferior vena cava filters is only standard modality for treatment of VTE.	80	40.0	102	51.0	18	9.0
All of the anticoagulants can cause bleeding	110	55.0	79	39.5	11	5.5

The physician specialty revealed a statistically highly significant influence on the level of knowledge (P=0.0001) which was observed higher among internal medicine physicians (58.5%) then 31.7% of the general surgery classified as having good knowledge, while only 18.2% and 14.3% of family physicians and gyne-obstetrics had good knowledge score respectively.

The study showed unexpected results as the percentage of knowledge tend to decrease with increasing years of experience, as 34.8% of those who worked for less than 5 years had good knowledge score in comparison with 21.0% of those who worked for 5 years and more, with a statistically significant association with the of level of knowledge (P=0.05).

The results showed that participation in training about VTE prophylaxis had no influence on knowledge score (P=0.910), as 28.6% of physicians who were trained had good knowledge compared to 30.6% of those who were not trained (table 3).

Table 3: Distribution of study sample according to their knowledge score versus different variables (N=200)

		Knowledge Score				P value
		Poor-Acceptable		Good		
		No	%	No	%

Discussion

The current study showed high response rate (94.3%)when compared with that reported by other studies carried out in Iraq, Pakistan [16], Nigeria[8] and Sudan [17] (84.5%,80.5% and 83.8%) respectively. This high response rate may reflects the advantage of self-administrated questionnaire and direct orientation by the researcher on the instruction given to the residents about the importance of such subject in ascertaining the knowledge and attitude and practice about VTE.

Departments of Internal Medicine, Obstetrics & Gynecology, Family physicians and General Surgery were involved in this study. There may be a relevance with the fact that most patients with higher risk factors of developing VTE are discovered within those departments who harbor the largest number of doctors in comparison to other wards.

Unfortunately, the vast majority of participants have not been enrolled into any training course about VTE prophylaxis guidelines, these results are in keeping with (Kesieme*et al;* 2016) who showed that the majority hadnot attained core of prophylaxis guidelines or protocols [18].This may explain our findings in residents with less than 5 years of experience who had a higher good knowledge score than those with 5 and more years of experience as the junior residents still attached to their undergraduate curriculum

In the present study, about one third of the participants were having good knowledge score while more than half of the study group appeared to have fair knowledge score and the rest had poor knowledge which are substandard, this coincide with findings of other researchers [17]. This may be attributed to loss of training programmers about the guidelines for the residents, this necessitate the importance of continuous medical training and educational strategies which focus on improving residents'knowledge about VTE.

According to each item of knowledge questionnaire, participants in the current study had good knowledge responses regarding definition, mechanisms and risk factors which goes in the same line with study in Nigeria[8]. This may be due to their knowledge about the VTE as a disease entity, but the lack of proper training which appear clearly in poor knowledge about the prophylaxis and treatment when only 22% of the participants correctly answered that there are multiple method for DVT prophylaxis other than warfarin. This finding is in agreement with a research conducted in Sudan in which two third of the participants didn't appreciate the importance of mechanical method as prophylaxis [17].

It should be noted that this study was conducted at a teaching hospital, which implies that the situation in the non-teaching hospitals could be worser.

In the current study, more than half of the internal medicine residents showed good VTE knowledge score with high significance association (P=0.0001) compared with Obstetrics & Gynecology residents who performed lowest score regarding the thrombosis knowledge which goes parallel with Ebrahimpur*et al*,2016 findings. This finding provides further evidence that the internal medical education still focuses rigidly on disease (VTE) which indicate the need to improve the VTE knowledge in all specialties [19].

Knowledge is still below the required level. In Iraq, The main reasons for underutilization of prophylaxis were the lack of awareness about the risk and the prevalence of VTE complications, fear of bleeding risk from drug prophylaxis regimen with complexity of the guidelines and financial restrictions [16].

Abstract

In this work; Cold plasma jets were utilize to determine the role of the charged molecules in the process of blocking the bacteria. These charged molecules played a key role in this disruption and using argon gas. These particles were found to play an important role in disabling *Streptococcus mutans* bacteria .UV and heating showed no secondary role in inhibiting bacteria while metastable stateandO3as well as O played a key role in this disruption.

Keywords: *Noble gas, cold plasma, S. mutans, metastable state.*

Introduction

Plasma Ionized gas represents a fourth state of matter consisting of electrons and charge carriers in addition to ions[1]. The killing of bacteria using non-thermal plasma has made this plasma an effective and useful role in various medical and biologic applications such as the removal of bacterial contamination and the sterilization of medical instruments in hospitals[2]. This type of plasma works at or near room temperature and this feature made Plasma does not produce heat damage to associated models or materials. This feature has opened the possibility of treating heat sensitive materials when developing a plasma jet that uses noble gases such as argon or helium, as well as killing bacteria in this way[3,4]. In the respiratory tract and mouth there *Streptococcus mutans* bacteria, gram positive bacteria and one member of mutant groups. *S.mutans* bacteria are responsible for the formation of bacteria in the mouth and therefore affect the teeth as well as immunodeficient patients who undergo bone marrow transplantation and chemotherapy. The most of these organisms have the ability to analyze sucrose and the formation of a layer on the teeth, which in turn provide the environment for fermentation and acid resulting from this fermentation leads to necrosis The tooth enamel layer is therefore tooth decay, figure (1) shows, a *S.mutans* bacteria and stock culture[5,6].

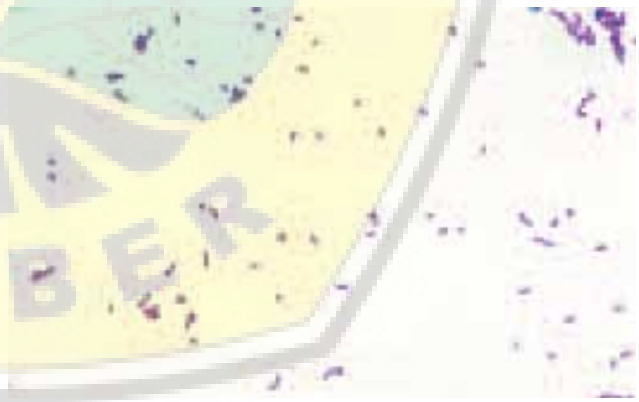

Figure 1: The Ovoid cells of streptococcus mutans bacteria and diameter (0.5–0.75 µm)[5]

Installation and operation of the experiment: A high voltage power source (12 KHz) used to generate discharge between two electrodes covered with an electric insulator. The voltage and current are measured by a high frequency digital oscillator (Tektronix TDS 2000). The high voltage applied is between two connectors, one or both, insulated with insulation to prevent turning

to the arc and limiting current. The plasma system is a conventional jet and discharge system.

Through the alternating voltage between the isolated high voltage electrode and the base of the model, a cold plasma is created to process the samples, the power source is connected to a stainless steel tube, the insulation is prevented. The current flows between the electrodes. The plasma is produced with a high concentration and with minimal gas heating and a vacuum between the needle The model (1-4 cm).

Figure 2 illustrates the experimental diagram of our work. A part connected to the isolated mica block which prevents heat transfer to the catcher, the other side is a stainless steel dielectric tube connected to the high voltage source, the system provides a high voltage (0-15 kV).

Between the upper surface of the model and the bottom of the probe the discharge is generated,distance is controlled during discharge at a fixed diameter (2.6 cm) and for all samples at room temperature and air pressure when conducting the experiment.

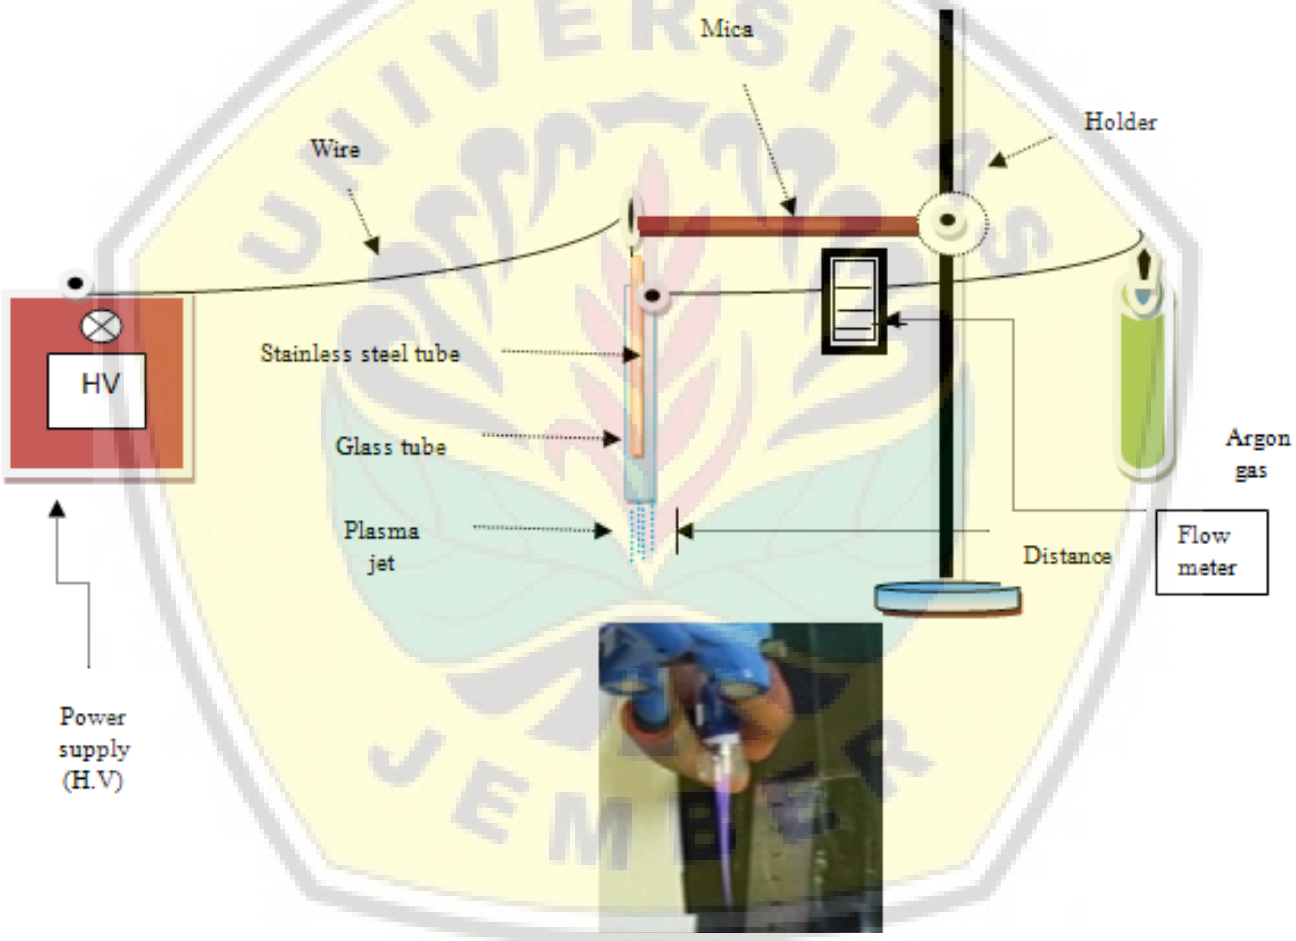

Figure 2: A schematic form to generate plasma jet

Materials and Method

In this work, the applied voltage (2 kV) and flow rate (1-3 l/min) as well as frequency (12 kHz) are optimal conditions to create non-thermal plasma to inhibit the bacteria in the mouth, teeth and tongue surface.

When a colony was taken from a solid medium after incubating it at 37°C and incubating overnight, a suspension of 1.5×10^8 (CFU/ml) was suspended using 0.5Mcfarland standard. 1: 100000 (*Streptococcusmutans* bacteria) and the effect of non-thermal plasma on this type of bacteria.

Below the plasma needle, place a 1 mL petri dish of suspended bacteria and variable distances (3,4 cm) at operational conditions (1, 2,3, 4 l/min) for exposure to this plasma.

Isolated isolates are not exposed to plasma. The isolated bacteria exposed to non-thermal plasma contain special media for all bacteria and cultured in petri dishesand then placed for 24 hours in the incubator at 37°C. After incubation, to demonstrate the efficacy and activity of non-thermal plasma in bacterial inhibition.

Results and Discussion

The activity of the gas flow rate on inhibition bacteria: The high flow rate of argon gas and high-speed particle discharge make it penetrate the outer wall of the *Streptococcus mutans* bacteria and inhibit bacteria through non-thermal plasma.

Increasing the rate of gas flow leads to the destruction of the cell membrane and the penetration of high-speed particles plays an important role in destroying the external structure of bacteria and the disappearance of cytoplasm; thus the death of bacteria. Figure 3 shows the increase in the kill rate by increasing the non-thermal plasma treating time at (3 cm) with the flow rate of the argon gas.

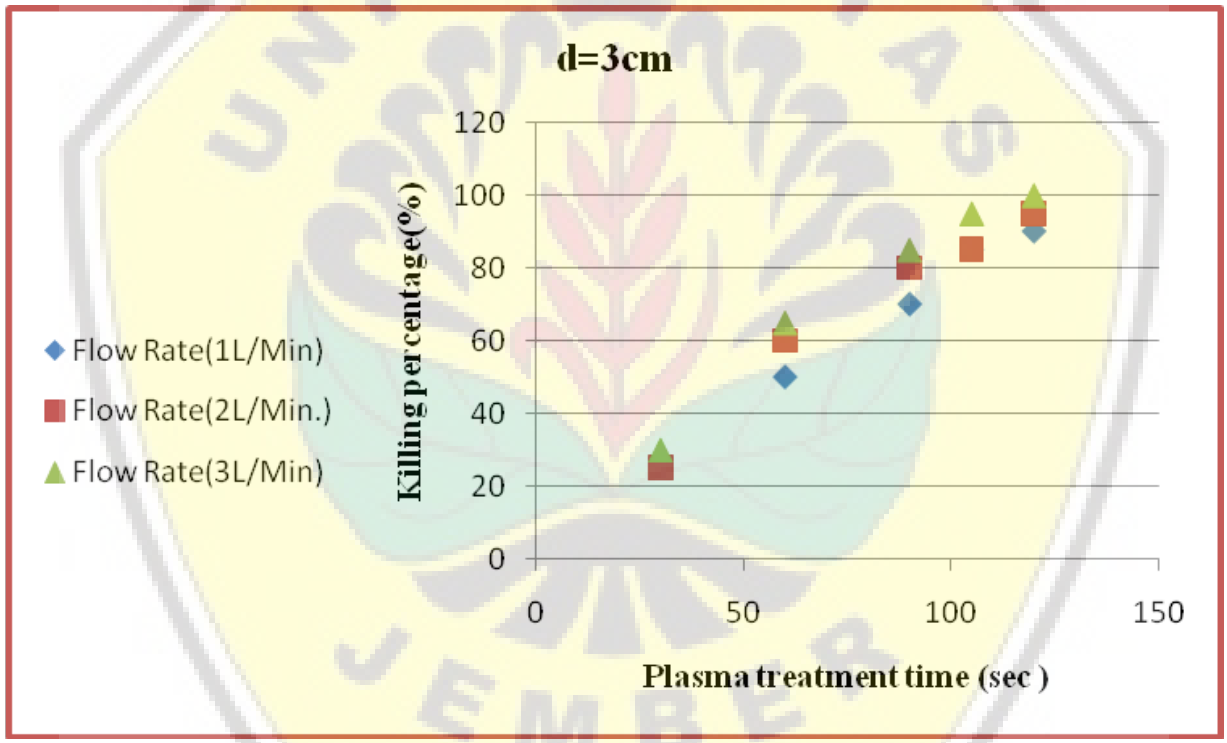

Figure 3: Killing percentage of Streptococcus mutans bacteria The relationship between & plasma treatment time at distance 3 cm

The effect of distanceon inhibition of S. mutans bacteria: Under certain conditions, the plasma treatment and its role on S. mutans bacteria were examined with different distances and times. The number of bacteria was estimated at different rates through the experimental conditions. The bacterial killing rate was defined as a function of plasma treating time as in Fig. 4. The results showed that the rate of killing of these bacteria increased with increased treatment time and decreased distance.

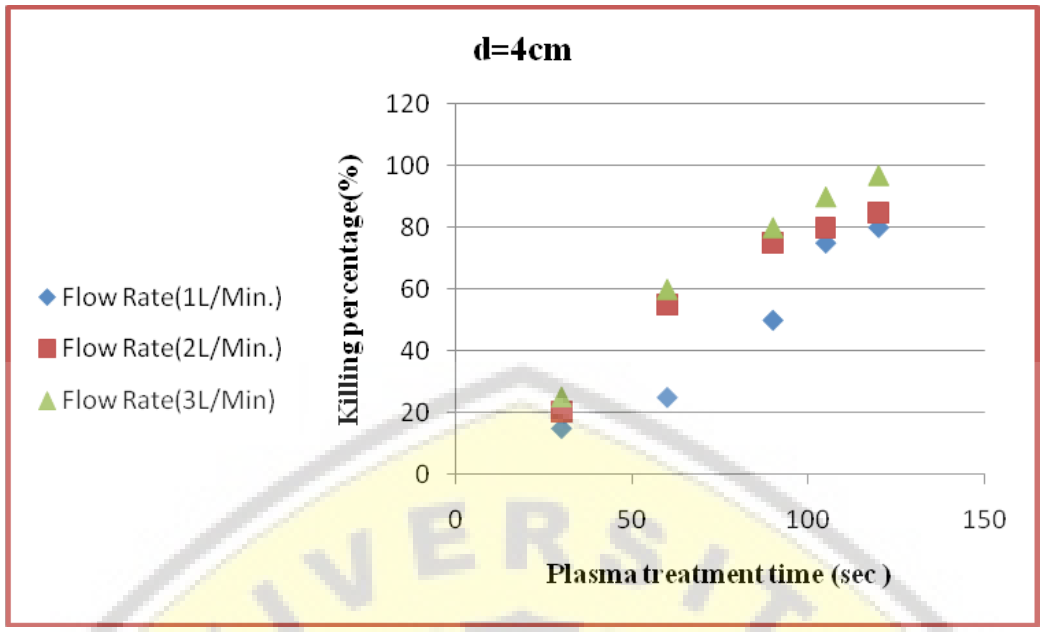

Figure 4: Killing percentage of Streptococcus mutans bacteria

The relationship between plasma treatment time at distance 4 cm: Within two minutes, interaction between reaction species and bacteria types is completed. This shows the role of the high voltage produced to a high degree to ionize the gas, this increases the intensity of the reaction which plays an important role to reduce bacterial cells. The charged particles also have the effect of deactivation of bacteria, UV and heating, it has been shown that active species such as ozone have a key role in inhibition of *streptococcus mutans* bacteria[7,8].

The increase in plasma treatingtime increases the inhibition of *streptococcus mutans* bacteria and these bacteria can be eliminated by exposure to cold plasma, this disruption Represented by working conditions of the plasma, such as processing time, flow of gasas well asapplied voltage [9].

Conclusions

The operating conditions of non-thermal plasma, such as treatingtime and distance, as well as gas flow, have a role in inhibition of *streptococcus mutans* bacteria. The use of plasma jet with atmospheric pressure, the use of plasma jet plasma generates a cold plasma that investigation the role of charged particles by inhibiting the bacteria.

The charged molecules, active species such as ozone and stable state, were found to be able to deactivate and inhibit the activation of *streptococcusmutans* bacteria..

Study of the Physiological Effect of Some Different Heart Diseases in Atrial Natriuretic Peptide (ANP) Concentrations of Hormone, Troponin and Nitric Oxide (NO) of Patients in Kirkuk Governorate

Wahbi Abdulqader Salman Al-Hamdany[1], Rasha Qahtan Mijwal Al-Azawy[1]

[1]Department of Biology, College of Education for Women, Tikrit University, Iraq

Abstract

This study was conducted at the Azadi Teaching Hospital in Kirkuk in (14/12/2016-24/06/2017), to determine the effect of some types of heart disease in Atrial natriuretic peptide (ANP) hormone, Troponin and nitric oxide, this study included some patients who were suffering of four types of heart diseases (Myocardial Infarction (MI), Ischemic heart disease (IHD), heart failure (HF) and Unstable angina (UA)), the number of patients and healthy was 60 and 30 respectively (heart patients were classified into four groups, each group included 15 persons). Their ages ranged from 40 to 90 years. Blood samples were collected from patients and healthy; the serum was separated in a common way. The concentration of Troponin increased significantly (0.05≥ P) in patients with MI in both males and females, As compared to other heart disease groups, while the lowest significant decrease (0.05≥P) in the concentration of Troponin in males and females suffering from (UA) and heart failure (HF). Nitric oxide concentrations increased significantly (0.05≥P) in healthy patients compared with all groups of heart patients and the group of female patients with UA (0.05≥P), was significantly higher than the group of males with the same disease, no significant differences were observed in nitric oxide concentrations between groups of male and female patients with myocardial infarction and heart failure, It is concluded that the totality of patients with (MI) is more likely to increase the concentration of (ANP) hormone and Troponin, while nitric oxide concentrations in all groups of heart patients decreased compared with healthy.

Keywords: *Heart disease, ANP, Kirkuk.*

Introduction

Heart disease is defined as a variety of diseases affecting the heart and blood vessels. Scientific studies have concluded that heart disease is the leading cause of death in all countries of the world especially cardiomyopathy (IHD) has been the leading cause of death accounting for 30% of the world's total deaths [(1)], followed by atherosclerosis and is one of the most important killer diseases globally[(2)], in a recent study in the United States, one out of every three patients has a heart disease, the rate of coronary artery disease was 48.8% of all types of heart disease, while stroke patients accounted for 16.8%, heart failure, hypertension,9.4%, vascular disease,3.1 and other heart diseases 17.9. Health care costs of heart disease amounted to $329.7 Billion, The number of deaths from heart disease was 1 million in 2015[(3)].

Deaths are expected to reach 23,600,000 deaths in 2030[(4)]. Because of reduced heart performance in patients with heart failure, hormonal factors are stimulated to try to maintain a balance in heart function to sustain blood flow in the circulatory system, thus, hormone activation gradually becomes more distinct as patients progress[(5)] and the heart produces a family of Natriuretic peptides (NPS) is produced and the main hormone of this family is the protective hormone of Atrial Natriuretic Peptides (ANP) which had been discovered by Drs de Bold [(6)], this hormone is one of the most important tools for diagnosis of heart disease[(7,8)], Nitric Oxide plays an important role in regulating cardiovascular function

through its role in regulating vascular tone and blood pressure so it protects the heart(9),also NO plays an important role in Endothelium Dependent which acts as vascular expansion and relaxation factor[10] it is released by the vascular lining in response to various other stimuli including Acetylcholine [11].

The aim of this study is to know the effect of some types of heart disease in Atrial natriuretic peptide (ANP) concentrations, Troponin and Nitric Oxide.

Materials and Method

This study included some patients who were suffering of four types of heart diseases (Myocardial Infarction (MI), Ischemic heart disease (IHD), heart failure (HF) and Unstable angina (UA)), the number of patients and healthy was 60 and 30 respectively (heart patients were classified into four groups, each group included 15 persons). Their ages ranged from 40 to 90 years. Blood samples were collected from patients and healthy; the serum was separated in a common way

Statistical Analysis: A statistical analysis done by using ANOVA One Way system, Moral differences were extracted between more than two averages and the differences were confirmed using (Mean±Stander Error)with significant differences (0.01≥P),(0.05≥P) and compare the averages in Dunkin way [12].

Results and Decision

Atrial natriuretic peptide (ANP) effect on heart disease: The table (1) and the horizontal comparison show a significant improvement I at the level (0.05≥P)of myocardial infarction (MI) females patients compared to male patients in ANP consecrations, patients with UA pectoris showed no significant differences between males and females in ANP hormone consecrations, we observed Moral superiority patients with (IHD) at level (0.05≥ P) in (ANP) hormone consecrations of female patients compared to male patients, patients with (HF), the males showed moral superiority at level (0.05≥P) in ANP hormone compared to female patients, many studies showed increasing of (ANP) hormone consecrations of patients with chronic(HF)[13].

Table 1: Comparison between some types of heart disease and healthy in the concentration of (ANP) hormone

Standards	Heart disease	Mean±Stander div.			
		N	Male	N	Females
ANP pg/ml	Healthy	10	34.80±1.06 c	20	38.45±3.64 d
	Patient with MI	12	135.3±4.2 a	3	*162.7±8.5 a
	Patient with UA	7	110.1±3.5 ab	8	112.1±3.7 b
	Patient with IHD	6	97.40±5.3 B	9	*120.6±5.0 b
	Patient with HF	7	*94.50±4.6 B	8	84.75±5.10 C

*Horizontally means that there are significant differences in probability level (P≤0.05),**Horizontally means that there are significant differences in probability level (P≤0.01), The vertically different letters mean significant differences (P≤0.05), MIMyocardial infarction, UAUnstable angina, IHDIschemic heart disease (cardiacin sufficiency), HFHeart failure.

In the same table, when comparing different heart diseases between healthy males and females, there was a significant increase in all heart patients (0.05≥P) compared with healthy males in the concentrations of this hormone, also there was superiority (0.05≥P)of patients with (MI) and (UA)pectoris was significant compared to patients with (IHD) and (HF) in (ANP) hormone consecrations, thus, it is concluded that the

diseases of (MI) and (UA)pectoris are the most harmful diseases affecting the increase in (ANP) hormone concentrations,also it was observed from the same table that when comparing different heart diseases between female patients and healthy females,all female patients were significantly higher than healthy females (0.05≥P), Patients with (MI),(UA) and (IHD)were (0.05≥P) superior to (HF) patients in (ANP) hormone concentrations,we conclude that patients with (HF) are the least affected by the increase in (ANP) hormone concentrations in females, in a previous study, there was an increase in (ANP)concentrations in patients with acute hypertension, congestive heart failure,or heart valve disease [14].

High levels of (ANP) have been associated with (HF), but it is still not clear if ANP, But it remains unclear whether ANP has a role in protecting the heart muscle [15], experimental data indicated that the (ANP) hormone plays a major role in cardiomyocytes hypertrophy healthy hearts to increase its efficiency in pressure and volume[16] or the Atrial natriuretic peptide (ANP)regulates the contraction process of cardiomyocyte by its role in Protein phosphorylation called Titin, also Troponin [17]showed that importance ofNatriuretic peptide cannot exclude because of the reasons that prevent the incidence of (IHD) and (HF) diseases, because (ANP) hormone may Stimulate the process of urination, by the secretion of sodium urinary and thus lead to the expansion of vessels and reduce the reduction of blood volume and cardiac output, is linked to increase the level of (ANP) hormone in the plasma with the condition of left ventricular hypertrophy and (HF) and increase blood flow[18].

The effect of heart disease in the concentrations of Troponin (T): Table (2) shows significantly superiority (0.01≥P) in Troponin consecration for healthy male compared with healthy female, studies showed that the consecrations High-sensitivity Troponin (hs-Tn) of healthy persons are unclear ability [19].

Table 2: Comparison of some types of healthy heart disease in Troponin (T) concentrations

Standards	Heart disease	Mean±Stander div.			
		N	Male	N	Females
Troponin ng/L	Healthy	10	**42.31±8.29 d	20	21.38±6.01 d
	Patient with MI	12	*4051±89.9 a	3	3210±29.16 a
	Patient with UA	7	1519±68.1 b	8	1317±24.01 b
	Patient with IHD	6	*494.0±35.3 c	9	362.0±6.70 c
	Patient with HF	7	61.60±4.47 d	8	**268.0±44.3 c

From the same table and through the vertical comparison note that the superiority of male patients with MI on all heart patients and healthy women are significant (0.05≥P) of Troponin consecrations, we did not observe any significant differences among patients with (UA) and male and female patients with (IHD),while male patients outnumber females at a tolerable level (0.05≥P) of Troponin consecrations,we observe (HF)significant superiority at level (0.01≥P) in Troponin consecrations of female patients comparative to male patients also previous studies showed that the levels of High-sensitivity Troponin I (hs-TnI) were higher with men that in women and was associated with all causes of death in both sexes[20].

As noted in our current study when comparing the various heart diseases of male patients with healthy males in the table significantly higher level of probability (0.05≥P)for male patients compared with healthy males in Troponin concentrations,a previous study indicated

that there was a high concentration of Troponin in the heart of older men,who were 70 years old.

These are signs of cardiovascular disease (CVD), because it is associated with an increased risk of coronary heart disease (CHD)[21], also the results of previous studies connect increase of levels High-sensitivity Troponin I (hsTnI) with increase the risk of cardiovascular disease [22].

Also it is noted in same table (2)that the patients with (MI, UA)were morally superior(0.05≥P)to patients with (IHD) and (H),also the patients with (HF) are less affected of Troponin consecrations for men, it was noted in many studies that heart Troponin is a typical diagnostic mark of myocardial,as the molecules of the heart muscle type of inhibitor(CTnI) and based onTropomicine (CTnT), they are essential elements of a cardiomyocytes job.

Measurement of cardiac Troponin has become a biochemical criterion for diagnostic testing myocardial and IHD[23], andthe experience of the heart Troponin revealed very low concentrations of cardiac troponin I(CTnI) and T(CTnT) in patients with (IHD)[24], studies showed that the Troponin increases from 20 to 50 times in patients with (MI)[22], it was observed that risk of MI and Acute coronary syndrome was four times higher in patients who suffer of high cardiac troponin (CTn), Troponin T will raises during 3-4 hours from the beginning of myocardial that continues for 10-14 days,at previous studies it had been depended on Troponin I level as a base to predict an increase in the number of dangerous events including HF and MI, appearance of effect of Troponin I level increase to be the biggest fatal event in all non-fatal cardiovascular events [23], increase of Troponin in patients with Coronary Heart Disease (CHD)Because the tear of microemboli plaque causes the myocyte necrosis,so Troponin consecration increase in patients with (IHD)[19], also with MI[24]. Other studies showed Increased troponin and its adverse effects in patients lead to chest pain (8) also with (HF), especially the older patients. The same table, there is a significant superiority in the level of (0.05≥P) probability of female patients on healthy females, Previous studies have shown that patients with heart disease have high concentrations of Troponin I and the risk of death in patients with increased Troponin I occurs gradually with increased Troponin I.

Effect of nitric oxide on heart disease: Table (3)shows significant differences between males and females in nitric oxide (NO)concentrations, the results were (27.18+1.62)(33.20+4 .94) respectively. Previous studies showed that NO which produced from vascular endothelial Nitric Oxide synthase (eNOs)`s job is to Relax the smooth muscles of the blood vessels and prevent thrombocytopenia and adhesion [26]

Table 3: Shows Comparison between some types of heart disease and healthy in (NO)concentrations

Standards	Heart disease	Mean±Stander div.			
		N	Male	N	Females
NO µl	Healthy	10	27.18±1.62 a	20	33.20±4.94 a
	Patient with MI	12	14.38±1.43 d	3	*23.00±2.06 b
	Patient with UA	7	21.70±1.29 b	8	21.13±8.12 b
	Patient with IHD	6	*19.15±1.60 bc	9	13.14±2.78 c
	Patient with HF	7	21.57±1.36 b	8	20.61±1.68 b

Our results from the same table showed that the healthy females were significantly higher at a potential level (0.05≥P) in (NO)consecrations on patient females alsos uperiority of patients with (MI, UA) and (HF),Compared with the same table,we note the superiority of female patients with (MI) at a probability level (0.05≥P) with male patients in nitric oxide concentrations, the results were (23.00+2.06) (14.38+1.43) respectively.

Conclusion

The totality of patients with (MI) is more likely to increase the concentration of (ANP) hormone and Troponin, while nitric oxide concentrations in all groups of heart patients decreased compared with healthy.

The Influence of Biosurfactant on Hardness and Roughness of Heat Cured Acrylic Resin

Inas Abdul Sattar Salman[1], Ban Nahal Shukur[1]

[1,2]Department of Prosthodontics, Dentistry College, Mustansiriyah University, Baghdad, Iraq

Abstract

The object of this study was to evaluate the effect of biosurfactanton roughness and hardness of heat cured acrylic resin.

Total numbers of (30) specimens have been intended. Immersing was conducted using two solutions: A. biosurfactant (biosurfactant produced from leuconostocmesenteriodes sp.) B.5% Sodium hypochloride. Distilled water was used as the control. Immersion time was 30 hours. The change in hardness was measured using shore D hardness tester and TR220 portable roughness tester was used for measuring the surface roughness**.** The statistical test used one-way ANOVA and post hoc- Tukey test.

The result showed a significant difference between control and experimental groups in the roughness tests and regarding the effect of soaking in 5% Naocl, there was no significant difference in hardnesstest. The immersing of heat cured acrylic resin in biosurfactant decreased the hardness and increased thesurfaceroughness.

Based on the result of this study the soaking of acrylic resin in biosurfactantdecreased its hardness and increased the surface roughness

Keywords: *Biosurfactant, acrylic resin, Naocl, hardness,roughness.*

Introduction

Poly (methyl methacrylate) is the most popular material used for the fabrication of denture resin because it has good esthetic, low water absorption and low toxicity; however this material is also has weakness that is its porous condition in which food attach and microorganism can proliferate in that area which in turn may contribute to oral disease[1] This situation can be avoided by disinfecting denturechemically. The need to disinfect prostheses has resulted in the widespread search for disinfectant agents that are innocuous to the prosthesis surface. Various chemical agents are used in actual prosthesis disinfection e.g aqueous formaldehyde, hydrogen peroxide, sodium hypochlorite, chlorhexidine which are effective in reducing the numbers of microorganism[2,3]. Several studies[4,5] demonstrated that various disinfectants affect the physical properties of denture base resins such as hardness[6], transverse strength[7,8], roughness[9] and deterioration on the surface of the denture resin[7].

The roughness of acrylic resin surfaces is a critical property because surface irregularities increase the likelihood of microorganisms remaining on the denture surface after the prosthesis is cleaned [10]. Another property that can influence the surface characteristics of acrylic resins is the hardness, which indicates the ease of finishing a material and its resistance to in-service scratching during cleaning procedures [11].

Biosurfactantsare microbial produced surface active compound. They are amphiphilic compounds

with hydrophobic and hydrophilic regions that confer the ability to accumulate between fluid phases, thus reducing surface and interfacial tension at the surface and interface respectively[12]. They possess the characteristic property of reducing the surface and interfacial tension using the same mechanisms as chemicals surfactants[13]. Biosurfactants are produced by several microorganisms which include *Acinetobacter sp., Bacillus sp, Candida antartica, Pseudomonas aeruginosa*. The physiological role of biosurfactant production in microorganisms includes antimicrobial activity and the ability to make substrates readily available for uptake by the cells in adverse environmental conditions[14]. Several applications of biosurfactants with medical purposes have been reported. Biosurfactants are considered relevant molecules for applications in combating many diseases and as therapeutic agents due to their antibacterial, antifungal and antiviral activities. Furthermore, their role as anti-adhesive agents against several pathogens illustrate their utility as suitable anti-adhesive coating agents for medical insertional materials leading to a reduction of a large number of hospital infections without the use of synthetic drugs and chemicals[15].

However, the beneficial antimicrobial effect and best preventive agent for acrylic resin as compared with other denture cleanser[16]. The surface properties of PMMA denture base material after such addition has not been investigated. This study is under taken to evaluate the hardness and roughness of acrylic resin denture after soaking in biosurfactant and Naoclas compared to control group.

Materials and Method

Sample Grouping: A total of 30 specimens were prepared from heat cure acrylic resin (vertex dental B.V.-Holland). Acrylic specimens were divided in to three groups, each group consist of 10 specimen according to type of disinfectant solution : first group immersed in distilled water (control group), second group immersed in 5% sodium hypochlorite, third group immersed in the biosurfactant. The biosurfactant produced from *Leuconostocmesenteroides* ssp. *cremoris,* Department of Biology/College of Science/Mustansiriyah University/ Baghdad/Iraq was used in this study. Each three main group further subdivided in to two groups according to physical test that performed (hardness and roughness).

Preparation of acrylicresin specimen's: For the preparation of the stone mold, the waxpatterns were prepared with dimensions of (10mm× 5mm ×3mm length, width and thickness respectively). Acrylic specimens (30 samples) (figure 1)were prepared from heat cure acrylic resin with 22gm/10ml (powder/liquid) ratio according to manufacturer's recommendation . The liquid was measured using a pipette and the powder was weighed using a precision scale. The conventional flasking technique for complete dentures was followed in the mold preparation. The Curing process was carried out according to the manufacturer's directions. The specimens were then stored in water at room temperature for 24 hours.

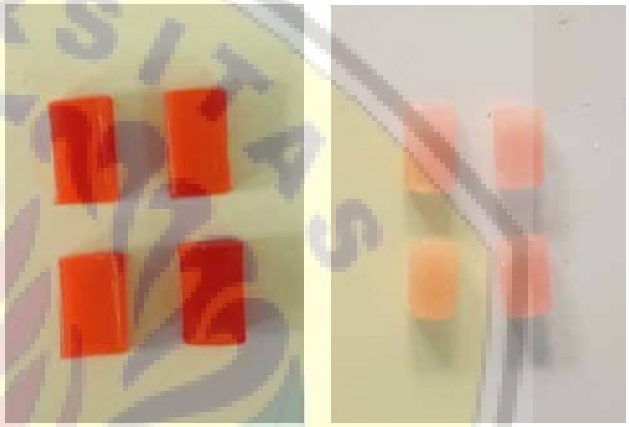

Figure 1: Wax patterns and acrylic specimens

Time of Immersion: All the specimens immersed in the solutions for 30h to stimulate the cleaning or immersion of acrylic dentures in cleansing solution for 5 minutes every day.[17] So immersion for 30h will stimulate the daily immersion for 360 days. Samples were taken out and cleaned with water and then were put on papers towel at room temperature and thereafter samples were ready for testing.

Mechanical and Physical Tests:

Surface Hardness Test: Test was performed using durometer hardness tester (TH 210, CHINA) (shore D hardness) as shown in figure 2. The usual method was to press down firmly and quickly on the indenter and to record the maximum reading. Three measurements were recorded on different areas of each specimen and an average of these three readings was recorded.

Figure 2: Durometer hardness tester

Figure 3: Surface Roughness Tester

Roughness Test: The surface roughness test by using an analyzing surface roughness tester(TR220 portable roughness tester, Beijing, time high technology. Ltd, China) device as shown in figure 3. The mean value for the four readings of the sensible needle on the surface of the tested material was dependent.

Results

Hardness Test: Table (1) showed descriptive data of tested groups. The mean of control group (water) is nearly the same as experimental group (5% Naocl). while the mean of biosurfactant specimens lower than others which mean that the immersion in biosurfactant decreases the hardness. From the result of One way analysis of variance (ANOVA) for hardness test in **table (2)** P- value is 0.02 which mean that there are significant differences among the tested groups. To determine which group has a significant difference between the treatment groups, i.e., between biosurfactant, 5% Naocl and water. Tukey HSD of multiple comparisons between studied groups for hardness test was made at **table (3)** which showed:

1. There was none significance difference between control (water) and Naocl groups (P>0.05).
2. There was significance difference between control and bio surfactant experimental groups (P<0.05).

Table 1: Descriptive Statistics data of hardness test

Group	N	Minimum	Maximum	Mean	Std. Error	Std. Deviation
Water	5	89	90	89.16	.121	.270
5% Naocl	5	89	90	89.08	.146	.327
Biosurfactant	5	84.50	89.10	87.1800	.86568	1.93572

Table 2: ANOVA test of hardness test

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	12.561	2	6.281	4.798	.029
Within Groups	15.708	12	1.309		
Total	**28.269**	**14**			

Table 3: Tukey HSD of multiple comparisons for hardness test between studied groups

(I) Group	(J) Group	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
1	2	.080	.724	.993	-1.85-	2.01
	3	1.980*	.724	.044	.05	3.91
2	1	-.080-	.724	.993	-2.01-	1.85
	3	1.900	.724	.054	-.03-	3.83
3	1	-1.980-*	.724	.044	-3.91-	-.05-
	2	-1.900-	.724	.054	-3.83-	.03

*. The mean difference is significant at the 0.05 level.

Roughness Test: Regarding the surface roughness of the control and experimental groups, it was found that the mean of control group (water) is lower than experimental groups (Naocl, biosurfactant) which mean the roughness increase of treated groups. One way analysis of variance (ANOVA) of roughness data in Table (5) revealed a highly significant difference among the groups (P value 0.000). So Tukey HSD of multiple comparisons between studied groups for hardness test at Table (6) was made which showeda significance difference between control and other experimental groups (P<0.05) and in the same table showed none significance difference between Naocl and bio surfactant groups (P>0.05).

Table 4: Descriptive Statistics data of roughness test(Mm) for control and experimental groups

	N	Minimum	Maximum	Mean	Std. Error	Std. Deviation
1-water	5	.81	.99	.8950	.03426	.07661

	3	.40420	.18044	.104	-.0772-	.8856
3	1	.94100*	.18044	.001	.4596	1.4224
	2	-.40420-	.18044	.104	-.8856-	.0772

*. The mean difference is significant at the 0.05 level.

Discussion

The purpose of immersing dental prostheses in a disinfectant solution is to in activate infectious viruses and bacteria and maintain adequate denture hygiene. In routine use of denture cleaner may affects the physical properties like surface roughness and hardness and then it may be determinable todental prosthesis rather than improving its longevity.

Surfactants are widely used for industrial, agricultural, food, cosmetics and pharmaceutical application however most of these compounds are synthesized chemically and potentially cause environmental and toxicology problem due to the recalcitrant and persistent nature of these substances[18]. With current advances in biotechnology, attention has been paid to the alternative environmental friendly process for production of different types of biosurfactants from microorganisms[19]. In comparison to their chemically synthesized equivalents they have many advantages. They are environmentally friendly, biodegradable, less toxic and non-hazardous. Biosurfactant showed inhibitory effect against several pathogenic bacteria[20].

Hardness is important property as it is important in preventing bending or breaking of the PMMA denture base[21]. The result of this study revealed that hardness of acrylic decrease as soaked in biosurfactant as compared with water and Naocland this may be due to leaching out of the monomer from the PMMA matrix and/or the diffusion of moleculesfrom the cleansing solution and into the PMMA resin through the formation of side group chains and water absorption can be affected by the occurrence of diffusion. Both of the above would result in thesoftening of the resin that affect strength of polymer chain which subsequent decrease the hardness of acrylic resinand this agree withPavarina et al [3]stated that prolonged immersion of denture in cleanser caused softening of the acrylic resin. Absorbed water has been shown to affect the surface properties of all forms of acrylic.

There was no significant effect on hardness after immersing in 5%Naocl and this agree with CristianeF[22] which showed that 60 minutes immersion in Naocldidn't affect surface hardness of acrylic resin. But this disagree with Neppelenbroek *et al.*[23] who demonstrated a significant decrease in hardness after immersion in chemical disinfectant solutions, including sodium hypochlorite and this may be to the different concentration and immersion time.

Roughness affects the patient's comfort and prosthesis longevity. A smoother surface leads to better esthetic results and less biofilm retention [24].In this study, roughness values increased in the samples that were immersed with biosurfactant and sodium hypochlorite in comparison to the control group(water) as the biosurfactant decrease the surface tension and this lead to increase the surface roughness in addition biosurfactant may pass into the matrix and widen space between the chain, causing the separation of the polymer chains to easily deforms plastically and cause roughness on acrylic resin. Disinfectant agent also may alter the surface of acrylic resin[6,8].

Conclusions

The following conclusions can be drawn from this study:

1. Immersion of heat cured acrylic specimen's in biosurfactant solution produced a significant increase in roughness and significant decrease in hardness.
2. No significant effect was observed on surface hardness of the tested specimens after immersion in Naocl while there was significant increase in surface roughness.

Abstract

To investigated the main histological changes of thyroid gland that infected with hyperthyroidism in the female patient in Al-Muthana province . The current study carried out forty samples of thyroid gland collected from Al-Hussien hospital tutorial. The tissue samples were divided into twenty infected samples with hyperthyroidism and other twenty as control group. The tissue samples were pass through the steps of histological technique the staining with H & E. The histological results of thyroid gland in control group showed The tissue section of healthy thyroid gland showed the thyroid parenchyma contained many follicles different in size which include (large, medium, small). The large follicles have low prevalent compared with other follicles types. The histological result of infected thyroid gland showed the large follicles present in the most prevalent that have significant increased the diameter (78.8 ± 1.9 µm) compared with large follicles in control group. The histological result of female hyperthyroidism noted parenchymal hyperplasia and several type of follicles lined by simple flattened epithelial rest on the prominent basement membrane.

Keywords: *Women; Goiter; and Histological study.*

Introduction

A goiter is an enlarged thyroid gland. The most common cause of goiter is lack of iodine in the diet. Hypothyroidism, hyperthyroidism, thyroid nodules or inflammation of thyroid and cancers cause goiter[1].

Hyperthyroidism (goiter) is define increased in the production of thyroid hormonestriiodothyronine (T3), thyroxin (T4) to the bloodstream, as this increase leads to a faster metabolic rate [2]. also known as thyrotoxicosis, a general term, refers to hyper metabolic state that results because of excess thyroid hormones[3].

The major causes of hyperthyroidism (goiter) are: Grave's disease, Toxic multinodular goiter (Solitary toxic adenoma thyroiditis), exogenous iodine and iodine-containing drugs, e.g. amiodarone, excessive T4 or T3 ingestion, ectopic thyroid tissue, e.g. Struma ovarii, functioning metastatic thyroid cancer HCG dependent e.g. choriocarcinoma, pituitary tumor (very rare)[4].

Evaluate dietary use of iodized salt as a risk factor for hyperthyroidism in people living in iodine deficient areas [5].Also factors associated with an increased risk of development of thyroid nodules and goiter include pregnancy and presence of uterine fibroids, probably related to estrogen and other physiopathologicalmechanism). The pathogenesis of the association between goiter and oral contraceptives remains to be settled and is probably a combination of several direct and indirect effects of sex steroids on the thyroid [6].

The aim of study is to determine the histological changes inhyperthyroidism (goiter) of female patient

Materials and Method

Histological technique: The current work carried out 40 samples of thyroid gland from AL-Hussien

hospital in AL-Muthana province. The thyroid samples were divided into two groups, twenty samples were collected from female patient that infected with hyperthyroidism and other twenty as control group. The tissue samples for histological study were pass through the histological technique which included (fixation with 10% formalin for 48 hours, dehydration by used deferent concentration of Ethanol –Alcohol (50%,70%, 80%, 90%, 100%) two hours for each concentration, Clearing with xylene, Embedding with paraffin wax, Blocking, Cutting, Loading and Staining with H & E)[7].

Results and Discussion

Histological results of the Female control

Follicles: The tissue section of healthy thyroid gland showed the thyroid parenchyma contained many follicles different in size which include (large, medium, small). The large follicles have low prevalent which have diameters (33.62 ±1.0 µm) and medium follicles were the most prevalent that have diameter (15.89 ±0.83 µm) that distributed among the thyroid parenchyma, while the small follicles distributed between other type of follicles which have diameter (6.57 ±0.35 µm) (fig1) .

The tissue section of infected thyroid gland showed the follicles lined by simple cuboidal epithelial with thickness (1.283±0.11µm), the basement membrane was prominent in the wall of follicles (fig 2). The thyroid follicles were filled with clear fluid called (colloid) (fig 3). The follicular cell was prominent nucleus with diameter (2.20 ±0.16 µm).

Histological results of the Female hyperthyroidism

Follicles

The histological result of infected thyroid gland showed the large follicles present in the most prevalent that have significant increased the diameter (78.8 ± 1.9 µm) (Diagram1) compared with large follicles in control group. The large follicles contained on the huge amount of colloid. The inner lumen of follicle was lined by simple squamous epithelial compared with control group (fig 4). This result agreement with to[8]which said amacro follicular pattern is characterized by large, flat sheets containing numerous regular follicular cells with small, dark, round nuclei in honeycomb arrangement, usually in a background of moderate to abundant colloid.

The type of large follicles have irregular in shape were appeared as wide cystic dilation (fig 5), the colloid in the large follicles have prominent spot dark in colour. The histological result showed high proliferation in the epithelial cells that lined the inner surface of large follicles (fig 6).

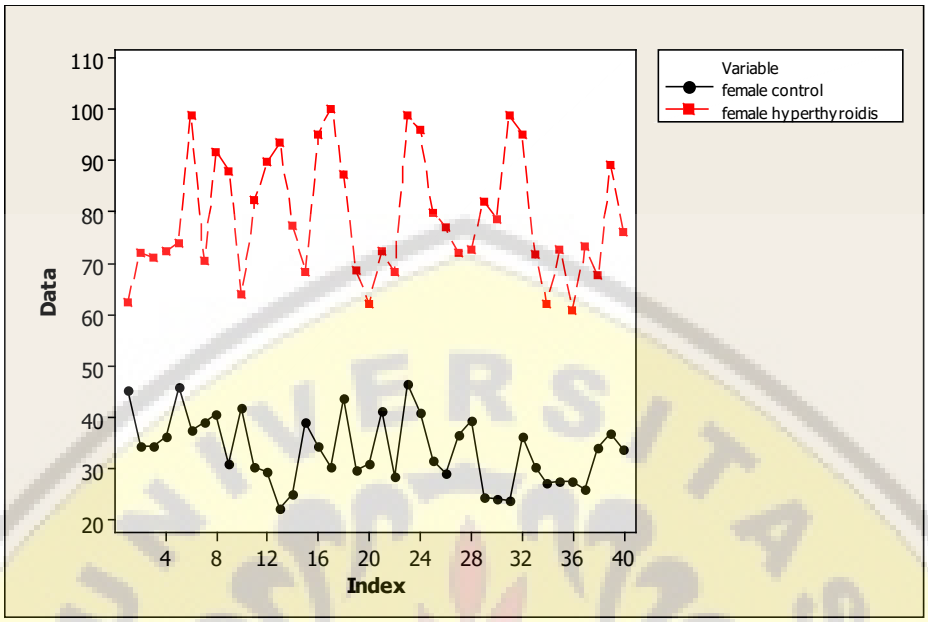
The histological result of infected thyroid gland showed the medium follicles have small amount of colloid material and predominance of follicular cells, which have significant increased the diameter (38.96 ±1.3µm) (Diagram 2) compared with medium follicles in control group and have significant decrease in diameter compared with male hyperthyroidism. This result agreement with to[8] which said nonmacrofollicular aspirates tend to be hypercellular with scant colloid and a predominance of follicular cells in small ring like micro follicles (composed of 6–12 follicular cells), ribbons, or trabeculae, or large 3-dimensional crowded arrangements.

The tissue section of infected thyroid gland showed the large follicles have thin follicular wall. The tissue sections noted many small follicles have spherical in shape filled with secretion were distributed between the fully large follicles.

The histological result of female hyperthyroidism noted parenchymal hyperplasia and several type of follicles lined by simple flattened epithelial rest on the prominent basement membrane, which have significant decrease in epithelial thickness (1.214 ±0.12) (Diagram 4) compared with control group and have significant decrease thickness of epithelial compared with infected male group .This result were agrrement with [9]were noted Follicles were lined mostly with flattened thyrocytes have promenint nuclei with increased chromatic density.

Statistical Analysis:

Diagram 1: The diameter of large follicles of thyroid gland in control group compared with female infected with hyperthyroidism.



Two-sample T for female control vs female hyperthyroidism				
Group	**N**	**Mean**	**StDev**	**SE Mean**
female control	40	33.62	6.61	1.0
Female hyperthyroidism	40	78.8	12.0	1.9

Histological Changes of Endometrium in Women with Postmenopausal Uterine Bleeding

Muna Z. Al-Hamdany[1], Mohammad A. Hayawi[2], Mustafa S. Fadil[3], Khansaa A.Shihab[4]

[1]Department of Anatomy, Mosul College of Medicine, University of Mosul, Iraq, [2]Department of Basic Sciences, College of Nursing, University of Mosul, Iraq, [3]Department of Pathology, Mosul College of Medicine, University of Mosul, Iraq, [4]Al-Khansaa Teaching Hospital, Mosul, Iraq

Abstract

This prospective cross sectional study aims to establish the histological changes in the endometrium in women suffering from postmenopausal bleeding (PMB)to exclude endometrial malignant changes. Forty patients were collectd from Al-Khansaa Teaching Hospital in Mosul from December 2017 to October 2018. Detailed history about the age, parity, obstetric, menstrual and drugs history was recorded. Dilatation and curettage under general anaesthesia was performed to obtain endometrial biopsy . The specimens were fixed in 10% neutral buffered formalin for 24 hours then processed to obtain tissue sections which were stained with Harris Hematoxylin and Eosin (H & E) and examined using light microscope. Statistical analysis of the results was done with significant level set as $P < 0.05$. Most of patients with PMB (62.5%) were between 51 and 65 years, (92.5%) of them were multiparous, (37.5%) were obese and hypertensive. Diabetes mellites was observed in (12.5%).Histological findings revealed (30%) endometrial atrophy, simple endometrialhyperplasia without atypia (25%), with atypia was found in (5%) while endometrial carcinoma was observed in (10%) and the incidence of endometrial carcinoma increases with advanced menopausal age. We conclude that postmenopausal bleeding is a significant symptom and should not be neglected and the incidence is significantly associated with multiparty, menopausal age between 51 and 60 years, high BMI, hypertension, diabetes and thyroid dysfunction. Majority of patients with postmenopausal bleeding showed benign atrophic changes (30%) which is the most common cause, proliferative and secretory endometrium, endometrial polyp and simple endometrial hyperplasia without atypia.

Keywords: *Postmenopausal bleeding, Endometrial hyperplasia, Atrophic endometrium.*

Introduction

Postmenopausal bleeding (PMB) is abnormal uterine bleeding occurring one year after menopause [(1)]. It may be just spotting, or normal menstruation or heavy bleeding, the approximate age of menopause is 49 ± 3 years with average age of 51 years, the possibilities of PMB decreases with increasing age [(2)]. Woman who bleeds after the menopause has a 10% risk of having genital cancer and the frequency of malignancy is increased with increased age and increased interval between PMB and menopause specially if no history of hormone replacement therapy [(3)]. The initial diagnosis is made by curettage and endometrial biopsy [(4)].A common cause for bleeding after menopause is the haphazard use of oestrogens for hormone replacement therapy in 10% of women otherwise, those with continuous or frequent bleeding should be investigated for malignant diseases of the uterus or cervix[(5)]. Multiple causes of post-menopausal bleeding has been established, but endometrial atrophy account for 60-80% of cases (6). Endometrial hyperplasia wheather simple, complex or atypical and endometrial carcinoma usually presents as PMB, cervical polyps and carcinoma of cervix may be a source of recurrent bleeding [(7)].Atrophic endometrium after menopause resulted from inadequate estrogen while in endometrial hyperplasia,Oestrogen is an established risk particularly in women with exogenous oestrogen, obesity, or ovarian tumour[(8)]. Endometrial hyperplasia occurs when the *endometrium* continue to grow in response to excessive estrogen stimulation, thelining

endometrium become abnormal and crowded [9]. Clinical significance of endometrial hyperplasia is due to possibility of PMB which may procede to endometrial cancer which is commonly presented as PMB[10]. Pelvic ultrasound and hysteroscopy with biopsy are appropriate procedures to recognize which woman is at higher risk of endometrial cancer and to evaluate the underlying etiology of PMB[11].We aimed in this study to establish the etiology of PMB and the significance of each cause based on histopathological changes in the endometrium .

Materials and Method

Forty patients were collectd from Al-Khansaa Hospital in Mosul during the period from December 2017 to June 2018 complaining from uterine bleeding appearing 1 year or more after menopause. The age of women ranged from 45 to 65 years .For all patients,full informations were collected from every patient about name, age, parity, with a detailed history including medical,obstetric, menstrual and drughistory were recorded and physical examination & investigations including complete blood picture & pelvic ultrasound were done. Dilatation and curettage under general anaesthesia was performed to obtain endometrial biopsy. The specimens were fixed in 10% neutral buffered formalin for 24 hours then the specimens were processed into paraffin blocks and serial sections were obtained from each block using Reichert's Rotatory Microtome and stained with Harris Hematoxylin and Eosin (H & E) then the stained sections were examined using light microscope. Statistical analysis of the results was done using Statistical Package for Social Sciences (SPSS) version 13 for windows.

Results

Most of patients with PMB (62.5%) were between 51 and 60 years age, (92.5%) of them were multiparous, (25%) were obese >100 kg and suffer from hypertension. Diabetes mellites was observed in (12.5%) of postmenoposal women whearas thyroid dysfunction was found in (7.5%) of them and (5%) have no specific medical problem. All the characteristics of patients with PMB are shown in (Table 1).According to the histological findings, the patients were classified into the following categories :

Twelfpatients (30%) of the pateints showed endometrial atrophy (Fig. 1) (Table 2).Six patients (15%) showed proliferative endometrium (Fig. 2) (Table 2). Two patients (5%) showed secretory endometrium (Fig.3) (Table 2).Ten patients (25%) showed simple endometrial hyperplasia without atypia (Fig.4) (Table 2).Two patients (5%) showed simple endometrial hyperplasia with atypia (Table 2).Two patients (5%) showed cystic endometrial hyperplasia as cystic dilatation of some glands (Table 2).Two patients (5%) showed endometrial polyp(Table 2).Four patients (10%) showed endometrial carcinoma (Fig.5) (Table 2).

Table 1: Characteristics of patients with PMB according to their age, parity and medical disease

	No. of Patients (N=40)	Percentage (%)
Age of patients (yrs)		
45-50	5	12.5%
51-55	10	25%
56-60	15	37.5%
61-65	7	17.5%
>65	3	7.5%
Parity		
Nuliparous	3	7.5%
Multiparous	37	92.5%
Medical disease		
Diabetes mellites	5	12.5%
Hypertension	15	37.5%
Thyroid dysfunction	3	7.5%
Obesity>100 kg	10	25%
Obesity ≤100 kg	5	12.5%
None	2	5%

Table 2: Histopathological findings of endometrium in women with PMB

Histopathological findings	No. of Patients (N=40)	Percentage (%)
Endometrial atrophy	12	30%
Proliferative endometrium	6	15%
Secretory endometrium	2	5%
Endometrial hyperplasia without atypia	10	25%
Endometrial hyperplasia with atypia	2	5%
Cystic endometrial hyperplasia	2	5%
Endometrial polyp	2	5%
Endometrial carcinoma	4	10%

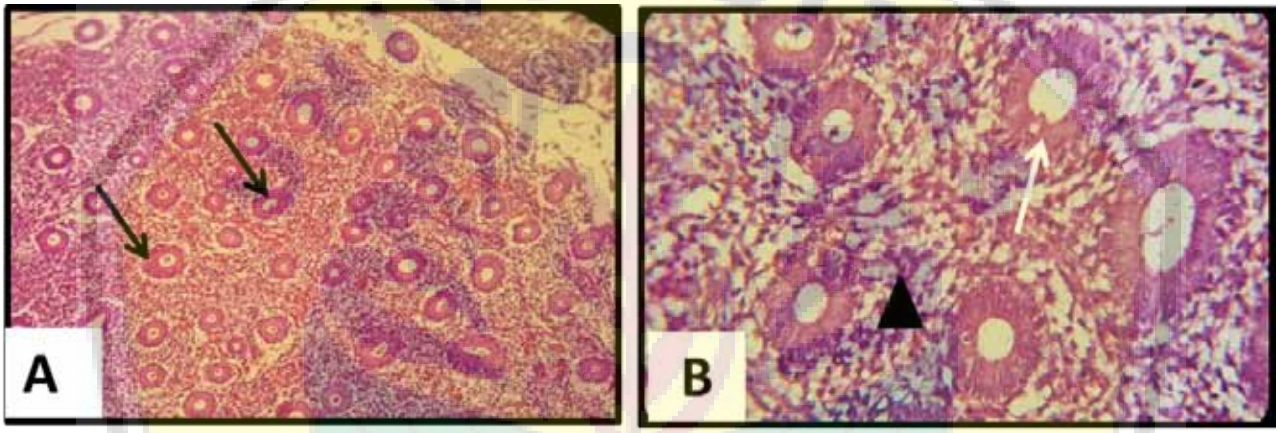

Fig. 2: A: Proliferative endometrium with round, narrow endometrial glands (black arrows) (H & E X 10).B: The glands are lined by single layer of columner epithelium (white arrow) and surrounded by edematous stroma(arrow head) (H & E X 40).

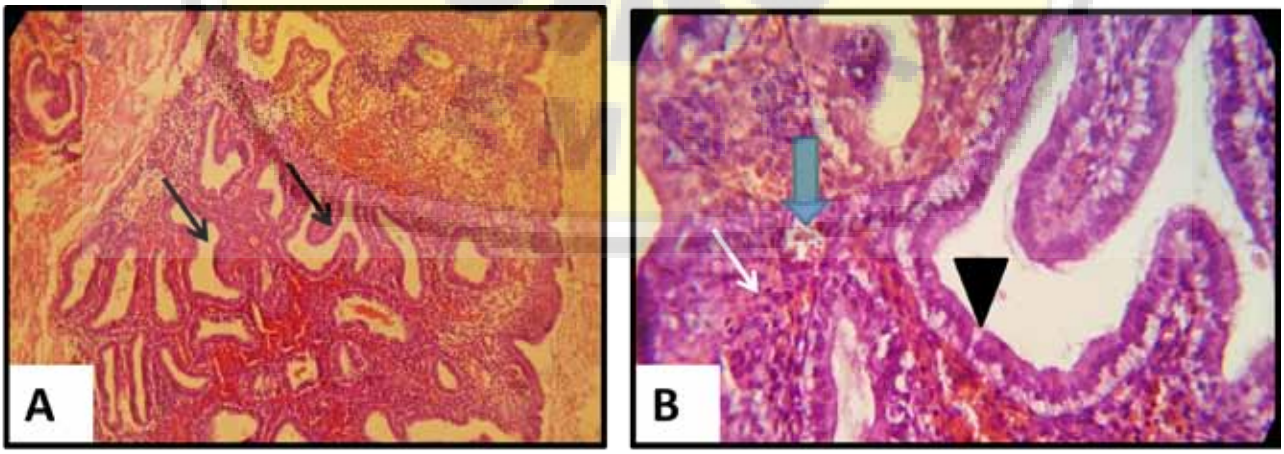

Fig. 3: A: Secretory endometrium with dilated, tortuous glands (black arrows) (H & E X 10), B: Secretory endometrium with coiled arteries (blue arrow), columnar epithelium lining the glands (arrow head), stromal edema(white arrow)(H & E X 40).

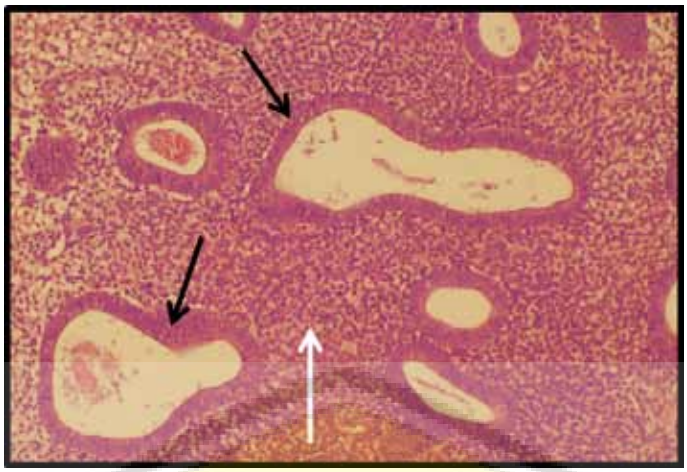

Fig. 4: Endometrial hyperplasia without atypiashowing irregular shape of endometrial glands lined by simple columner epithelium (black arrows) surrounded by abundant cellular stroma (white arrow) (H & E X 40).

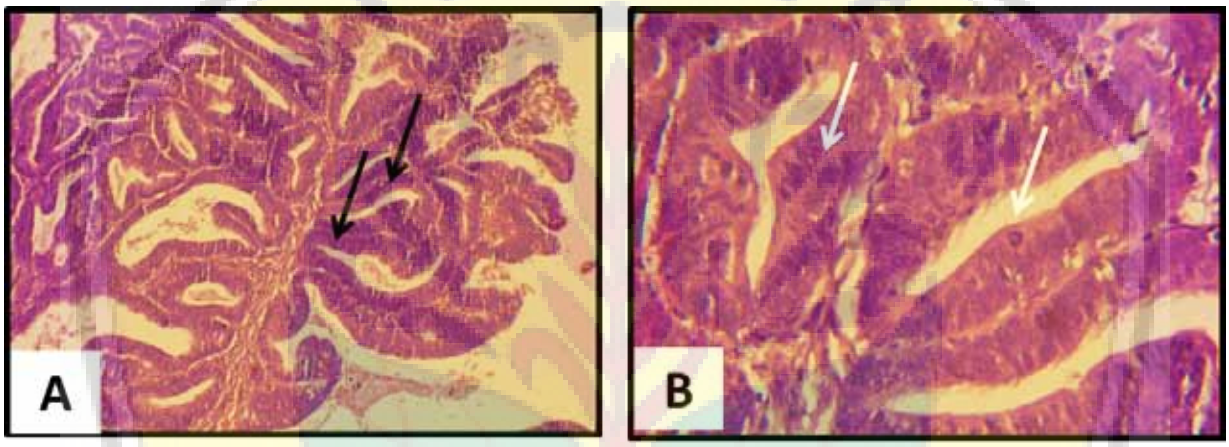

Fig. 5: A- Endometrial carcinoma show back to back irregular endometrialglands with scanty intervening stroma (black arrows), B- The glands are lined by pseudo stratified pleomorphic columnar cells some of them with prominent nucleoli(H & E X 40).

Discussion

Postmenopausal bleeding is a disturbing illness of postmenopausal women, the representative complaint of post menopausal women is the base of clinical analysis of the etiology of this problem [12].Most of patients with PMB (62.5%) were between 51 and 60 years age and decrease to (3%) in women more than 75 years, such finding agrees with previous studies reported that the rate of PMB declined with increasing age in the postmenopausal period>60 years whearas the incidence of endometrial carcinoma increase [13].On the other hand, Breijer*et.al*, (2010)[14]mentioned that the peak incidence of PMB and malignancy was in the age group of 55-64 years. The rised number of patients in this age group could be explained that at menopause, the number of ovarian follicles decrease and their resistance to gonadotrophic stimulation increased, resulting in a lower level of estrogen which is inadequate for the growth of normal endometrium causing desequamation followed by bleeding [15]. In the advanced menopausal ages, fewer cases of PMB are recorded may be due to earlier assessment and optimal management of the disease [16]. Majority of the study sample 92.5% were multiparous and this may be attributed to the early menarche and early childbearing and multiple pregnancy in our society besides, the association of multiparity with ovulatory cycles and hormonal effects [17]. In this study, (37.5%) of women with PMB were hypertensive, the exact reasons

is not fully understood but many studies revealed that oestrogen hormonerelaxes theblood vessels maintaining optimal blood flow thus the decline in oestrogen levels during menopause may contribute to hypertension and bleeding in addition to otherfactors like stress, anxiety, andlack of exercise [18].Obesity >100 kg was found in 25% of patients, nearly a similar figure was previously noticed by Acmaz et.al, (2014)[19] who reported a statistical significant association between postmenopausal bleeding and body mass index even that obese women at the postmenopausal periodwere significantly affected by serious precancerous lesion since that the obesity increase estrogen hormone by decreasing levels binding globulin which stimulate the endometrial growth or by increasing theconversion of androstenedione to estrone in the adipose tissue [20]. Diabetic patients were 12.5% of the study group similar to previous reports about a significant association between PMB and risk of diabetes in the diabetes prevention program [21].7.5% of patients have thyroid dysfunction, similar finding have been observed by other worker who noticed frequent nodular goiter and hypothyroidism associated with postmenopausal bleeding with difficult diagnosis due to nonspecific symptoms particularly in thyroid cancer which worse the prognosis [22].Dilatation and curettage still used as an accurate method for diagnosis besides clinical examination and pelvic ultrasound but recently, biopsy guided by hysteroscopy is the investigation ofchoice [23].

Histopathological evaluation of the curettage sample is necessary in identifying the cause of abnormal uterine bleeding [24].In this study a predominant observation in women presented with PMB is endometrial atrophy (30%), such finding is comparable to that of (Bani-Irshaid et. al, (2011)[25]. The cause of bleeding from an atrophic endometrium is not knownbut the anatomical vascular changes particularly thinning of the wall of veins lying superficial to the dilated cystic endometrial glands making the vessel more vulnerable to damage in addition to irregular local haemostatic mechanisms in the uterus [26].Proliferative endometrium (15%) and secretory endometrium (5%) were identified in the postmenopausal women which is a comparable finding to otherstudies which reporteda proliferative endometriuml with dense stroma and increased extracellular matrix in the postmenopausal women under effect of oestrogen similar to the endometrium found in the premenopausal monthly cyclewhile progesterone induces further thickening of the endometrium, increased vascularity,large tortuous glands filled with secretions [27].Endometrial hyperplasia was identified in 30% of the cases such finding is significantsince it is considered to be a precursors of endometrial carcinoma with a wide variations in percentage of progression according to the type of hyperplasia[28]. Simple endometrial hyperplasia without atypia found in 25% of patients which is comparable to Ellenson et.al 2010[29]who reported that endometrial hyperplasia results from chronic estrogen stimulation unbalanced by the counter effects of progesterone and characterized by proliferation of endometrial glands. The role of progesterone is to eradicate endometrial hyperplasia. through its receptorand to promote inhibition of growth and apoptosis of the malignant cells by regulating the genes that direct these processes [30].Endometrial polyps found in 5% of women, might be attributed to the difference between the endometrial polyp and normal endometrium regarding the cell proliferation, receptor expression and apoptosis suggesting that polyp may be considered as a precancerous pathology [31].Endometrial carcinoma was found in 10% of cases similarly, other studies conducted a significant risein the incidence of malignancy with recurrent PMB, advancing age, prolonged time interval between the menopause and onset of bleeding, increasing amount and duration of bleeding and enlarged uterus [32,33].

Conclusion

Postmenopausal bleeding is a significant symptom and should not be neglected. The incidence of PMB is significantly associated with multiparity, menopausal age between 51 and 60 years, high BMI, hypertension, diabetes and thyroid dysfunction. While The incidence of endometrial carcinoma increases with increased menopausal age. Majority of patients with postmenopausal bleeding showed benign changes of endometrium including atrophic changes (30%) which is the most common cause, proliferative and secretory endometrium, endometrial polyp and simple endometrial hyperplasia without atypia. Premalignant changes like simple endometrial hyperplasia with atypia and endometrial carcinoma should not be excluded and require thorough clinical evaluation and management.

Treatment of Receding Gingiva with Gingival Mask in Patient with Aggressive Type of Periodontitis

Ban Zuhair Ahmad

Department of Periodontics, Collage of Dentistry, University of AL-Issra, Iraq

Abstract

Periodontitis is a destructive disease that inflame the supporting tissues of the teeth and is caused by specific microorganisms, resulting in progressive destruction of periodontal ligament and alveolar bone with periodontal pocket formation, gingival recession, or both. There are many type of periodontitis and one of them are Aggressive type that cause a very sever destruction of bone and gum recession. Receding gums can disrupt a perfect smile, the reconstruction of these areas with prosthesis like gingival veneer can be useful to correct the deformities remaining after the control of periodontal diseases, especially in the maxillary anterior region. The gingival replacement unit is designed to simply create an esthetic replacement for missing gingival (gum) tissues associated with bone and soft tissue loss around natural teeth or dental implants. It is unlike a denture in as much as it depends on the natural teeth or implants for it retention and not the palate or the residual ridge which would retain a removable denture.

Keywords: *Periodontitis, Aggressive periodontitis, gingival veneer.*

Introduction

Aggressive periodontitis is considered to be a type of periodontal disease and includes two classifications of periodontitis:

- **Localized aggressive periodontitis (LAP):** Which is localized to first molar or incisor interproximal attachment loss
- **Generalized aggressive periodontitis (GAP):** Is the interproximal attachment loss affecting at least three permanent teeth other than incisors and first molar.[(1)]

Clinical Features are: Mostly in individuals under 35 years old, the amount of plaque present is inconsistent with the amount and severity of tissue destruction with a high plaque pathogenicity due to the presence of increased levels of bacteria like *Aggregatibacter actinomycetemcomitans* (A.a) and *Porphyromonas Gingivalis* (P.g) and the key diagnostic feature is vertical bone loss around teeth including the first molars and incisors, it also runs in the patient's family. [(2)]

The correction of such recessions can be done by various type of surgical root coverage procedures but sometimes gingival recession can be generalized and very extensive that it cannot be corrected by surgical root coverage procedures. The alternative for such a clinical situation is gingival prosthesis. [(3,4)]

Gingival prosthesis (gingival mask or gingival veneer) is a flexible removable periodontal prosthesis that used to replace receding gum due to periodontal surgery, gum recession or due to trauma. Materials that can be used for gingival veneer include pink auto cure and heat cured acrylics, porcelains, composite resins and thermoplastic acrylics as well as silicone based soft materials. [(5,6)]

The indications for gingival mask are:[(7)]

- Gum recession with root exposure and open

interdental areas due to loss of papillae after periodontal disease or post-periodontal treatment therapy.

- Provisional coverage prior to definite restorations. Temporary splint.
- As a gingival augmentation for implant supported prosthesis.
- When there is proclination of teeth along with mild recession.
- As an interim measure in cases where final treatment planning is delayed.

Contraindications of gingival mask include:[7]

- Poor or unstable periodontal health.
- Poor oral hygiene.
- High caries activity.
- Known allergy to silicone.
- Heavy smoker's patients.

Case Report: A 34 year-old female patient reported to the Department of Periodontics, AL-Esra'a university collage with the complaint of teeth mobility, gum recession, sensitivity and food impaction in the maxillary anterior region. The patient expressed dissatisfaction with esthetics of her existing dentition [figure 1, figure 2]

Figure 1: Patient with anterior gingival recession

Figure 2: Orthopantomogram before bone augmentation

After ORAL examination, medical, dental history and radiographic (O.P.G) FINDING:

- The diagnosis : aggressive periodontitis
- The treatment plan :
- The patient first received phase-I therapy, which included oral-hygiene instructions. Scaling and root planning by ultrasonic and hand instruments.
- Splinting for anterior teeth for stabilization of the teeth. (figure 3 a)
- One month after initiation of phase-I therapy a surgical procedure was planned. A Kirkland flap operation with bone augmentation for anterior teeth was planned. A crevicular incision was placed and a full-thickness periosteal flap was elevated. The flaps were repositioned and sutured using interrupted non-resorbable 4-0 silk suture, after which the operated site was covered with a non-eugenol periodontal dressing for protection [Figure 3b]. Postoperative instructions included advice not to brush the operated area for 2 weeks and to rinse the oral cavity with chlorhexidine (0.2%) mouthwash twice daily for 2 weeks. After 1 week, the periodontal dressing and sutures were removed and the surgical area was flushed with antimicrobial solution.

A periodontal surgery of the maxillary teeth improved the periodontal condition, but left the patient with a significant loss of papillae. The patient found the resulting tooth sensitivity extremely uncomfortable and was also very unhappy with the unaesthetic appearance of the elongated teeth.

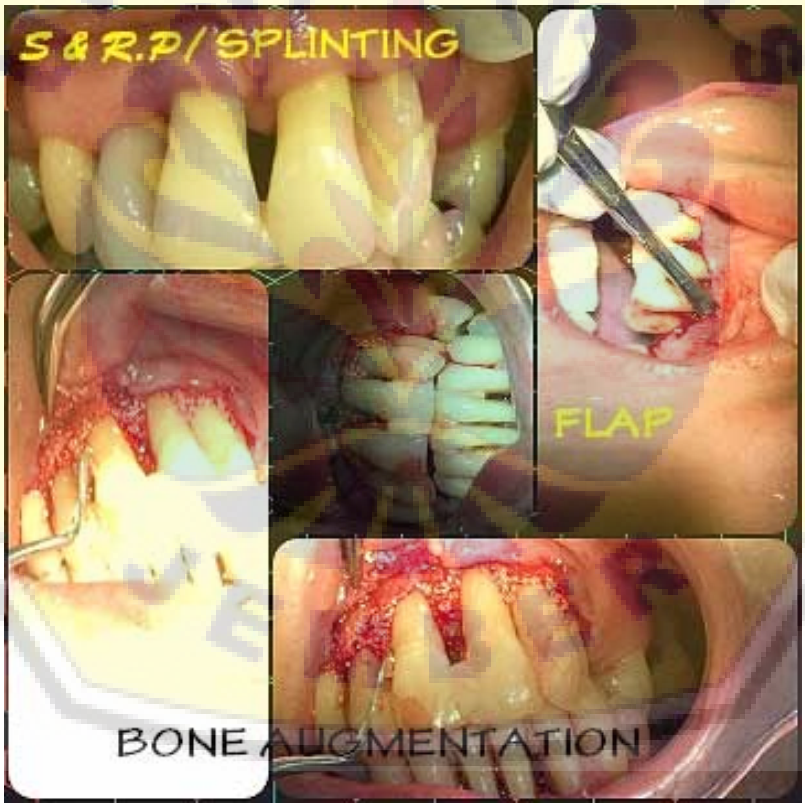

Figure 3: (a) Scaling and root Planning/splinting (b) Flap/Bone Augmentation

- After healing Impression for anterior teeth for gingival veneer was done for the patient, a diagnostic impression was made using alginate impression material (Tropicalgin, Zhermack, Italy). The impression was then poured with type III dental stone (Kalrock, Kalabhai, India). A labial custom tray was made using Self cure methyl methacrylate (DPI, Self-cure, India) after blocking the interdental spaces from palatal side on the model using utility wax. The tray extended from incisal edges to

vestibular sulcus from canine of one side to canine of contralateral side. The custom tray tried in the mouth and practiced for orientation and a buccal approach was used to create the master impression with a complete interproximal detail. The impression was made using addition silicone impression material (Reprosil, Regular Body, Dentsply, USA). The cast was prepared using type IV die stone (Kalrock, Kalabhai, India) and a gingival prosthesis was waxed up and processed in heat-cured acrylic resin (DPI Heat cure, India). Retention was achieved with minor interproximal undercuts. The prosthesis was made extremely thin and had enough flexibility to engage these undercuts. (Figures 4,5)

- Prosthesis delivered to patient (figure 6)

Figure 5: Fabrication of flexible gingival prosthesis

Figure (6): Prosthesis delivered to patient

Discussion

Progression of periodontal disease can cause deep gum, pocket formation and with resective osseous surgeries often lead to creation of recession and a potential for a compromised esthetic outcome, especially in the maxillary anterior region[8] .With successful surgical treatment, the result mimics the original tissue contours. Such treatments include minor procedures to rebuild papillae and also bone augmentation to support the soft tissue. It is possible to create esthetically pleasing and anatomically correct tissue contours when small volumes of tissue are being reconstructed, but this method is unpredictable when a large volume of tissue is missing.[9]

The gingival veneer is a viable treatment option for restoring anterior esthetics in clinical situations where there are esthetic concerns caused by significant gingival recession. Case selection is important for predictable and successful outcome.[10]

In the present case, this material was chosen to construct gingival veneer as mentioned by Green et al. Loss of interdental papillae in maxillary anterior region can often lead to esthetic and functional clinical problems. [11] The gingival mask can replace a large volume of tissue that has been lost to the disease process or its treatment. The advantage of the prosthesis is that it can be easily cleaned, creates an ideal contour with removable prosthodontic materials and does not disturb the other dental units. In the present case the prosthesis provided an esthetic result, reduced hypersensitivity significantly, prevented food impaction and improved phonetics.

Conclusion

The periodontal attachment loss, loss of interdental papilla and gingival recession in the maxillary anterior

region can often lead to esthetic and functional clinical problems which disturbs patient's life. Dental esthetics is based not only on the "white component" of the restoration, but also on the "pink component. Gingival veneer is a good treatment option for patients with generalized/multiple recessions to achieve good esthetics. Prosthetic option of a gingival veneer helps in mimicking natural appearance of the gingiva in a predictable way, which is cost-effective to the patient.

Constructing and Standardizing the (Social Affiliation) of the Players of the Universities of the Middle Euphrates Futsal Club

Saba Shaker Farhan[1], Asaad Ali Safih[2], Raafat Abdulhadi Kadhim[3]

[1]*University of Al-Qadisiyah/The College of Physical Education and Sport Sciences/Iraq*

Abstract

The research included the introduction and the importance of research in which the role of (social affiliation) for the futsal players of the gymnasiums in the universities of the Middle Euphrates and in the construction of the criterion of social affiliation of the players of the universities of the Middle Euphrates futsal of the halls was pointed out. The research included research procedures in the field. The researchers used the descriptive method in the survey method and also included the society and the sample of the research and how to choose them. They represented the players of the universities of the Middle Euphrates futsal clubs (105) players for the 2018-2019 season. The tools and tools used by the researchers to reach the goals of his research, which was a measure of (social affiliation) consisting of (10) paragraphs and prepared from the researchers.

The study consisted of presenting and discussing the results of the social affiliation after applying the measure to the players and evaluating the relationship between the players of the universities teams of the Middle Euphrates futsal clubs. After sampling and statistical treatment, the following researchers concluded, a standardized scale has been obtained which is capable of detecting the weakness and strength in the social affiliation of the players of the universities of the Middle Euphrates futsal clubs.

Keywords: *Building Scale, Social Affiliation and Futsal.*

Introduction

Sport psychology is an effective factor in the performance of the individual towards success as it is a science that benefits the trainers, players and administrators to achieve excellence in their performance, as it comes in the forefront of science to help the success and development of the level of sports performance and closely linked to them, the psychological aspect is one of the pillars of the training process And sports competitions because of its importance in enhancing the chances of winning. Sports psychology has acquired great importance in the study of the psychology of players in order to reach all the basic elements that will upgrade the players to the higher levels and cast a shadow on the level of their achievements and achievements and hence began to focus on the most important concepts that can be related to sports psychology, including the concept of (social affiliation) loyalty, which is a key factor in the promotion and build confidence between the people and institutions that belong to them in order to achieve the common goals of athletes in general and athletes Which in turn represents a real motivation to achieve achievements by showing a spirit of mutual cooperation and striving to achieve gains with diligence and dedication.[1]

And that social belonging is the result of socialization that helps in the implantation of social belonging to the individual, as some studies believes that “socialization is the responsibility of the family, where is considered a crucial indicator and a significant behavior”.[2]

Research Aim: Building and standardizing the (social affiliation) of the players of the universities of the Middle Euphrates futsal club.

Research Methodology

The approach is defined as "a way in which a person reaches a reality". Because the research approach is the path chosen by researchers to arrive at the truth and the nature of the problem determines the approach used, it is the success of the research and this is why the problem has forced the researchers to use the descriptive method in the survey method. "The survey is one of the basic method of descriptive research".[3]

Community and sample search: "The objectives set by the researchers for their research and the procedures used by them determine the nature of the sample to be chosen." Thus, the research community represented the players of the universities of the Middle Euphrates futsal universities for the academic year 2018-2019 (105) representing (7) teams, The total number of students is 100% of the research community distributed to the universities of the Middle Euphrates represented by universities (Karbala, Kufa, Babel, Al-Qasim Green, Central Technical University, Muthanna and Qadisiya). (100%) of the population and sample of the research, table (1).

Table (1): Shows the distribution of building sample, standardization and sample application

Sample construction and standardization			Sample application

Measures to build the scale:

Determining the phenomenon studied: The current research aims to build and standardize the scale of social affiliation of the players of the universities of the Middle Euphrates futsal club.

Determining the purpose of the study: The need to determine the purpose of the scale stems from the hypothesis that the shape and characteristics of the scale differ according to the purpose of the scale. Therefore, the purpose of the current research is to construct and standardize the scale of the players of the universities of the Middle Euphrates Futsal Federation.

Select the metric paragraphs: Identified paragraphs scale (social affiliation) b 10 paragraphs of all positive followed ladder alternatives quintet (not OK, OK somewhat, OK, OK significantly, OK very large degree), followed balance (1, 2, 3, 4, 5), respectively, to be the maximum degree of the scale (50) degree.

Pilot Study: In order to ensure that the scales of the scale are clear to the players and to identify the time taken to answer them as well as to identify the conditions of application of the scale,(30) randomly selected players for the period from 5/1/2019 to 13/1/2019, it became clear from the experience that the paragraphs of the scale are clear and the researchers did not face difficulties with the survey sample. It also found that the time taken to answer ranged from (5 - 10) minutes, a mean (5.7) minutes.

Validity of metric paragraphs: The researchers presented the scale in its first form to the experts and specialists in the field of psychology to identify the validity of the scales of the scale using a questionnaire

containing two choices (valid), (not valid) and after collecting the forms the researchers extracted the value of the square of each paragraph to identify the paragraphs to be used in Scale (social affiliation) as shown in Table (2).

Differentational Ability: To determine the possibility of acceptance or rejection of the paragraph in the light of the coefficient of distinction of the status of (AIPL) as stated a set of rules after conducting several studies, namely:[4]

1. If the coefficient of excellence greater than 0.40, the paragraph is characterized by high distinction and excellent.
2. If the coefficient of distinction is between 0.30 and 0.39, the paragraph is considered to be of good character.
3. If the coefficient of distinction is between 0.20-0.29, the paragraph is considered to be fairly good (marginal paragraphs that need to be improved).
4. If the coefficient of excellence is less than 0.19, the paragraph is weak and it is recommended to delete it.

Therefore, the researchers applied the criterion of "social affiliation" on the building sample of the players of the universities of the Central Euphrates futsal of the 105 gymnasiums on 25/1/2019 in order to achieve the discriminatory power of the standard terms, In Table (3).

Internal Consistency: The relationship of each paragraph to the field to which it belongs is found by finding the correlation coefficient for each paragraph in the field. The purpose is to know whether these paragraphs are expressed in this field, they represent an aspect of this area.[5]

Honesty Authenticity: The researchers used the validity of the content. This type of honesty depends on the examination of the content of the scale in a precise way. This means that the quality of the content of the scale is represented in a class of positions. The scale is true if its divisions and branches are properly represented. In the search for experts by a questionnaire that included two options (valid) and (not valid). After collecting the forms, the researchers extracted the value of the square of each paragraph, as shown in Table (2).

Reliability: The researchers used the method of applying the scale twice the period between the first and the second three weeks on (30) players from the teams of the universities of the Middle Euphrates futsal of the halls, the first application was applied on 2/2/2019 and the second time on 16/2/2019 and This method is applied to the same sample twice under the same conditions as possible and the use of correlation coefficient between the results of the application at both times and indicates the correlation coefficient of stability of performance and this coefficient is called the stability coefficient.[6]

Standardization:

Extracting levels for the studied fields: After extracting the relative weight of each paragraph of the scale, the levels were found by finding the length of the class by subtracting the highest score the player can get from the lowest score the player can get divided by the number of levels and then collecting the lowest score the player can get. The domain along the class can extract the least class.

Results

View, analyze and discuss results:

Table (2). Chi square value for scale scales (social affiliation)

Paragraph	Expert opinion		(Chi square) value	Type of significance
	Suitable	Not suitable		
1	15	0	15	Sig.
2	15	0	15	Sig.
3	14	0	11	Sig.
4	15	0	15	Sig.
5	15	0	15	Sig.

Paragraph	Expert opinion		(Chi square) value	Type of significance
	Suitable	Not suitable		
6	13	2	8	Sig.
7	13	2	8	Sig.
8	15	0	15	Sig.
9	15	0	15	Sig.
10	15	0	15	Sig.

The value of square (Chi square) in all the paragraphs is significant and all of them are greater than the numerical value of (3.84). This indicates that all the paragraphs of the scale are suitable for measuring what was set for it, to measure the social affiliation of the players of the Middle Euphrates futsal.

Table (3). The coefficient of discrimination of the social interaction scale

S	Coefficient of discrimination	S	Coefficient of discrimination
1	0.49	6	0.44
2	0.44	7	0.37
3	0.41	8	0.61
4	0.38	9	0.37
5	0.40	10	0.51

Table (3) shows that all the values of the coefficient of discrimination are statistically significant in the light of the criteria set by Ebel, which indicates that all the paragraphs of the scale are highly marked.

Table (4). Correlation between application of the scale and re – application

S	Variables	Coefficient of correlation
1	(Social affiliation)	0. 89

Table (5). Shows the paragraph and the axis that belongs to the correlation coefficient

S	Coefficient of correlation	S	Coefficient of correlation	S	Coefficient of correlation
1	0.66	5	0.77	9	0.60
2	0.63	6	0.59	10	0.61
3	0.63	7	0.64		
4	0.59	8	0.61		

Table (5) shows that the correlation value calculated between the paragraph and the dimension to which it belongs is greater than the tabular value at a significance level (0.05) of (0.32), which means that there is a significant correlation between them and then .

Table (5). Shows the levels of the scale (social affiliation)

The Level	Degree
Very good	8-42
Good	8-34
Average	8-26
Acceptable	8-18
Weak	8-10

In Table (5) we find that the level is very good, ranging from (8-42), the level is good ranging from (8-34), while the average level is between (8-26), the acceptable level ranges from (8) -18), while the level is weak (8-10).

Table (6).Shows the arithmetic mean and level of the scale (social affiliation)

The Level	Duplicates
Very good	8
Good	22
Average	51
Acceptable	17
Weak	7

The length of the class was calculated by subtracting the highest value that can be obtained by the individual from the minimum value divided by the levels. The length of class (8) has reached the frequency of the sample on the scale at a very good level (8) and (22), while the average level reached (51) and reached the acceptable level (17), while it reached the weak level (7).

Discussion of Results

As shown in Table (5), the level is weak (7), the acceptable level is (17), the average level is (51), the level is good (22) and the level is (very) good. (8) From the above results, it is found that the individual sample of the research sample was distributed at different test levels and in different proportions. This indicates that the test distinguishes between the individual differences of the sample members in the evaluation process since the sample members are distributed naturally. Quantification of phenomena - as in analogy but goes further it refers to judging the value These phenomena, if provided as excellent or good or medium, not all of them have any strong or all of them are weak. It is worth mentioning in the same context to mention the importance of socialization of athletes in general and athletes of the effectiveness of football halls specifically as it is a dynamic interactive process lasting to bring about processes of change and harmony between the team to achieve its goals and satisfy their needs,[7] and also to the importance of the character and characteristics of collective The effectiveness of football for the halls, which is dominated by cooperation and unity of purpose and that the players face a common destiny and depend so much on each other so that if one of them faced a problem, its effects will be reflected on the rest of the team, as mentioned above The target group (the research sample), which is represented by university students possess a high level of educational level, they certainly understand the value of their harmony and harmony with others and are aware that the basis of regular life away from psychological and social problems is due to the nature of the relationship with others in the team or outside the team they belong It is the basis of the normal life of the individual and without it the relationship with others becomes blurry and incomprehensible marred by conflicts and psychological crises and the development of reciprocal relations inside and outside the stadium which is a requirement to work with any team, so that it can be employed for the benefit of only The goal of the team that the team seeks to achieve, which is reflected positively on increasing the effectiveness and productivity of the team .[8]

The interaction between the members of the team is critical to achieving the desired results of the team and is one of the key elements that cause the players to reach a state of collective harmony, as it plays a pivotal role in giving players the ability to solve the motor problems to reach the maximum degree of cooperative behavior among the team members. Therefore, the players of the collective games and the football players of the halls recognize the importance of developing this aspect in order to achieve what they want. This indicates that all the paragraphs of the measure are suitable for measuring what they were set for, to measure the social affiliation of the players of the middle Euphrates teams.[9] This indicates that the test distinguishes the individual differences of the sample members in the evaluation process since the sample members are distributed naturally. The evaluation is not limited to quantifying the phenomena as in the measurement, but goes further. Judging the value of these phenomena as if presented as excellent or good or medium not all are strong or all weak.[10]

Conclusions

1. The scale of the ability to detect weaknesses and strength in the social affiliation of the players of the university's futsal teams of the halls
2. The scale of the ability to choose the players of futsal teams of universities for the halls according to social affiliation
3. The measure is valid for measuring the social affiliation through the clarity of its paragraphs and

comprehensiveness and through the distribution of sample members moderately.

Using Multiple-Criteria Decision Analysis for Emergency Health Centers for the Visit Million Based-Gis (Holy Governorate of Karbala)

Mahdi Wahhab Neamah[1], Ali M. Alskmani[1]

[1]*Department of Statistics, Faculty of Administration and Economics, Kerbala University, Iraq*

Abstract

This research aims at presenting a scientific method in the integration of statistical method and statistical programs in the arrangement and analysis of raw data to obtain criteria and weights used with GIS programs and spatial analysis in locating the emergency health centers for the visit of the Labrabinia within the center of the holy province of Karbala and (The number of visitors to the centers, the health center near the Husseiniya procession, the flow of visitors entering the city center, the influx of visitors out of the city center and the number of Hussainian processions within the area of each proposed health center).

While using the analytical hierarchy method (AHP) using the matlab program for the purpose of analyzing the factors and limiting them in the main factors and knowing which factor is the most influential. Based on the results of the analysis of the matrimonial matrix based on the weights resulting to the main vectors For the decision matrix, the weighting method for each of these factors was determined. Therefore, based on the Priorities for Criteria, it was found that the potential weights for the criteria based on the marital comparisons are (12.7)) And near the health center of the procession Husseiniya (27.7) and the flow of visitors entering the city center (5.7) and the flow of visitors a departure from the city center (3.3) and the number of processions Husseiniya within the area of each proposed health center (50.7)).

Keywords: *Multi-standard MCDM; GIS; choice of health center sites; AHP.*

Introduction

The visit of the 40th day of the death of Imam Hussein (peace be upon him), is one of the most important religious events in all parts of the world. The city of Karbala receives millions of people from all over the world. Millions of visitors come from all the provinces of Iraq and from neighboring countries to Karbala to visit Aba Abdullah Al Hussein, and his brother Abu al-Fadl al-Abbas (peace be upon him). If some visitors walk more than 500 kilometers on foot and the increase in the number of visitors each year needs to provide logistical supplies such as medicine and food and the provision of roads and health supplies and other It is necessary to provide emergency centers in the city for the first aid and also transport the injured due to overcrowding .

The development of techniques and the use of Geographic Information Systems (GIS) to convert spatial data and addresses as points on the map through the process of geocoding and then using spatial analysis of geo-processing and statistical analysis models of points, polyLines, polygons and each geographical characteristic has their own data, which are of particular importance in the statistical perspective of their ability to adapt to the various sciences because they represent the link between them and are used to serve them. The health aspect is one of the important aspects dealt with in the study analysis and distribution The study of public health falls within the topics of community services, which became a basic requirement should be available properly in accordance with health planning according to specific criteria as well as the importance of the health aspect as a standard Is important for measuring the human development of communities and peoples.

Analytical Hierarchy Process (AHP): The decision-makers are calling for the adoption of modern

method of strategic decision-making using the scientific method and the process of hierarchical analysis presented by the scientist Thomas[1] to analyze and formulate alternatives and proposals, a useful way to check the consistency of decision maker evaluations, Bias in the decision-making process[1].

AHP is one of the tools used in decision making (MCDM), a mathematical theory of measurement and decision making developed by the world of Thomas (Saaty 1980) in the mid-seventies.

These are the simple ways we actually deal with problem-solving through decision-making (Saaty 1980). In general, the AHP process is as follows:[2]

1. A complex problem is organized by analyzing it into a hierarchical series with sufficient levels to include all criteria to reflect the objectives of the decision maker.
2. Standards are compared in a systematic manner using the same measure to measure the relative importance of each criterion and the priorities among which are to build standards within the hierarchy.
3. Relative position of each alternative For each criterion, an element in the hierarchy is selected using the same metric.

Decision Making

The decision of a group of operations is:

1. Having a problem needs to be solved
2. There are a number of alternatives to solve the problem
3. Choose the most appropriate alternative depending on proper thinking

4. Chieve the desired goal based on the choice of the most appropriate alternative of the alternatives offered [3]

Criteria Criteria can be grouped into three groups:

1. In terms of quality of the standard, the standards are classified as quantitative and descriptive
2. In terms of the composition of the criteria are classified into two complex and simple standards
3. In terms of change in time, standards are classified as dynamic and static (static)

Euclidean Distance Scale[4]

To illustrate the idea of this measure, we assume that both elements K and L are represented in Figure 8,

To find the distance between the two elements K, L uses Pythagoras' theorem:

$$D^2_{K,L} = (Ok)^2 + (OL)^2$$

$$= (X_{K1} - X_{L1})^2 + (X_{K2} - X_{L2})^2$$

$$D_{K,L} = \sqrt{\sum_{j=1}^{2} \left(X_{Kkj} - X_L\right)^2}$$

Generally:

$$D_{K,L} = \sqrt{\frac{1}{p}\sum_{j=1}^{n} \left(X_{Kkj} - X_L\right)^2} \quad \ldots(1)$$

As p represents the number of elements (n > p) taken into the calculations. In reference to equation (1), vector notation can be obtained as follows[5]

$$X_K = (X_{K1}, \ldots\ldots X_{Kj} \ldots\ldots X_{Kn})$$

$$L_K = (L_{K1}, \ldots\ldots L_{Kj} \ldots\ldots L_{Kn})$$

Then,

$$D_{K1L} = \hat{\sum_{j=\bullet}} (X_K - X_L)^2 = (X_{K.} - X_{L.})'(X_{K.} - X_{L.}) \ldots(2)$$

Symmetrical Analysis Model [6]: The model of the P-symmetric analysis of two dimensions shows that the elements of the P matrix after approximation in a weighted euclidean domain after k ^ *, we will return the formula of matrix p of the matrices Du, G, F and approximate formula using partial matrices to approximate the smallest squares Equivalents of the rank k ^ *.

$$P = rc^T + D_r F_k \cdot D_{uk}^{-1} \cdot G_k^T \cdot D_c \quad (4)$$

That's Mean:

$$Pij = ricj\left(1 + \sum_{z}^{k} \frac{f_{iz} g_{jz}}{u_z}\right) \quad (5)$$

$$= ricj\left(1 + \sum_{z}^{k^*} \frac{f_{iz} g_{jz}}{u_z}\right) \quad (6)$$

The approximation of the approximate Pij form of

the main axis format was used to determine the missing values of the data matrix[7]

Steps of the process of hierarchical analysis: Based on the selection criteria and we obtain the comparisons of priorities and the extent of stability and the extent of overlap between the elements have been calculated.[7]

1. The hierarchical structure of each criterion is constructed
   a. For best results, criteria and sub-criteria must be defined and all selection factors used to consider the best suitable site should be considered.
   b. Determination of weight for all criteria, sub-criteria and alternative using AHP[8]

Table (1): Measures of relative importance[9]

Scale	Description
1	Equally Important
3	Weak importance of one over another
5	Essential or strong important
7	Very great importance
9	Extremely preferred
2,4,6,8	Intermediate values between the two adjacent judgments

Priority Analysis Hierarchy analysis:

a. **Setting priorities:** The determination of the binary comparisons in the hierarchical form with an evaluation ranging from (1-9) on the basis that the numbers give comparisons that can be increased or decreased according to the following equation

n (n -1)/2

Where n equals the number of parameters

When comparing, a matrix must be designed according to the following conditions

a. It has a diameter of one because it represents a comparison of the standard with the same breath
b. The values below the inverse diameter values are higher than the diameter
c. The provisions shall be free of contradiction [10]
2. Consistency Verification When a compatibility matrix is A Inverted so that the sum of the two values equals one.

This value known as λ max will be greater than n The amount of difference is measured by the degree of contradiction.[9]

Suppose we want to compare a set of n elements in pairs according to their proportions and weights. Refer to the items by A1, A2 ... ..An and their weights by W1, W2 .....Wn

The comparisons can be represented by a matrix as follows[11]

$$A = \begin{bmatrix} \frac{w1}{w1} & \frac{w2}{w1} & \cdots & \frac{wn}{w1} \\ \frac{w1}{w2} & \frac{w2}{w2} & \cdots & \frac{wn}{w2} \\ \frac{w1}{wm} & \frac{w2}{wm} & \cdots & \frac{wn}{wm} \end{bmatrix}$$

The Eigen value and the characteristic roots of matrix A of class PXP are the following set of solutions:

$$|A - \lambda I| = 0 \quad \ldots (7)$$

Equation (1) is called the characteristic equation, which is polynomial of P in λ and has only P of the characteristic roots of Morrison [5]The distinct values are not necessarily all distinct or all non-zero or even all real.[12]

Therefore, from the theory of multidimensional equations we deduce that:

The multiplication of the characteristic roots of the matrix A is equal to | A | is that

$$|A| = \prod_{i=1}^{n} \lambda i$$

2. **The sum of the characteristic roots of A is equal to the effect of matrix A:**

$$tr(A) = \sum_{i=1}^{n} \lambda i$$

Applied Side: The best health emergency center for the quaternary visit using weight standards to compare the centers that were presented in the theoretical side, the Analytical Hierarchy Process (AHP) using the GIS the purpose of obtaining the results and applying them to data affecting the selection of the optimal location for health centers.[13]

Sample Size: Five criteria were identified and the expert opinion was taken in GIS, statistics, health and Al-Husseiniya and Abbasid holy sites through a number of 60 experts 'assessment and the proposal of 270 health emergency centers to choose the most important on the main streets And subsidiary.

Data Description:

The research data criterion are as follows:

A1: Preparation of processions within the area of each center.

A2: Near the procession from the center.

A3: Preparation of reviewers.

A4: Preparing Visitors.

A5: Preparing Visitors Out.

Emergency Health Centers N = 1,2 ....., 270

Analysis of Results

Decision Matrix: Setting the Matrimonial Matrices The resulting weights are based on the main vectors of the decision matrix. Note that all the columns in the regular matrimonial matrix contain one

Table (2): Matrimonial Maturity Matrix

Criteria	A1	A2	A3	A4	A5
A1	1	0.33	2	7	0.2
A2	3	1	7	7	0.33
A3	0.5	0.14	1	2	0.14
A4	0.14	0.14	0.5	1	0.11
A5	5	3	7	9	1
Column Totals	**9.64**	**4.61**	**17.5**	**26**	**1.78**

Then we divide each element of the matrix on its total column and convert the values in the matrices comparison matrix to a decimal formula as follows:

We then extract the average elements in each row and then repeat what is represented as the priority (relative) vector of the criteria

Priorities for Criteria Through the Decision Matrix, it was found that the resulting probability weights for the criteria based on marital comparisons are as follows:

Table (3): The (relative) priorities of the resulting weights of the standards

Category	Criteria	Priority	Rank	(+)	(-)
Preparing processions within the area of each center	A1	50.7	1	19.7	19.7
Near the procession from the center	A2	27.7	2	9.2	9.2
Prepared by reviewers	A3	12.7	3	5.5	5.5
Preparing Visitors	A4	5.7	4	1.2	1.2
Preparing Visitors Out	A5	3.3	5	1.3	1.3

Estimating Consistency Ratio:

Calculate the consistency index (CI): (Compute the consistency index (C):

$$C = \frac{\lambda_{max} - n}{n-1}$$

Where n is the number of items that are compared

Compute the consistency ratio (CR)

$$CR = \frac{C}{R}$$

Where RI is a random pointer, a consistency indicator for a matrices comparison matrix that was randomly generated. It can be shown that RI depends on the number of items that are compared.

Multiply each value in the first column of the matrimonial matrices by the relative priority of the first element examined. Same procedures for other items. Collect values across rows to obtain a vector of values named "weighed sum."

$$0.278\begin{bmatrix}1\\3\\0.5\\0.14\\5\end{bmatrix}+0.143\begin{bmatrix}0.33\\1\\0.14\\0.14\\3\end{bmatrix}+0.077\begin{bmatrix}2\\7\\1\\0.5\\7\end{bmatrix}+0.045\begin{bmatrix}7\\7\\2\\1\\9\end{bmatrix}+0.457\begin{bmatrix}0.2\\0.33\\0.14\\0.11\\1\end{bmatrix}=\begin{bmatrix}0.278\\0.834\\0.139\\0.039\\1.39\end{bmatrix}+\begin{bmatrix}0.047\\0.143\\0.020\\0.020\\0.429\end{bmatrix}+\begin{bmatrix}0.154\\0.539\\0.077\\0.038\\0.539\end{bmatrix}+\begin{bmatrix}0.315\\0.315\\0.09\\0.045\\0.405\end{bmatrix}+\begin{bmatrix}0.091\\0.151\\0.064\\0.050\\0.457\end{bmatrix}=\begin{bmatrix}0.885\\1.982\\0.39\\0.193\\3.22\end{bmatrix}$$

$$\lambda_{max} = 5.265$$

$$C = \frac{\lambda_{max} - n}{n-1} = \frac{5.265-5}{5-1} = 0.066$$

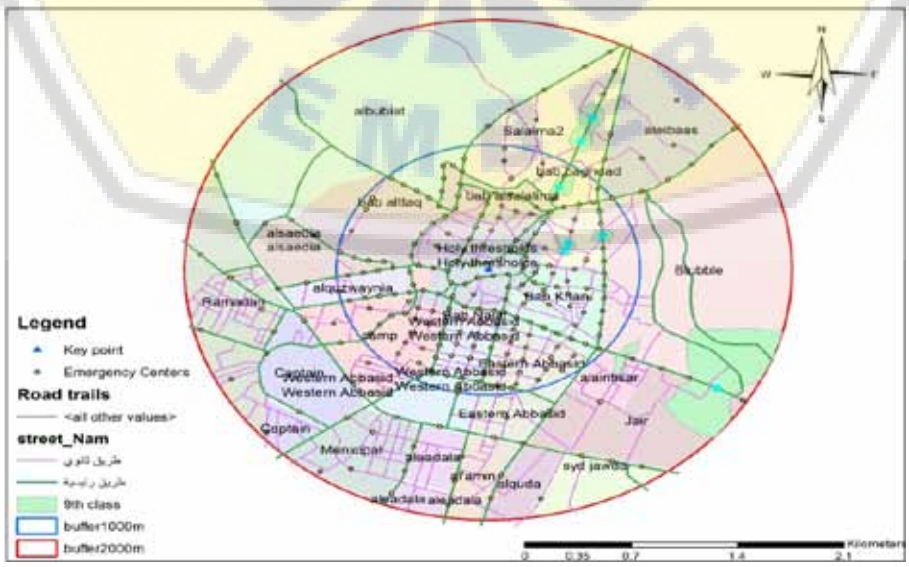
$$CR = \frac{C}{R} = \frac{0.066}{1.1} = 0.059 \le 0.066$$

Note that the degree of consistency resulting from the matrimonial matrimonial matrix is acceptable

The conversion of digital maps of all standards from Vector to Raster using spatial analysis and recalassify functions to map and divide data as follows:

9th class: Emergency health centers of utmost importance

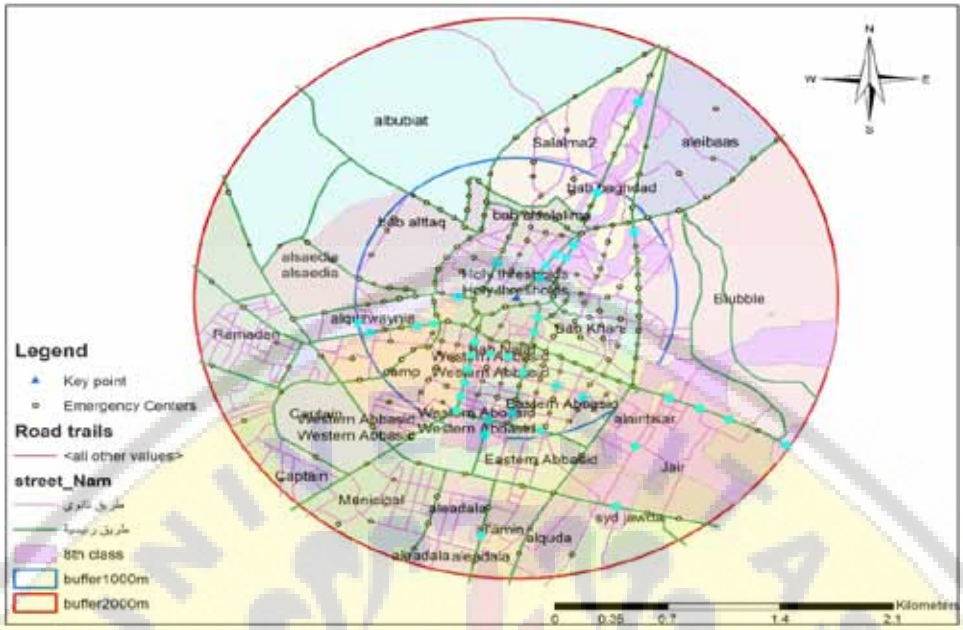
There are 7 temporary health centers of utmost importance and 3% of the proposed temporary health center



Map (1) 9th class for emergency centers of utmost importance

Map (1) 8th class: - The most important health emergency centers

There are 39 most important temporary health centers and 14% of the proposed temporary health center



Map(2): 8th of the most important emergency centers

7th class: Important health emergency centers

There are 42 most important temporary health centers and 16% of the proposed temporary health center

Conclusions

1. Through the decision matrix, it was found that the most important criterion with the highest possible weights for the criteria based on the marital comparisons is the preparation of the processions within the emergency center and was 50.7 and then the average number of reviewers of the proposed centers and the maximum 27.7.
2. The proposed emergency centers were classified according to importance and the following are shown
   A. Class classification 9th class Importance degree utmost importance it was No. of suggested centers 7 and Percentage %3
   B. Class classification 8th class Importance degree the most important it was No. of suggested centers 39 and Percentage %14
   C. Class classification 7th class Importance degree mission it was No. of suggested centers 42 and Percentage %16
   D. Class classification 8th class Importance degree less important it was No. of suggested centers 28 and Percentage %10.

Where the number of centers 270 centers proposed and found that 154 centers were not important and almost insignificant and by 57% of the centers that were proposed.

Ethical Clearance: The Research Ethical Committee at scientific research by ethical approval of both environmental and health and higher education and scientific research ministries in Iraq

Conflict of Interest: The authors declare that they have no conflict of interest.

Milk Proteins Co-precipitate Preparedusing Zinc and Ferrous Salts

Zardasht K. Ali[1], Jasim M.S. Al-Saadi[2]

[1]Food Science and Human Nutrition Department, College of Agricultural Sciences Engineering, University of Sulaimani, Iraq, [2]Dairy Science and Technology Department, College of Food Sciences, AL-Qasim Green University, Iraq

Abstract

The ideal conditions forskim cow milk protein co-precipitate preparation byusing zinc and ferrous salts were investigated. The optimum concentration of zinc and ferrous salts (chloride and sulfate) used to milk proteins co-precipitate preparationwas 18 mM for zinc chloride, ferrous chloride and ferrous sulfate and 24 mM for zinc sulfate. These ion concentrations yielded 93.95, 93.63, 93.71 and 94.01 % of total milk proteins respectively.

The best pH values forpreparing milk proteinsco-precipitate was 6.6, while the best heat treatments were at 90 °C for 20 min.

Keywords: *Cow milk, Proteins co-precipitate, Zinc, Iron.*

Introduction

Milk contains two main protein groups, casein and whey proteins. Caseins are phosphoproteins that are precipitated at pH 4.6 at 20 °C from raw milk. They make up about 80% of the complete protein content in milk. This group's main proteins are categorized as αs1-, αs2-, β-and k-caseins(1).

Only 80% of milk proteins are recovered during the manufacture of casein and about 20% of milk proteins (whey proteins) are lost. The production of coprecipitates was created due to the high dietary value and the required functional characteristics of whey proteins in addition to the need to improve the amount of the resulting proteins(2).

A milk protein co-precipitate may be described as the product containing both casein and heat coagulating whey proteins (3). Milk protein co-precipitates are generally prepared by heating the milk at a temperature above 60 °C. The protein complex may be precipitated directly after heat treatment or it may be cooled and then precipitated. Precipitation is achieved with either acidic, divalent ions (like calcium), or other ions affecting the complex's solubility.(5)

Heat treatment is crucial for the manufacturing of co-precipitates as it causes the denaturation of whey proteins and their interaction with caseins, especially through the creation of disulfide bonds (6), especially the interaction of k-casein and β-lactoglobulin.(7)

The role of adding an ion (e.g. calcium) in producing sheep milk co-precipitate is related to the fact that ions act as the cross-linking agent between whey proteins and caseins by forming ion bridges.(4) By heating skim milk at 85°C and adding an ion salt, (8) it recovered 96% of cow milk proteins and (4) also recovered 97% of sheep's milk proteins as co-precipitate.

Milk, however, has low levels of some significant vitamins and minerals, including iron and zinc(9), so increasing the quantity of some of these micronutrients in malnourished individuals could improve the dietary balance and health. Milk is widely consumed, thus the fortification of milk and milk products could provide vital nutrition to a large proportion of the world's populace, its often fortified with minerals such as Zn, Fe, Ca(9).

The purpose of the present work was to find ideal conditions (concentration, pH and temperature) for skim cow milk protein co-precipitate preparation.

Materials and Method

Milk Samples: A bulk of cow's milk was supplied from the field of College of Agricultural sciences engineering, Sulaimani University, Iraq and the milk was skimmed by centrifugation (2500 g at 5 °C for 30 min).

Preparation of Coprecipitate: Coprecipitate preparation experiments were on four batches of bulk cow skim milk for zinc and ferrous (chloride and sulfate).

Effect of different concentration of zinc and ferrous: Cow skim milk samples (100 ml) were subjected to pre-heat treatment at 85°C for 15 min. in a water bath and cooled to room temperature of 22°C. Different concentration (9-30 mM) of zinc and ferrous (as chloride and sulfate) was added to the milk and mixed thoroughly. After that samples were heated to 85°C for 20 min and then cooled to room temperature. After at least 12 hrs. The forming gels were cut to remove whey and filtered through Whatman No. 1 paper. Protein recovery was calculated from the protein concentration of the filtrate using the following equation:

$$\text{Protein recovery (\%)} = \frac{\text{protein concentration in milk} - \text{protein concentration in whey}}{\text{protein concentration in milk}} \times 100$$

Effect of pH: The pH of skim milk was adjusted to pH values between 6.0 and 6.9 using 1 M HCl and Na OH. The best concentrations of zinc and ferrous salts which resulted in the highest protein recovery were added and the milk samples were heated at 85C for 15 min. The samples were filtered through Whatman No. 1 paper. Protein concentrations in the filtrate were determined.

Effect of Heating Temperature: Cow skim milk samples were pre-heated at 80, 85, 90 and 95°C for 15 min, then the best concentrations of zinc and ferrous salts which resulted in the highest protein recovery were added and milk samples were re-heated at the same temperatures as above (80, 85, 90 and 95°C) for 15 min. The samples were filtered through What man No. 1 paper and the protein concentration of the filtrate was determined. The precipitated coprecipitate was washed with distilled water and freeze-dried.

Chemical Analysis:

Protein Determination: Total nitrogen in the filtrate was determined by the Kjeldahl method[10]. Protein concentration was calculated using a conversion factor of 6.38.

Gel Electrophoresis (SDS-PAGE): The skim cow milk co-precipitates was analyzed using SDS-PAGE electrophoresis.[11]

SDS-PAGE was performed on a 5% (w/v) polyacrylamide in 0.5M Tris-HCl buffer, pH 6.8 stacking gel and a 15% (w/v) polyacrylamide in 1.5M Tris-HCl buffer, pH 8.8 containing 0.1% (w/v) SDS separation gel. Samples were dissolved at 2 mg mL-1 in 0.5M Tris-HCl buffer, pH 6.8, containing 0.1% (w/v) SDS, 5% (v/v) 2-mercaptoethanol. After heating at 100°C for 5 min, 10% (v/v) glycerol and 0.01% (w/v) bromophenol blue added, then 10 µL of the sample was loaded in the gel. The gels were run under constant voltage of 200 V and 40 m A for about 2-2.5 hrs. The gel stained by Coomassie Brilliant Blue R-250 for 2 hrs., then the excess dye was removed from the gel by destain solution (acetic acid, ethanol and distilled water) and gel store in 10% ethanol in 5 °C.

Particle Size: The particle size distribution of the dried products was measured by laser light scattering using a Malvern Mastersizer 2000 granulometer equipped with a Hydro 2000MU sampler for liquids (Southborough, MA, USA). For the measurements, the dried powders samples were dispersed in distilled water and the particle size distribution was calculated depending on the refractive index because the refractive index of the powders was unknown. The dispersant liquid was put into a beaker and the samples were added until the instrument measured the 15% of obscuration. The mean values of the particle size measured in. Size dispersion was evaluated directly by the software of the instrument, using the span index (SI), according to the formula.

Zinc and Iron Determination: Zinc and iron were determined by ICP method[12].

Result and Discussion

Effect of Ions concentration on protein recovery in cow milk co-precipitate: The effect of the concentration of ions added to skim cowmilk on the protein recovery at 85°C for 20 min. is shown in figure (1) which shows that cow milk protein recovery increased with increasing added ions concentration especially after 12 mM. At 9 mM, the recovery of milk proteins was 91.62, 92.89,90.65 and 90.98 % for Fe

Cl2, Fe SO4, ZnCl2 and ZnSO4 respectively and this recovery increased and reached to highest at 18 mM (93.95, 93.63 and 93.71 %)for Fe Cl_2, Fe SO_4 and $ZnCl_2$, however the highest percentage of recovery was 94.01 % for $ZnSO_4$ at 24 mM. These results of recovery were nearly the same previous result found [8], who recover 96% of milk proteins by using 25 mM concentration of calcium.

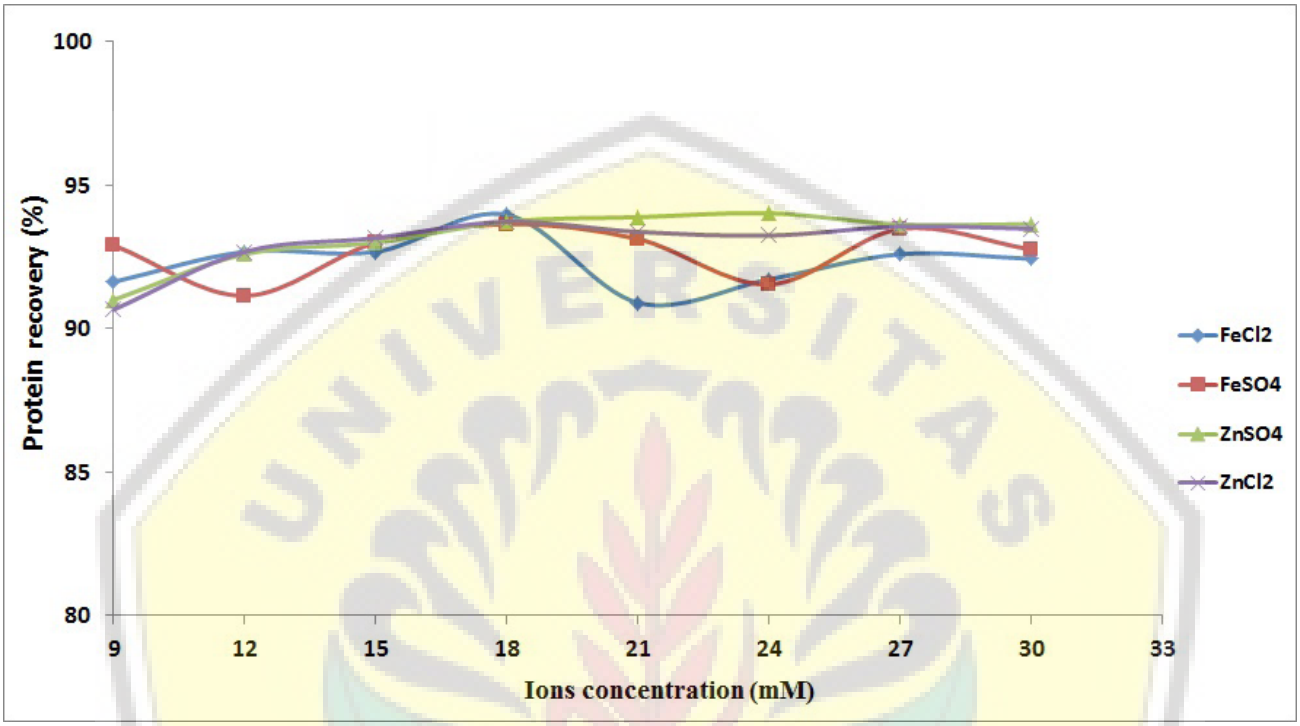

Figure 1: Effect of the concentration of ions added to cow milk on the protein recovery at 85°C for 20 min.

Effect of pH on protein recovery in cow milk co-precipitate: The effect of pH on protein recovery is shown in Figure (2). At low pH (pH=6), the recovery of cow milk protein were low (92.79, 92.66, 94.5 and 92.9% for Fe Cl_2, Fe SO_4, $ZnCl_2$ and $ZnSO_4$ respectively) because the pH is lower than normal pH of milk and close to the isoelectric point of the caseins, which is 4.6 and this led to the precipitation most of the casein after heating without taking enough time to react with whey protein and that's resulted in adecrease in protein recovery. Furthermore, lowering the pH significantly increases the denaturation temperature of β-Lg [13].

At higher pH values especially (pH = 6.6), the protein recovery increased because interactions between caseins and whey proteins through disulfide bonds occur [7]. The highest recoveries were in 6.6 which were (95.59, 93.61, 94.69 and 93.11 %) for Fe Cl_2, Fe SO_4, $ZnCl_2$ and $ZnSO_4$ respectively.

These findings are in general agreement with the result of other investigation [14]. At higher pH values (pH= 6.9), the protein recovery decreases and these can be explained by the fact that the level of denatured whey proteins associating with the micelles is depending on the pH at heating and with the rise of pH, the association of whey proteins with casein decreased [15].

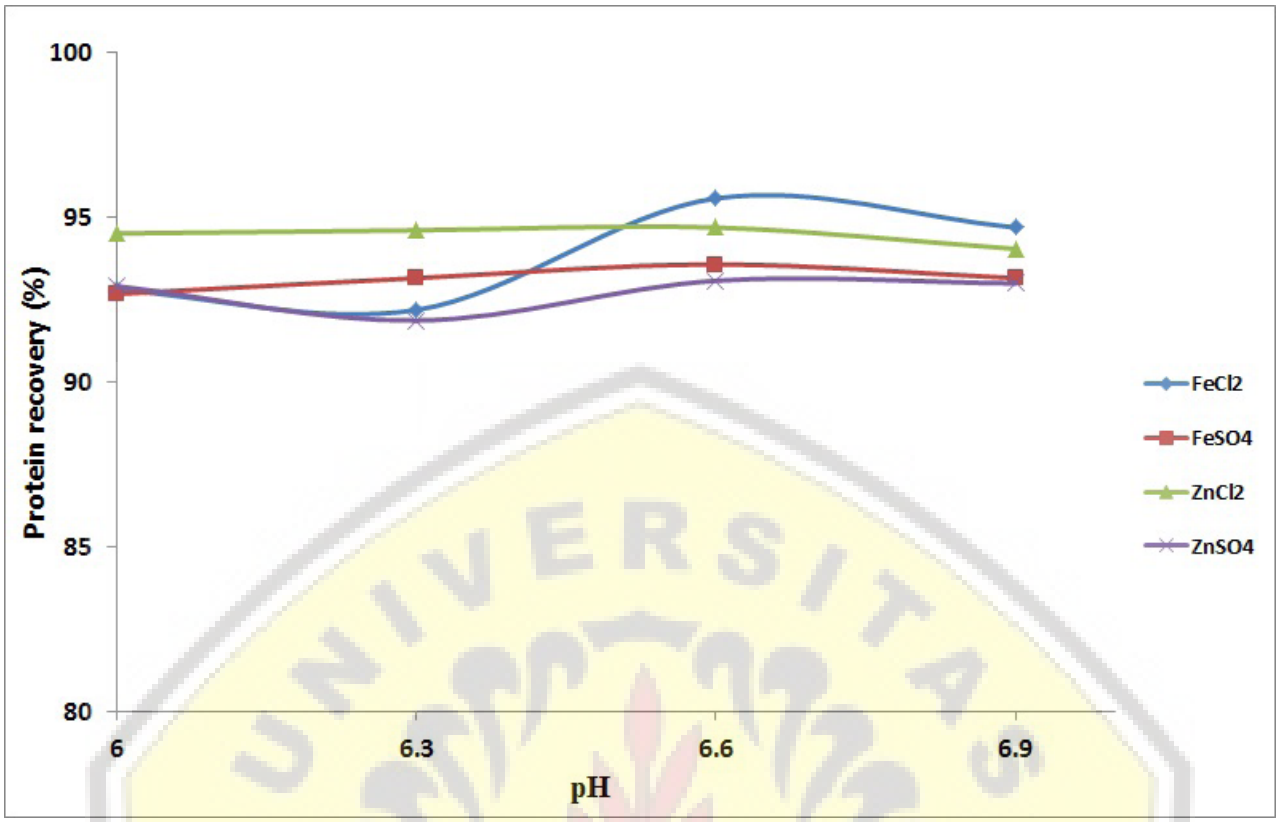

Figure 2: Effect of pH on protein recovery after adding 18 mM of for Fe Cl_2, Fe SO_4 and $ZnCl_2$and 24 mM of $ZnSO_4$ to cow milk and heating at 85 °C for 20 min.

Effect of heating temperature on cow milk co-precipitate: The effect of heating temperatures, between 80 and 95°C, on protein recovery as co-precipitate from skim cow milk, is shown in Figure (3). At the lower temperatures (70-75°C), co-precipitate gels from cow milk were not formed or were very weak, because the amount of ions (zinc and ferous) binding to casein were less than that required to saturate and cross-link the casein at these temperatures [16], so the results of these temperatures not inserted in figure.

At 80°C, whey proteins already precipitate with casein, andat 85-95°C, the coprecipitate contained the most whey proteins, resulting in complex formation between denatured β-lactoglobulin and K-casein[17] and K-casein with α-lactalbumin[18].

Protein recovery after addition best concentration of zinc and ferrous salts and adjusting milk pH to 6.6 were (95.16, 93.15, 94.12 and 92.74%) after heating at 85°C and became (95.73, 93.47, 94.84 and 93.14%) after heating at 95°C for Fe Cl_2, Fe SO_4, $ZnCl_2$ and $ZnSO_4$ respectively.

However, the highest percentage of protein recovery was after heating at 90°C for 20 min which was (96.1, 93.70, 95.01 and 93.30%) after heating at 95°C for Fe Cl_2, Fe SO_4, $ZnCl_2$ and $ZnSO_4$ respectively

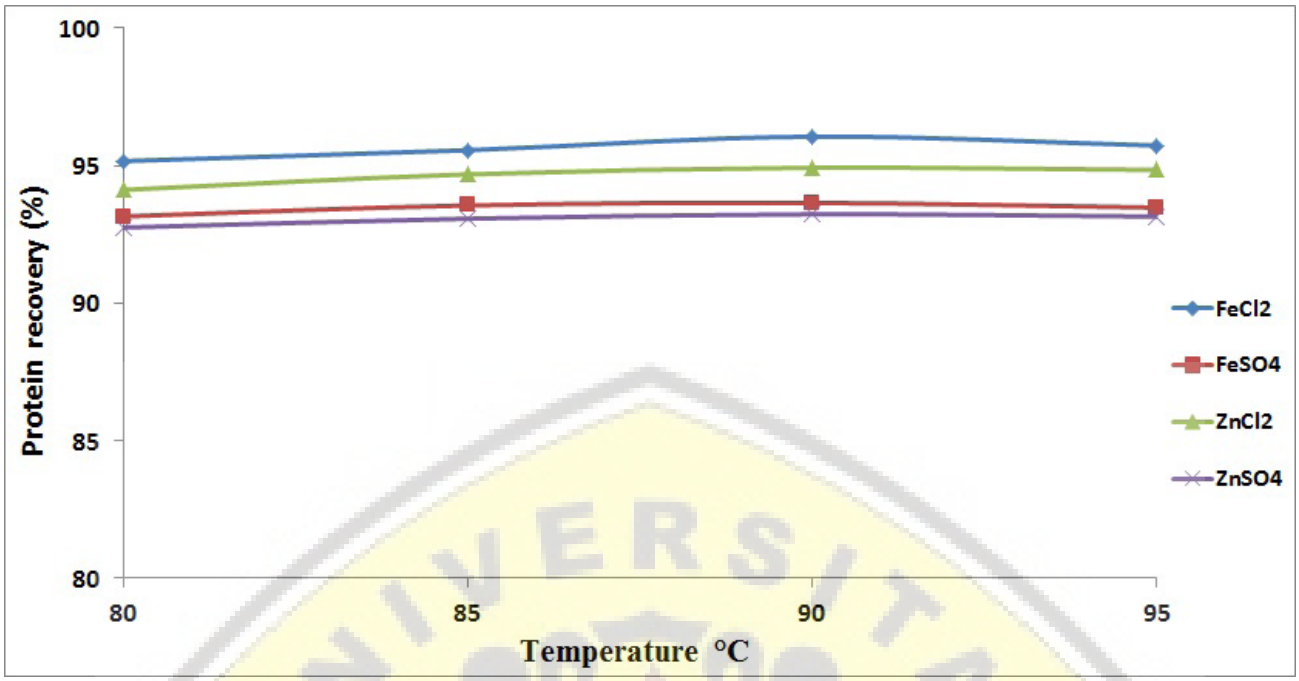

Figure 3: Effect of heating temperature on protein recovery of cow milk (pH 6.6) after adding 18 mM of Fe Cl_2, Fe SO_4 and $ZnCl_2$ and 24 mM of $ZnSO_4$ and heating at different temperatures.

Figure 4: SDS-PAGE of milk co-precipitate samples prepared using 18 mM of Fe Cl_2, Fe SO_4 and $ZnCl_2$ and 24 mM of $ZnSO_4$, milk pH 6.6 and heating at 90°C for 20 min. Lane 1, 2, 3 and 4, are co-precipitate prepared using zinc chloride, zinc sulfate, ferrous chloride and ferrous sulfate respectively.

Figure 4 showed SDS-PAGE bands of cow milk co-precipitates that made after adjusting milk pH to 6.6, adding 18 mM of Fe Cl_2, Fe SO_4 and $ZnCl_2$ and 24 mM of $ZnSO_4$ and heating at 90 °C for 20 min.

From the previous figure, we can conclude that all milk co-precipitate samples prepared using Fe Cl_2, Fe SO_4, $ZnCl_2$ and of $ZnSO_4$ contain most of the whey proteins (α-La and β-Lg) and caseins. These results are in good agreement with previous results [4] how prepared co-precipitate from sheep milk.

Particle Size: Particle size assessment, particle size measurement, or merely particle size measurement is the collective name of the technical processes or laboratory techniques that determine the size range and/or average or mean particle size in a powder or liquid sample.

The volume and the size of the particle size of skimcow milk protein co-precipitate prepared using zinc and ferrous (chloride and sulfate). We noticed a substantial difference between their particle sizes,2.5-7% of particle have size 40-300 µm as zinc chloride milk protein co-precipitate and 2-8% of particle have size 150-700 µm as zinc sulfatecow milk protein co-precipitate and this big difference in sizes maybe due to concentration used, which used 18 mM for $ZnCl_2$ and 24 mM for $ZnSO_4$. These results indicate that the addition of zinc salts in the production of cow milk protein co-precipitate cause major changes in casein micelles structure and size.

The particle size of cow milk protein co-precipitate prepared using ferrous chloride and ferrous sulfate, it noticed no significant difference between their size particle,3-10% of particle have 150-750 µm and 150-700 µm for ferrous chloride and ferrous sulfate respectively, and that's due to using the same treatment and concentration for both of them which were 18 mM.

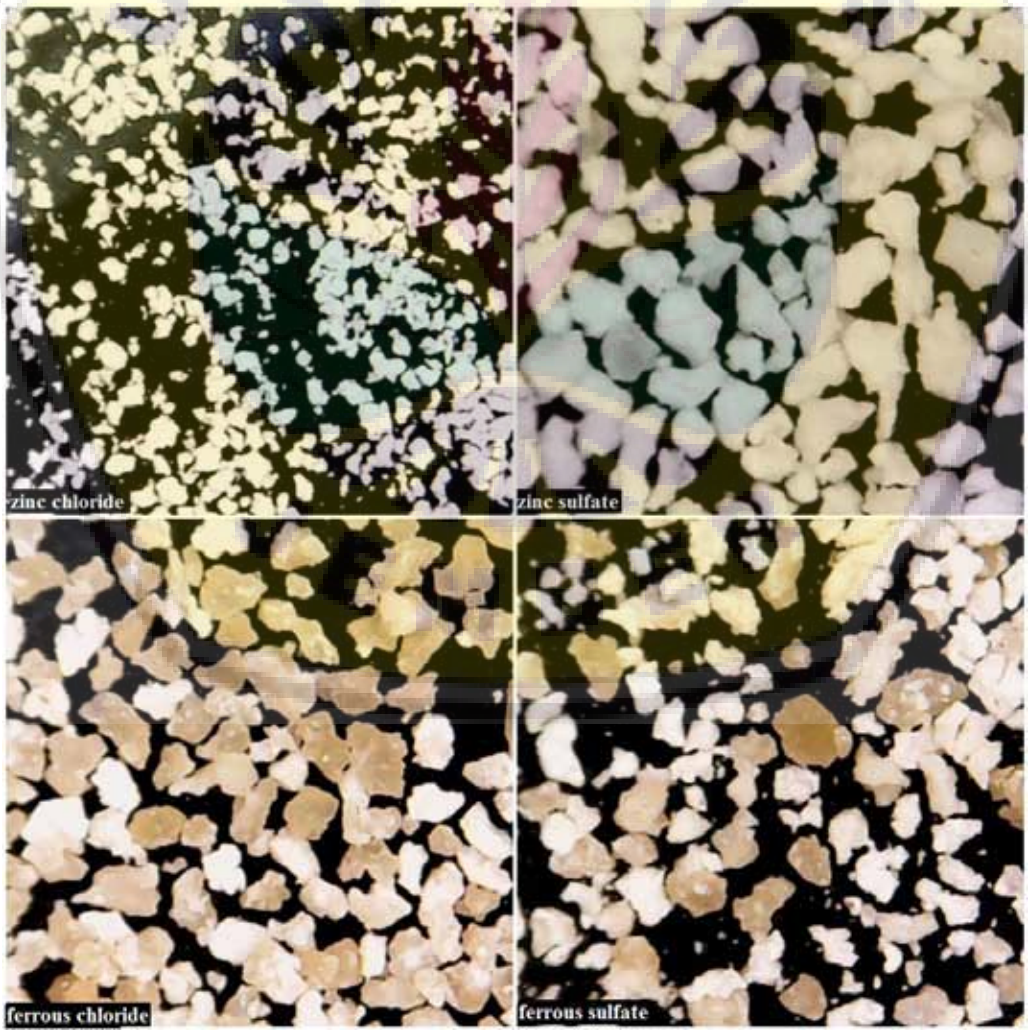

Figure 5: Particle shapes of co-precipitates under digital microscope (1000 X)

Zinc and Iron Determination: The concentration of zinc and iron in cow milk protein co-precipitate prepared in this study was a determent to establish the quantity of these minerals in milk protein co-precipitate and their effect on the calcium.

Both iron and zinc beside calcium concentrations in co-precipitates were determined by ICP and results were showed in figure 6.

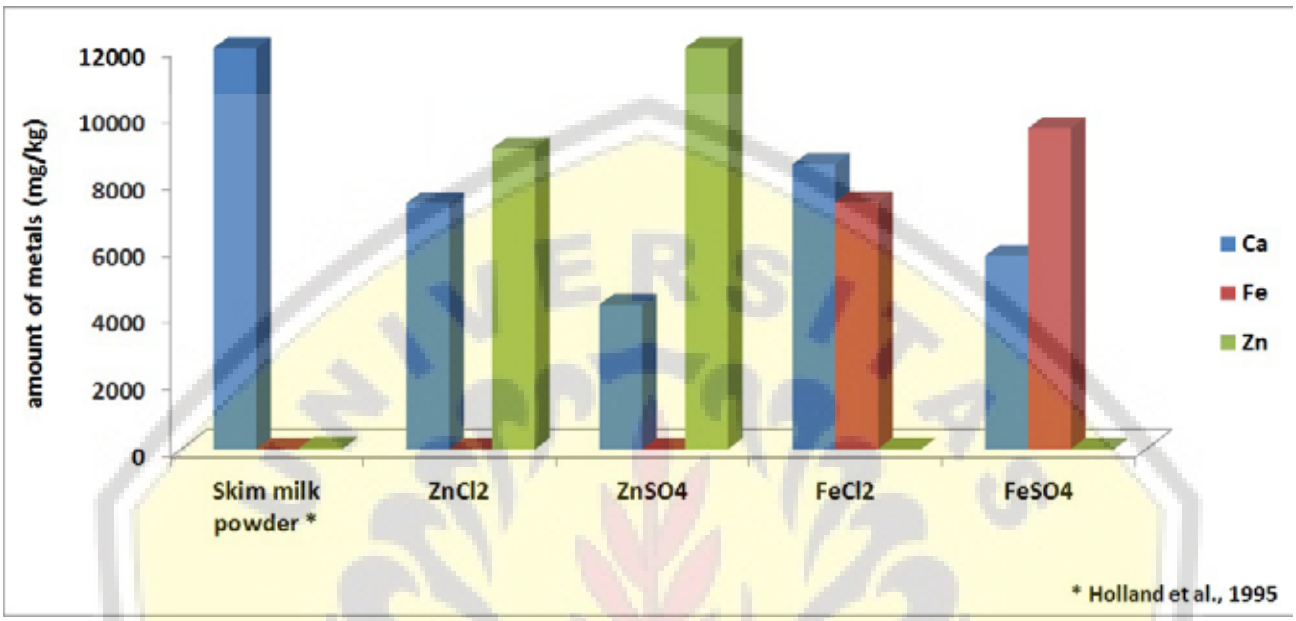

Figure 6: The amount of iron, zinc and calcium mg/kg

The amount of iron,zinc and calcium in skim milk powder are (4.5, 40, 12000) mg/kg respectively[19] and it noticed that amount of iron and zinc increased significantly when added to same metal to co-precipitate and that's mean the process of fortification was successful.

As known milk doesn't contain enough amount of iron and zinc, opposite to calcium which available in high amount. After fortified with iron, its concentration increased to 7390 and 9600 mg/kg for milk protein co-precipitate prepared with Fe Cl_2 and Fe SO_4 respectively, but calcium concentration decreased to 8520 mg/kgin Fe Cl_2 and 5790 mg/kg in Fe SO_4.

Also, zinc amount in milk protein co-precipitaterose after fortification to 9000 and 12000mg/kg for $ZnCl_2$ and $ZnSO_4$ respectively, this increment inzinc concentration was accompanied with a reduction in calcium and this indicates the replacement of calcium in casein micelles with by iron and zinc and losespart of calcium with whey.

Determination Efficacy of Natural Plant Extraction in Athletes with Joint Injuries

Sameerah Abdulrasool Kadum Alatabii

College of Science, University of Baghdad, Baghdad, Iraq

Abstract

Presint study highlighted using of alternative medicine therapy in treatment of joint ankle and knee injuries of 43 athletes who injured during the exercise. Students of the College of Science from the first stage to fourth stage were divided into knee injuries) 24 cases (and ankle injuries) 19 cases (The samples were considered in department of sports activity, College of Science, University of Baghdad. Natural comparison in the period of treatment approved in the health centers of physiotherapy, the extracts of medicinal vegetable oil were used to treat a number of athletes injured during sports matches within 45 days. Two experimental groups were performed in current study in knee injuries and ankle injuries. Test group, exercises and message with using oil and control group, exercise and message without using oil. Paraffin oil, olive oil and radish oil were used. The biological activity of these oils have been checked in the laboratory to find the best biological effect against four pathogenic bacteria related to inflammation of arthritis. Olive oil has been found to be the most effective against the studied bacteria causing inflammation in injury area. The finding identified through the results recorded in the experiments. The healing of the injured have improved to return to exercise in less than three weeks for mild and moderate cases of injury due to the use of these oils as a combination in topical treatment of natural chemical compounds that reduced the treatment period by about four days with well-known exercises in the sports activity department at the College of Science for aseveral weeks.

Keywords: *Knee, Ankle, Exercises, Joint injuries, Plant extractes.*

Introduction

Using of alternative medicine for the treatment of arthritis as a very effective and local treatment, which introduce good results for many patients with arthritis and these types of treatments do not cause problems in the joints ankle and knee, they are natural oils and useful for the skin as well as joints[(1)]. Many of the consultants in diseases of obesity, thinness and physical therapy, pointed out that the ability of alternative medicine to treat arthritis is large, especially in reducing the pain of patient throughout the day[(1)].

Olive contains effective oleuropein, an antioxidant that removes atherosclerosis and rejuvenates tissues. Vitamin E, K also contains three powerful antioxidants, hydroxytyrosol, vanillic acid and verbascoside, which are useful in the treatment of rheumatoid arthritis[(2)]. The oil of olive contains a high proportion of unsaturated fats, vitamin E and K, multiple phenols, chlorophyll, pheophytin, sterols, squalene and compounds that give it odor and flavor[(2)].

When the joint is contaminated with infected microorganizem, the surrounding area becomes inflamed and infected. The source of the inflammation is bacterial [(3)]. In general, the infection is concentrated in one large joint, such as the knee or thigh. However, there are cases where the spread of arthritic and affects several joints in the body, depending on the source of pollution and frequency of spread. The most widespread bacteria that cause infection in the joints in adults and children are: *streptococcus*, *staphylococcus* and

Haemophilusinfluenza[3]. These microorganisms are carried into the bloodstream and run through to the joint, leading to an inflammatory reaction and severe aches. Septic arthritis may also result from a viral or fungal infection. Viruses that may cause aggressive arthritis are: hepatitis, herpes, acquired immunodeficiency virus (HIV) and the virus that causes mumps [4].

Its pointed to the importance of natural oils for the treatment of arthritis, pure and original paraffin oil, as well as virgin olive oil of the original, they are high-quality natural oils that are easily absorbed through the skin applied to the inner layer under the skin, by painting on the knees properly from Continuous and continuous massage for at least 10 minutes at a time [2].Natural oils are a solution of alternative medicine for the treatment of arthritis, provided that the olive oil used is cold and not as warm as some believe so as not to spoil and lose its value and thus lose its function, which is the lack of massage which is continuous to the joint directly and tries to work in the field of oil and compensate for the deficiency of natural oil or what is known as "albumin,", as well as olive oil should be cold and cold [5]. The natural oils such as paraffin and olive oil are gradually and continuously used to soften the joints as a natural laxative [6]. It is an ideal solution offered by alternative medicine for the treatment of arthritis, which reduces the roughness and friction between the bones of the knees and limits its continuous infections and pain and improves the ability to walk better, provided that this process is repeated more than 3 times a day on a regular basis [7].

Arthritis is a common disease among many people. It is inflammation and pain in one or more of your joints, including the knees, the palm of the hand, the backbone. There are more than 100 different types of arthritis with different causes and treatment method. The most common types are osteoporosis (OA) and rheumatoid arthritis (RA), in the following lines we recognize the symptoms of arthritis and its causes and treatment, according to the site Health line [8].

Cartilage is a connective tissue that is flexible in the joints. It protects the joints by absorbing pressure and shock caused by movement, but the reduced natural amount of this cartilage tissue causes arthritis [9].

As for the large separation, it is caused by damage and torn cartilage causes the movement of bones on one another and the disease is more serious if you have a family history of the disease. These attacks affect the synovial membrane, a soft tissue in your joints that produces fluid that feeds the cartilage [9].

The main aim of the treatment of arthritis is to reduce the pain suffered by them and prevent further damage to the joints, such as heating pad or ice cubes and mobility aids such as: stick or walker to help relieve pressure on the joints painful. There are medicines for the treatment of arthritis such as: Analgesics, including: hydrocodone or Acetaminophen, which is effective for the treatment of pain but does not reduce inflammation. Alternative medicine treatment using medicinal vegetable oils for massage work for its importance in relieving the pain and then doing simple exercises known [10].

Materials and Method

The sample consisted of 43 patients aged between 19 and 25 years of age and was divided into two groups,control and experimental groups according to type of injuries. 1ml from each oil were mixed together and being 3ml, then used for every treated locally point about 10 minutes, three times a week.In current study, 24 cases of knee injuries, Twelve were treated with vegetable oil mixture, message and special exercises (test group) and twelve were treatment with message and special exercises without mixture oil (control group). In another experiment 19 cases of ankle injury group was divided to 9 treated with vegetable oil mixture, message and special exercises (test group) and 10 were treated with message and special exercises without using mixture of oil (control group) to record time differences and the effect of the oil mixture on the time of medical rehabilitation of the injured. The message is a mild message around the injury area. The excersie and n] message that used in current study were three times per week for 30 minutes.

Three medicinal plant oils were purchased from the local herbalist: olive oil extract, paraffin oil extract and radish oil extract. These oil were used by 1 ml and their biological activity was carried out against the bacteria that cause responsible for the inflammation in injury area of athletics. The study samples were taken by 43 sportsmen who were injured in the time of exercise and visited physiotherapy center in Baghdad. The use of a mixture of these medicinal vegetable oils in the local injury areas to determine the improvement in their health status and recording the time period for obtaining complete healing.

The exercises of knee injuries: Different exercises that used in this case, i, flexsion and relaxation (3 x 15); ii, rotation of knee join (3 x 15) in side and outside; iii, Lightweight resistanceby half a kilogram for 10 times.

The exercises of ankle injuries: Different exercises that used in this case, i, upward and downward of ankle join (3 x 15); ii, inward rotation (3 x 15) and outward rotation (3 x 15). iii, Lightweight resistance by half a kilogram for 10 times. iv, lateral even roataion (3 x 15) and medial rotation (3 x 15). v, plantar flexion (3 x 15) and dorsi flaxsion (3 x 15). vi, eversion rotation (3 x 15) and inversion roation (3 x 15).

Arthritis Symptoms: The main symptoms of arthritis are joint pain and joint stiffness that worsen with age. Here are the symptoms (joint pain, joint stiffness and swelling, drop motion rate, redness of the skin around the joint, symptoms are worse in the morning in most cases with arthritis).

Biological efficacy of therapeutic oils: The anti-bacterial effect of several plant oil extracts (Olive oil, Paraffin oil and Radish oil) against several pathogenic bacteria (*Streptococcus*, *Staphylococcus*, *Pseudomonas aeruginosa* and *acinetobacter*) was evaluated in vitro, the clinical isolates of pacteria were procured from department of Biology, College of Science, University of Baghdad (gifted from Assistant Professor, Ayaid K. Zgair, Ph.D). The plates method was used to evaluated the anti-bacterial effect of oils against above clinical pathoges [11].

Statestical Analysis: All values were calculated as the mean ± standard deviation (SD).Differences between test and control groups were analysed using Student's t-test using Origin version 8.0 software. A value of $P<0.05$ was considered to be statistically significant[12,13,14].

Results

The results showed clear difference in the use of medical oils as a biological effect against the pathogenic bacteria causing infection and inflammation. Table 1. Shows that all used oil had high antibacterial effect on the pathogenic bacteria that used in current study. This study showed that this highest effect was observed in case of using olive oil.

Table 1. Antibacterial effect of three oils against pathogenic bacteria associated with join injury. The results showed in diameter of inhibition zone on culture media (in vitro)

Name	Streptococcus	Staohylococcus	Pseudomonas	Acinetobacter
Olive oil	22.3 mm	21.2 mm	18.4 mm	18.9 mm
Paraffin oil	18.6 mm	19.7 mm	17.1 mm	16.5 mm
Radish oil	16.5 mm	18.1 mm	16.2 mm	14.4 mm

The present study showed that using of three oil extracts gave a good healing of injury of joints a topical treatment of knee and ankle injuries. The results were read according to the healing of join damage with the time. The results showed that the use of these oils were highly effective in treating of join injury the use of these oil considered as a safe treatment without complications on the human body or place of injury through health improvement with treatment in rehabilitation exercises. This consistents with the advice of doctors specialized for joint and orthopedic injuries and through public interest. The currents study showed that the using of mixture of three oils reduse the duration of healing as compare with healing without using of oils treatment (Figure 1).

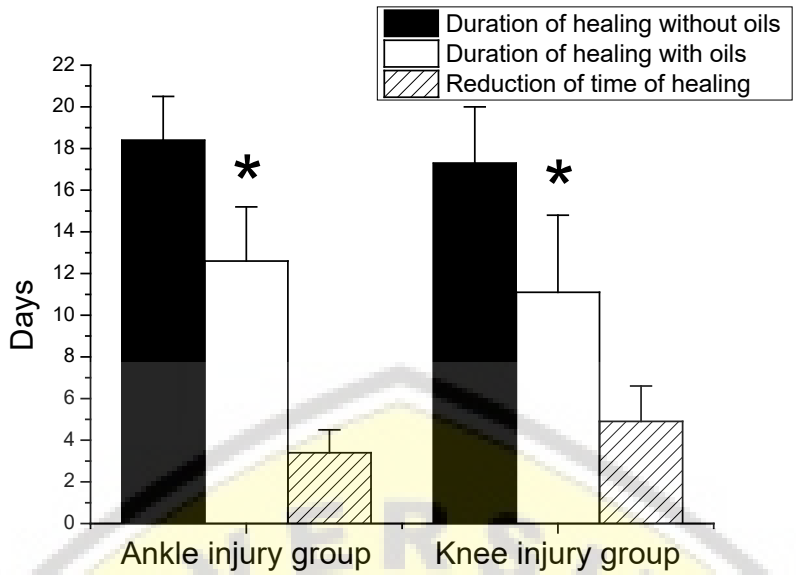

Figure 1. Effect of using of mixure of three oils (Olive oil, Paraffin oil and Radish oil) on the time of healing in days. Asterisks indicat of significant different from duration of healing without using mixture of oils. P<0.05 indicates of significant difference. All values were represented in mean ± standar errar.

Discusion

Through repeated injuries to athletes, especially ankle and knee injuries, simple and medium recommended the use of medicinal vegetable oils as a safe treatment of complications and contain the compounds soothing pain and multiple vitamins useful to the body.Ankle healing of torsion must be strengthened through exercise. The muscles and ligaments must be strengthened to stabilize the ankle firmly in place. Consult doctor or physiotherapist and follow the instructions and exercises that are prescribed for patients. The patients should never feel pain during exercise. If it happened immediately the exercise should be stopped because there are inevitably speeches [15].

In present study, the several oils that extracted from plant to treat the athletes suffering from repeat injury. The oils were used to reduce the population of bacteria that may effect on the injury during stimulation of inflammation. Also the mixture of using of oil were used to reduce the time of healing of athletes.

The presence of pathogenic bacteria may estimulate the inflammation in the infection area. The repeat injure athlates may be suffering from small distruction in their skin during hard exercise and that may be the access of pathogenic bacteria and their appendages that responsible form infaction and inflammation [16]. These phenomena may responsible for increasing the duration of healing of athletes, that is why when these oil used during the treatment time, reduced the duration of healing significantly.

Several study fucosed on the positive effect of using of plant extracts oils on the healing of repaeat in jury athlates [17]. The reason on using of these kind of oil in treatment of repeat injury athletes is the safe of using of these kind of oils and highly effect of healing of athletes, because of these kinds of oils reducing the duration of healing as compared with other kind of midicins [15].

examination of the injured athletes show that the gradual development during the use of this herbal medical combination topically by relieving the pain until the recovery of full and the time period was less than the time recorded without the use of this medicinal plant treatment. The medicinal plant mix contains a lot of natural chemical compounds and vitamins and important elements such as turbines, flavonoids and alcohols, which have the properties of reducing the feeling of pain as well as the ability to absorb by the skin and contribute to the speed of healing.

It is also recommended to practice swimming, Aqua gym and bike riding because these sports stimulate the

ankles without putting pressure on the joints. Also pay attention to shoes, It is necessary to use the appropriate shoes for each type of sport and move away from high heels shoes because it may be a cause of loss of balance while walking.

Conclusion

From this study it can be concluded that the using of oil that extracted from plant such as Olive oil, Paraffin oil and Radish oil highly effective in healing of athletes suffering from repeat injuries.

The Effect of the Stepans Model on Improving the Arbitration Mechanism of Students in Volleyball

Ayat Hussein Ali Tohma[1], Hayder Salman Mohseen[1], Rafid Saad Hadi[1]

[1]University of Kerbala/The College of Physical Education and Sports Science/Iraq

Abstract

The importance of research is evidenced by the search for method, strategies and models of advanced teaching and the use of modern means and techniques interspersed with a kind of suspense and excitement taking into account the gradual in difficulty in order to promote the mechanism of arbitration volleyball. The research problem arises on the following:

The researchers noted through the follow-up lessons volleyball material for the third stage, that there is fluctuation of the level of students in the arbitration performance confirmed that the researcher back to the forms of students grades and previous years, so we must seriously think about this problem and find the appropriate solution to address it and look for method, strategies and teaching models In order to improve the mechanism of arbitration volleyball for students of the Faculty of Physical Education and Sports Sciences at the University of Kerbala and all universities in Iraq for the better.

The researchers used the experimental method by designing two equal groups (experimental and control). The research sample was (40 students) through physical education and sports sciences - University of Karbala. After unloading the data and processing them statistically and to achieve the research objectives, the following conclusions were reached:

The use of the (Stepans) model further improve the arbitration mechanism when improving the arbitration mechanism of students of the third stage compared to the method used for teaching.

Keywords: *Stepans model, arbitration and mechanism.*

Introduction

There is no doubt that the tremendous advances in modern means and technologies have an impact on the teaching and learning processes. The current models of education are no longer the traditional teaching models that rely on direct indoctrination, which was used by the learner in the role of passive recipient only, but became entirely dependent on the interaction between the student and the material Educational and provide the opportunity to reach creative processes by relying on available means and employ them to serve the student in achieving the goals set and relying on himself and under the direct guidance of the teacher.

Many modern teaching models are designed in the civilized world because of their impact on the capabilities of the human mind. The means of teaching and learning in particular, therefore, became the means of education is a necessity for learners and those who are responsible for the educational process in all stages of university education to raise the level of efficiency of the process of education and its outcomes.[1]

Volleyball is a game full of opportunities that help learners to grow (physically, mentally, emotionally and socially). In front of large numbers of students, without the actual participation of the student in the educational situation, which makes him not enough attention to his individual performance and due to the increase in the number of students in one class made them spread in a large area away from the teacher, which makes follow-up Explanation or vision of the model is very difficult

and then shows the differences in individual differences between students and this method, although it has advantages, but it does not respect the subjectivity of the student to the degree that enables him to highlight his personality by treating the teacher individually according to his tendencies, attitudes and abilities.[2]

The importance of the research is to use the Stepans model as an attempt by the researcher to use it to increase the visual intelligence in improving the arbitration mechanism of students in international volleyball law cognitively and practically and to draw the attention of the teaching staff towards the use of this model, especially in teaching the subject of international law volleyball and reflect this statement on The level of their students in theory and practice.

Research Methodology

The experimental method was used to design the two equal groups (experimental and control) with pre- and post-measurement, which is consistent with the requirements and problem of research and achievement of objectives.

Table (1). Shows the research design

Groups	Pretest	Independent variable	Posttest
Experimental group	Volleyball arbitration mechanism	Stepans model	Volleyball arbitration mechanism
Control group	Volleyball arbitration mechanism	The teaching mechanism followed by the teacher	Volleyball arbitration mechanism

Community and Research Sample: The research community included the third stage students in the Faculty of Physical Education and Sports Sciences - University of Karbala for the academic year (2018-2019) and the number (109) students divided into four divisions (A, B,C and D) and was chosen two divisions random method are (A, D) and excluded practicing students For the game and repeaters and teachers studying, where the number of excluded (15) students and thus became a sample of the research (40) students distributed to two groups, the sample of the exploratory experiment, which number (10) students and the selection of (20) students for the research sample, which constitutes a ratio (18.34)(20%) of the research community, which constitutes (18.34%) of the research community. The totals (55.02%) of the research sample.

Determine the Volleyball Arbitration Mechanism Test: For the purpose of determining the test of the arbitration mechanism of volleyball for students of the third stage in physical education and sports sciences-University of Kerbala, the researcher adopted the evaluation form of the refereed performance test of international volleyball law and presented to a group of experts and specialists in volleyball in the faculties of physical education and sports sciences, which depends on The virtual construction of arbitration performance in the evaluation process through the arbitration of a match between students and the evaluation of referees by experts by the form of arbitration performance evaluation.

Fields: Through the survey of sources and scientific references and personal interviews with a group of professors of volleyball in the faculties of physical education and sports sciences and presented to them a set of forms contained in a number of studies and in light of this was approved to choose a study (David, 2016) has been identified areas The arbitration mechanism is divided by (7) areas for each of (the first referee, the second referee).

Arbitration Mechanism Form: Based on the study, the researchers formulated the evaluation form of the arbitration mechanism in its preliminary form. The assessment is through direct observation by three evaluators.

Design of educational modules in the model of Stepans[3]: For the purpose of achieving the research objectives and the application of the independent variable mentioned above, the vocabulary of volleyball material for the third stage (the law of the game) was selected

and the choice of vocabulary from (hand signals for the first and second referee) and the steps of the Stepans model (6) and the integration of a set of applications of imaginary intelligence, including (Instructional brochures, flexes, educational films Within these steps to enhance the work and application of the model Stepans), the time of the educational program was divided by the model of Stepans) to teach international law in volleyball, which consists of (8) units of instruction and one educational unit per week, a group of sources were surveyed And scientific references father The previous studies, which dealt with the use and application of the model of Stepans according to specific steps mainly according to the six levels of cognitive field of Bloom)) was taken into account in the selection of units to be consistent with the objectives of the research and proportionate in its content with the characteristics of the sample members and take into account the excitement and suspense and to suit the possibilities The modules included a set of steps. The researcher believes that these steps can be implemented in practical lessons in general and in volleyball lessons in particular if they are modified and categorized. Several sources mentioned from Pan Applications Visual intelligence is (movies, flex, audio and video ... etc.) and are classified as follows:[4]

- **Commitment to Outcome:** The arbitration case is explained in theory by the teacher.
- **Presentation of ideas:** Presentation of a set of educational poster images for a set of arbitration cases pertaining to the vocabulary of the units of education and ask students to choose the correct arbitration case that has been theoretically explained and participation in the form of small cooperative groups and then the group as a whole.
- **Facing Ideas:** Here is a comparison between the correct answer and expectations of students regarding the arbitration situation using the educational book prepared by the researcher and included (a set of tests, including the image of the correct reference to the arbitration status, what does the following referencing refer to you and the next referee)? Educational units as a whole.
- **Representation of the concept:** Display the correct answer by watching videos (educational films) related to the arbitration case was discussed, for example (hand reference to the first referee where the ball is inside).
- **Expanding the concept:** Give additional examples and models (Power Point contains more pictures and educational films that refer to arbitration cases in the educational unit for a period not exceeding (1) minutes).
- **Going beyond the concept:** The application of the arbitral situation through the establishment of full matches and applied by students during the lecture and linked to arbitration in full.

Results

Presentation of the results of the pre- and post-test teams of the experimental group members (Stepans model) in the variables studied, analyzed and discussed:

Table (2). Shows the difference between the pre and posttests of the members of the experimental group in the arbitration mechanism in volleyball

Variable	Units	Pretest		Posttest		Diff.	(t) value	Sig	Statistical significance
		Mean	SD	Mean	SD	Means			
Arbitration mechanism	Degree	19.900	2.100	52.150	3.703	33.250	69.193	0.00	Sig.

Table (3). Showing the difference between the pre and posttests of the members of the control group in the arbitration mechanism

Variable	Units	Pretest		Posttest		Diff.	(t) value	Sig	Statistical significance
		Mean	SD	Mean	SD	Means			
Arbitration mechanism	Degree	20.750	1.712	30.600	2.479	9.850	8.226	0.00	Sig.

From table (3)There are a significant difference between the two means and it means that there is a significant effect of the mechanism used for teaching by the subject teacher in improving the arbitration mechanism of the third stage students in the Faculty of Physical Education and Sport Sciences/Karbala University. The control group provided the teacher with theoretical information, explanations and presentations related to international law in volleyball, which contributed to the improvement of the members of the control group in telemetry. All education and the emerging innovations are only models and educational formats to achieve the needs and desires of a part of learners and to solve the immediate problems that emerge from time to time.

Table (4). Showing the value of (t) calculated between the post-tests of the two groups (experimental and control)

Variable	Units	Experimental group		Control group		(t) value	Sig	Statistical significance
		Mean	SD	Mean	SD			
Arbitration mechanism	Degree	52.150	3.703	30.600	2.479	21.626	0.00	Sig.

Discussions

From Table (2 and 3)this theory through the development of students' concepts and presentation they have new concepts and this is confirmed that theory which is concerned with building the knowledge of the learner, as it is influenced by the social and cultural environment of the learner, so learning is viewed from this angle as: The learner has to establish a balance between his knowledge and his previous ideas and new knowledge and ideas, since the constructivist theory supports the construction of knowledge and uses all mental processes, the use of visual intelligence through the use of images and shapes and references of the rulers and tabulated in the form of fragmented images and sometimes link images with texts and phrases (right words, Wrong words) and leave the space for the student in the educational units to realize the correct and emphasizes it and eliminates the error and helps in the process of feedback, of intelligence in the use of educational means use purely according to specific data and this is confirmed by images are working on raising operations and mental capacity, where there is a relationship between memory operations and the use of images and illustrations, especially in the call and the identification process.[5]

Recent scientific studies have confirmed that the greater the impact on the senses of learning, the greater the success of the educational medium (image) in determining the objectives of the lesson. The importance of the use of images and drawings and the need to develop their reading skills among learners and the researcher sees a positive role for the teacher where his role differed from the traditional method followed through guidance and problem-solving and instant feedback as well as contributed to give the learner an opportunity and this is confirmed by the constructive theory However,[6]the role of the teacher differs from traditional education through its active role by focusing on creating a learning environment and assisting in accessing learning resources and confronting learners to solve their problems and tries to find solutions to those problems through research, exploration and social negotiation of solutions. Guidance and guidance and raise issues without interfering with their parts, but the learner to analyze that issue and identify its parts and data and then infer relationships and the installation of a knowledge structure stand-alone, through the review of educational units and theoretical framework The researcher found that the learner has a positive role in the management of his work in an orderly.[7]

From table (4) the results showed that there are statistically significant differences between the average scores of the experimental and control group to improve the mechanism of arbitration in volleyball and for the benefit of the experimental group. This means that the experimental group who studied the model (Stepans) according to the visual intelligence over the control

group who studied according to the method followed. (Stepans) According to the imaginary intelligence in the learning process improved the mechanism of arbitration volleyball, because of the interaction between students and material on the one hand and between students and their peers and the teacher on the other, through the use of modern techniques and teaching method serve the model (Poster educational, instructional booklet, screen visual presentation, videos and PowerPoint) and this is unlike the usual way, which focuses on the teacher only considers the educational process center.[8]

The modern teaching models put learners in a good learning environment by encouraging them to face problems and work towards a solution in several ways, most notably that it encourages learners to participate effectively with each other and provides them with immediate opportunities to address misconceptions and concepts that increase their motivation. To learn more and when applying a small part of the image intelligence classifications to the side of the model will increase the ability to solve the problems of the student in the mechanism of arbitration volleyball with ease in addition to processing information correctly,[9] fast and accurate through feedback By the peer or teacher or modern means and techniques (educational poster, educational brochure, videos and PowerPoint) to reach the best performance in the arbitration mechanism for the learner. In the view of that modern means and techniques can overcome the problem of individual differences by resorting to the use of multimedia because these means of multi-quality stimuli and display these stimuli in different ways and method allow the learner the opportunity to choose the appropriate ones, which corresponds to his ability, desires and tendencies.[10]

Conclusions

1. There is a need when the third stage learners to use advanced teaching strategies.
2. The use of the model (Stepans) according to the visual intelligence further improve the mechanism of arbitration among learners.
3. For the model (Stepans) according to the visual intelligence the ability to make learners more confident themselves through their active participation, which generates positive concepts among learners.
4. Compatibility (Stepans) according to the visual intelligence with the modern means and techniques that make the learner the center of the educational process and the center around which all the events.
5. The model (Stepans) in accordance with the visual intelligence and modern means and techniques that have been employed in the teaching of curricula, providing effort to the teacher and further improved the mechanism of arbitration among students of the third stage.

Effect of Exercises by Different Media (Water, Sand and Tartan) in the Development of Some Physical Abilities and the Skill of Spike Volleyball for Students

Hamida Obaid Abdulamir[1], Donia Abdulsalam Fadel[1]

[1]*University of Kufa, Faculty of Education for Girls, Department of Physical Education and Sports Sciences, Iraq*

Abstract

Volleyball is one of the team games and one of the most games that achieve opportunities for practice, competition and recreation, therefore, the success of the volleyball team depends on the ability and ability of its players to perform basic skills of all kinds and with the least amount of errors possible through the performance of skills accurately and quickly and smoothly and at an equal level.

The research aimed to identify the impact of exercises with different floors (Tartan-water-sand) in the development of the most important physical abilities and the skill of crushing the students and the researchers used the experimental approach in the method of equal groups to suit the nature of the research problem.

After conducting the tests related to the research, the data were collected, the statistics were conducted and the results were drawn through which the most important conclusions were reached.

Keywords: *Exercises, water, sand and tartan.*

Introduction

Volleyball is one of the team games and one of the most games that achieve opportunities for practice, competition and recreation, therefore, the success of the volleyball team depends on the ability and ability of its players to perform basic skills of all kinds and with the least amount of errors possible through the performance of skills accurately and quickly and smoothly and at an equal level. In order to be able to achieve these skills to a level of ideal performance and mastery must be found ways and method of training and different atmospheres and floors, which must be the diversity of training places in order to take the volleyball to the required level so that it is easy to learn accurately and correctly.

Through the follow-up the two researchers noted that training on basic skills, especially the skill of overwhelming multiplication in one environment is not reflected positively on physical abilities and most basic skills, including overwhelming multiplication and also that the stability of the environment leads to boredom by the learner or trainee, so the researchers wanted to answer the following question.[1]

Does the different environments have the effect of developing some physical abilities and the skill of spike? Therefore, the researchers wanted to find a new way of training using a different environment based on the types of floors, including tartan, water and sand for the purpose of answering this question. Therefore, consideration should be given to the importance of diversity in training settings, in order to gain the required fitness, in addition to the basic skills of the game.

Research Aims:

1. Preparation of exercises with different floors (Tartan - water and sand) in the development of the most important physical abilities of students.
2. Identify the impact of exercises with different floors (Tartan - water and sand) in the development of the most important physical abilities and the skill of overwhelming beaten students.

Hypothesis: Exercises with different resistors a positive impact on the most important physical abilities and skill of spike volleyball for students.

Research Methodology

The researchers used the experimental method in the method of equivalent groups to suit the nature of the research problem.

Community and Research Sample: The research community consisted of the team of the College of Education for Girls/Department of Physical Education and Sports Science/University of Kufa for the academic year (2018-2019) and the number of 30 students. The students were divided into three equal groups randomly and by lot, with ten students per group.

Exercise vocabulary using different resistors:

- The total number of units (24) training units per group by 3 units per week.
- Time of application of exercises using different resistors (50) minutes and each student from the group of water, sand and control exercises the same.

The researcher supervised the implementation of exercises using different resistors on (18/11/2018 until 15/1/2019).

- The sample consisted of three groups trained the first group (control) in the internal hall Department of Physical Education and Sports Science/College of Education for Girls/University of Kufa (Tartan land). The second group was trained in water in the first swimming pools at the level of the knee (52 cm) by (8 units) and in the swimming pool Millennium Center with pelvic level (90 cm) (8 units) and in the chest level (1.30 m). The third group trained in the sand.

Post Testing: After the completion of the implementation of all the units conducted after the tests of the sample (the first experimental and second and control), on (16-17/1/2019) The researcher has followed the method that I used in the pretest tests under the same conditions and under the same spatial and temporal conditions for almost two days the first day physical tests The second day motor and skill tests.

Results

Table (1). Shows the mean values, standard deviation, calculated (t) value and sig value for the pre- and post-tests of the three groups

Variables		Units	Pretest		Posttest		(t) value	Sig.	Type of significance
			Mean	SD	Mean	SD			
First experimental group	Sergeant	Grade	24.10	2.68	29.80	1.98	10.20	0.00	Moral
	Medical ball		224.50	20.47	262.40	21.94	10.11	0.00	Moral
	Reaction speed		1.20	1.07	1.11	0.85	0.85	0.00	Moral
Second experimental group	Sergeant		23.30	1.82	27.90	1.59	13.53	0.00	Moral
	Medical ball		224.90	20.57	238.70	20.02	6.61	0.00	Moral
	Reaction speed		1.18	0.92	1.03	0.73	6.51	0.00	Moral
Control group	Sergeant		23.90	2.330	25.70	2.11	4.32	0.02	Moral
	Medical ball		223.50	21.08	224.00	21.32	1.93	8.52	Moral
	Reaction speed		1.19	1.12	1.16	0.99	2.64	0.27	Moral

Table (2). Shows the mean values, standard deviation, calculated (t) value and sig value for the pre- and post-test tests of the three research groups

Variables		Units	Pretest		Posttest		(t) value	Sig.	Type of significance
			Mean	SD	Mean	SD			
First experimental group	Technical performance of the skill of spike	Grade	3.30	6.74	7.20	7.88	10.30	0.00	Moral
	Accurate spike		6.30	6.74	14.20	9.18	18.23	0.00	Moral
Second experimental group	Technical performance of the skill of spike		3.10	8.75	6.40	6.99	9.00	0.00	Moral
	Accurate spike		6.20	7.88	12.70	9.48	16.19	0.00	Moral
Control group	Technical performance of the skill of spike		3.20	7.88	5.50	5.27	7.66	0.00	Moral
	Accurate spike		6.30	6.74	10.30	9.48	10.14	0.00	Moral

Table (3). The variance analysis of the three research groups shows the physical abilities under consideration for the post test

Variables	Source of variation	Sum of squares	df	Average squares	F	Sig.	Type of significance
Sergeant Medical ball	Between groups	84.20	2	42.10	11.52	0.00	Moral
	Within groups	98.60	27	3.65			
Reaction speed Sergeant	Between groups	07507.	2	3.75	8.42	0.00	Moral
	Within groups	12036.50	27	445.79			
Medical ball	Between groups	0.90	2	0.45	2.307	0.00	Moral
	Within groups	5.27	27	0.19			

Table (4). Shows the differences between the mean averages of the three research groups in the technical performance and accuracy of the crushing skill compared to the value of the least significant difference (L.S.D)

Variables	Groups	The difference between the means	Difference	L.S.D value	Sig.	Type of significance
Technical performance of the skill of spike	Group1-2	7,20-6.40	0.8	1.22	0.14	For the benefit of the first experimental group
	Group1-Cont.	7.20-5.50	1.70		0.00	
	Group2-Cont.	6.40-5.50	0.90		0.06	
	Group1-Cont.	6.90-5.40	1.50		0.00	
	Group2-Cont.	6.10-5.40	0.70		0.08	
Accurate spike	Group1-2	14.20-12.70	1.50	2.49	0.01	For the benefit of the first experimental group
	Group1-Cont.	14.20-10.30	3.90		0.00	
	Group2-Cont.	12.70-10.300	2.40		0.00	
	Group1-Cont.	11.30-8.700	2.60		0.00	
	Group2-Cont.	10.10-8.700	1.40		0.07	

Table (5). The variance analysis of the three research groups shows the technical performance and accuracy of the overwhelming multiplication skill of the post-test

Variables	Sources of variation	Sum of squares	df	Average squares	F	Sig.
Technical performance of the skill of spike	Between groups	14.46	2	7.23	15.62	0.00
	Within groups	12.50	27	0.46		
Accurate spike	Between groups	77.40	2	38.70	43.92	2
	Within groups	23.80	27	0.88		

Table (6). It shows the differences between the mean of the three research groups in the most important physical abilities tests compared to the value of the least significant difference (L.S.D)

Variables	Groups	The difference between the means	Difference	L.S.D value	Sig.	Type of significance
Sergeant	Group1-2	29.800-27.900	1.900	1.6	0.35	For the benefit of the first experimental group
	Group1-Cont.	29.800-25.700	4.100		0.00	
	Group2-Cont.	27.900-25.700	2.200		0.16	
Medical ball	Group1-2	262.40-238.70	23.700	17.7	0.18	For the benefit of the first experimental group
	Group1-Cont.	262.40-224.0	38.400		0.00	
	Group2-Cont.	238.70-224.0	14.700		1.31	
Reaction speed	Group1-2	1.119-1.036	0.083	1.17	0.14	For the benefit of the second experimental group
	Group1-Cont.	1.119-1.169	0.05		2.08	
	Group2-Cont.	1.036-1.169	0.133		0.02	

Discussions

Discuss the results of physical abilities in the post-tests of the three research groups: Through the tables that show the differences between the mean to indicate the value of the least significant difference for the pretest and posttest tests of the three groups we note that the differences were in favor of the first experimental group and this shows that the exercises applied and prepared by the researcher had a positive effect in improving their level and development.In the physical abilities (sergeant and medical ball) that I was using water circles, the researcher in this field resorted to the preparation of various exercises and aids such as small barriers, ladders, circles, cones and rug in addition to water basins to create suitable training conditions for the development of physical abilities of the skill and this has been confirmed in The auxiliary tools contribute to the development of physical abilities of the specialized activity in addition to the use of a set of aids to a certain stage that pushes the players to perform more repetitions by creating the desire to be something new applied in the disadvantages of the process are different from the conventional method.[2]

Either the bases of the development of the first experimental group on the second experimental group and the control with regard to the explosive capacity of the two men, the evolution of jumping in the players of the first experimental group, which was performing physical exercises especially that the stage of training requires the players to perform specialized physical training within effective training units to create a state of upgrading At the level of special physical abilities to the impact of stomach exercises, especially physical exercises where the researcher relied on the optimal use of different means of swimming pools, people and peace with the use of these exercises similar to the performance in the development the results of telemetric measurements are proportional to the development of physical ability.[3] One of the important things that the researcher was keen to apply is to perform these exercises with the same motor range of skill in addition to performing these exercises with the same skill required in the game and

using body weight was the focus in the performance of these exercises on the speed in power generation,[4] the performance of exercises at high speed and explosive as well as the implementation exercise with maximum effort in accordance with the correct technique as well as taking adequate rest between groups in order to perform the athlete in each exercise in a state of appropriate preparation.[5]

In addition, the researcher was keen to take into account the wavy parts of the training unit and also take into account the sequence in the exercises. This applied to the explosive capacity of the arms where the optimal use of the explosive capacity exercises of the arms in terms of the gradient in the intensity of these exercises and the rise in the number of repetitions in a scientific and codified and were performing exercises in a manner that performs the correct skill to throw the ball in the game of volleyball and this was confirmed that the development of motor performance is one of the physical requirements in learning the motor path. In addition, the researchers pointed out that the research sample has never been exposed to training modules for the development of explosive power using different floors in addition to the use of Gradual load resistors for the purpose of developing strength and speed with the use of various exercises and multiple exercises, where the use of large resistance is an appropriate means to develop components (explosive power), while achieved when using muscle resistance that is less than the load of the race to develop components of speed (explosive power).[6]

Discuss the results of technical performance in the post tests of the three research groups: Through the tables that show the differences in the arithmetic media to indicate the value of the least significant difference for the technical performance tests and the performance accuracy of the post-test of the three groups we note that the differences were in favor of the first experimental group that applied the training unit using the water medium as this type of training helped players to get rid of patterns Conventional training and performance in volleyball practice and efforts to produce diverse responses thus diversify the training community and the use of new tools and work to find resistors and suitable environments.[7]

The researcher also attributes the reason for this development to the impact of training in different environments in addition to exercises prepared by the researcher and the use of auxiliary tools during educational units, including small barriers, circles and terraces, which can be used in many exercises and in all directions in addition to swimming pools, which contributed effectively to the development of physical skills researched If the exercise is one of the means that contribute effectively to the development of public and private abilities and basic movements and skill in order to reach the player to the highest level possible in the skill performance of the game or sports activity Households.[8]

Through this presentation, we show the positive and effective impact in learning the technical performance of the basic skills in volleyball, which need accuracy and concentration in its performance and high kinetic compatibility, so the practice of female volleyball players with different resistances a positive and effective impact by focusing attention and repetition again and again during Performance and perception of the positions of technical performance and accuracy of performance with training, whether physical or skillful This gives a guarantee to determine the goals and determine the accuracy of movement and reduce the proportion of errors as the sense of skill mentally and physically contributes to the development of performance level if it is within a training program Based on the scientific standards governing the training processes. [9]

Then came training in the sand second and a difference in the results and the control group came third in learning technical performance and accuracy, as well as the impact of sandy surfaces. Sand training and training means have an effective effect to increase the number of types of exercises available to the athlete can perform exercises on a daily basis and also perform exercises characterized by high strength The time limit for the training unit. Sand is the best natural environment for resistance training, which works to raise and improve the player's physical and functional performance.[10]

Conclusions

Through the results presented, the researcher reached the following conclusions:

1. Exercises have had a clear impact on the three training groups.
2. There are significant differences between the three training groups in physical abilities and was in favor of the first experimental (explosive power kinetic

speed), which uses water media has a more positive impact than training on sand and training on Tartan.

3. Training in the sand has a positive impact on physical abilities (reaction speed) where they were in favor of the second training group that used sand.
4. There were significant differences between the three training groups in the skill performance and was in favor of the first experimental group that trained in the media.

Effect of Rotation with Phosphate and Lactic Training in Adenosine Triphosphate Enzyme and the Strength of Speed and Achievement of 800 Meters

Noor Sabah Shehab AL-deen[1], Hussein Makki Mahmoud[1], Alaa Flaih Juuad[1]

[1]*University of Kerbala/College of Physical Education and Sports Science/Iraq*

Abstract

Through the practice of the researcher to the effectiveness of the arena and the field and through personal interviews with the players and coaches as well as access to Arab and foreign sources shows the existence of weakness in the quality of lactic loading in the players of 800 m for young people, which leads to a decline in the level of performance as well as the lack of dependence of coaches on proper planning using Training curricula where training on the phosphine system and lactic individually both separately and the lack of use of phosphine training and reliance widely on the prevailing energy system, which is lactic from here manifested the problem of research and took the researcher rotation dates phosphate and lactic and for the same training unit where the research aimed to:

- Preparation of alternating exercises (phosphate and lactic) in the enzyme triphosphate adenosine and lactic acid and achievement of the hostility 800 meter youth.
- Recognize the effect of rotation exercise (phosphate and lactic) in the enzyme triphosphate adenosine to the hostility 800 meter youth.

The researcher used the training methodology by designing the two equal groups (control - experimental) with pre- and post-measurement. The experimental method is one of the most accurate types of other approaches and the results can be adopted, blinded and applied, thus it is more suitable for the research objectives and hypotheses.

The researchers identified the research community of Karbala governors for the effectiveness of (800 meters) and the number (6 clubs) who officially participated in the championships held by the Central Federation of Athletics and the number (10 runners) The researcher has chosen a sample by the method of comprehensive inventory of (10 runners), the sample is The same sample was used to represent the community and it used the statistical method (arithmetic mean, standard and mean deviation, torsion coefficient, variation coefficient, Chi square, correlation coefficient of rank (Pearson), t test for analog samples and t test for independent samples, The most important conclusions encompassing the following:

- Exercises characterized by alternating between phosphate and lactic exercises positively affect the enzyme triphosphate adenosine and strength characteristic speed.
- Characteristic strength exercises with speed in improving the technical stages of the competition (800 m) by improving the application of the amounts of force on the ground and rebound at high speed to be performance at high speeds.

Keywords: *Phosphate, lactic adenosine triphosphate and enzyme.*

Introduction

Sport is no longer a hobby practiced by individuals to spend the vacuum, but became a science in itself contains many other sciences, whether medical, chemical, psychological or kinetic. The interaction of knowledge in these sciences and their interdependence between them has made qualitative progress in all fields of sports, whether indexes or improve the physical

and tactical returns of sports teams in both individual and group events. Among the important sciences that contributed to the improvement of achievements is the science of physiology of sports training. Biochemistry, which is concerned with studying the chemical changes that occur during the production of energy required for muscular work as well as the various biochemical processes that occur in muscle cells as a result of metabolism.[1]

As well as known, training leads to many changes whether physical changes from the development of physical characteristics of the type of physical activity or internal changes, which include functional or chemical changes to different body systems and depending on the type of training and chemical changes that occur within the muscle cell to release the necessary energy to work The progression of the individual's athletic level depends on the positive of these chemical changes in order to achieve the adaptation of the organs and organs in order to face the fatigue resulting from training, which in turn leads to slow chemical processes, including enzymes, hormones, etc. There are changes in the blood are enzymatic changes, including the change in the enzyme triphosphate adenosine and enter these variables within the physiological and biochemical adaptations that occur as a result of the impact of sports competitions with different loads.[2]

Strength is one of the most important elements of physical preparation and physical attributes important in our daily life in general and sports training in particular, as it is the most influential attribute in all sports events, which must be possessed by the athlete to reach the highest levels and achieve the best results and strength types The maximum force is either (the characteristic force of speed, explosive power, carrying force. Since the effectiveness of 800 m is a game in which the work of the anaerobic system (lactic) at a high rate stops the player and get tired early. Hence the importance of research in the preparation of anaerobic effort (phosphine - lactic) to combat fatigue and activate the enzyme triphosphate adenosine and thus maintain Speed performance as long as possible during training competition.

Research Methodology

The researchers used the experimental approach to design the two pre- and post-scale equivalent groups (control and experimental) that are most suitable for the research objectives and hypothesis and to experiment with the experimental design of the research.

Community and Research Sample: The research community consisted of the hostile clubs of Karbala governorate for the effectiveness of (800 m) and the number of (6 clubs) who officially participated in the championships held by the Central Union of Athletics (10 runners). The researcher then conducted measurements of the extraneous variables affecting the research variables competition (800 m) namely (length, mass and training age) in order to conduct the homogeneity process in these variables.

Determine the characteristic force test at speed:

Test configuration:

First: Test name: leg strength test.[3]

The purpose of the test: measurement of the characteristic force at the legs

Required Equipment: Playground 400 m, 25 m set on a straight line, 2 cones, stopwatch, assistant.

How to take the test: A distance of 25 m is determined on a straight line and marked on the beginning and end of the line (cones). Complete the specified distance, the time taken to jump between the cones is recorded, then the test is repeated with the other legs in the same way.

Pretests: On Monday 24/12/2018 at 4:00 pm, the researcher applied the pretests to the members of the researches in the athletics training center in Karbala governorate. Then the completion of the test (800 meter) for both members of the control and experimental groups and the process of blood withdrawal immediately after the completion of the competition (800 meter) to measure the enzyme ATPase and the same procedures in the stage before the effort, but it will be numbered blood pipes (tubes) from the letters A1 to A10 A refers to the enzyme M after conducting pretests.

Equivalence Sample Search: The researchers conducted the process of equivalence between the two groups of the variables of the research under study using the statistical law (t) for independent samples of equal number, as shown in table (1).

Table (1). Shows the equivalence of the control and experimental groups with measurements and variables under study

Variables	Units	Groups	Mean	SD	(t) value	Level of Sig.	Statistical significance
Power characteristic of speed (right)	Sec.	Control	5.890	0.203	0.173	0.867	Non sig.
		Experimental	5.910	0.160			
Power characteristic of speed (left)	Sec.	Control	5.860	0.096	0.532	0.609	Non sig.
		Experimental	5.810	0.187			
Enzyme before effort	U\L	Control	14.296	0.635	0.696	0.790	Non sig.
		Experimental	14.200	0.453			
Enzyme after effort	U\L	Control	16.900	0.941	0.699	0.773	Non sig.
		Experimental	16.880	0.856			
Achievement	Sec.	Control	124.860	1.038	0.880	0.317	Non sig.
		Experimental	125.616	1.193			

Main Experience: The researchers worked on planning exercises to be included within the training program to develop the research variables (under study) for the experimental group, relying on the analysis and review of a large number of specialized scientific sources and references, from His study has been characterized by the following exercises:

1. Exercises were carried out in the special preparation phase.
2. Exercises included in the training program started on Saturday, 5/1/2019.
3. The implementation of the exercises included in the training program lasted for 12 weeks.
4. The number of training units (3 training units) per week.
5. The total number of training units (36 training units).
6. Days of training modules: Saturday, Monday, Wednesday.
7. The time of training units differed from the other according to the objectives and requirements of each, ranging between (60 d - 100 d).
8. The intensity used in the implementation of the exercise ranged between (80% - 100%) of the maximum ability of the athlete in the light of pretests applied to the research sample.
9. As for the training method, the researcher used the method of high intensity interval training (80% - 90%) and repetitive training (90% - 100%).
10. The duration of the intermodal rest between the repetitions (2 d - 3 d) and exercises (5 d - 10 d) in maximum speed exercises, but in the exercises of the lactic system, the researcher used rest by pulse to return the pulse to 120 n/d
11. The implementation of the exercises prepared in the training program ended on Wednesday 27/3/2019.

Posttests: After the completion of the implementation of the vocabulary of the training program the researchers worked to re-apply the tests and measurements conducted in the pre and the same time, place and steps for the tests and measurements of the pre variables (under study) as much as possible.

Results

Table (2). Shows the mean values, the standard deviation, the calculated (t) value and its statistical significance for the posttests of the physiological and physical research variables and the achievement of the control and experimental groups

Variables	Units	Groups	Mean	SD	(t) value	Level of Sig.	Statistical significance
Power characteristic of speed (right)	Sec.	Control	5.530	0.222	3.881	0.005	Sig.
		Experimental	5.070	0.144			
Power characteristic of speed (left)	Sec.	Control	5.570	0.168	3.097	0.015	Sig.
		Experimental	5.230	0.179			
Enzyme after effort	U\L	Control	19.770	0.626	5.099	0.001	Sig.
		Experimental	21.860	0.669			
Achievement	Sec.	Control	123.810	0.617	3.034	0.016	Sig.
		Experimental	122.592	0.652			

Discussion

Through the analysis of the results obtained by the researcher and the presence of significant differences between the two tests after the two groups of research results for the benefit of the experimental group.

The researchers attributes the reason for this preference to the use of successive exercises between the two phosphate and then lactic systems in the same training unit, as the phosphate exercises with extreme stress, which work depends on the burden on the nervous system, the amount of improvement provoked by the central nervous system of the motor units in the muscles and organs that Working with extreme intensity leads to improving the work of sensory receptors (muscle spinners) in the muscles by transferring sensory nerve excitation through the sensory nerve to the brain and increased its efficiency. This in turn led to the improvement of the brain's work in sending the nerve signals to the motor units involved in the muscular work, which is proportional to the force of excitation. This high excitement of the central nervous system followed by tactical exercises contributed to the ability of the runners to produce high performance.[4]

These exercises, which included exercises with extreme stress and followed by exercises with extreme stress, require rapid release of energy to perform work better and higher efficiency and that the enzyme (ATPase) is an important and direct factors by accelerating the release of energy in the body through the reconstruction (ATP), as the effective Its performance is characterized by fast frequency movements and requires the production of energy in the phosphate and lactic system that dominates the competition. The nature of this method of successive training in the phosphate and lactic systems contributed to improving the activity or effectiveness of the enzyme ATPase better than the control group. Usually, ATP is built to regenerate energy.[5] Pointed out is one of the most important enzymes responsible for releasing energy during physical exertion, where ATP stocks are replenished by an enzyme (ATPase) that acts on a combination of ADP. (ADP) with the phosphate ion to reproduce energy. The activity of the enzyme (ATPase) is activated (acetylcholine), which helps to activate or excite the muscle containing the substance (ATP) Stored in the muscle myosin head located within muscle fibers and also helps to activate or release calcium ions (Ca++) to curb activity Alterbonin and activate the enzyme (ATPase), which helps to release energy (ATP).[6]

Also, this method of training helped the experimental research sample to tolerate high concentrations of lactic acid since the performance in lactic exercises following phosphate exercises had a high performance speed due to the excitement of the nervous system caused by phosphate exercises and this certainly over time will generate adaptations Runners are better able to tolerate higher concentrations of this acid accumulated in the muscles making the experimental group able to perform faster while maintaining a high speed rate for as long as possible.[7] This indicates that the ability to tolerate

lactic acid has uh Especially in the runners' superiority in racing, the adaptation of the runner to withstand the increase of lactic acid in this type of training makes the continuity of high performance during competition even more despite the increase in muscle accumulation, within this we see that the high concentration of lactic acid in the blood of group members The experiment was the result of the training pattern that characterizes the motor performance or the high motor frequency of the exercise used by them. This led to the development of the experimental group. Indicator The energy from anaerobic fracture of glucose is high in terms of increasing the concentration of lactic acid in the blood, which makes the athlete able to perform at a faster rate and for a longer period.[8]

As for the variable force characteristic speed, the preference of the experimental group over the control. The researcher believes that the reason is the same as in the variables enzyme ATPase and lactic acid and this reason enabled the runners to shed a large force and high speed for as long as possible and this enables them to perform high speeds and thus reduce the time of performance,[9] whether in training or competition, whenever the power of the hostility In each step of running and less time touching each foot flattened and rebound them increased speed of hostility and this is one of the most important training requirements and The hostile arena and the field need mainly to muscle strength and speed and agility and muscle elongation with special distinction of the ability and distinctive power for speed, runners must train hard and with large quantities of muscle strength and as short as possible and that the activities of the arena and the field are activities depend in nature on the ability and strength and in the activities of the enemy and jogging completes the time of each ground flattened by a procedure of the second, so it requires the athlete rapid response And strong and this is achieved in the experimental group exercises.[10]

Conclusions

1. Exercises characterized by alternation between phosphate and lactic exercises positively affect adenosine triphosphate enzyme and strength characteristic at speed.
2. The method of training alternating between phosphate and lactic exercises is better in the development of research variables than the method prepared by the trainers.
3. Contribute strength exercises characteristic speed in improving the technical stages of the competition (800 meter) by improving the application of the amounts of force on the ground and rebound at high speed to be performance at high speeds.
4. The exercises prepared by the researcher contributed significantly to improve the level of achievement of the competition (800 meter) for the young members of the experimental group and this proved by the results of measurement and comparison between them.

The Effect of Biometrics Training in Developing the Explosive Ability of Legs and Scoringaccuracy of Jumping in Basketball for Youth

Jabbar Ali Kathim[1] Rami Jabbar Kadhim[2], Hussein Mnaty Sachit[3]

[1]Al-Qasim Green University/Department of Student Activities/Iraq, [2]Babylon Educational Directorate/Al_Waely Secondary School for the Distinguished Boys/Iraq, [3]University of Kerbala/The College of Physical Education and Sport Sciences/Iraq

Abstract

The problem of research is that many of the trainers want to diversify in the exercise to develop the physical abilities, especially the explosive ability of legs and their dependence on the heaviest and without the means and other training method, which reflected negatively on many of the important offensive skills in basketball, including the skill of scoring from jumping in basketball so he The researchers aim to develop the explosive ability of the muscles of legs and the accuracy of the scoring of the jumping. The aim of the research is to prepare the retraining exercises to develop the explosive ability and accuracy of the scoring in the youth basketball in the age of 16-18 and to identify the effect of the retaliatory force exercises to develop the explosive capability and accuracy of scoring in the basketball for youth ages (16-18) years. The experimental approach was used in the style of equal groups of pre and post testing to suit the nature of the problem.

The research community consisted of (20) young players aged (16-18) years belonging to Imam Al-Motaqin Sports Club for the 2017-2018 training season. The research sample was selected in a comprehensive inventory method. The research sample consisted of the research community as a whole. Each team has 8 players and 4 players for the exploratory experience. The time plan included 24 training units per group. (8) Weeks, with three training units per week (Sunday, Tuesday, Thursday), training time (90) minutes with a total of (2160) training minutes. The following issues were taken into consideration when implementing the training curriculum: Training was organized for the three groups: (days - time - playground). Warm up: It was unified for both groups. The main part: The experimental group applies the exercises prepared by the researchers. The closing part (calm): It was unified for the two groups.

Keywords: *Biometrics, explosive ability and scoring accuracy.*

Introduction

The sports field has developed rapidly in its various tracks as it is of great importance in the life of the community as one of the important basic pillars which gives the individual the freedom to choose the activities that reflect the abilities and potential. The basketball game is one of the exciting collective games that have witnessed progress in technical terms and the public as a result of the increasing demand for its practice[1]. The progress witnessed by the game is a natural and inevitable result of scientific research and sound planning, which was based on objective scientific foundations and the correct method of training in order to reach high levels. The technique of retraining training is an important training tool that has a positive effect on the development of physical abilities. It has also been developed to raise the functional and skill level of the players due to the specificity of this technique in training. This is due to the mechanism of muscular action during the strength training. It improves muscle elasticity and increases muscle strength. Resulting from decentralized and central muscular contraction[2-4].

It is known that physical abilities, including muscle strength, have an important role in raising the level of physical fitness of basketball players, especially the youth, through which the player can master all technical skills in the best manner with the correct application of the instructor's instructions and plans on the playground and the explosive capacity of the most important physical abilities of football players The basket being "the special muscular strength of the muscles that operate primarily in the sport of the individual and qualify the muscles mainly in the motor performance of the sport practice .

Jumping is one of the most common types of scoring used by a basketball player to get rid of the defender by jumping and thus scoring. This skill is based mainly on the vertical jump strength of the target player and his concentration and his ability to avoid the defender who is jumping with him[3]. The strength and height of the jump of the target depends on the length of the defender and the height of his jump and the extent of his reaction towards the movement of the target and after the goal of the basket In light of the advanced, the importance of research lies in the preparation of physical exercises in the form of strength and a reaction to the development of the explosive capacity of the muscles of men and accuracy (B) of the jump for young basketball players.

Research Aims:

1. Preparation of retaliatory force exercises to develop the explosive capability and accuracy of scoring in the basketball for young people (16-18 years).
2. To identify the impact of strength training exercises to develop the explosive capability and precision scoring in the basketball for youth ages (16-18) years.

Research methodology and field procedures:

Research Methodology: The experimental approach was used in the style of equal groups of pre and post testing to suit the nature of the problem.

Research community and its samples: The research community consisted of (20) young players aged (16-18) years belonging to Imam Al-Motaqin Sports Club for the 2017-2018 training season. The research sample was selected in a comprehensive inventory method. The research sample consisted of the research community as a whole. Each team has (8) players and (4) players for the exploratory experience.

Field Research Procedures: To achieve the main objective that researchers want to reach, follow certain basic steps, as well as some detailed steps. These include:

1. **Determining the tests that measure the search variables:** The two researchers conducted a survey of the available sources and scientific studies in order to determine the test of the variables of the research (explosive ability, accuracy of the scoring of the jump in basketball), resulted in the nomination of the long jump test of stability to measure the explosive capacity. And then a semi-circular move to the middle and right of the standard to measure the precision of the jump in the basketball. The tests were presented to a group of experts in the field of sports training basketball, in order to determine the validity of these tests for the attribute to be measured and agreed upon by 100%.
2. **General Test Description:**

First: The long jump test of stability:

- Purpose of the test:

Measure the explosive force of the material muscles of the trunk and legs.

- **Tools:** A suitable place for the spring, taking into consideration that it is flat, free of obstacles and not smooth and on dirt if possible, determined by two parallel and perpendicular lines on the jump line, a measuring tape and chalk cutters for marking.
- **Performance Description:** The laboratory stands directly behind the line of the jump, so that the foot strap touches the starting line from the outside and at an appropriate distance between the legs. The arms are raised high and the laboratory starts with the arms moving forward and down with the knees bent half and the trunk tilting slightly forward and extending the knees to move the weight of the body with explosive force. Arms to the maximum of the back of the weighted and push the ground with feet firmly in the attempt to jump forward distance are raised feet together as they are landing on them together and otherwise the attempt is unsuccessful.
- **Registration:** The laboratory is given two attempts and the best attempt is recorded with a measuring tape. The distance to be fixed is that the strip is perpendicular to the jump line and with high alignment from the inside edge of the jump line to the inner edge of the nearest hopper body.

Second: Test accuracy in basketball:

Jumping from the front left of the free throw line then moving half-circle to the center and right (2)

- Purpose of the test: Measure the accuracy of the jump scoring.

Tools:

- Basketball court, tape measure, basketball number (2) legal, goal basketball, chalk

Measures:

- Draw three points in the form of small circles (15 cm) as markers for the three areas where the test is performed and as follows
- The first mark left of the end of the free throw line and the distance (30 cm).
- The second mark the middle of the free throw line and the distance of (90 cm) towards the line of postscoring three-point throw.
- Third mark right end of free throw line and distance (30 cm).

Performance Description:

- The player takes the position of standing in the specified place outside the free throw area and on the left (the first mark) and with the ball.
- The player to jump with one hand and towards the basket directly without touching the ball to the target plate.
- The player (15) throw performed by three groups, where each set five throws.
- The first set is done from the mark on the left of the free throw line and at 30 cm.
- The second set is performed from the mark in the middle of the free throw line and at 90 cm towards the long distance line (three point throw).
- The third group is performed from the mark on the right of the free throw line and at 30 cm.
- The player leaves the jumping position after each set and moves half-circle to the center and right.
- Before starting the second set allows another player to lead his groups and so on alternately for both players and the rest of the players.
- Each laboratory has only one training pitch before performance.

Test Instructions:

- The player took the right position (the place on the left and with the ball).
- The player has the right to perform (15) throw by three groups and each set (5) consecutive throws.
- Each player has only one attempt.
- The number recorded by the player shall be announced on the next player to ensure the factor of competition.

Test Performance: Registered: Call the names first and record the results of throws second.

Arbitrator: Stands the side of the player not to give the ball a note and correct the performance and count.

Colleagues: To withdraw the ball after the performance of the scoring from behind the middle of the free throw by the player and then give it to the referee who gives it to the player for the purpose of the second strike and so on.

Calculation of Grades:

- The player is credited with two steps for each successful shot (involving basketball).
- Calculate and score one score for each shot in which the ball touches the ring and enter the basket
- Do not count degrees when the ball touches the plate and enter the basket.
- The player's score equals the sum of the points he gets in the 15 throws.
- The maximum degree of test (30) degree.

Pretests (Equivalence): The researchers conducted the pretests on 7/5/2017 at 6:00 pm in the basketball court at Imam Al-Motaqin Club where the pre measurement was done by testing the jump from the stability and testing the accuracy of the scoring in the basketball.

Table (1): The equivalence between the research sample and the investigated variables

Variables	Units	Experimental (pretest)		Control (pretest)		The value of Mann Whitney		Type of significance
		Median	SD	Median	SD	Calculated	Level of significance	
Jump out of constancy	Cm	1.76	1.21	1.77	1.32	56.7	0.177	Non sig.
Accuracy of scoring of jumping	Degree	16.09	4.58	17.11	2.43	66.88	0.089	Non sig.

The sample size (16) and the level of significance (0.05)

General framework for the implementation of austerity exercises: The time plan included 24 training units per group. (8) Weeks, three training units per week (Sunday, Tuesday, Thursday), training time (90) minutes. The following issues were taken into consideration when implementing the training curriculum:

- Training date: was unified for the three groups: (days - time - stadium).
- Warm-up: was united for both groups.
- The main part: The experimental group applies the exercises prepared by the researchers see Annex (2), but the officer continues training the trainer.
- The closing part (calm): It was unified for the two groups.
- The intensity of the exercises are between (75-90).
- Training method used (high intensity training - repetitive training).

Posttests: The tests were carried out on Monday, 10/8/2017 under the same conditions as the pretests, where the results were proved and treated statistically.

Results

Table (2): Shows the values of the groups for the pre-trial and post-experimental tests of the experimental group and the values of the calculated Wilcoxon test and the significance level of the tests being investigated

Variables	Units	Pretest		Posttest		Wilcoxon value	Sig. level	Type of significance
		Median	SD	Median	SD			
Explosive power	Cm	1.76	1.21	1.88	0.99	0	0.001	Sig.
Accuracy scoring	Degree	16.09	2.58	20.76	2.76	0	0.000	Sig.

Sample size (8) and level of significance 0.05

Table (3): Shows the values of the groups for the pre-test and post-test tests of the control group, the measured values of the Wilcoxon test and the significance level of the tests being investigated

Variables	Units	Pretest		Posttest		Wilcoxon value	Sig. level	Type of significance
		Median	SD	Median	SD			
Explosive power	Cm	1.77	1.65	1.81	0.87	0	0.003	Sig.
Accuracy scoring	Degree	17.11	2.43	18.99	3.51	0	0.002	Sig.

Sample size (8) and level of significance 0.05

Table (4): Showing the values of the groups for the post tests of the experimental and control groups, the calculated Mann Watteni values and the significance level of the tests being investigated

Variables	Units	Experimental (posttest)		Control (posttest)		Mann Wattenivalue	Sig. level	Type of significance
		Median	SD	Median	SD			
Explosive power	Cm	1.88	0.99	1.81	0.87	14.883	0.001	Sig.
Accuracy scoring	Degree	20.76	2.76	18.99	3.51	22.33	0.005	Sig.

The sample size (16) and the level of significance (0.05)

Discuss the results of the tests of the variables investigated for the two groups: In the study of the results of the table (2, 3, 4), there was an improvement in test results (long jump of stability, accuracy test of jumping in basketball) for the experimental groups and control in the telemetry in the pre measurement, By the researchers (refractive force training), has positively influenced the search variables (explosive force, accuracy of the scoring of jumping in basketball) for his research. In general, the references to sports training that we mentioned in selecting the content of the curriculum emphasize the need to plan the training curriculum to achieve the goals that translate into observable performance and measurement and this is what the researchers struggled to achieve. The researchers attribute this improvement to the exercises prepared by the researchers for development the explosive capacity of legs's muscles, which was carefully prepared based on studies, research and sources, as well as the opinions of the trainers involved in the field of sports training[5].

These exercises contributed effectively to the development of explosive capacity, Explosive style. In conclusion, we conclude that the exercises used in this study have had a significant impact on the accuracy of the performance of the scoring of the jump in basketball. Both charity and Mohammed Bareqa (2010) agree that the strength training is one of the most effective training method, to produce movements that are muscular and based on a physiological and surgical basis, is the best method of developing muscular ability effectively and leads to strength and speed of performance[6].

The researchers attributed this development in the variables studied to the exercise force, which was prepared by the researchers and applied to the experimental group, which has a clear impact on the explosive capacity of legs and reflected this remarkable development on the technical performance of the skill of jumping in basketball. This is confirmed by in addition to the amount of strength gained for the hands, wrists, arms and shoulders, the player must have two legs with a large degree of ability and strength for ease of movement and wide range,most explosive force will be used to jump up[7,8].

Conclusions

1. Exercise (retraction) has contributed significantly to the development of the explosive capacity of the muscles of legs, for the sake of research.
2. Exercise (Abrasive Strength) has contributed significantly to the development of precision scoring of jumping in basketball, for his research.

Evaluation of Serum Osteopontin Level and Growth Differential Factor Growth-15 in Chronic Renal Failure

Zinha Ali Al-Obaidy[1], Ammar Lateef Hussein Al-Zubaidi[2]

[1]B.Sc. in Medical Technology, Department of Medical Lab, Technical College, Northern Technical University, Iraq,
[2]Ph.D. Cinical Biochemistry, College of Medicine–University of Tikrit/Iraq

Abstract

Background: Chronic renal failure (CRF), describes the gradual loss of kidney function. It is a major public health problem, estimated to 200 million individuals worldwide. Many researchers in the field of chronic kidney failure tried to link the CRF with many factors, but few of them worked to link the disease with growth differentiation factor 15 (GDF15) and Osteopontin (OPN) together. Osteopontin (OPN) is a pleiotropic glycoprotein expressed in various cell types in animals and in humans, including bone, immune, smooth muscle, epithelial and endothelial cells. Moreover, OPN is found in kidneys (in the thick ascending limbs of the loop of Henley and in distal nephrons) and urine. The protein plays an important role in mineralization and bone resorption. It was demonstrated that OPN and some OPN gene polymorphic variants are associated with the pathogenesis and progression of multiple disorders, such as cancer, autoimmune, neurodegenerative and cardiovascular diseases. GDF15 a member of transforming growth factor-beta (TGF-beta), family is involved in several pathological conditions, which include inflammation, cancer, cardiovascular, pulmonary and renal diseases.

Aim: The aim of this study were to determine the changes in serum levels of osteopontin (OPN) and growth differential factor 15 (GDF15) in chronic renal failurewith stage 2, 3, 5.

Methodology: A control study was included 60 renal failure patients (26 females and 34 males) whose ages between 18-86 years olds attended the renal failure unite in Kirkuk General Hospital in the period time April to June 2019. The data were collected from the cases group in 3 different stages of the renal failure cases;(30) cases were with stage 5, (15) cases were with stage 3 and (15) cases were with stage 2. The control group who were match to the patients studied includes 28 healthy controls.

Results: The study showed that there is the significant difference between serum level of patients and the control groups. In this study showed that is high levels of Osteopontin (OPN) in patients stage 5 only with no deferens in stages 2,3 compare with control group and high levels of Growth differential factor growth-15(GDF-15) in all stages (2,3,5) compare with control group.

Conclusion: The results of the current study showed a significant increase in the level of OPN in stage 5 as an indication of the renal failure reached the end stage. On the other hand, GDF-15 gradually increases with progression of renal failure stages.

Introduction

Chronic renal disease is a clinical disorder which occurs when there is a gradual decline in renal function over a period of several months to years and most of the functional alterations seen in chronic renal impairment can be explained in terms of a full solute load falling on

reduced number of normal nephrons [1-3]. Osteopontin (OPN) is a highly negatively charged and glycoprotein and was first identified in osteoblasts [4, 5]. In the normal adult kidney, OPN is expressed by the thick ascending limb of the loops of Henley. Moreover, OPN expression is observed in collecting duct epithelium, where it correlates with the number of macrophages in the tissue [6,7].In addition GDF-15associated with chronic renal failure.GDF15 is a divergent member of the TGF-b cytokine superfamily that was discovered and cloned as a divergent member of the TGF-b superfamily in the late 1990s independently in at least seven different laboratories. Names were given based on relationship to TGF-b members or different cloning strategies applied. Using a subtraction cloning approach designed to identify genes related to macrophage activation, previously called macrophage-inhibitory cytokine-1(MIC-1) and is expressed by activated macrophages[8,9]. In recent years, GDF-15 has emerged as a biomarker forrenal failure[10].

Objective: The objective of this study was conducted to evaluate serum levels of OPN and GFR15 in different stage of chronic renal failure and study the ability of using both of OPN and GRF15 as a markerin adults patients undergoing with renal failure.

Methodology

The study is a control study that was conducted on 88 individuals, comprised of 60 patients' who had undergone a chronic renal failure and 28 controls. Patients were subjected to chronic renal failure in General Kirkuk Hospital, Kirkuk - Iraq between 1st of April, to 1st of June, 2019. Patients' data were collected and compared with 28 apparently healthy subjects who participated as control group. Cancer patients, liver patients and autoimmune disease were excluded in all cases . The levels of osteopontin and growth differential factor growth-15 measured by ELISA technique. The principle of ELISA, various antigen-antibody combinations are used, always including an enzyme labeled antigen or antibody and enzyme activity is measured calorimetrically.

Blood Samples: A volume of 5ml of blood sample was taken by vein puncture from each subject enrolled in this study. Blood samples were placed into sterile test tubes, after blood clotting, the samples were centrifuged at 3000 rpm for 15 min and the obtained serum were aspirated using mechanical micropipette and transferred into clean plain tubes with screw which labeled and stored in deep freeze at -20 C° for the biochemical measurement of osteopontin and growth differential factor growth-15 in chronic renal failure, by ELISA.

Normal Value: OPN: 0.156-10 ng/ml, GDF-15:23.438-1500 pg/ml.

Statistical Analysis: Computerized statistically analysis was performed using IBM SPSS V21.0.0 statistic program. Comparison between study groups was done using ANOVA (Analysis of Variance). Numerical variables were reported in terms of mean and (T-test) for comparison between categorical variables. The (P<0.05) was considered statically significant for interpretation of result.

Results

Table 1: Comparison of Osteopontin level between control group and each state of the cases group (stage 2, stage 3, stage 5)

Group	Mean ± SE			
	Control	Stage 2	Stage 3	Stage 5
Patients	0.06 ± 0.07	0.46 ± 0.15	0.60 ± 0.16	4.17 ± 0.91
P-value		>0.05	>0.05	<0.005

* (P<0.005)Significant, ** (P>0.05), NS: Non-Significant.

Table 1 and figure 1 showed Cases were compared in three different stages of chronic renal failure: stage 2, stage 3 and stage 5. The levels of OPN in patients with renal failure stage 5 (4.17±0.91) was increasing significantly (p<0.005) compared with control groups (0.06±0.07) while stage 3 (0.60±0.16) and stage 2(0.46±0.15) non-significant difference from control group (0.06±0.07) (p>0.05).

Table 2: Comparison of Growth Differential Factor-15 level between control group and each state of the cases group (stage 2, stage 3, stage 5)

Group	Mean ± SE			
	Control	Stage 2	Stage 3	Stage5
Patients	11.29±5.26	77.14±11.12	65.87±5.73	662.54±112.74
P-value		<0.003	0.012	<0.005

* (P<0.05)Significant.

Table 2 and figure 1 showed the levels of GDF-15 in patients with renal failure stage 5 (662.54±112.74) was increasing significantly (P<0.005) compared with control groups (11.29±5.26) whereas in patients with renal failure stage 3 (65.87±5.73) was increasing significantly (P=0.012) and stage 2 (77.14±11.12) was increasing significantly (P<0.003) compared with control group.

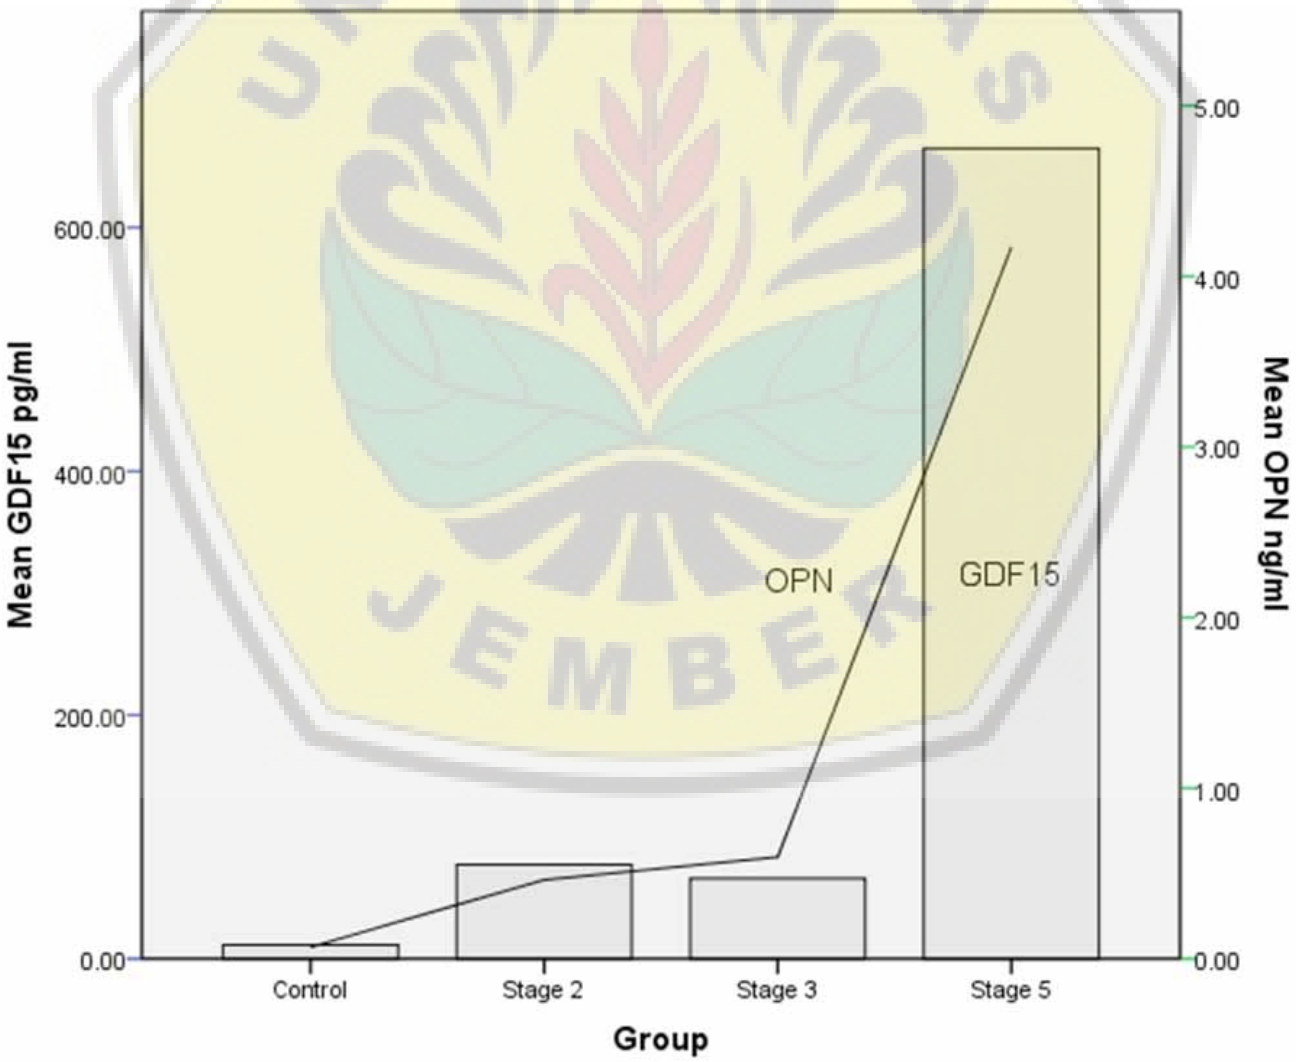

Figure (1): Comparison of Growth Differential Factor 15 and Osteopontin level between control group and each state of the cases group (stage2, stage3, stage5).

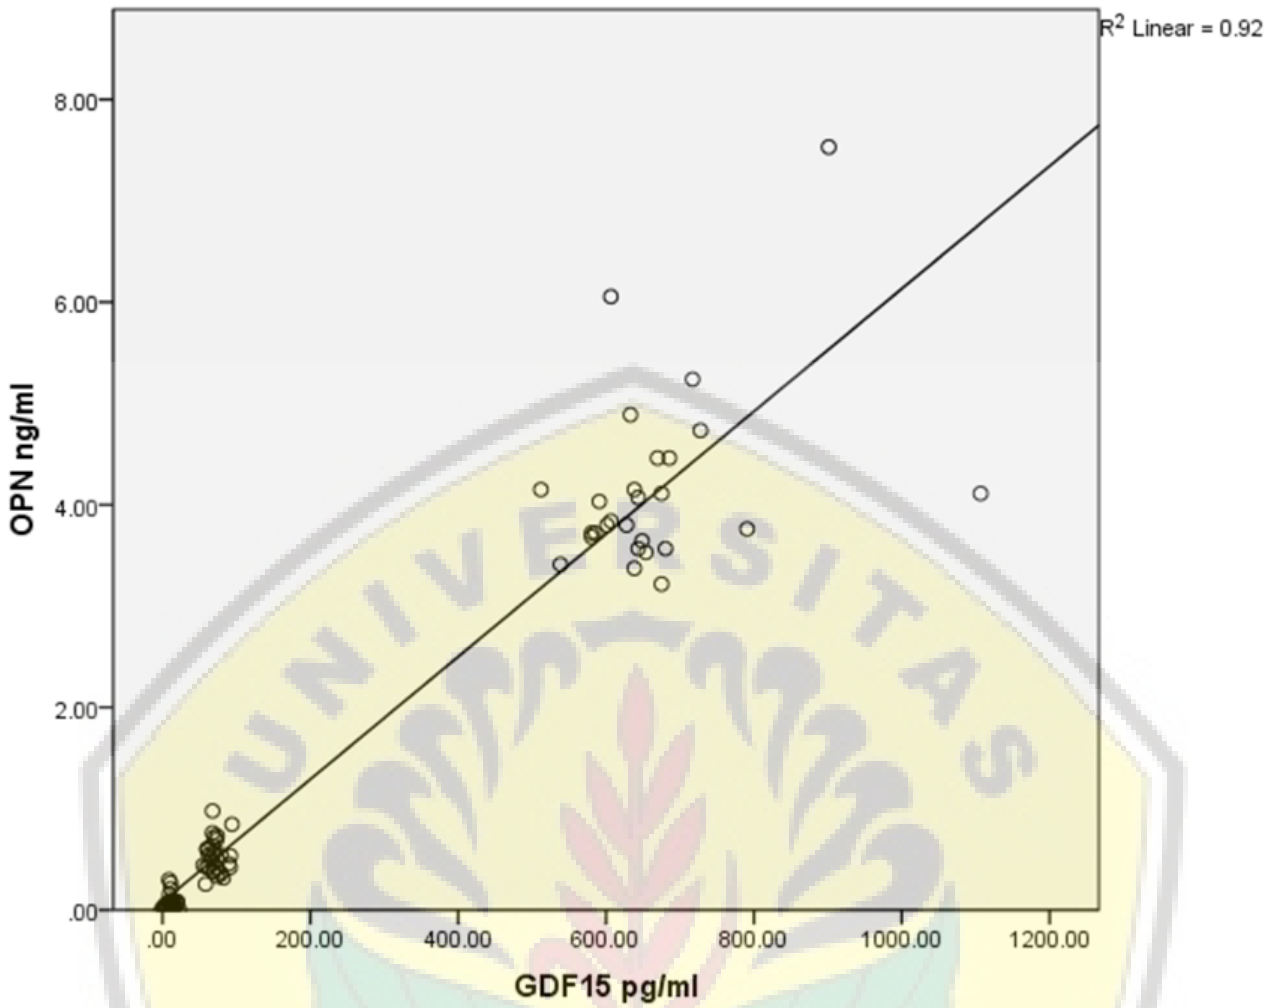

Figure (2): Scatterplot of the Correlation between GDF15 and OPN

Figure 2 showed there was a significant positive correlation between GDF15 and OPN, R =0.959, R^2 = 0.92, n=88, P <0.005.

Discussion

Chronic Kidney Disease is a major clinical problem in Iraq as well as in the world [(11)].In this study the level of OPN and GDF15 were measured in three stages (2, 3, 5) of CKD and compared with those of healthy subjects. OPN and GDF-15 has been implicated in the pathology of several renal conditions. The results obtained in this study from 60 patients compared with 28 healthy individuals revealed that the majority of the patients were males (57%) and about one-third of the female cases were older than 50 years (43%), since estrogen, estradiol and progesterone are factors that inhibit OPN expression [(7)]. Measurement of OPN level in patients with CKD significant higher level only in stage 5 than that of control (P<0.005) a highly significant difference in OPN mRNA in renal damage this finding is in agreement with (Lorenzen et al.,2008) [12] and agreement with (Yan et al., 2010)[13] found that plasma OPN concentration was proportional to the severity of renal function damage, indicating that OPN was an independent risk factor of the severity of renal function damage, but in currently study measurement of GDF15 level in patients with CKD significantly different level in all cases state; stage 5 (P<0.005), stage 3 (P=0.012) and stage2 (P=0.003) than that of control was agreement with (Nair et al., 2017)[14] found Circulating GDF-15 levels have been shown to strongly correlate with increased risk of CKD progression. OPN was strongly correlated with GDF-15(r=0.959 p<0.005) because the both was directly proportional to the damage of the kidneys.

Conclusion

The results of the current study showed a significant increase in the level of OPN in stage 5 as an indication of the renal failure reached the end stage. On the other hand, GDF-15 gradually increases with progression of renal failure stages.

Evaluation of the Role of Fibroblast Growth Factors 23(FGF23) as a Marker for Left Ventricular Hypertrophy in Adults with Hypertension

Ammal K. Ibrihem[1], Ammar L. Hussein[2], Hasan I.Sultan[3]

[1]Medical Technology, Department of Medical Lab, Technical College, Al-karama Teaching Hospital/Iraq, [2]Cinical Biochemistry, College of Medicine–Tikrit University/Iraq, [3]F.I.C.M.S. Medicine Department-College of Medicine–Tikrit university/Iraq

Abstract

Background: Hypertension (HTN) is among the most common, noncommunicable disease in the world. Approximately 80 million people (32.6%) in the United Statesand one billion worldwide suffer from HTN .Fibroblast growth factor 23 (FGF23) is a phosphaturic hormone produced by osteocytes and osteoblasts that binds to FGF receptors in the presence of the transmembrane protein α Klotho. FGF23 mainly targets the renal proximal tubule to inhibit calcitriol production and the expression of the sodium/phosphate cotransporters NaPi2a and NaPi2c, thus inhibiting renal phosphate reabsorption. FGF23 also acts on the parathyroid glands to inhibit parathyroid hormone synthesis and secretion. FGF23 regulation involves many systemic and local factors, among them calcitriol, phosphate and parathyroid hormone. Increased FGF23 is primarily observed in rare acquired or genetic disorders, but chronic kidney disease is associated with a reactional increase in FGF23 to combat Hyperphosphatemia. However, Higher levels of FGF23 have been associated with worse cardiovascular outcomes. Whether FGF23 is associated with rising blood pressure (BP) and induce left ventricular hypertrophy (LVH) and are associated with an increased risk of mortality some studies have examined whether lipid levels are prospectively associated with the risk of developing hypertension.

Aim: The aim of this study were to evaluate FGF 23 levels as indicator of LVH in hypertensive patients.

Materials and Method: The study is a comparative prospective case-controlled study that was conducted on 90 individuals, comprised of 60 hypertensive patients including thirty patients who had hypertension with Left Ventricular Hypertrophy (LVH) and thirty patients who had Hypertension without LVH and thirty controls. Patients were subjected Ibn Al-Bitar Cardiac Surgery Center from March to Jun 2019.

Results: The results showed there wasa statistically significant differences (P<0.0001) in the serum FGF23 level between hypertension with LVH group (541.515±148.25 Pg/mL) and Hypertension without LVH group (239.27±108.85 Pg/mL).on the other hand there were significant (P<0.0001) increases in FGF 23 levels in both groups compared with control group (38.37±26.44 Pg/mL).

P = 0.436, P = 0.062, P = 0.774 and P = 0.485 for Cholesterol, triglycerides, HDL and LDL respectively, were not significantly different between studied groups.

Conclusion: The FGF23 is higher in hypertension patient with LVH than those withoutLVH and there were increased in FGF23 levelsin both groups compared with control group. Hence, the change in FGF 23 could probably serve as a diagnostic marker in hypertension patients to predict the possibility to develop LVH.

Keywords: *Fibroblast growth factor23, left ventricular hypertrophy, hypertension.*

Introduction

Hypertension (HTN) is among the most common, noncommunicable disease in the world. Approximately 80 million people (32.6%) in the United States [1] and one billion worldwide suffer from HTN[2], Long term HTN leads to hypertensive heart disease and is the result of anatomical and functional changes in the cardiovascular system (which is a cardiovascular sequelae of HTN) and is defined as left ventricular hypertrophy (LVH), left atrial enlargement, left ventricular diastolic dysfunction, functional mitral regurgitation and neurohormonal changes [3]. The hemodynamic overload from HTN causes left ventricular (LV) remodeling, which usually manifests as distinct alterations in LV geometry, such as concentric remodeling or concentric and eccentric LV hypertrophy (LVH).fibroblast growth factor-23(FGF23) is an endocrine hormone released from the bone that acts on the kidney to stimulate phosphaturia and inhibit calcitriol synthesis [4]**.** FGF23 is a 32 kDa glycoprotein and belongs to the superfamily of fibroblast growth factors (FGF)[5]. Recent evidence showed that locally secreted FGF23 may act as a regulator of bone mineralization in osteocytes in an autocrine/paracrine manner[6] and also the local secretion of FGF23 in the heart has putative paracrine functions [7]. FGF23 levels rise in the presence of chronic kidney disease to maintain phosphate levels; however, elevated FGF23 levels are associated with worse cardiovascular outcomes and increased mortality [8].Elevated FGF23 levels have also been associated with increased left ventricular mass and incident heart failure in patients without known chronic kidney disease [9].FGF23 may up regulate the renin–angiotensin–aldosterone system (RAAS) by decreasing calcitriol—a potential negative regulator of the RAAS system [10].In addition, experimental studies suggest that FGF23 may increase renal sodium uptake independent of the RAAS system leading to volume expansion and possible effects on blood pressure (BP)[11].some studies have examined whether lipid levels are prospectively associated with the risk of developing hypertension[12,13].

Patients Materials and Method: Prospective case-controlled study. The protocol of this study was approved by the scientific committee of Tikrit University-College of Medicine and the agreement of the attendance to Ibn Al-Bitar Cardiac Surgery Center to collect the sample from the patients was approved by the Baghdad/Karkh Health Directorate. This study was conducted on ninety individuals including thirty patients who had Left Ventricular Hypertrophy (LVH) and thirty patients who had Hypertension and thirty healthy control subjects. The samples were collected from Ibn Al-Bitar Cardiac Surgery Center from 20th of March, 2019 to 20th of June, 2019. The criteria of exclusion were patients with Impairment in renal function, Diabetes mellitus, Bone disorder, Chronic illness. The age, gender and clinical manifestation of each patient with HT combined with LVH and without LVH, were recorded in a checklist.

Patients data were collected and compared with 30 apparently healthy subjects who participated as control group. The levels of FGF23 was measured by ELISA technique whereas the levels of other parameters (Cholesterol, triglycerides, HDL and LDL) were measured by colorimetric method according to the manufacturer manual.

Blood samples A volume of 5ml of blood sample was taken by vein puncture from each subject enrolled in this study. Blood samples were placed into sterile test tubes, after blood clotting, the samples were centrifuged at 3000 rpm for 15 min and the obtained serum were aspirated using mechanical micropipette and transferred into clean plain tubes with screw which labeled and stored in deep freeze at -20ºCuntil used for the various investigations.

Detection range for **FGF23**15.6 -1000 pg/ml*

Normal Value:Total Cholesterol : <200 mg/dl**, Triglycerides:**35-160mg/dl**, HDL-C:**40-59mg/dl**, LDL-C:**<130mg/dl .

Statistical Analysis: Statistical analyses were performed using SPSS statistical package for Social Sciences (version 21.0 for windows, SPSS, Chicago, IL, USA). Data are presented as mean ± SD, range and median for quantitative variables and number and percentage for qualitative variables.

Comparison between study groups was done using ANOVA (Analysis of Variance) for normally distributed data and using Kruskal-Wallis for non-normally distributed data.. Relation between FGF23 and the other parameters was done using Pearson's correlation. P value of <0.05 was considered statistically significant.

Results

1. **Measurements offibroblast growth factor 23 (FGF23) among three study groups:** Comparison among three study groups regarding serum FGF23 level was performed using Kruskal-Wallis test.

Cases which have included: LVH (HT with LVH), HT and control**.** There was a statistically significant difference in the serum FGF23 level**s** between HT with LVH group (541.515±148.25 Pg/mL) and HT without LVH group (239.27±108.85 Pg/mL) and both groups are different from the control group (38.37±26.44 Pg/mL). Kruskal-Wallis test = 35.32, P = 0.0001. as see in figure (1).

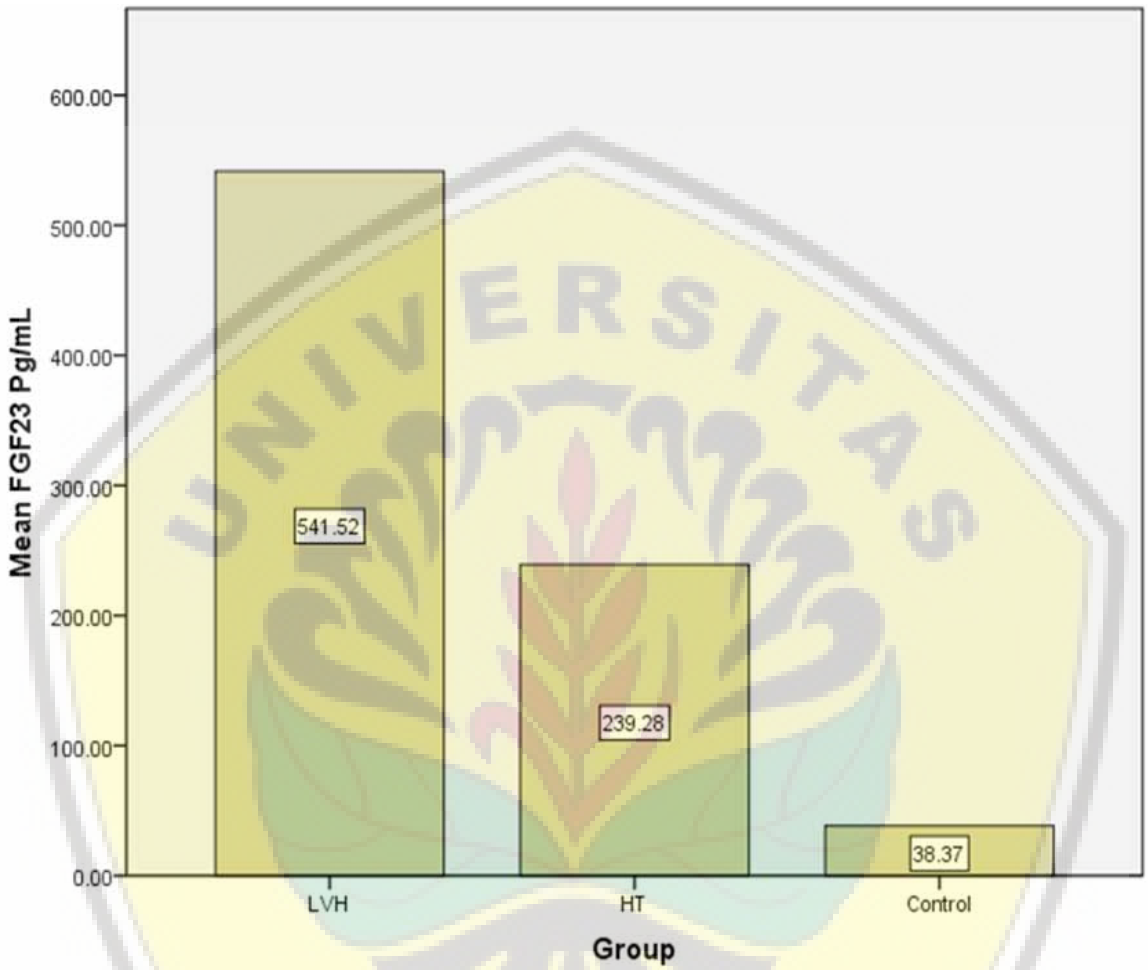

Figure (1): Distribution of FGF23 between groups

2. **Measurements of Lipid profile among three study groups:** Comparison among three study groups regarding serums Cholesterol, TG, HDL and LDL levels was performed using ANOVA (Analysis of Variance). Cases were: LVH**,** HT**.** Cholesterol, triglycerides (TG), HDL and LDL were not significantly different between studied groups. Cholesterol level in LVH group was (5.0300±2.58139mmol/L) and HT group was (5.0537±3.04455 mmol/L) and the control group (4.0920±0.45993 mmol/L) P = 0.436 .

TG level in LVH group was (1.9430 0± 1.49277 mmol/L) and HT group was (1.6540 ± 0.80800 mmol/L) and the control group (1.1193 ± 0.27580 mmol/L) P = 0.062 .

HDL level in LVH group was (1.1533± 0.49670mmol/L) and HT group was (1.1267± 0.21645mmol/L) and the control group was (1.0733± 0.18310mmol/L) P = 0.774 .

LDL level in LVH group was (2.9900± 1.11737mmol/L) and HT group was (2.8400± 1.37705mmol/L) and the control group was (2.5500± 0.55388 mmol/L) P = 0.485. These statistics were as summarized in (Figure 2).

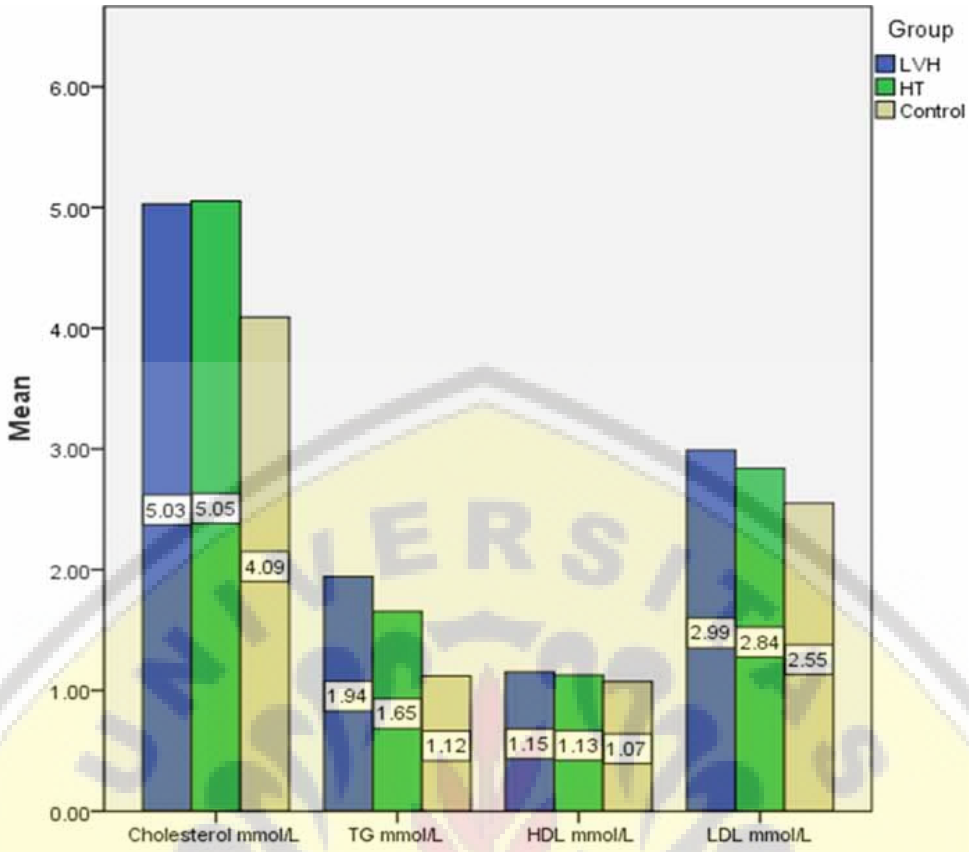

Figure (2): Distribution of Cholesterol, TG, HDL, and LDL between groups

Discussion

This study was found the FGF23 levels was significantly elevated in patients with HT and LVH compared to apparently healthy controls. This study agree with Matsui I *et al*., 2018 and Rodelo-Haad C *et al*., 2019 Whose founds the FGF23 was higher in LVH and HT compared to healthy controls [14,15].Activated NFAT1 plays an important role in the transcriptional regulation of FGF23 through the proximal NFAT-binding site in the FGF23 promoter. Elevated levels of serum FGF23 correlated with ventricular hypertrophy and did not correlate with kidney function[15]. Inflammation is 1 of the key factors causing an up regulation in the transcription of FGF23[16,17]. Nuclear factor-kB, akey factor in the inflammatory signaling pathway, transcriptionally regulates the expression of target genes, including FGF23[18]. Although NFAT was initially identified as a nuclear factor that can bind to the promoter of interleukin-2 in activated T cells, The studies have revealed that NFAT also contributes to innate immune and inflammatory responses [19]. Recent studies suggest that enhanced FGF23 action in Hyp mice increases distal renal tubule reabsorption of sodium, leading to hypertension and LVH, as quantified by total heart weight normalized to body weight[20]. The present study showed the cholesterol levels was not significantly elevated in patients with HT and LVH compared to apparently healthy controls (p value 0.436), triglycerides levels was not significantly elevated in patients with HT and LVH compared to apparently healthy controls (p value 0.062), LDL levels was not significantly elevated in patients with HT and LVH compared to apparently healthy controls (p value 0.485), HDL levels was not significantly elevated in patients with HT and LVH compared to apparently healthy controls (p value 0.774). This present study agree with (Akintunde AA., 2010)[21] He found The mean fasting lipid levels were not statistically different among the hypertensive and normotensive subjects, and agree with, (Kaur M *et al.*, 2000)[22]. And this present study disagree with (Osuji CU *et al.*, 2012)[23] they found that the, serum TC, TG and LDL-L concentrations are significantly higher in hypertensive patients than in normotensive subjects.

Conclusions

The FGF23 is higher in hypertension patient with LVH than those without and The FGF23 could be served as a diagnostic marker in hypertension patients to predict the possibility to develop LVH.

Isolation and Identification *Pseudomonas Aeruginosa* from Clinical Samples and Irrigation Water: Susceptibility to Common Antibiotics

Huda Abbas Mohammed M. AL-Jaryawi[1], Ayaid Khadem Zgair[2]

[1]*Environmental Research and Studies Center, Babylon University, Babylon, Iraq,*
[2]*Department of Biology, College of Science, University of Baghdad, Baghdad, Iraq.*

Abstract

Pseudomonas aeruginosa is considered opportunistic organisms Treatment of *P. aeruginosa* infections can be complicated due to its natural resistance to antibiotics. There is a good relation between the ability of bacteria to form biofilm and antibiotic susceptibility. In present study, twelve environmental isolates (PAE1, PAE2, PAE3, PAE4, PAE5, PAE6, PAE7, PAE8, PAE10, PAE11, PAE12 and PAE14) and seven clinical isolates (PAC1, PAC2, PAC5, PAC7, PAC8, PAC9 and PAC10) of *P. aeruginosa* were used in current study. The results showed that the resistant to antibiotic by clinical isolates was higher than environmental isolates. Furthermore, Ticarcillin/Clavulanic Acid (TIC/CLA) antibiotic was high effective against environmental isolates than clinical isolates. Most environmental isolates were resistant to IMI and Amik antibiotics higher than clinical isolates. Colistin showed a lower effect of (MIC) in clinical isolates compared to environmental isolates.

Keywords: *Environmental and clinical isolates of P. aeruginosa, VITEK 2 Densi Check device, Biofilm, Antibiotic susceptibility.*

Introduction

P. aeruginosa is a Gram-negative rod-shaped bacterium causing for many infections immune compromised persons, burned patients and individuals hardship from cystic fibrosis. In addition to known swimming and twitching motilities, *P. aeruginosa* is capable of second kind of migration called swarming. This intricate kind of motility is usually defined as a rapid and consistent translocation of a bacterial inhabitance across a semi-solid surface[(1)].

The bacterial social behavior is the formation of attached communities called biofilms that happen by flagella[(2,3)]. As well playing a role in swarming motility, RLs and HAAs are also involved in many aspects of biofilm development[(4)]. *P. aeruginosa* was known to be major pathogens associated with human infection and that associated with ability of clinical isolates to form biofilms [(5)].

Biofilms have been discovered since 3.2 billion years ago[(6)] and the first to photocopy the biophysics composition in 1683 by A. Leeuwenhoek scraped a layer of deposition from his teeth and examined under a microscope [(7)]. The first use of biofilm was in 1977 by William Costerton who noticed that most of the majority Bacteria on the sedimentary rocks of planktonic bacteria in the alpine lake are described and stored in biofilm [(8)]. In fact, more than 99% of the microorganisms in the ecosystem are found as biofilm on types of surface [(9)].

There are many prospect reasons behind biofilms formation by bacteria.Some of them are protection by avoiding the host immune system and keeping themselves

from harmful conditions,colonization in region has wealthy in nutrients and sequester it and placement of advantage mutual system and live as community[10].

There are many advantages of bacterial cell biofilm. The main ones are antibiotics resistance in addition to detergent and antiseptic, Avoid immune system response and protection from the conditions of environment[11].

Materials and Method

Samples Collection: Fifty three samples were collected from burns, respiratory tract and ears infections of indoor patients in Hilla Hospital and Al-Hussein Hospital in Karbala. Swabs were taken from the infected areas of the patients and cultured on the nutrient agar. Seventy samples were collected from Shatt al-Hillah and Al-yahudia Rives. The water samples were collected in sterile glass containers until, The water samples were cultured onto nutrient agar for identification of bacteria.

Identification of suspected P. aeruginosa: Suspected isolates cultivated on Cetrimide agar for produce yellow-green to blue-green colonies which fluoresce under UV light[12]. These colonies were cultivated on MacConkey agar[13]. VITEK 2 Densi Check instrument, fluorescence system (bioMe´rieux) (ID-GNB card) includes 43 nonenterobacterial gram-negative taxa was used to confirm the species of bacteria. Testing was performed according to the instructions of the manufacturer. Briefly, strains were cultured on LB agar for 18 to 24 h at 37°C before the isolate was subjected to analysis. A bacterial suspension was adjusted to a McFarland standard of 0.50 to 0.63 in a solution of 0.45% sodium chloride using the VITEK 2 Densi Check instrument (bioMe´rieux). The time between preparation of the solution and filling of the card was always less than one hour. Analysis was done using the identification card for gram-negative bacteria (ID-GNB card) containing 41 fluorescent biochemical tests. Cards are automatically read every 15 min. Data were analyzed using the VITEK 2 software version VT2- R03.1 [14].

Antibiotic Susceptibility: The standard method to test the susceptibility of *P. aeruginosa* to the several antibiotics (Ticarcillin/Clavulanic acid, Piperacillin/ Tazobactam, ceftazidime, cefepime, imipenem, gentamicin, tobramycin, ciprofloxacin, ticarcillin, amikacin)[15]. VITEK 2 Densi Check instrument (bioMe´rieux) was used to check the supportability of clinical and environmental isolated of *P. aeruginosa*.

Statistical Analysis: All data represent mean values and standard error of at least five replicas of independent experiments. The differences between two groups were analyzed by using student's t test. Pearson coefficient test was used to estimate the correlation between biofilm formation and MIC. Origin 8.0 version software[16,17,18].

Results and Discussion

Isolation and Identification of p. aeruginosa: Seventy of environmental specimens were collected from Shatt al-Hillah and Al-yahudia. The samples were collected in clean and sterile glass containers. The suspected *P. aeruginosa* isolates were identified according to color of colony that produced a pigment such as pyocyanin onto cetrimide agar. Fifty-three specimens were collected from burns, respiratory tract and ears of patients visited AL- Hilla Hospital and Al-Hussein Hospital in Karbala. The samples cultured into Muller-Hinton agar and cetrimide agar.From seventy specimens only fourteen (20%) specimens were identified as suspected *P. aeruginosa*. The suspected isolates were diagnosed by VITEK 2 DensiCheck apparatus, the results showed twelve *P. aeruginosa* (17.14%). Whilst from fifty-three environmental samples only ten suspected *P. aeruginosa* isolates were identified (18.86%), then isolates identified in VITEK 2 DensiCheck apparatus (BioMérieux), only seven isolates were identified as *P. aeruginosa* (13.2%) (Table 1).

Several studies used VITEK technique for diagnosis the isolates [19], That is why, it is used to identify clinical and environmental isolates of *P. aeruginosa* involved in current study. In the other studies, the presence of *P. aeruginosa* isolated from the sputum of patients with respiratory tract infection at percentage of 11.1%[20]. While, other studies explain that happing of infection with *P. aeruginosa* in persons hurt with respiratory tract infection was 25% [21].

Table 1. Number and percentage of *P. aeruginosa* that isolated from environmental and clinical samples.

Isolated sample	No. of sample	No. of suspected p. aeruginosa	Percentage of suspected p. aeruginosa	p. aeruginosa VITEK2	Percentage
Environmental	70	14	20 %	12	17.14 %
Clinical	53	10	18.86 %	7	13.2 %

The bacteria cannot invasive the tissue and presence only on the mucosal surface of respiratory tract and this original sin can be specified as colonization [3]. Isolated bacteria from oil polluted soil that collected from different places in Baghdad, Kut and Hilla,locate that thirty five *Pseudomonas* isolates were isolated from seventy five oil contaminated soil [22].

VITEK 2 DensiCheck device technology was used to determine the sensitivity and resistance of environmental and clinical isolates to broad range of antibiotics. In present study, PAE1 isolate showed the highest level of MIC for all antibiotics. The results showed that most environmental isolates were sensitive to most antibiotics that used in current study. PAE1 resisted to highest number of antibiotics (8 antibiotics) and susceptible to one antibiotic (TIC/CLA) and it was showed intermediate susceptible to four antibiotics followed by PAE12 was resisted to three antibiotics while other environmental isolates more sensitivity to antibiotics (Table 2).

Table 2. Minimum inhibition concentrations (MIC) of different antibiotics tested against environmental isolates of *P. aeruginosa* (PAE1, PAE2, PAE3, PAE4, PAE5, PAE6, PAE7, PAE8, PAE10, PAE11, PAE12, PAE14) that collected from Shatt al-Hillah and Al-yahudia.S, sensitive to antibiotic; R, resistant to antibiotic; I, intermediate. VITEK 2Densi Checkinstrument (bioMe´rieux(was used to measurethe MIC.

Identically, the sensitivity and resistance in terms of MIC for seven clinical isolates were measured to several antibiotics (13 antibiotics). Table (3) showed that most isolates (clinical isolates) were resistance to high number of antibiotics with high value of MIC .the isolates PAC7, PAC8 sensitive to the highest number of antibiotics and not resistance to any antibiotics used in present study, while PACI, PAC2, PAC5, PAC9 were sensitive to one antibiotics (COL) and resisted to 12 antibiotics from 13

antibiotics that used in current study. The isolate PAC10 appeared resisted to four antibiotics and sensitive to 8 antibiotics and intermediate to 2 antibiotics (CEF and PIP). The present study, showed that the clinical isolates were resistant to high number of antibiotics as compared to environmental isolated and PAC1, PAC2, PAC5, PAC9 were resistant to the highest number of antibiotic and PAE1 was sensitive to highest number of antibiotics (table 2).

Table 3. Minimum inhibition concentrations (MIC) of different antibiotics against clinical isolates of*P. aeruginosa* (PAC1, PAC2, PAC5, PAC6, PAC7, PAC8, PAC9 and PAC10) that isolated from sputum of patients suffering with respiratory tract infection, burns and wounds infection. S, sensitive to antibiotic; R, resistant to antibiotic; I, intermediate. The antibiotic MIC was measured by VITEK 2Densi Checkinstrument (bioMe´rieux)

The results of current study showed highly difference between clinical and environmental isolates in terms of MIC especially for heaps of antibiotic (TIC/CLA, PIP, PIP/TAZ, CEF, CEFE and AMI). The present study showed thatTIC/CLA was high effective against environmental isolates than clinical isolates. CIP was appeared low effective against environmental isolates than TIC/CLA. Colistin was showed very low effective on clinical isolates (Figure 1).

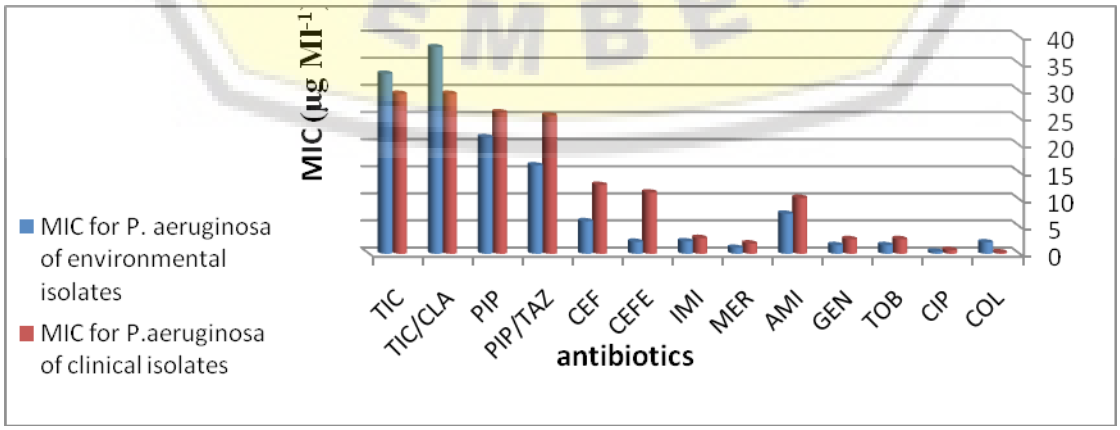

Figure 1. Minimum inhibition Concentration (MIC) of different antibiotics against environmental and clinical isolates of P. aeruginosa.

Bactericidal activity of fluoroquinolones, β-lactams, macrolides and aminoglycoside [23]. In present study all clinical isolates were sensitive to Colstin (COL). utilization of antibiotic with high dose and not under recommendation of doctor leads to more troubles relating with produce of new strains of bacteria that can resist to antibiotics. Modern study explained that the sensitivity of antibiotic related with the pathogenicity of and acuteness of bacteria to source infection [24].

Conclusions

Clinical isolates of *P. aeruginosa* are highly resistant to antibiotics than environmental isolates.

Ethical Clearance: The Research Ethical Committee at scientific research by ethical approval of both environmental and health and higher education and scientific research ministries in Iraq

Effect of Non-oxygen Physical Program with Different Work-to-rest Ratio in the Development of Anaerobic Capacity and Muscular Fatigue Index for Junior Futsal Players

Inaamjaleel Ibrahim[1], Marwah Mahmood Ali[2]

[1]Mustansiriyah University/Department of Physical Education and Sport Sciences, Faculty of Basic Education/Iraq,
[2]Al-Esraa University College/Department of Physical Education and Sport Sciences/Iraq.

Abstract

The study aimed to identify the effect of anaerobic physical training program with different work-to-rest ratio for the two groups in the development of anaerobic abilities of the muscles of the legs. The researchers used the experimental method to design the pre and post measurement of two experimental groups to suit its relevance and nature of the research. The sample was chosen in a deliberate manner from the futsal players of the youth halls aged (16-17) from the National Center and the number of (45) young people. The experimental group that used the time-to-rest ratio (1: 2) on the experimental group that used the time-to-rest ratio (1: 3) in anaerobic capacities. The researchers also recommended to emphasize the futsal coaches to organize the training load on the development of training programs according to energy production systems.

Keywords: *Non-oxygen, physical program and muscular fatigue.*

Introduction

The sports training has become a process oriented to improve the level of the player through the indicators planned to develop the competencies of the modern requirements of the game of futsal and as a basis for building elements of physical and motor competence that play an important role in fitness and skill that qualifies him to carry out his duties for the performance of motor performance more effectively and positively to the performance required during the game.[1]

The issue of energy production when the athlete of scientific topics that have become of great interest without energy there is no movement and therefore the identification of energy sources and try to employ the optimum employment during performance leads us to progress and achievement or else Energy production is one of the most important topics related to sports activity. This activity is very diverse in terms of intensity and duration. This diversity is also offset by the diversity of energy production systems. [2]

The body gets energy through the food it consumes, this food turns into chemical energy stored in the body but is not used in its primitive form directly as it is used to form a compound is triphosphate adenosine and to rebuild and form this basic energy compound, which takes one of three ways to rebuild it either depend on the phosphate system or lactic acid system or Oxygen system These systems vary depending on their dependence on oxygen during the process of energy production. Here, we can rely mainly on the system of lactic acid to produce energy. The researchers believe that the game of futsal is one of the games characterized by the fact that most of the physical and skill movements performed by the players are movements with maximum or near maximum anaerobic abilities dependent These movements require a different effort in intensity as players jump to different heights and run at short distances over time and perform short-term physical and skill movements.[2]

Matches are performed under anaerobic conditions, while this energy is compensated in air conditions during rest, but these rest periods may be prolonged or shortened according to the rhythm of the game and in order for the player to succeed in physical performance or skill must have the physical, skills, mental and functional special to perform the required motor duties are characterized by most Skills in the game of futsal anaerobic work, which lasts from (5-15) seconds and repeated during games or training many times in order to enjoy the player from the performance of physical and planning duties efficiently and effectively This requires a high level of physiological efficiency and a great deal of muscle capacity In the game of futsal, the research is gaining importance through the preparation of anaerobic physical training program with different time-to-rest ratio in order to identify the impact of the development of anaerobic energy production on the abilities and fatigue index of the players.[3]

Research Aims:

1. Identify the effect of anaerobic physical training program with different work-to-rest ratio for the two groups in developing anaerobic abilities of the muscles of the legs.
2. Identify the effect of anaerobic physical training program with different time-to-rest ratio in the fatigue index of the two groups.

Research Hypothesis:

1. There are statistically significant differences between the results of pretest and posttest tests for anaerobic physical abilities and in favor of the dimension of the two groups with different time-to-rest ratio (1: 2) and (1: 3).
2. There were significant differences between the results of the pre- and post-tests and the fatigue index for the benefit of the two groups with different time-to-rest ratio (1: 2) and (1: 3).

Research Methodology

The researchers used the experimental method to design the pre and post measurement of two experimental groups to suit its relevance and nature of the research.

The Research Sample: The sample was chosen by deliberate method from the futsal players of the youth halls (17-16) from NBK center. The sample consisted of (30) players representing (80%) of the research community. Using the lottery, this sample was divided into two experimental groups (15) for each group. About their percentages.

Table (1). Shows the specification of the research sample

Variables	Number	Percentage
Research community	45	100%
The research sample	30	%66.66
Exploratory sample	10	%22.22
Excluded	5	%11.11

Table (2). Shows statistical significance and homogeneity of the research sample in the variables (age, height, mass and training age)

Tests	Units	Mean	SD	Skewness
Age	Year	16.600	0.982	5.915
Mass	Kg	63.066	3.073	4.872
Length	Cm	164.600	3.417	2.075
Age of training	Year	1.796	0.409	2.77

From Table (2), it was found that the coefficient of difference is less than (30) and this confirms the homogeneity of the research sample.

Physical Ability Tests[4]: The vertical jump test of stability was measured by the Johnson equation.

Objectives: To measure the muscle capacity of the two men.

Tools Used: Wall-chalk-tape measure.

Method of Performance: The laboratory holds chalk, the shoulder is touching the wall and raise his arm to the maximum extent possible with a note that the feet and heels are touching the ground and put a mark and then the first measurement between the first mark and the ground (M1) and when you give the reference to the examiner, he bends the trunk in front and down with the knees bent To reach the right angle with the weighted arms and then the feet together with the individual knees and extend the trunk up and the arm to the maximum height possible and mark the chalk on the wall and then the second measurement between the second marker and the ground (M2).

Test Conditions:

- Warm-up (5-10) minutes- Jump from steady mode.
- The laboratory is given two attempts.

Registration:

- Calculate the difference between the second and first marks (M1-M2)
- Best distance recording try.

Training Program: Two experimental approaches were designed for anaerobic physical exercises for the two research groups, which differ from one to the other in terms of time-to-rest ratio and were presented to a group of experts in the field of sports training science, training physiology and futsal. Physically, it is determined by the time of exertion and the rate of energy consumption in this activity and it is a basic principle to build a training program, the need to determine the system of energy production used in order to distribute the physical loads in the light.

Table (3). Shows the time-based training methodology for the boy

	Training time	The number of iterations in the module	The number of groups in the training unit	The number of iterations in the training group	Work to rest ratio	Rest type
Energy system ATP_PC	10seconds	50	10	5	1:3	Negative
	15seconds	45	5	9		
	20seconds	40	4	10		
	25seconds	32	4	8		

Table (4). Show the guide to Adopting the Training Program with Different Time-to-Rest Ratio (1: 3) and (1: 2)

Exercises	Time	Total repetition	Partial repetition	Rest	Number of groups	Total work time	Total rest time	Total a second	Rest between groups	Total exercise for each minute
1	10	50	6	30	1	60	150	210	3Min.	6.5
2	10	50	6	30	1	60	150	210	3Min.	6.5
3	15	45	6	45	1	90	225	315	3Min.	8.25

8	25	32	4	75	1	100	225	390	3Min.	9.5
9	20	40	5	60	1	100	240	325	3Min.	8.41
10	20	40	5	60	1	100	240	325	3Min.	8.41
11	20	40	5	60	1	100	240	325	3Min.	8.41
12	20	40	5	60	1	100	240	325	3Min.	8.41

Field Research Procedures:

Pre-test: 5-6/1/2019 on the members of the research sample before the implementation of the two programs in order to see their level in the variables under study. After the completion of the implementation of the two programs, the tests were conducted on 5-6/4/2019 to find out their level in the variables under study.

Results

Table (5). Shows the significance of the differences between pre and post measurement in the variables and anaerobic physical abilities and fatigue index of the experimental group used time to rest ratio (1: 2).

Results

Differences between the pre and posttests of the variables under study: From the results obtained from tables (5 and 6) we see that there has been clear progress in the two research groups that used different time-to-rest ratios in anaerobic physical exercises in the training program,[5] as the tables mentioned showed significant differences between the pre- and post-test and after-benefit the training methodology,[6] which achieves the hypotheses of the research which stipulated that there are significant differences with regard to the variables under study between the pre and post tests and in favor of the post test of the two research groups.[7] Time to rest, which took (8) weeks and (3) training units per week in which the pressure on the power system (ATP-CP),[8] a guide to build a time-based training program, which was used times (25-20). The anaerobic exercise leads to adaptations and physiological changes and increases energy sources by ATPs (10-15 seconds) ATP-CP and CP in muscle and increase the energy houses and mitochondria found within muscle cells.[9]

The researchers attribute this to the reduction of

rest periods between repetitions, which led to increased exercise intensity as a result of the implementation of anaerobic physical exercises in the training program gradually from week to week, which led to adaptation to reach a better level of the ratio (1: 3) It is due to the development Anaerobic physical abilities and increased body resistance to work against factors that delay the appearance of fatigue by using energy sources through the regular exchange between fatigue and recovery.[8] Training in anaerobic energy production time affects the level of activity of some enzymes known as anaerobic enzymes,[10] which regulate anaerobic energy representation, the researchers attributed this to the increased strength of the breathing muscles, which reduces the resistance of the flow of air in the air passages and increases the amount of air entering the lungs and thus improves the process of gas exchange,[11] resulting in the efficiency of the respiratory system increases the volume of oxygen that is pumped into the blood stream, which leads to increase the effectiveness of muscle strength The heart resulting in efficient circulation and carry more oxygen thus increasing the volume of oxygen consumed at rest.[12]

Conclusions

1. Anaerobic physical exercises with different time-to-rest ratio have made significant progress in anaerobic abilities.
2. The experimental group that used the time-to-rest ratio (1: 2) was superior to the experimental group that used the time-to-rest ratio (1: 3) in anaerobic capacities.

Comparison of Clients' Satisfaction in Family Health Adapted Centres and Primary Health Care Centres in Baghdad 2018

Abdul Munem Y. Al-Dabbagh[1], HanadiTawfeeq Hassoon[2]

[1]MBChB, DM, FICMS (FAMCO)/Iraqi Board for Medical Specializations/Scientific Council of Family and Community Medicine/Baghdad/Iraq, [2]MBChB/Al-Rusafa Health Directorate/Ministry of Health/Iraq

Abstract

Background: Patient satisfaction is a key criterion for evaluating the quality of health-care services. Family health strategy is now being used in a number of primary health care centers as a new model to enhance the quality of provided health care services.

Aim of Study: To evaluate and detect differences in the quality of services provided by family health adapted centers and primary health care centers.

Method: A comparative cross-sectional study was conducted to measure clients' satisfaction in two family health adapted centers and two traditional primary health care centers. Data was collected from 240 participants through direct interview using a SERVQUAL based questionnaire.

Results: Total satisfaction score was significantly higher in family health adapted centers (79.18±5.054) compared to that in primary health care centers (50.76±11.801). The means of all the studied dimensions in family health adapted centers were also significantly higher than that in primary health care centers.

Conclusion: Overall Patients' satisfaction in family health adapted centres was higher than in traditional primary health care centres in all the studied dimensions, reflecting that the quality of care is better in family health adapted centers.

Keywords: *Patient satisfaction, family medicine, family health strategy.*

Introduction

Health is designated as a fundamental human right by almost all countries and its development is considered as one of the most important government responsibilities. [(1)]According to the World Health Organization (WHO) guidelines, all countries need to establish continuous monitoring and evaluation programs.[(2)] Patient satisfaction is a key criterion for evaluating the quality of health-care services.[(3)] It can be defined as the level of congruence between patients' expectations and their perceptions for the care received.[(4)] Patient satisfaction has emerged as an increasingly important health outcome and is currently used for the following purposes: (i) to compare different health-care programs or systems; (ii) to evaluate the quality of care; (iii) to identify which aspects of a service need to be changed to improve patient satisfaction; and (iv) to assist organizations in identifying consumers likely to dis-enroll.[(5)]Feedback from patients is vital if deficiencies are to be identified and improvements to be achieved.[(6)] Patient satisfaction is one of the most widely used outcome indicators of the quality of health care. As a result, patient satisfaction is an active area of research that is increasingly being used to guide health care, because it encompasses patients' needs.[(7)]

Years after the Alma Ata Declaration, policy-makers come to believe more and more that it is essential to support the revitalization of PHC.[(8)] This valuable point has led health system policy-makers across the world to seek an effective model for providing PHC.[(8)]for this reason family medicine (FM) emerged as a transition from medically focused to client-centered and family-centered models.[(9)] Family Medicine is defined as a specialty of medicine that provides comprehensive care

to individuals and families by integrating biomedical, behavioural and social sciences.[10] In contrast to an aggressive assault on the disease, family physicians championed longitudinal health care, which allowed both patient and physician to understand the natural history of illness and to share decisions over time.[11] In 1994, the Family Health Strategy (FHS) was put in practice.[12] The FHS has evolved into a robust approach to provide primary care for defined populations by deploying interdisciplinary health care teams.[13] The nucleus of each FHS team includes a family medicine physician, a nurse, a nurse assistant and four to six full-time community health agents. Family health teams are organized geographically, covering populations of up to 1000 households each, with no overlap or gap between catchment areas. Each FHS team member has defined roles and responsibilities and national guidelines help structure FHS responses to most health problems.[13]

In Baghdad the FHS started in 2013 in Bab AL-Muadam and AL- Mansour health care centers. However, to our knowledge there is no research conducted to evaluate the quality of health services provided by these centers or compare them to other traditional centers.

This study utilized patient satisfaction as a benchmark to assess the difference in the quality of health services provided in family health adapted centers (FHAC) and primary health care centers (PHCC).

Methodology

Acomparative cross-sectional study with analytic element was conducted in two family health adapted centers (Bab Al-Muadam/Al-Resafa and Al-Mansour/Al-Karkh) that were randomly selected out of twenty family health adapted centers in Baghdad. Their comparison group was selected from the nearest catchment area to minimize differences in the socio-economic status of the participants as a result; two PHCCs were chosen (Al-Sheikh Umar/Al-Resafa and Al-Washash/Al-Karkh). The data was conducted for a period of three months, starting from 1st of May till the end of July/2018.

The included study participants were restricted to those who were ≥18 years old and who had at least two visit to the included centers, Any patient who worked in the selected health care institutions was excluded. The clients were taken from the waiting area of the selected centres and any patient who met the selection criteria and was ready to participate was included in the study. This resulted in a convenient sample size of 240 participants (60 from Bab Al-Muadam, 60 from Al-Mansour, 60 from Al-Sheikh Omar and 60 from Al-Washash). The data was collected by the researcher through a direct interview with the patients using a pre-designed and validated clients' satisfaction questionnaire based on SERVQUAL model (service quality by Parasuraman 1988).[14]The questionnaire was modified to better fit the quality of health services.[15] The questionnaire consisted of two parts, the first part was about specific characteristics of the patients which include (age, gender, marital status, occupation and level of education) and the second part was about the quality of the services provided by the institute. This part covered six dimensions (tangibility, reliability, responsiveness, assurance, empathy and accessibility & affordability).

Satisfaction scores were calculated using a Likert-type scale. The scores were given 3= highly satisfied, 2= satisfied, 1=uncertain and zero for dissatisfied. The data were summarized, presented and analyzed using SPSS version 22. Frequency and percentages were used to represent categorical data, while the mean and standard deviation used to represent numerical data. Independent student t-testused for the analysis. In all statistical analysis, level of significance (p value) was set at ≤ 0.05 and the results presented as tables.

Results

The study included 240 respondents, 120 (50%) from FHACs and 120 (50%) from PHCCs. Their mean age was (37.76±9.08 years) and the majority of them (61.7%) were below the age of 40 years. of the study sample, (88.3%) were females and (87.5%) were married. Only (19.6%) of clients were employed, while (80.4%) were un-employed. Regarding the level of education 36.7% of the studied sample was an intermediate and secondary. (Table 1).

Table 1: Distribution of studied cases according to their basic characteristics

Variables		No.	%
Age (mean±SD)=37.76±9.08 years			
Age group	<40 yrs.	148	61.7%
	≥40 yrs.	92	38.3%
Total		**240**	**100%**
Gender	Male	28	11.7%
	Female	212	88.3%
Total		**240**	**100%**

Variables		No.	%
Marital status	single	22	9.2%
	married	210	87.5%
	Divorced or widowed	8	3.3%
Total		**240**	**100%**
Occupation	employee	47	19.6%
	un employed	193	80.4%
Total		**240**	**100%**
Educational level	primary and less	84	35.0%
	intermediate & secondary	88	36.7%
	college	68	28.3%
Total		**240**	**100%**

A significant difference was found between the mean of total satisfaction score and the type of PHCCs, It was higher in the FHACs (79.18±5.054) compared to that in PHCCs (50.76±11.801). The means of all the studied dimensions were significantly higher in the FHACs compared to that in PHCCs. The means of tangibility, reliability, responsiveness, assurance, empathy and accessibility & affordability in FHACs were 17.73, 11.81, 14.61, 14.77, 11.64 and 8.62 respectively. While in the PHCCs were 12.69, 7.85, 8.44, 8.75, 6.52 and 6.53 respectively. The gaps between FHAC and PHCC satisfaction means in descending order were 6.17, 6.02, 5.12, 5.04, 3.96 and 2.09 for responsiveness, assurance, empathy, tangibility, reliability and accessibility & affordability. (Table 2).

Table 2: Shows the significance of differences between means according to the studied dimensions

Dimension	Health care center	N	Mean	S.D	P value
Total score	FHAC	120	79.18	5.054	0.001
	PHCC	120	50.76	11.801	
Tangibility score	FHAC	120	17.73	0.877	0.001
	PHCC	120	12.69	3.974	
Reliability score	FHAC	120	11.81	0.781	0.001
	PHCC	120	7.85	3.511	
Responsiveness score	FHAC	120	14.61	2.047	0.001
	PHCC	120	8.44	3.103	
Assurance score	FHAC	120	14.77	1.075	0.001
	PHCC	120	8.75	2.023	
Empathy score	FHAC	120	11.64	1.527	0.001
	PHCC	120	6.52	1.806	
Accessibility & affordability score	FHAC	120	8.62	0.909	0.001
	PHCC	120	6.53	1.815	

Discussion

Patients' satisfaction has long been considered as an important component when measuring health outcome and quality of care in both developed and developing countries and constitutes a significant indicator of the health care quality.[16]

The significantly higher total satisfaction score in FHACs was in accordance with a study conducted in Brazil, 2012 in which they found that those who enrolled in FHS were more satisfied compared to those using the traditional primary care centers.[17]

The current study revealed that clients of FHACs were significantly more satisfied than those in PHCCs regarding tangibility. This is most probably attributed

to the nature of tangibility questions (updated facilities, clean environment with good directional signs) and the fact that FHACs were more recently established in comparison with PHCCs. Tangibility has been noted as one of the most important factors that can affect patients' satisfaction when dealing with quality of services.[18] Regarding reliability, it was found that FHACs were more reliable than the PHCCs. This may be due to the fact that more competent health practitioners and more competent staff were hired in FHACs compared to the other PHCCs. In the family health centres, only specialized physicians in the field of FM can be found while uncertified general practitioners can be found in the PHCCs. Moreover, the number of patients attending the FHACs is less than that those who attend the PHCCs, thus the doctors spend more time with each patient and hence, provide better quality of care. In 2018, the annual average number of patients attended Al-Washash centre was about two times the number attended Al-Mansour centre (2113 vs 952). Regarding the consultation time spent by the doctor with the patient it was found to be also important, a short time spent with the attendants could reflect an inadequate care and a care that is provided in a hurry with little clinical assessment and health education lead to poor satisfaction.[19]

The mean score for responsiveness was significantly higher in FHACs than in PHCCs. This means that FHACs provide services more promptly than the PHCCs. This may be attributed to the fact that the number of clients in FHACs is less in comparison with PHCCs. Therefore patients do not have to wait in long queues in order to see a health practitioner. A study conducted in Bostwana found that, the participants' greatest displeasure was with the time spent in the PHCC, as 63.9% of them were displeased with this aspect.[20]Waiting time is a source of dissatisfaction for patients and remains a challenge to the quality of care and services in clinics.[21] A previous study from Aldana et al. identified that long waiting time and insufficient consultation time as factors contributing to patient dissatisfaction.[22]

This study found that FHACs scored significantly higher than the traditional PHCCs with regard to assurance. This can be explained by the fact that doctor-patient relationship in the family centers is better in comparison with PHCCs. Al-Jumaily and Al-Lami stated that communication skills and doctor-patient relationship had a great effect on attendants' satisfaction. Reception and welcoming of the doctor make the first bridge for communication with the consumer and bring relief and trust.[19] A study conducted in Netherland also reported that higher satisfaction scores were related to higher scores on the doctor-patient relationship.[23] In addition, family doctors were more aware about their patients' conditions than the physiciansin PHCCs. This can be attributed to the fact that the patients' records in the FHACs are available, so the doctors would be able to review their clinical history and treat them more efficiently. Explaining the medical condition to the patient and treatment outcome are also important factors of assurance. Due to the small number of patients being seen in FHAC, doctors are able to spend more time with their patients and explain their medical conditions more thoroughly and thus enhance their satisfaction and assurance.

Family adapted centers were able to empathize more with the clients compared to PHCC. As each family is assigned to a specific family doctor in the FHAC, this has led to the development of a better doctor-patient relationship with the clients at a personal level and further understanding of their specific needs.In a study of patient satisfaction with health care service delivery, it was reported that to deliver better health service, primary health care physicians must establish relationships with their patients.[20] Empathy enhances the provider–patient relationship and therapeutic efficacy, decreases patient anxiety, improves patient enablement and has shown clear links to patient health outcome.

The accessibility & affordability to the family centers were more significant than that in PHCC, this may be due to that family centers were newly existed and built to be easily accessed by the clients. A study conducted by Bamidele AR et al. reported that ease of access to the facility was of importance to 91.4% of the participants.[20]As for affordability, despite the fact that the prices in both types of PHCCs are the same and fixed by the Ministry of Health, the satisfaction level on the service's prices was better in family health adapted centers. This may be attributed to the fact that the quality of care provided in the FHAC is much better than that provided in the PHCCs, thus the patients feel that paying for such good-quality services is worthy.

Clinical and Bacteriological Study in Puerperal Sepsis

Hiyam A. Bunyan

Maternity and Pediatrics Hospital, Health Directorate of Babylon City, Babylon, Iraq

Abstract

Background: Motherhood is a distinct bio-psychosocial process that transforms and broadens the role of a woman into that of a mother. Puerperal pyrexia and sepsis are among the leading causes of preventable maternal morbidity and mortality not only in developing countries but also in developed ones, as well, therefore, the aims of current study were to find out common organisms causing puerperal sepsis and to identify their antibiotics sensitivity patterns.

Method: This cross-sectional study was carried out during the period from June 2018 to December 2018. The clinically suspected cases of puerperal sepsis were included in this study. Endocervical swab or secretion and blood from each case were collected following standard procedure for microscopic examination and isolation of bacteria with antimicrobial susceptibility testing. The isolates were identified on the basis of colony morphology, colony Gram staining and appropriate biochemical tests. The identification of isolates was done, per standard biochemical testing and antibiotic sensitivity testing, as per CLSI guidelines.

Result: Out of (65) women recruited in present study, the majority of them 52(80%) were between 20 and 29 years of age. Majority of them were uniparous. In addition, 45(69.2%)of the cases showed bacterial growth, while the rest of samples were sterile. Gram-negative organisms were isolated in 31(68.9%)of the cases cases,while Gram-positive organisms where isolated in 14(31.1%)of the cases. *Klebsiellaaerogene* was the most frequent isolate in 12(26.7%) cases followed by *Staphylococcus. aureus*in 9(20%) cases then *Pseudomonas aeruginosa*in 8(17.8%) cases, *Proteus*in 7(15.5%) cases, *E. coli*in 4(8.9%) cases, *Streptococcus agalactiae*in 3(6.7%) cases and *Streptococcus pyogenes* in 2(4.4%) cases. In the present study, out of (65) cases studied, bacteremia was present in 45(86.5%) cases. Present study showed a predominance of Gram-negative bacilli (71.11%), whereas (28.88%)of isolates were Gram-positive cocci.

Conclusion: In view of the changing spectrum of the causative agents of puerperal sepsis and their antibiotics sensitivity patterns from time to time and from one hospital to another a positive blood culture and antibiotic susceptibility testing of the isolates are the best guide in choosing the appropriate antimicrobial therapy in treating puerperal sepsis.

Keywords: *Puerperal sepsis, antibiotic sensitivity pattern, blood culture, gram-positive, bacteremia.*

Introduction

Motherhood is a distinct bio-psychosocial process that transforms and broadens the role of a woman into that of a mother. Childbirth is a life-changing event as wonderful and joyful experience as it is for many. It can also be a difficult period, bringing with it new problems which have the potential to be life-threatening. Puerperal pyrexia and sepsis are among the leading causes of preventable maternal morbidity and mortality not only in developing countries but also in developed ones, as well[1].WHO has defined puerperal sepsis as "a genitaltract infection occurring between rupture of membranes and the 42nd day postpartum, coinciding with fever and pelvic pain, abnormal vaginal discharge, abnormal odour or discharge, or a delay in reduction of uterine size must also be present." Puerperal sepsis occurs in 1-8% of all deliveries. Fifteen percent of maternal death was attributed to puerperal sepsis in India and (16.4%) worldwide. Maternal mortality ratio is a sensitive indicator of health status of women[2].

In addition, (35%) of maternal morbidity was due to puerperal sepsis in India. Puerperal sepsis contributes to a lot of maternal morbidity, more so in rural women. This incidence is (5-10) times higher when a woman is delivered by cesareans section. Study of common organisms causing puerperal sepsis and their antibiotic sensitivity pattern will help to start prompt antibiotics treatment until culture report comes. The organisms which cause it include *S. aureus*, *S. Pyogenes* and Coliform bacteria[3]. There are very few studies particularly on bacterial etiology of puerperal sepsis. It is known that bacterial pattern with their antimicrobial susceptibility is a dynamic and changing phenomenon and surveillance of this event is needed in every healthcare setting. Puerperal sepsis is a systemic inflammatory response to infection in genital organs, which is manifested by fever, tachycardia, local vaginal discharge, tachypnoea and hypothermia. Puerperal sepsis could be attributed to no or improper use of aseptic technique during delivery or in immunocompromised mothers[4]. Predisposing factors leading to puerperal sepsis include primiparity, prolonged labour, anaemia and multiple vaginal examinations during labour and post-partum period. Besides, endometritis, wound infection, mastitis, urinary tract infection and septic thrombophlebitis are chief causes of puerperal sepsis[5].

Therefore, current study was aimed to find out common organisms causing puerperal sepsis and their antibiotics sensitivity patterns.

Materials and Method

This cross-sectional study was carried out for a period of six months; from June (2018) to December (2018). The clinically suspected cases of puerperal sepsis were included in this study. Patients with similar sign and symptoms but diagnosed as having other diseases e.g. UTI, cervical polyp, ulcerated uterine prolapse and vaginitis and also patients with history of taking prior antibiotics treatment within seven days were excluded from the study. Verbal consent was taken from every patient before sample collection and the purpose of the procedure was explained clearly. Endocervical swab or secretion and blood were collected from each patients following standard procedure for microscopic examination and isolation of bacteria with their antimicrobial susceptibility. Specimens were collected carefully to avoid normal resident flora. One aliquot of collected specimen was immediately inoculated in blood agar media at bedside for anaerobic culture. The rest of the specimen was transferred to the Department of Microbiology for further investigations. Wet film and smear were prepared from each cervical sample. Prepared Smear was stained by Gram staining[6]. Wet film and the stained smears were searched for observing morphology of relevant organisms and number of pus cells. Cervical swab/secretion was inoculated into two plates of blood agar, one MacConKeys agar, one Nutrient agar and One Mannitol saltagar media. One Blood agar, MacConKeys agar, Nutrient agar and Mannitol salt agar media were incubated at 37ºC for 24 hours aerobically. Another Blood agar plate was incubated anaerobically at 37°C for 48hrs[7]. Fromeach patient, a 10-mlsample of blood was collected in Brain Heart Infusion Agar-Brain Heart Infusion Broth (BHIA-BHIB). Blood culture bottles were observed daily for signs of growth like turbidity, colonies over solid slant portion, sub cultured onto solid media (like blood agar and MacConkeys agar) and evaluated after (24) hours, (48) hours and a maximum of upto seven days before declaring it as a negative culture. Blood culture bottles were incubated at (37°C) aerobically within an hour after collection of blood at bedside. Blood culture bottles were examined macroscopically for growth in the morning and afternoon on the 1st day of incubation and in the morning of each day thereafter. Culture that appeared as per hazy appearance of the broth was picked up and Gram stain was done[8]. Subcultures were done on Blood agar, Nutrient agar and MacConkey agar media and incubated at (37ºC) for (48) hours aerobically. Bottles that appeared macroscopically negative were examined with Gramstain on the 1st, 4th and 7th days of incubation and blind subcultures were done on the 1st and 4th days on a Blood agar. Subcultured plates were held for two days before they were discarded as negative. The Blood culture bottles were kept on incubation for one week and were discarded when there was no growth[9]. Isolation of bacteria from the collected specimens was done by inoculatingthe samples into Nutrient agar, Blood agar, MacConkey agar, Trypticase soya broth and Thioglycollate broth media within the earliest possible time (less than one hour) after collection. Inoculated Petri dishes were then incubated at (37ºC) for (24–48) hours aerobically[7]. The isolates were identified on the basis of colony morphology from colony Gram-staining and appropriate biochemical tests. Identification of isolates per standard biochemical testing and antibiotic sensitivity testing was done as per CLSI guidelines[10].

Results and Discussion

Post-partum morbidity continues to be a major health issue which needs to be investigated critically not only for curative but also for preventive and promotive health objectives. It is believed that in developing countries almost all women (70%) have some form of antenatal care, but only (30%) receive postpartum care. A big proportion of Iraqi women are still having delivery at home with or without any prenatal and intra-natal care. They are malnourished, anemic and remain prone to postpartum complications. Out of (65) women recruited in present study, 6(9.3%) were teenagers, 23(35.5%) were between 20 and 29 years of age and 36(55.4%) were between 30 and 39 years. The majority of them came from lower socioeconomic classes (Table 1). A totalof 65 women, 31(47.7%) had delivered at privatehospital, 21(32.3%) at other hospitals and 13(20%) had home delivery (Table 2). It is important to understand the bacteriology of puerperal sepsis. Enhanced detection of blood stream infections needs to be a national priority. Blood culture is the essential investigation for the management of sepsis. In the present study, out of (65) cases studied, bacteremia was present in 45(69.2%) cases. Present study showed predominance of Gram-negative bacilli31(68.9%) with 14(31.1%) isolates being Gram-positive cocci. *Klebsiellaaerogene* was the most frequent isolate 12(26.7%) followed by *Staphylococcus aureus*9(20%), *Pseudomonas aeruginosa* 8(17.8%), *Proteus* 7(15.5%), *E. coli* 4(8.9%), *Streptococcus agalactiae* 3(6.7%) and *Streptococcus pyogenes* 2(4.4%).

Similar findings were reported by another study which showed isolation of Gram negative organism (60%) and Gram positive cocci (40%) from cases of puerperal sepsis[11]. Distribution of bacteria as the cause of puerperal sepsis observed in the present study was in contrast to other studies which showed predominance of Gram-positive cocci (78%) with (8%)of isolates were Gram-negative bacteria[12]. *Klebsiella* and *S. aureus* were the major isolates in current study. Other studies from India reported that*E. coli* as the predominant pathogens followed by *S. aureus* and *Klebsiella*[13], whereas [14]reported *E. coli* as the predominant pathogen in puerperal sepsis[15]. Other organisms isolated in our study were *Pseudomonas aeruginosa*, *Proteus*, *E. coli*, *Streptococcus pyogenes* and *Streptococcus agalactiae*in descending order of frequency. Another study found that *E. coli* as the predominant bacteria (50%) followed by *Staphylococcus* species (30%) and *Streptococcus* species (20%)[16]. Distribution of *E. coli*, *Staphylococcus* species and *Streptococcus* species in another study done in USA was reported to be (36%), (28%) and (21%), respectively,[17]. Moreover, [18] reported that the most common bacteria were *Staph. epidermidis*, *E. coli*, *Enterococci* and *streptococci*. The frequency of puerperal infection due to Group A beta hemolytic Streptococci have decreased greatly in the21stcentury and now they rarely cause maternal death. In the 18th and 19th centuries puerperal infection was a serious life-threatening condition[19]. In the present study, antimicrobial susceptibility of different bacterial isolates revealed that *K. aerogenes* was resistant to Ampicillin (91.7%) and Norfloxacin (75%). On the other hand, *P.aeruginosa* showed resistance to Ciprofloxacin (50%). The majority of isolates of *Proteus* were resistant to Ampicillin (75%) and Norfloxacin (75%). *E. coli* showed resistance to Ampicillin (75%). However, *S. aureus* showed resistance to Gentamicin (88.9%), Ampicillin (55.6%). *Moreover, S. Pyogenes* was (100%)resistant to Ampicillin and Amikacin. Others reported that majority of different Gram-positive cocci showed sensitivity to Cephalosporins. Another study from Nepal also observed that (100%) strains of Gram-positive cocciwere sensitive to Cephalexin[20]. Finding of the two studies mentioned above were well consistent with results of the present study. In a study by [21], *E. coli* and other Gram-negative bacteria showed (100%) sensitivity to Gentamicin which was not similar to our study. Sensitivity to Ciprofloxacin among different bacteria found in the present study was similar to that reported by [22].

Table (1) Distribution of patients according to age

Age (Years)	Number of cases	Percentage
<19	6	9.3
20-30	23	35.4
31-40	36	55.2
Total	**65**	**100**

Table 2 Place and type of delivery of cases

Place	Type of delivery	Number of cases	Percentage
Privet hospital	Normal delivery	16	47.7
	Caesarean section	15	
Other Hospitals	Normal delivery	11	32.3
	Caesarean section	10	
Home delivery	Normal delivery	13	20
Total		**65**	**100**

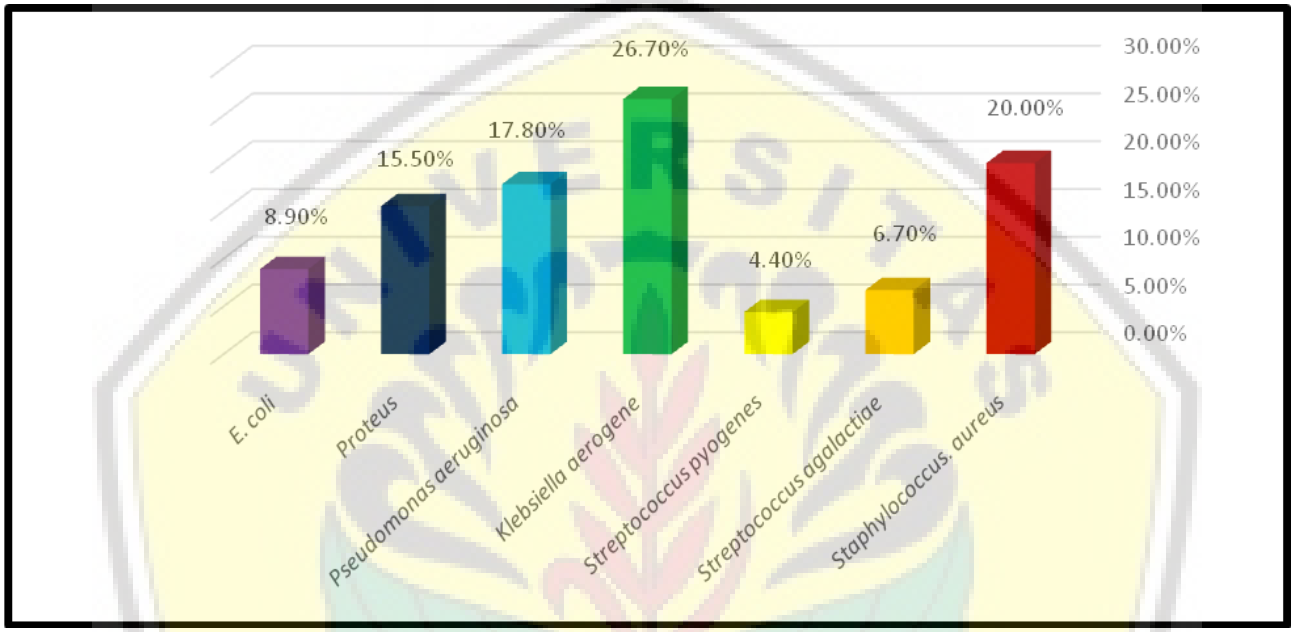

Figure (1): Gram-positive and Gram-negative bacterial isolates from patients suffering from puerperal sepsis.

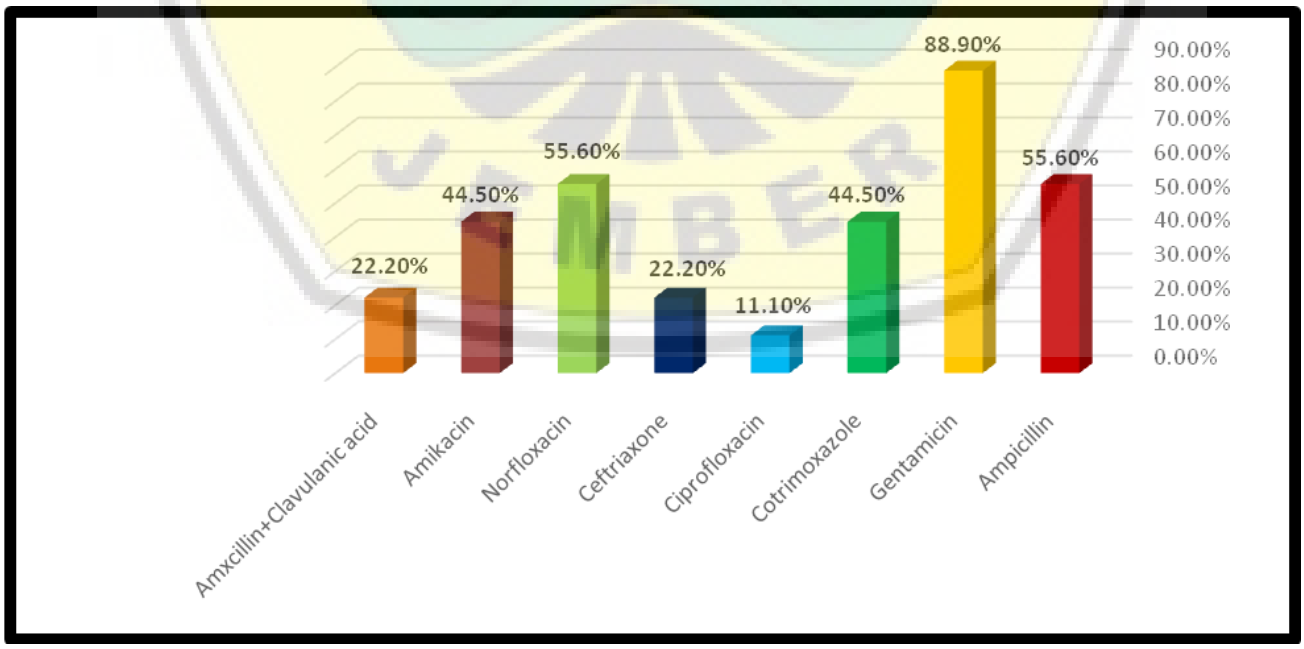

Figure (2): Antimicrobial resistance for S. aureus.

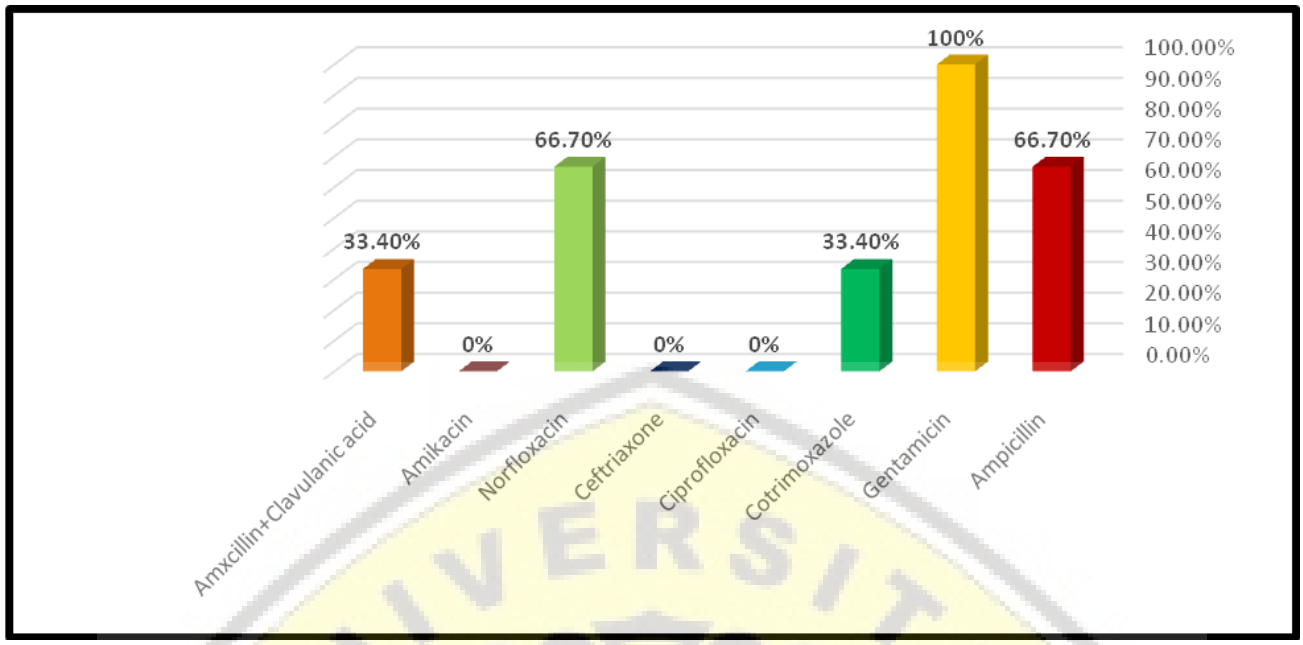

Figure (3): Antimicrobial resistance for S. agalactiae.

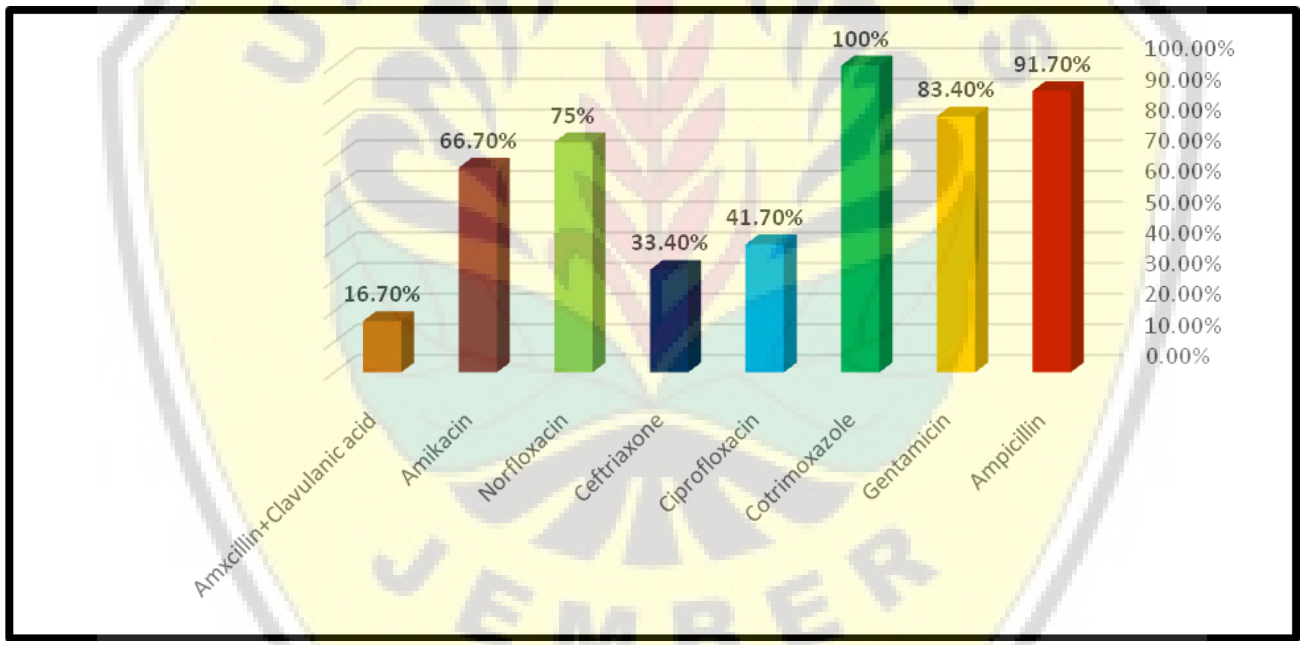

Figure (4): Antimicrobial resistance for K. aerogene.

Conclusion

In view of the changing spectrum of the causative agents of puerperal sepsis and their antibiotics sensitivity patterns from time to time and from one hospital to another, a positive blood culture and the antibiotic susceptibility testing of the isolates are the best guide in choosing the appropriate antimicrobial therapy in treating puerperal sepsis.

The Relationship between the Exercise of Electronic Games and Social Intelligence among Middle School Students

Zahraa Hamid Khafeef[1], Saaed Hussein Ali Al-Thallab[2], Abdel-Amir Khalaf Aret[3]

[1]College of Basic Education, University of Babylon, Babylon, Iraq

Abstract

The current research aims at finding out the relationship between playing electronic games and social intelligence among middle school students. The sample of the study consisted of (334) middle school students in six schools and was chosen randomly. To achieve the objectives of the study, the researcher prepared a questionnaire for the exercise of electronic games on the students of the intermediate stage consisting of (30). The results of the study indicate that there is a risk of the exercise of these electronic games in terms of impact on students and caused them social isolation, less interactive and integrated with their peers. According to these results, researchers should undertake more research and studies on students in schools.

Keywords: *Electronic games, social intelligence and middle school students.*

Introduction

Because of the technological development in which the world is living, as well as the development in the fields of computers and the Internet, personal computers and games devices such as PlayStation, Xbox, Galaxy IPod, iPad and BlackBerry have become available in the lives of young people and adults are not free of any of these devices and spend time Long games in the exercise of these games and all kinds and forms of free and complete, these games to enrich the people and satisfy their desires and tendencies, they became immersed in the world of electronic games, which made them busy only in how to access the electronic games The most popular in the world, which is shown on the television "video games" or on the computer screen, "computer games," which also play on the control panels allocated to them or in their own games rooms, so that the games provide the person fun by challenging the use of The hand with eye "kinetic visual synergy" or limit to mental potential.[1]

Studies have pointed out that electronic games are practiced by boys and girls, but many studies have shown that there is a difference in the amount of time spent and their preferences for the quality of these games.[2] American children spend more time playing electronic games than they do in school.[3] A study on the views of parents and children about electronic games and this study showed that the views of the parents confirmed their concern for the scenes of violence and sexual images and the impact of their practice of the negative impact on the performance of their duties. Without control of any kind by the parents, the minority owns the devices play at home, which can be monitored by parents, either the majority are playing these games in the halls allocated for this and Internet cafes without any control, Adams also noted that children and young people between the ages of 8 and 18 years old spend an ounce Counts most in the practice of electronic games more than any other activity except sleeping and this in turn leads to reduced physical activity and leads them to obesity.[4]

Education is witnessing a great interest in the world and continuous development for the better to keep pace with the characteristics of the scientific and technical era and the requirements of the twenty-first century.[5]

Education has a great role in building human society through the formation of the individual as an integrated form and make it more mature and developed.[6]

Human is a social being not only self-sufficient, but uses the other and the characteristics of human life in social manifestations and areas[7], Social relationships and consolidation is an important characteristic for every human being. He cannot live isolated from others, but lives in a society that interacts with his or her members. He interacts with and empathizes with them. Social intelligence is the mutual influence of individuals. Belonging to it and its effectiveness in it [8]. The brain is the material machine of thought and intelligence. The ability of man to perceive and to express, to understand meanings and to respond to instructions is created. Man is only a notebook. Thus, the discovery of the electrical scale of the brain has led to some understanding of how the brain works. It is the center of consciousness of the body, which is the voice of the human self and its environment. It describes, distinguishes, compares, reflects and dreams and these mental abilities are often The brain's brain function, if every new experience and experience passes through the individual really changes from the chemical composition of the brain to the brain and that the brain's exciting reception of any kind is activated by the communication process between the neurons. The more exciting the new challenge is, the more active cells are activated and vice versa, [9] As in Figure (1).

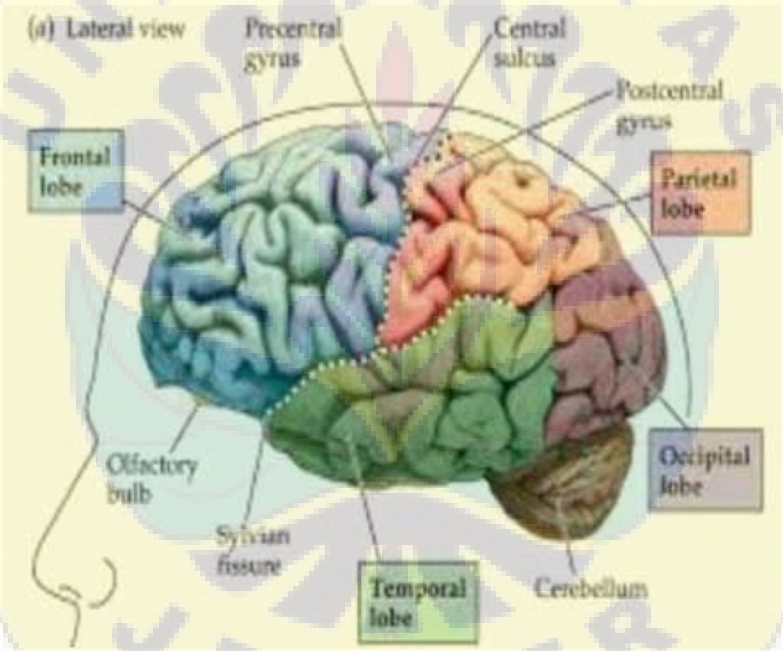

Figure 1: Demonstration of human brain lobes

The brain includes four lobes of the brain:

1. The front lobe, which is the center of executive control and includes 50% of the size of each hemisphere, controls the movement through the top of the two halves.
2. The temporal lobe/center of talk on the left side.
3. The lobe of the cage/specialized in visual processing.
4. Parietal lobe/Special attention to stimuli and sensory integration and guidance.[10]

Research Problem: People in our societies are living in a revolutionary technological revolution. Electronic devices, gaming devices, tablets and smart phones have become more and more present in their lives and have spread so fast that as much as the individual enjoys playing these games as much as he hides himself from the surrounding world, Subject and conduct many studies on them.

The proliferation of electronic games and the increase in the number of hours spent by individuals

play a significant role in the psychological and social effects they cause. In this context, many studies to the seriousness of electronic games on the health, social and cultural aspects and some recommended the need for new studies to follow the growing impact on individuals and even children.

Research Importance: There are many studies that dealt with the category of children in Iraq, but there is no study on the youth category in Iraq, which is the subject of the current study. The importance of this study stems from the modernity of its subject. It aims at educating individuals about the danger of the exercise of these games and the social isolation that causes them and the health and social effects.

This category was chosen because it is the basis of society and it builds the society and raises the need to educate the youth at this stage. And help them to build their personality as the researcher hopes that this study will enrich the Arab library with the information and benefit that can be achieved by applying it to a sample of students (males) to make them aware that they do not addicted or increase their practice of these games, Within the limits of the researcher's knowledge) a topic that has not been raised before in Iraq. It follows the importance of this study to shed light on the youth, because it is the basis of society and we must contribute to building the personality of young people, especially in the light of the technological development and the great technological revolution that they are going through[10]. This study provided an opportunity to educate individuals, especially students who play electronic games, because of the negative impact on their social interaction with the world around the study will also be used as a reliable reference to educate students from the exercise of these games. The results that will be reached in the current study in the field of education can be used by researchers, educators and psychologists in schools. This study is a starting point for further studies that address the student class, as it aims to educate students of addiction to the exercise of these games.

The aim of this research is to find out the relationship between playing electronic games and social intelligence.

Materials and Method

This research is an analytical descriptive research based on collecting the largest number of information about the phenomenon to diagnose it and shed light on its various aspects in an attempt to understand and analyze it in order to reach the principles and laws that control the social phenomena and human behaviors.

The research community included middle school students (intermediate and middle school) for six public day schools affiliated to the General Directorate of Education in Babil Governorate for the academic year 2018 2019. The research sample chose one department from each stage.

Search Tools:

First: Identification of the exercise of electronic games: The researcher prepared a questionnaire on the practice of electronic games after reviewing the literature related to electronic games in order to obtain data on the degree of practice of the sample of the electronic games. The questionnaire included data on the exercise of electronic games. The questionnaire consisted of 30 words, A group of experts in the field of education and psychology to express their opinions in terms of clarity in terms of whether or not and suitability to the nature and sample of the study. After obtaining the views of the arbitrators, the researcher reviewed the questionnaire and make a number of amendments and additions proposed.[12]

A questionnaire was presented in its preliminary form, consisting of (30) paragraphs, on ten of the specialized arbitrators of the professors in the universities who have a doctorate in psychological and educational guidance, educational psychology, in order to judge the adequacy of the paragraphs to the dimensions to which they belong, as well as the linguistic integrity and clarity. The wording of the paragraphs has been based on the proportion of 80% of the agreement of the arbitrators. The arbitrators pointed to the amendment of some paragraphs and the final form of the questionnaire has become (30) paragraphs.[13]

Second: The measure of social intelligence: After reviewing the literature related to social intelligence, the researcher designed this tool, taking advantage of what was mentioned in some previous studies and the scale of (40) are answered by the triple key (apply, do not apply, apply to some extent) and the researcher presented the scale on A group of arbitrators with experience and experience in the field of education and psychology. The researcher asked the arbitrators to express their views in the paragraphs of the measure in terms of clarity of the paragraphs or not and their relevance to the nature of the study. After obtaining the opinions of the arbitrators,

the researcher reviewed the tool after its arbitration and make amendments to it.

Indicators of Construction Honesty: In order to extract the indicators of the validity of the construction of the scale, the correlation coefficients of the vertebrae were extracted with the total score in an exploratory sample from outside the sample of the study consisting of (38) students, where the paragraphs of the scale are analyzed and the correlation coefficient of each paragraph is calculated. For each paragraph in the form of correlation coefficient between each paragraph and the total score on the one hand and between each paragraph and its correlation to the dimension to which it belongs and between each dimension and the total score on the other hand and the correlation coefficients of paragraphs with the tool as a whole ranged between (0.28) Dimension (0.68).

Results and Discussion

The results showed that the use of female students in electronic games was high, with an arithmetic average of 63,87 and a tabular value of (3.09), which is greater than the table value at a level of 0.05 (1.96) (782) and the (t) value (1.56), which is less than the value of the scale (0,05) of (1.96). The correlation coefficient between the games and social intelligence (0.73-). This shows that electronic games have an adverse effect on social intelligence. The result of this study is that the students do not enjoy social intelligence. This is due to the fact that these electronic games affect their social interaction. The low level of female students in schools can be seen in electronic games which are classified as games that lead to interaction with the device only. Individuals with parents or friends.

The results showed that there were no statistically significant differences among the sample members who played electronic games and who did not practice on the linguistic intelligence scale, while there were statistically significant differences among the sample members who play electronic games and Those who do not practice on the social intelligence scale for the benefit of those practicing. The results also showed that there were no statistically significant differences in relation to the gender variable between the average scores of the respondents who play electronic games on the linguistic intelligence scale. The results showed that there were no statistically significant differences in relation to the city variable between the average scores of the sample members who play electronic games on both the linguistic intelligence scale and the IQ scale. Social.[11-13]

Conclusions

1. Members of the research sample play using advanced electronic devices, allowing them to open new applications and encourage them to play a lot.
2. There is an impact on the social intelligence of middle school students as a result of the exercise of electronic games and for a long time that affects their social intelligence.

Ethical Clearance: The Research Ethical Committee at scientific research by ethical approval of both environmental and health and higher education and scientific research ministries in Iraq

Cardiovascular Response to Exercise in Obese and Hypertensive Patient: Case Control Study

Huda Jabbar Dibby

Department of Physiology, College of Medicine, University of Al-Qadisiyah, Al-Diwaniyah Province, Iraq

Abstract

The problem of overweight and obesity is one of the major health problems seen in daily clinical practice worldwide and it represents a real challenge to both public and individual wellbeing (1-3). In addition, hypertension is a risk factor for major cardiovascular and stroke events. The value of regular exercise for managing obesity and hypertension has been documented in literatures based on long-term follow up outcomes however short term complications have received little attention.

The aim is to evaluate hemodynamic response to exercise in sample of hypertensive and hypertensive and obese patients.

Patients with essential hypertension who regularly visits the medical unit in Al-Diwaniyah teaching hospital were selected and randomly allocated into two groups, hypertensive obese and hypertensive non obese patients. The group of third group of obese non-hypertensive patients was also selected randomly from the pool of patients vesting the medical units for acute self-limiting viral illnesses. Control group of apparently healthy subjects included doctors and health workers in the hospital.

Mean systolic blood pressure of hypertensive and hypertensive obese patients was significantly higher than that of both control and obese groups ($P< 0.05$). Mean diastolic blood pressure of hypertensive and hypertensive obese patients was significantly higher than that of both control and obese groups ($P< 0.05$). Mean heart rate of hypertensive and hypertensive obese patients was significantly higher than that of both control and obese groups ($P< 0.05$). There was also significant variation in hemodynamic response following maximum exercise and 10 minutes after rest among groups.

There was significant variation in hemodynamic response following maximum exercise and 10 minutes after rest among groups.

Keywords: *Exercise, hypertension, obese.*

Introduction

The problem of overweight and obesity is one of the major health problems seen in daily clinical practice worldwide and it represents a real challenge to both public and individual wellbeing[1]. Several major health problems are significantly linked to overweight and obesity such as ischemic heart disease, diabetes mellitus and a number of malignant neoplastic disorders[2]. of the main factors that predict morbidity and mortality accompanying obesity are inadequate cardiorespiratory function, poor muscle strength and malfunctioning autonomic nervous system[3]. In comparison with normal subjects, obese patients have been shown by several studies to have lower heart rate variability and reduced baroreflex sensitivity [4].

Corresponding Author:
Huda Jabbar Dibby
Department of physiology, College of medicine, University of Al-Qadisiyah, Al-Diwaniyah province, Iraq
e-mail: huda.budairy@qu.edu.iq

On the other hand, exercise is one of the best practiced ways to treat obesity and its related complications. Reduction of weight is the main outcome aimed by obese persons practicing it; however, a number of health-related improvements have been registered with practicing exercise even in the absence of significant weight reduction [5]. of these observed benefits, improvement in cardiorespiratory fitness and muscle strength are the mainly highlighted outcomes in published literatures[1,6].

Essential hypertension is one of the most common cardiovascular disorders and a major modifiable risk factor for ischemic heart disease and cerebrovascular accidents worldwide[7]. A number of randomized controlled trials have been carried out to investigate the role of regular exercise in hypertensive patients [8]. Moreover, a number of meta-analysis studies have investigated the outcome of these randomized controlled trials to make the picture clearer[9]. These meta-analyses came up with a conclusion that aerobic exercise training reduces blood pressure by 5 to 7 mmHg and that dynamic resistance exercise reduces blood pressure by 2 to 3 mmHg among hypertensive patients [10]. However, the exact response of hypertensive patients in the presence of obesity is not well established in available literatures, therefore, the present study was conducted aiming at comparing response of patients with obesity and or hypertension to standard graded exercise test in terms of heart rate, systolic blood pressure and diastolic blood pressure changes.

Materials and Method

Subjects and study design: Patients with essential hypertension who regularly visits the medical unit in Al-Diwaniyah teaching hospital were selected and randomly allocated into two groups, hypertensive obese and hypertensive non-obese patients. The first patient was randomly selected according to a random number generated by computer and the rest of patients were selected as every other 10. The group of third group of obese non-hypertensive patients was also selected randomly from the pool of patients vesting the medical units for acute self-limiting viral illnesses. Control group of apparently healthy subjects included doctors and health workers in the hospital. Finally we were able to categorize our sample into the following groups: healthy control subjects (n = 35), hypertensive patients (n = 25), obese patients (n = 27) and hypertensive and obese patients (n = 21). The study was done at Al-Diwaniyha teaching hospital, Al-Diwaniyah province, Iraq. The study extended from October 2018 through January 2019. The study was case control study.

Exercise Test: Treadmill was used to accomplish the practical work of this study. The test was carried out at room temperature (20 to 25°C). ECG monitoring was carried out to record heart rate whereas an arm-cuff sphygmomanometry was used to determine systolic and diastolic blood pressure. The test included the following phases: baseline readings of heart rate and systolic and diastolic blood pressure, maximum exercise readings and then reading were repeated 10 minutes after the rest.

Ethical Consideration: The study was approved by institutional ethical approval committee and a verbal consent was taken from all subjects following full and detailed explanation of the aim and the procedures of the current study.

Statistical Analysis: Statistical evaluation and analysis of obtained data was carried out using SPSS version 23 and Microsoft office Excel 2010. Nominal data were expressed as number and percentage, whereas, numeric variables were expressed as mean and standard deviation (SD). One way analysis of variance and post hoc LSD tests were performed to study mean difference among groups. The level of significance was set at $P \leq 0.05$.

Results

Demographic characteristics of control and study groups are shown in table 1. Mean age of obese and hypertensive and obese patients was significantly higher ($P< 0.05$) than the mean age of both control group and hypertensive groups. There was no significant difference in mean age between control and hypertensive groups ($P> 0.05$); there was also no significant difference in mean age between obese group and obese and hypertensive group ($P> 0.05$). Mean BMI of obese and hypertensive and obese patients was significantly higher ($P< 0.05$) than the mean BMI of both control group and hypertensive groups. There was no significant difference in mean BMI between control and hypertensive groups ($P> 0.05$); there was also no significant difference in mean BMI between obese group and obese and hypertensive group ($P> 0.05$). Mean body fat% of obese and hypertensive and obese patients was significantly higher ($P< 0.05$) than the mean body fat% of both control group and hypertensive groups. There was no significant difference in mean body fat% between control

and hypertensive groups (P> 0.05); there was also no significant difference in mean body fat% between obese group and obese and hypertensive group (P> 0.05). Mean Waist circumference of obese and hypertensive and obese patients was significantly higher (P< 0.05) than the mean Waist circumference of both control group and hypertensive groups. There was no significant difference in mean Waist circumference between control and hypertensive groups (P> 0.05); there was also no significant difference in mean Waist circumference between obese group and obese and hypertensive group (P> 0.05).

Table 2 shows comparison of mean systolic blood pressure, diastolic blood pressure and heart rate among control and study groups, at maximum exercise. Mean systolic blood pressure was significantly highest in hypertensive obese patients followed by both obese and hypertensive patients and lastly by control subjects. Mean diastolic blood pressure was significantly highest in hypertensive obese patients followed by both obese and hypertensive patients and lastly by control subjects. Mean heart rate was significantly lowest in all study groups in comparison with control group (P<0.05); however, there was no significant difference in mean heart rate among study groups themselves (P> 0.05), table 2.

Table 3 shows comparison of mean systolic blood pressure, diastolic blood pressure and heart rate among control and study groups, 10 minutes after rest. Mean systolic blood pressure was significantly highest in hypertensive obese patients followed by both obese and hypertensive patients and lastly by control subjects. Mean diastolic blood pressure was significantly highest in hypertensive obese patients followed by both obese and hypertensive patients and lastly by control subjects. Mean heart rate was significantly lowest in all study groups in comparison with control group (P<0.05); however, there was no significant difference in mean heart rate among study groups themselves (P> 0.05), table 3.

Table 1: Demographic characteristics and baseline measurement of study groups

Characteristic	Control (n= 35)	Hypertensive (n=25)	Obese (n=27)	Hypertensive & Obese (n=21)
Age (years)	22.01± 3.23 B	22.21 ± 5.02 B	29.21± 4.93 A	28.29± 5.21 A
BMI (kg/m2)	23.04 ± 1.61 B	24.42 ± 2.23 B	35.29 ± 3.70 A	35.43 ± 3.41 A
Body fat percentage (%)	19.2 ± 4.0 B	22.2 ± 4.1 B	34.3 ± 6.7 A	37.2 ± 5.3 A

Discussion

The present study showed that mean baseline systolic blood pressure of hypertensive and hypertensive obese patients was significantly higher than control group and within the hypertensive range (> 140 mm Hg) indicating poor control of blood pressure of those patients despite being managed for hypertension for years. On the other hand, mean diastolic blood pressure of hypertensive and hypertensive obese patients was also significantly higher than that of control group; however, the mean diastolic blood pressure was within normal acceptable range (< 90 mm Hg). In addition, baseline mean heart rate was within normal acceptable limit (60 – 100 beat/minute) for all groups despite the presence of some significant difference among groups.

The inadequately controlled blood pressure in hypertensive patients enrolled in the present study may be explained by inadequate compliance to drug therapy or inadequate dietary salt restriction or to a lesser extent attributable to sympathetic overflow in such medical environment. Indeed strict blood pressure control is mandatory for such patients in order to avoid life threatening cardiovascular and cerebrovascular events.

In maximum exercise, mean systolic and diastolic blood pressure of hypertensive patients reached the highest levels in comparison with control group and obese patients; obese patients also experienced higher than normal mean systolic and diastolic blood pressure but the level was less than hypertensive patients. Regarding heart rate, the mean level was lower in both hypertensive and obese patients than in control group, being lowest in hypertensive groups. However, after 10 minutes, it was observed that hypertensive and obese patients failed to returned to baseline readings. This was also the case for control group; however, the blood pressure readings were higher in hypertensive and obese patients than in control group whereas mean heart rate was lower in patients than in control group.

Regular aerobic exercise has been shown to reduce both systolic and diastolic blood pressure in patients

with hypertension [11] and is generally recommended by international guidelines [12]. Nevertheless, guidelines mention nothing about the recommendations concerning exercise for patients with resistant hypertension and hypertensive obese patients. Continuous physical activity is accompanied byless risk for mortality and cardiovascular complications in hypertensive patients who are known to be resistant to usual management guidelines [13].However; evidence for the advantages of regular physical activity is still lacking for resistant hypertension, a number of studies have been carried out with promising results. An aerobic exercise program of 8–12-weeks (29), which consisted of treadmill walking based on an interval-training pattern, 3 times/week, reduced 24-hour systolic blood pressure by 5.4±12.2 mmHg and 24-hour diastolic blood pressure by 2.8±5.9 mmHg. Moreover, daytime systolic and diastolic blood pressurehas been reduced by 5.9±11.6 mmHg and 3.3±6.5 mmHg and nighttime systolic and diastolic blood pressure has been reduced by 3.8±17.1 mmHg and 1.9±8.2 mmHg, respectively [14]. This decline in blood pressure was also seen in subsequent researches with exercise training based on heated water [15].

Conclusion

There was significant variation in hemodynamic response following maximum exercise and 10 minutes after rest among groups.

Despite these recommendations about the benefit of exercise, we observed in the current study, transient development of blood pressure peaks that may be complicated by life threatening events such as aortic dissection and thromboembolic phenomena. Therefore, we recommend that exercise in obese and hypertensive patients should start gradually with continuous ambulatory monitoring to avoid unnecessary shooting of blood pressure levels.

Effect of Effective Learning Style Using Extensive Visual Exercises in Developing Visual Skills and Learning the Spike Volleyball Skill of Students

Wissam Riad Hussein[1] Ashraf Abdulamir Al-Watifi[1], Ahmed Radi Kadhim[1]

[1]*University of Babylon/The College of Physical Education and Sport Sciences/Iraq*

Abstract

The aim of the research was to prepare the wide-ranging exercises in the context of effective learning to develop visual skills and learn the spike volleyball of students, to recognize the effect of ESOP. Effective learning through extensive visual exercises in developing visual skills and learning spike volleyball for students, researchers used the experimental approach with the design of the two equal groups The research community represents the students of the second stage in the Faculty of Physical Education and Sports Science - University of Babylon, for the academic year (2018-2019) of (122) students. (16) Students were divided into two groups of control and experimental, each group of (8) students, thus the percentage (13%). The researchers conducted the tribal tests on 11/11/2018 On the hall of the Faculty of Physical Education and Sports Sciences at the University of Babylon and the start of the educationl programs on 14/11/2018 and ended on 19/12/2018 and included educational units interspersed with the exercises of wide consideration of the skill studied and the researchers carried out post tests for the research sample on 25/12/2018 On the Hall of the Faculty of Physical Education and Sports Sciences - University of Babylon. The most important conclusions were that extensive exercises had a positive impact on the development of visual skills and the learning of volleyball. The effective learning method had a positive impact on the development of visual skills and the learning of volleyball-spike. The group also helped to provide the largest number of different motor models of the skill studied by applying them to the extensive exercises associated with skill, which led to the ease of learning and the performance of spike.

Keywords: *Visual exercises, visual skills and spike.*

Introduction

The educational process is one of the areas that have received the development and scientific progress of its great role that can play in the building of the learner and solve problems, as well as it positively affect the ability to learn and acquire different motor skills on the basis of advanced practical basis and measured this progress knowledge of the strategies and method of modern learning and the use of appropriate exercises and always seeks the existing educational process to search continuously and continuously about the best and most important strategies and method of modern education in order to achieve learning and progress and exercises are one of the method that help to build the personality of the deceased Science and that gives him opportunities to express himself and his abilities and creativity, as well as it is a rich area of activities that satisfy the need of the learner urgent movement and the nature of the performance skill in various sports, including volleyball is linked to a set of differences and characteristics between learners, The more the teacher learns about these differences, the easier it is to develop visual skills and learn motor skills.[1]

And that the broad consideration of the student of the stadium is an important element that should be possessed by learners, especially players spike because of the speed and accuracy of performance in modern volleyball so learners have to have a wide field of view of the field of play through the development of visual skills, which gives a greater opportunity to learn for skill and successful behavior Through the accuracy of the strike and reduce the error, which serves the implementation of skills in the form of optimal and fast, which required teachers or trainers to focus on and develop.[2]

The importance of research is through the use of modern strategies, including method and exercises for broad consideration appropriate for the development of visual skills and learning the spike of the volleyball of students and knowledge of the impact of these method and exercises in the skills explored, through the observation of researchers in the lack of use of strategies and modern method and special exercises for those skills and the importance of In the development of which increases the ability of students to learn the skill studied as required with the economy effort and time spent.

Research Methodology:

The researchers used the experimental approach to design experimental and control experimental and control groups to suit the nature of the research problem and its objectives.

Community and sample search: The research community represents the students of the second stage in the College of Physical Education and Sports Sciences - University of Babylon, for the academic year (2018-2019) of (122) students. The pilot sample consisted of (10) students and outside the main research sample. This sample is specific to the visual skills tests and the spike of the volleyball. The main sample was randomly selected by lottery method by (16) students and was divided into two control and experimental groups, Group (8) students and this is the percentage (13%).

Table (1). Shows the equality of the two sets of search

Variables	Units	Mann Whitneyvalues	Level of significance	Type of significance
Skill to realize the field of vision	Grade	18	0.45	Non sig.
Skill grasp the depth of vision	Grade	23	0.90	Non sig.
Spike front skill	Grade	21	0.71	Non sig.

Tests used in research:

First: Test the accuracy of the skill of spike facing within the realization of the field and depth of vision:

Due to the absence of a standardized test that measures the accuracy of the spike in recognition of the scope and depth of vision. To achieve the first objective of the research, the researchers constructed a test. The researchers followed the following scientific steps:

Determination of the objective of the test: The researchers set the goal of the construction of the test as the objective of the test to assess the accuracy of spike facing within the realization of the field and depth of vision.

Determination of test specifications: After the researchers were informed of the relevant scientific references and sources, the researchers defined the test specification and verified the validity of the test. The researchers considered the preparation of a questionnaire for the test and was presented to a group of experts and specialists of (7) volleyball experts and kinetic learning, testing and measurement. After collecting the questionnaires, the researchers used a good match test (Chi square) to analyze the opinions of the experts statistically and to indicate their agreement regarding the validity of the test as shown in Table (2).

Table (2). Shows the values of (Chi square) calculated for agreement of experts and specialists about the validity of the test the spike front within the field of perception and depth of field of vision accuracy.

Name of test	Proper	Inappropriate	Value of (Chi square) calculated	Percentage of agreement	Type of significance
Test hit the spike front within the field of perception and depth of field of vision accuracy	7	0	7	100%	Sig.
At the degree of freedom (1) and the level of significance (0.05)					

The accuracy test is described as the spike in the field and the depth of vision:[3]

Name of test: Test the accuracy of the spike facing within the realization of the field and depth of vision.

The purpose of the test: Measuring the accuracy of the spike facing within the realization of the field and depth of vision.

Used tools: Volleyball legal court with accessories, volleyball number (3), stopwatch, semi-misleading false glasses number (8) and data dump form.

Performance method: The laboratory is wearing the shaded glasses in the standby mode (3-4 meters) of the network in one of the centers (2, 3, 4). When asked to start performance, the laboratory performs the skill to try to drop the ball in the inner triangle set on the opposite pitch.

Performance conditions: Each laboratory (5) successive attempts and must be a good preparation in each attempt and calculated grades according to the place of the fall of the ball and as follows:

- In the area (A) (3) degrees.
- In the region (B) (1) one degree.
- In the region (C) (5) degrees.
- Outside these areas (zero) of grades.

Registration: The laboratory counts the grades obtained in the five attempts, noting that the total score of the test is (25) degrees for each center.

Test the technical performance of the skill of spike:[4]

The purpose of the test: To evaluate the technical performance of the skill of the spike through its virtual form and its three parts (preparatory, final and final).

Instruments used: Legal volleyball court, plane legal balls number (3) and evaluation form.

Performance specifications: The student performs the lab spike of the center (4) so that the teacher to prepare the ball from the center (3) and the student is doing the skill of spike trying to drop the ball within the corresponding field.

Performance conditions: Each student (3) consecutive attempts. - The student will receive the laboratory (0) in case of contact with the net ball and fall in the stadium (the student's laboratory) or in the case of spike in the manner not agreed upon.

Vision field perception test:[5]

Objective of the test: (1) and plotted (8) angles from the middle of the circle each angle (45) 0 represents 8 directions as shown in the picture (1).

Test depth perception: Objective of the test: measuring the player's ability to estimate distances between two bodies at different distances between them

Test time: (60) seconds per laboratory.

Tools used: Krejiniski is a wooden box without cover and without front side placed on a table, measuring 100 cm length, 40 cm width, height 15 cm.

- Contains two sticks to estimate the distances each square 2 cm x 2 cm height of 10 cm.
- A black star is placed on the front side of the box to change the attempts.
- On the table.
- Sets the height of the chair so that the device is at the player's level of view.
- Close the black curtain until the player sees the sticks.

- Move the second stick of the movement for a distance of 10 cm and then 20 cm and 30 cm.
- Each time you open the curtain and ask the player to determine the distance between the two sticks.
- Calculation of scores: Calculates the amount of error in each attempt and records.

The main experiment to test the accuracy of the spike in the realization of the field and depth of vision: The main experiment was implemented through the application of the test on the building sample of (100) students on Monday (5/11/2017) in the closed hall of the Faculty of Physical Education and Sports Sciences at the University of Babylon and the re-test took place on Monday (19/11/2018)). In the same place and under the same circumstances, the statistical analysis was carried out to test visual cognitive speed in order to determine the ability of the test and to extract the indicators of honesty, stability and the level of difficulty of the test.

Educational Programs: The researchers applied the educational programs (educational units) based on effective learning, which includes extensive visual exercises that develop visual skills (understanding the field of vision and perception of depth of vision) and learning spike against the experimental group, while the control group applied the normal educational programs and two units per week For the period of (8) units and the time of the educational unit 90 d and the division of the time of the educational unit to the preparatory section (18 d) and the main section (60d) and the final section (12d), as the application of educational units on the experimental group on 14/11/2018 And ended on 19/12/2018 and included tamar broad consideration of effective and appropriate skills and the subject of research using different tools and means for each variable exercise performances skills have been studied in which the type, where the share of exercise skills studied in the experimental group is (48) minutes from the main section of the educational unit.

Posttests: The post-tests (technical tests) were applied to the research sample on 25/12/2018 on the playgrounds of the Faculty of Physical Education and Sports Sciences - Babylon University at (1) pm.

Results

Discussion

The success of the educational process requires the use of effective and appropriate method and exercises and the availability of the means, tools and devices for the implementation of the unit drawn. The wide-ranging exercises play an important role in enabling the teacher to implement the educational plan and students in the speed of mastery of the skill and researchers believe that the gradual use of those exercises It is easy to the hardest thing with the increase of repetitions is necessary to contribute to the progress of the level of students and their interaction and their rush to learning and therefore the educational unit has achieved its goal in achieving development and learning.[6]

The effective learning strategy has contributed to the development of visual skills (awareness of the field of vision - understanding of the depth of vision) and the learning of spike volleyball by providing sufficient space to correct the technical performance of students and avoid mistakes, Because these exercises,[7] tools and effective means provide the stability of the place and time of performance of the skill of spike by allowing the student to adjust the steps and the distance of performance and the place of jumping and landing and thus the student will learn to performance because his thinking will be on the Only disease without thinking about time to hit the ball or place of fall or throw is correct and that place fall from a height or throw different to the other, which will negatively affect the performance of the student.[8]

The extensive training exercises contributed to learning the technical performance of the spike skill because it helps the student to adjust the steps and the distance of performance and time of performance and thus provided stability of the movement by fixing the place of jumping and spike to provide a constant environment for the performance of the skill, the effective use of the educational unit achieved the goal of its use in education, as it made clear progress in learning the spike skill in terms of technical performance.[9]

Conclusions

1. The extensive training exercises in the development of visual skills and the learning of volleyball-volleyball students
2. The effective learning strategy has a positive impact on the development of visual skills and learning spike volleyball.
3. The wide-ranging exercises helped the members of the experimental group to provide the largest number of different motor models of the skill studied, which led to the ease of learning and the performance of s spike.
4. The application of extensive viewing exercises with effective teaching tools and tools has helped to develop visual skills and learn the spike of students' volleyball.

Long Term Oral Contraceptive Administration is Associated with Low Serum Levels of Nitric Oxide, Vitamin C and Vitamin E

Aseel S. Hassan[1], Raid M. H. Al-Salih[2], Alaa H. Al-Naser[3]

[1]Lecturer, [2]Prof., Chemistry Dept. College of Science/Thi-Qar University, Iraq,
[3]Lecturer, College of Medicine/Thi-Qar University, Iraq

Abstract

Background: Oral contraceptives are now commonly used by women worldwide as a method for preventing pregnancy. In addition, it was proposed that women taking these drugs require supplementary vitamin E. The aim of this study was to identify changes in serum levels of nitric oxide, vitamin C and vitamin Einwomen taking oral contraceptives for more than three years.

Method: The study included (60) women using these tablets and (58) healthy women used as control group. Levels of nitric oxide, vitamin C, vitamin E were estimated in all women participants. In order to estimate the effect of age on levels of nitric oxide, vitamin C and vitamin E, women were divided into two groups: thirteen women aged (18-35) years and thirteen of women aged (36-45) year, remarked to it with symbols (A and B). These groups were compared with two groups of nonuser's women: twenty-nine of women aged (18-35) years and twenty-nine of women aged (36-45) year, remarked to it with symbols (AC and BC).

Results: There was a significant decrease in levels of nitric oxide, vitamin C and vitamin E) ($P \leq 0.05$) in all women who were taking oral contraceptives when compared with control women. In addition, the results illustrated significant elevation in nitric oxide,vitamin C and (vitamin Elevels ($P \leq 0.05$) in the two groups of user's women when compared with the control groups. Also, it showed none significant elevation in nitric oxide in group (B) in comparison with group (A) ($P \leq 0.05$), while no significant differences were seen in vitamin C and vitamin E levels ($P \leq 0.05$) between groups (A) and (B) and control groups.

Conclusion: The results of this study indicated that the use of combined oral contraceptives resulted in low levels of nitric oxide, vitamin C and vitamin E.

Keywords: *Oral contraceptives, nitric oxide, vitamin C, vitamin E.*

Introduction

Oral contraceptives (OCs) are now commonly used by millions of women worldwide as a method for preventing pregnancy[(1)]. The use of present contraceptives has contributed substantially to the reduction of maternal and infant morbidity and mortality and to the ability of women to contribute to society[(2)]. There are three types of oral contraceptive pills: combined estrogen-progesterone, progesterone only and the continuous or extended-use pills. The most commonly prescribed pill is the combined hormonal pill with estrogen and progesterone. Progesterone is the hormone that prevents pregnancy, while the estrogen component will control menstrual bleeding. Birth control pills are primarily used to prevent pregnancy[(3)]. Some serious side effects have been reported in women taking them. Studies have indicated a relationship between

e-mail: aseelsattar72@gmail.com

oral contraceptives use and cardiovascular disease [4]. Oral contraceptive steroids are one of the factors that enhance oxidative stress and lead to the formation of free radicals. Oxidative stress (OS) constitutes a disturbance caused by an imbalance between the generation of free radicals and antioxidant system, which causes damage to biomolecules. This, in turn, may lead to the occurrence of many chronic degenerative diseases[5]. Reactive oxygen species (ROS) or 'free radicals' are highly reactive oxygen-derived molecules characterized by having unpaired electrons in their outer valence orbital. They include oxygen-centered radicals (hydroxyl radical, nitric oxide radicals and superoxide anion radical[6]. NO• is generated in biological tissues by specific NO synthase that metabolizes arginine to citrulline via five-electron oxidative reaction. At a physiological pH of 7.2, the sodium nitroprusside compound is decomposed into aqueous solution and generates NO•. Stable products (nitrate and nitrite) are produced when NO• reacts with oxygen under aerobic conditions, which can be determined by using the Griess reagent [7]. The antioxidant activity of estrogen has been attributed to prevention of expression and function of $NADP^+$/NADPH oxidase, an increase in expression and activation level of endothelial isoform of nitric oxide synthase (eNOS) and stimulation of the expression and activation of manganese superoxide dismutase[8]. Exogenous estrogen administration restores endothelial function by enhancing nitric oxide synthesis through genomic and non-genomic mechanisms and by reducing oxidative stress and nitric oxide breakdown[9]. Antioxidants are free radical scavengers which help in delaying or prevention oxidation by trapping free radicals. The normal vital concentration of free radicals or reactive oxygen species (ROS) in living organisms is maintained by antioxidants[10]. Well-documented dietary antioxidants include ascorbic acid (vitamin C), α-tocopherol (vitamin E), polyphenols and carotenoids[11]. In line with preclinical findings, Briggs and Briggs[12] showed that combined-type OCs decreased plasma tocopherol in healthy Caucasian women and, therefore, proposed that women taking these drugs require supplementary vitamin E. In line with this hypothesis, it has been stated that vitamin C levels in platelets and leukocytes are lowered by use of OCs, specifically those containing estrogen, which is thought to increase the rate of metabolism of vitamin C. Other authors reported that with adequate dietary intake of ascorbic acid, there is no threat on ascorbic acid status as a result of using OCs[12].

Subjects and Method

The study was carried out on 60 women taking oral contraceptives and fifty-eight healthy age-matched women (control group). Users of oral contraceptives had attended the family planning clinic at Maternity and Pediatric Hospital in Nassyrieh, Iraq. The age of users and controls ranged from (18-35) year. According to age, women used combined oral contraceptives were divided into two subgroups;Group A included thirteen women aged (18-35) year and group B included thirteen women aged (36-45) year. Also, the women who were not using combined oral contraceptives were divided into two subgroups similar to the users in the age Group AC included twenty-nine women and Group AB included twenty-nine women.

Blood samples were obtained from user women and control group by venipuncture. Samples were allowed to clot at 37°C and then centrifuged at 3000xg for 10min. Sera were removed and stored at (-20°C) for later measurement of biochemical parameters, unless used immediately.

Determination of Serum Nitric Oxide Levels: The method described by[13] has been used to estimate the concentration of nitric oxides (NO). The principle of this method included measurement of nitrite oxide (NO-2), which is the most stable oxide of nitrogen oxides and the addition of zinc sulphate to serum sample which works on the deposition of proteins first and reduction of nitrate oxide (NO-3) to nitrite oxide (NO-2). Nitrite oxide, in acidic medium, turns into nitrous acid (HNO2) which nitratesthe sulfanyl amide to give the dizonium salt sulfanyl amide diazonium. The latter, in turn, condenses with the alpha-naphthylethylene diamine dihydrochloride complex whose absorption is measured at wavelength 540nm.

Determination of serum vitamin C concentrations: This method was based on the principle that ascorbic acid is oxidized by copper to form dehydroascorbic acid and diketogulonic acid. These products are treated with 2,4-dinitrophenyl hydrazine (DNPH) to form the derivative bis-2,4-dinitrophenyl hydrazone. This compound in strong sulfuric acid undergoes rearrangement to form a colored product which is measured at 520nm. The reaction was run in the presence of thiourea to provide a mildly reducing medium, which helps prevent interference from non-ascorbic acid chromogens[14].

Determination of serum vitamin Econcentration: In this method determination of tocopherol in serum was done by colorimetric method. Serum vitamin E was measured by the method of Baker on the basis of reduction of ferric ions to ferrous ions by vitamin E and the formation of complex with 2-2` dipyridyl and it was measured at 520nm[15,16].

Result and Discussion

Table (1) showed a significant decrease in the concentration of serum nitric oxide (NO) in the age groups (A) and (B) in comparison with their control groups (AC) and (BC) ($P \leq 0.05$). In addition, we found non-significant differences in the concentration of serum NO in group (B) in comparison with group (A). Also, there were non-significant differences between control groups (AC) and (BC).

The study indicated that the use of oral contraceptive pills resulted in low levels of nitric oxide. These results were different from those reported in a previous study [17]who found that taking low-dose oral contraceptives in healthy women did not causeany differences in levels of amino acid and nitric oxide, however, the results of this study were consistent with another previous study[18]. Estrogen can increase the bioavailability of nitric oxide (NO) in the endothelium, possibly by preventing the initiation of atherosclerosis [19]. The predominant isoform of NOS in the endometrium is eNOS and this is predominantly localized in the epithelial cell layer. Estrogen through both genomic and non-genomic mechanisms up-regulates eNOS and iNOS and phosphorylatese NOS in primary endometrial epithelial cells [20]. The inclusion of progestin in postmenopausal HRT appears to blunt the effects of estrogen on endothelial NO production [21]. It was found that the addition of medroxy progesterone acetate reduces the effect of estrogen on endothelium dependent relaxation[22]. OCT can increase oxidative stress, possibly leading to vascular complications[19]. Furthermore, progesterone may reduce ROS formation and cause vascular relaxation in a tissue-specific fashion[23]. However, progesterone antagonizes the vasoprotective effects of estrogen on anti-oxidant enzyme expression and function and enhances NADPH oxidase activity and the production of ROS[24]. The behavior of molecules related to oxidative stress can differ according to types and doses of estrogen, progestogen or the particular compounds of estrogen and progestogen. Estrogens are generally known to have various vascular actions by increasing the bioavailability of NO via activation of NO synthase[25].

Data in Table (2) showed a significant decrease in serum Vitamin C levels in groups (A) and (B) in comparison with control groups (AC) and (BC), respectively ($P \leq 0.05$) and there were no significant differences in serum vitamin C between groups (A) and (B) ($P \leq 0.05$). There were no significant differences between control groups (AC) and (BC). The results of this study were consistent with those reported by[26] who found that the key nutrients affected by oral contraceptives were folic acid, vitamins (B2, B6 and B12) and vitamins (C, A and E) as well as some minerals. Combined Oral Contraceptives also resulted in biochemical changes such as altered nutritional status with regard to several vitamins such as vitamin C [27]. Meanwhile, some of these micronutrients are cofactors and/or coenzymes of other enzymes and are involved in important metabolic pathways [28].

The decrease in the levels of vitamin C in postmenopausal females might be due to its increased consumption to counteract the increased oxidative stress and to inhibit membrane lipid peroxidation. Also, may be because vitamin C can restore the antioxidant properties of oxidized vitamin E, suggesting that a main function of vitamin C is to recycle vitamin E radical [29].

Data in Table (3) showed a significant decrease in serum Vitamin E levels in groups (A) and (B) in comparison with control groups (AC) and (BC), respectively ($P \leq 0.05$). Also, there were non-significant differences in serum vitamin E between groups (A) and (B) ($P \leq 0.05$). There were non-significant differences between control groups (AC) and (BC). Several review studies have shown that vitamin E and vitamin C were lower in OC users in comparison with non-users[30].

Table (1): Serum Nitric Oxide (NO) levels in oral contraceptive users and their controls according to their age groups

Age Group/yr	Users		Controls		*P*-value
	Subgroup (No.)	NO (µmol/mL) Mean±SD	Subgroup (No.)	NO (µmol/mL) Mean±SD

Interleukin-4 (rs2243250) Polymorphism Confer the Susceptibility in Migraine Patients

Manal M. Kadhim[1], Rusul H. K-Al-Hilaly[2], Noor Maki Jabar Al-Sulaiman[3]

[1]Professor of Clinical Immunology Department of Medical Microbiology, College of Medicine, Al-Qadisiyah University, Diwaniyah, Iraq, [2]Assistant Lecturer, Department of medical microbiology, College of Medicine, Al-Qadisiyah University, Diwaniya, Iraq, [3]Assistant lecturer, Department of Biology,College of Medicine, Al-Qadisiyah University, Diwaniya, Iraq

Abstract

Background: The pathogenesis of migraine is still unclear, but much evidence suggests a role of inflammation in pain generation.

Aim: This study was conducted to understand if there is a probable role of IL-4 and its polymorphism, as anti-inflammatory cytokine, in migraine headaches.

Method: Evaluated and investigated the single nucleotide polymorphisms of IL-4 (rs2243250) gene in 119 subjects. Sixty were Migraine patients while others were apparently healthy individuals used as a controls.

Results: The frequencies of genotype CC was significantly more frequent in study group than in control groups, 70.0% versus 15.3%,variant allele A was more frequent in study than in control group, 78.3% versus 33.1%.

Conclusion: Allele C of IL-4 was significantly higher frequent in patients group compared to control group, C allele had etiologic effect.

Keywords: *Migraine, IL-4 (rs2243250), Allele, Genotype, RFLP-PCR.*

Introduction

Migraine is a common disorder characterized by recurrent disabling attacks of headache associated withnausea, vomiting, hypersensitivity to light, sound and smell (migraine without aura), and, in athird of patients, neurological aura symptoms (migraine with aura)[(1)]. The interaction between immune cells is regulated by several mediators, including interleukins and cytokines, which play an essential role in pathobiological processes such as, inflammation, immunity and pain[(2)].

The 2010 Global Burden of Disease Study (GBD2010), ranked the migraine as the third most prevalent disorder in the world and ranked third-highest cause of disability in men and women under the age of 50 worldwide[(3)]. The onset of migraine is more prevalent in adolescence, particularly at the age of 16–28 years, a period associated with the largest concentrations of IgE, the well-known antibodies that mediate allergic responses in the body[(4)]. Adult females were more effected by migraine, this skewed sex ratio is mostly due to hormonal variation during menstruation and pregnancy and to genetic predisposition[(5)].

For more than a century, scientists have investigated the pathophysiology of migraine and presented various reports ranging from the vascular theory to cortical spread depression theory. Unfortunately, none of the

e-mail: manal.kadhim@qu.edu.iq

mechanisms have sufficiently explained the primary origin of migraine pain or migraine aura[6]. the vascular theory and the neuronal theory, explaining the etiology of migraine headache were proposed. The vascular theory was introduced by Thomas Willis where he recognized that "all pain is an action violated" and argued the pain from headache is caused by vasodilatation of the cerebral and meningeal arteries.[7], The alternative and widely accepted theory suggests that cortical spreading depression (CSD), a wave a neuronal hyperactivity followed by an area of cortical depression, accounts for the aura and that the headache depends on activation of the trigeminovascular pain pathway[8]. One of the most important aspects of the pathophysiology of migraine is the inherited nature of the disorder. Transmission of migraine from parents to children has been reported as early as the seventeenth century and numerous published studies have reported a positive family history[9]. Cytokines, small protein molecules secreted in response to immune stimuli, are involved in signaling that activates CNS glial cells and this activation is part of a poorly understood interaction between immune challenge and host that can lead to the development or facilitation of pathologic pain[10]. Polymorphisms that have functional significance have been described for some cytokines genes. These may cause inter-individual variations in the levels of cytokine production. As cytokines are considered to be pain mediators in neurovascular inflammation, these polymorphisms may have an effect on the generation of migraine pain[11].

As migraine is a multifactorial disease with various environmental and genetic etiologies, attempted to evaluated the role of some cytokines genes polymorphisms such as TNF-α−308 G/A (rs1800629), IL-1α+4845 G/T (rs17561), IL-1β+3953 C/T (rs1143634) and interleukin-1 receptor antagonist variable number tandem repeat (IL-1RA VNTR) genes in pathogenesis of Mo was done. In previous studies a relation has been found among TNF-α, IL-1α polymorphisms and Mo. But such a relationship does not exist in migraine with aura patients.[12]

Interleukin-4 (IL-4), an anti-inflammatory cytokine, plays an important role in modulating pain threshold and has an essential role in stimulation of pain receptors in the trigeminal nerve fibers[13]. The human IL-4 gene is located on chromosome 5q31 and consists of 25 kb. So far, numerous allelic variant polymorphisms have been found in IL-4 gene, that the important ones are including -590C/T (rs2243250), -33C/T (rs2070874), +3437C/G (rs2227282) and 2979G/T (rs2227284)[14]. This study was conducted to understand if there is a probable role of IL-4 and its polymorphism, as anti-inflammatory cytokine, in migraine headaches.

Materials and Method

Patients: The present study was conducted on 60 migraine patients (16 males and 44 females), diagnosed by neurologist selected from those who visited the neurology department in Al-Diwaniya Teaching Hospital from January to March 2019.Patients were interviewed directly by using an anonymous questionnaire form which covered age, sex, family history and others. Another group consist of 59 apparently healthy individuals (17 males and 42 females), without any history of systemic disease were clinically considered as healthy also included in the study as a control group. **Informed consent was obtained from all study subjects after explanation of the nature and possible consequences of the study.**قف اظا

Genotyping: The genotypes of the IL-4(rs2243250) gene were determined by Restriction Fragment Length Polymorphism (RFLP)-PCR, Table (1). The PCR products were amplified using a Maxime PCR PreMix (iNtRON), then the PCR products were visualized in an ethidium bromide-stained 2% agarose gel using a UV Transilluminator.

Statistical Analysis: Chi-square test assumption was assessed for both the patient and control groups by comparing the observed numbers of each genotype. Data were presented, summarized and analyzed using two software programs. These were the Statistical Package for Social Science (SPSS) version 23 and Microsoft Office Excel 2016.Logistic regression analysis was used to estimate the odds ratios (OR) and 95% confidence intervals (CI) for the association between the genotypes, alleles or haplotypes and the risk of ALL. The results are presented as the mean values ± 1 standard deviation (SD) and a P value of ≤0.05 was considered to indicate statistical significance.

Results and Discussion

Demographic and clinical parameters:

Distribution of IL-4 (rs2243250) Genotypes CC, TT and CT in Control and Study Groups: Distribution of IL-4 (rs2243250) polymorphism was detected by RFLP-PCR technique, at this locus there're three genotype CC, TT and CT figure (1).

The current study revealed thatThe Frequency distribution of patients and control subjects according to IL-4 genotypes is demonstrated in table (4). Homozygous CC genotype was significantly more frequent in patients' group than in control group, 42 (70.0%) versus 9 (15.3%), respectively (P < 0.001). The risk offered by CC genotype was 16.92 in terms of odds ratio (95% confidence interval of 5.84 - 49.00) and the etiologic fraction (EF) was 0.77. Heterozygous genotype CT was less frequent in patient's groups in comparison with control group, 10 (16.7%) versus 21 (35.5%), respectively; however, the difference was statistically insignificant (P = 0.311)

Frequency distribution of patients and control subjects according to IL-4 alleles shown in table (5). Allele C was significantly higher frequent in patients group compared to control group, 94 (78.3%) versus 39 (33.1%), respectively; whereas allele T was significantly less frequent in patients group compared to control group, 26(21.7%) versus 79(66.9%), respectively (P < 0.001), The risk subjected by allele C was 7.32 in terms of odds ratio (95% confidence interval of 4.10 - 13.07) and the etiologic fraction was 0.61. On the other hand, allele T may be considered as a protective and the odds ratio was 0.14 (95% confidence interval of 0.08 - 0.24) and the preventive fraction was 0.61.

There is little data providing evidence that enhance the understanding of how migraine may relate to, an anti-inflammatory cytokine and IL-4 gene variation. Previous reports are relatively conflicting with this recent leading study (but in different population and disease) which revealed that the IL-4 rs2243250 SNP in the genotype TC and also rs2227284 SNP in the genotypes TG and TT play a protective role. These polymorphisms could resulting to changing in Th2 release IL-4, or affecting IL-4 affinity to their cell targets and consequently unbalance between Th1/Th2 cytokines may possibly influence the spreading of pain producing processes in migraine. IL-4 appears to be a prospective target for future development of migraine-specific preventive therapies. The current study strengthen by the result conducted by Nourollahetal., (2017) who studied the relation between IL-4 rs2243250 (C/T) gene polymorphism and migraine and found that the allele frequency were 67% for C and 33% for T in healthy control versus 80.5% for C and 19.5% for T in migraineurs, respectively and implicated that the IL-4 rs2243250 (TC) and rs2227284 (TG and TT) SNPs have a protective role in susceptibility to migraine disease in Iranian patients. But no significant associations between IL-4 SNP rs2070874 (TC, TT and CC genotypes) and migraine were found.

Table 1: Primers sequence with orientation and the PCR product size.

Primers	Sequence (5'-3')		Amplicon
IL-4 gene polymorphism (rs2243250)	F	TAAACTTGGGAGAACATGGT	195bp
	R	TGGGGAAAGATAGAGTAAT	

Table (2): The Patient-Control Difference in mean age.

Age (Years)	Control Group n = 60	Study Group n = 60	P*
Mean ±SD	32.71 ±12.43	31.20 ±12.50	0.510 † NS
Range	11 -60	13 -60	

SD: standard deviation; *n*: number of cases; *: Chi-square test; NS: not significant at P > 0.05

Table (3): Comparison of Gender Frequency Distribution between Control and Patient Groups.

Gender	Control Group n = 60	Study Group n = 60	P *
Male, n (%)	17 (28.8%)	16 (26.7%)	0.794 ¥ NS
Female, n (%)	42 (71.2%)	44 (73.3%)	
Male: Female	1:2.75	----	----

n: number of cases; *: Chi-square test; NS: not significant at P ≤ 0.05

Table (4): Frequency distribution of patients with Migraine and control subjects according to IL-4 genotypes

IL-4 genotype	Patients Group n = 60		Control Group n = 59		P †	OR	95% CI	EF	PF
	n	%	n	%					
CC	42	70.0	9	15.3	<0.001 HS	16.92	5.84-49.00	0.77	---
CT	10	16.7	21	35.5	0.311 NS	1.73	0.58-5.11	0.14	---
TT	8	13.3	29	49.2	Reference				

n: number of cases; †: Chi-square test; EF: etiologic fraction; PF: preventive fraction; OR: Odds ratio; HS: highly significant at $P \leq 0.01$; NS: not significant at $P > 0.05$.

Table (5): Frequency distribution of patients with Migraine and control subjects according to IL-4 alleles

	Patients Group n = 120		Control Group n = 118		P †	OR	95% CI	EF	PF
IL-4 Allele	n	%	n	%					
C	94	78.3	39	33.1	<0.001 HS	7.32	4.10-13.07	0.61	---
T	26	21.7	79	66.9		0.14	0.08-0.24	---	0.61

n: number of cases; †: Chi-square test; EF: etiologic fraction; PF: preventive fraction; OR: Odds ratio; HS: highly significant at $P \leq 0.01$

Figure (1): Agarose gel electrophoresis image that show the RFLP-PCR product analysis of IL-4 gene polymorphism (rs2243250) (T/C) by using AvaII restriction enzyme in 2% agarose. Where M: marker (1500-50bp), lane (TT) wild type homozygote that showed undigested by restriction enzyme as 195bp. Lane (T/C) heterozygote, the product digested by restriction enzyme into 195bp, 177bp and invisible 18bp. Lane (CC) mutant type homozygote, the product digested by restriction enzyme into 177bp and invisible 18bp bands

Conclusion

Allele C of IL-4 rs2243250 was significantly higher frequent in patients group compared to control group. C allele had etiologic effect whereas allele T was significantly less frequent in patients group compared to control group. T allele consider a protective factor.

The Effect of Combined Preventive Exercises Using (Plyometric-Agility) Method in Improving the Anaerobic and Rapid Ability of the Muscles of the Legs for Female Students

Doaa Mohammed Salman[1], Mohammed Naji Shaker Abugneam[2]

[1]Post Graduate, [2]Assist Prof., University of Kufa/Faculty of Education for Girls/ Department of Physical Education and Sports Sciences/IRAQ

Abstract

Physical fitness is one of the lessons of students in the first year of study in the departments and faculties of physical education and sports sciences in Iraq, so it is necessary to use new method to improve their capabilities, including these exercises method (Plyometric-Fitness), a composite method that combines during the performance Short anaerobic power and explosive and rapid strength of the muscles of the legs.

The researchers used these exercises within the lesson after dividing the students into two groups. The first experimental group was the best in the results as it used in addition to the method (Plyometric-Agility) preventive tools that helped to feel the student safe and fear of injury when performing, followed by the total Control. The researchers used the exercises in a number of educational units according to the curriculum.

Keywords: *Fitness, Fitness, Fitness, Anaerobic Ability, Preventive Tools and Composite Exercises.*

Introduction

Physical fitness has become a necessity and a basic need for all members of society, being an expression of health and activity, a different meaning of lack of movement and inactivity, which in turn leads to the loss of aesthetic and agility of the body and make it vulnerable to many diseases. Physical fitness studied one of the classes in the departments and faculties of physical education and includes a set of exercises to develop the elements of physical fitness and health (strength, speed, fitness and cardiorespiratory fitness, endurance, flexibility... etc.) these elements have a functional and mechanical as well as psychological.[1]

Corresponding Author:
Doaa Mohammed Salman
Assist Prof., University of Kufa/Faculty of Education for Girls/Department of Physical Education and Sports Sciences/IRAQ
e-mail: mohammedn.shaker@uoKufa.edu.iq

In this lesson, students suffer from a large number of vocabulary and lack of time in addition to the inability of students to integrate exercises and therefore not taking the time to improve, so the researchers sought to address this problem using a new method that includes composite exercises between the physical and motor side (Plyometric and fitness) with the use of preventive method Which protects the student from injury that may occur, in the sense that exercises (Plyometric - Agility) works to strengthen the muscles targeted during the exercise and that these method work to protect the joints from injury.[2]

It is one of the most effective and effective training method used to develop muscle capacity and improve the speed of the muscles of the legs and arms in particular. Only one as well as to improve the force characteristic speed or speed is the ability of the nervous system in the muscular system to overcome the resistors and is characterized by high speed and output the maximum possible speed The agility of the motor capacity is the ability of the individual to change the positions of the body or trends on The ground or in the air accurately and

smoothly and the timing is correct, or is the ability of the individual to change direction quickly and well timing and functional variables affecting the performance in the exercises Plyometric and agility Short-term anaerobic ability It affects the ability of muscles to perform strongly and quickly.[3]

Practical Part:

Field Research Procedures: The experimental method was used in the research, which is a deliberate and controlled change to the specific conditions of an event. The research community was determined by the first grade students in the Department of Physical Education and Sports Sciences at the College of Education for Girls\University of Kufa for the academic year 2018 - the number of (51) students were selected (24) A sample of the study was divided into two groups (experimental and control) in each group 12 students by simple random method (lottery) and thus the sample represented (47.059)% and thus the sample was representative of the research community, which is the basis of research, the researchers provided some tools and devices, including balance To measure height and body mass of Chinese-made, Bonding tapes, colored markers, metallic tape, Japanese-made Sony video camera with camera stand (200 images/sec), electronic timing clocks (2) for documenting tests and procedures, medical balls weighing 1-3 kg, number 10, terraces With heights of 20-40 cm number 6.

Tests Used in the Research:

Vertical jump test of stability (Sargent):[4]

Test Objective: To measure short anaerobic power.

Tools Used: A piece of chalk, a wall or a board with measurements in cm

Method of Performance: The laboratory stands holding a piece of chalk next to the wall or painting so that the eagles on the ground and then raise his arm holding the chalk full along to put a mark on the painting with chalk. After that, the laboratory will swing the arms down and back, bending the trunk forward and down and bending the knees to the upright position. On the board or wall at the highest point it reaches and measurement to the nearest (cm).

Method of Recording: The distance difference between the two marks - before the performance and after the performance is calculated in terms of function, which represents the student's short anaerobic power.[5]

Short anaerobic capacity = 2.21 * body weight *Ö Jumping distance in meters.

Test run by jumping to a distance of 30 meters (calculate the number of steps):[6]

Test Objective: To measure the force characteristic of the muscles of the legs.

Tools: Stopwatch, 50 square meters, registration form.

Method of Performance: The laboratory stands on a certain line and then begins to perform successive jumps between the right and left man and on the combs with a focus on the extension of the back leg and bend the front of the knee and the arms movement is consistent and alternate with the legs

Recording Method: The number of steps in which the legs touch the ground is recorded for 30 meters.

Pretests:

The pre-test of the research sample was conducted on Sunday 25/11/2019.

Field Applications:

The researchers prepared physical exercises in the manner (Plyometric - Agility) method (high intensity interval training) as well as the use of preventive means, where the researchers used a set of preventive means to help students in the performance of some exercises characterized by high strength and high pressure on the joint and these method are represented A group of ligament for four joints in the body, including (elbow joint - ankle joint - knee joint - ankle joint) where these means are used for the purpose of protecting the joint from injury as well as increased sense of safety, where the experimental group used preventive means during the application The control group applied the curriculum adopted by the teacher. Where the use of the curriculum over the course of (8 weeks) by three training modules per week was used these method in the application of exercises for the purpose of achieving research objectives. The exercises were applied from Sunday (2/12/2018) to Thursday (24/1/2019) days (Sunday - Tuesday - Thursday) and the performance of the exercise (25-30 minutes) and the sample carried out exercises prepared by researchers in the main section.[7]

Posttests: The post-test of the research sample on Sunday 27/1/2019.

Statistical Means: SPSS specialist program was used.

Results

At the end of the application of the exercises were statistically deal with the results of the tests before and after the experimental group and the control group to know the difference between the two tests for the same group where the mean and standard deviation and the value (t-test) calculated are the statistical processes used, where there was a significant difference and favor The researchers also examined the results of the two groups' post-test tests to determine the significant difference in favor of either group.

Table (1). Shows the mean, the standard deviations, the calculated (t) value and the significant differences of the pre- and post-test results of the experimental group

Tests	Units	Pretest		Posttest		(t) Value	Moral value	Significance of differences
		Mean	SD	Mean	SD			
Sargent test	Watts	576.57	166.06	717.11	80.38	-3.04	0.000	Sig.
The characteristic power of the legs	Number	18.33	2.15	16.17	0.937	4.91	0.000	Sig.

Table (2). Shows the mean, the standard deviations, the calculated value (t) and the significance of the differences of the pre- and post-test results of the control group

Tests	Units	Pretest		Pretest		(t) Value	Moral value	Significance of differences
		Mean	SD	Mean	SD			
Sargent test	Watts	489.96	47.86	523.76	41.60	-2.93	0.000	Sig.
The characteristic power of the legs	Number	18.75	0.75	17.58	0.792	10.38	0.000	Sig.

Table (3). Shows the mean, the standard deviations, the calculated (t) value and the significant differences for the results of the post-test of the experimental and control groups

Tests	Units	Experimental group		Control group		(t) Value	Moral value	Significance of differences
		Mean	SD	Mean	SD			
Sargent test	Watts	717.11	80.38	523.76	41.60	4.04	0.000	Sig.
The characteristic power of the legs	Number	16.17	0.937	17.58	0.792	4.91	0.000	Sig.

Discussions

The two tables (2.1) show that there are differences in the arithmetic mean, standard deviations and the value of (T-test) calculated in the research tests for the two groups before and after the value of (Sig) less than (0.05), there are significant differences between the tests for the benefit of the posttest as well In Table (3) the differences of the experimental group when compared with the control in the post-test and the researchers attribute this difference in the improvement of the experimental group to the exercises used in the method (Plyometric-Agility),[8] which helped exercise to strengthen the muscles of the legs, which helped to jump more strongly as well as a distance The second test in the number of x Watt less, which indicates the improvement of the rapid strength of the muscles of the legs and high flow and less effort and less time,[9] which worked on the fitness exercises associated with the exercises Plyometric was the performance of the experimental group of exercises composite where performs Plyometric movements and

then in the same exercise perform the movements of agility, which supports what he said The development of rapid strength increases the ability of the nervous system to implement movements quickly at the effective extension of joints jumper after effective flexion movements preceding the movement of progress, as the exercises used to help improve the explosive strength of the muscles of the legs through The rapid contraction of the muscles and the simultaneous regulation of the muscular work,[10] which made the force on the ground to rise up and achieve distances beyond the results of the pretest test in addition to preventive means (ligaments on the joints) in increasing the motivation for performance and a sense of security and safety for performance, especially as the movements Plyometric and agility characterized by high intensity Speed in performance and continuous change in performance.[11]

Conclusions

1. Preventive exercises using (Plyometric - Agility) of the experimental group and the use of a group of ligaments (splicing) positive effect in the protection of joints from injury and determine the ranges of movement and thus improved performance in the test of measuring short-term anaerobic capacity of the muscles of the legs represented by the test of the vertical jump (Sargent) As well as agility.
2. Complex exercises in the style (Plyometric - Agility) helped to reduce the time and effort for the sample through the use of exercises to improve more than one physical variable at the same time.

Psychological Integration and its Relationship to the Psychological Rigidity of Volleyball Players from the Sitting Position

Zahra Mohammad Hadi[1], Zaid Abdulamir Mohammed[2], Yassin Alwan Al-Tamimi[2]

[1]Post Graduate, [2]Assist. Prof., University of Babylon/College of Physical Education and Sports Science/Iraq

Abstract

The research contained two axes is to identify the level of psychological integration and psychological rigidity and the relationship between the volleyball players from the sitting position, where the built psychological scale and the preparation of the scale of psychological rigidity and the use of descriptive method of relationships to suit the nature of the research. The research sample included (75) players and showed a significant correlation between them by the use of statistical means.

Keywords: *Psychological integration and psychological rigidity.*

Introduction

Our modern world has witnessed a scientific and information revolution that exceeded its previous revolutions throughout the ages. This requires a strong scientific basis, as it needs an innovative creative person with a visionary to benefit from modern technology to keep pace with the requirements of modern times in order to qualify players in order to contribute to this rapid development. Which is sweeping the world.

Psychological integration is an important and fundamental concepts related to the personality and mental health of the individual and its adaptive relationship with the environment and social environment, where individuals differ in terms of their physical and mental abilities and personal abilities in various fields, as well as the psychological integration of the individual's ability to change his behavior and habits when faced with a new situation or problem It is a positive psychological development refers to psychological maturity and helps the learner to overcome negative habits, it represents a basic criterion for mental health It represents the access point of the formation of the learner personality and face direct obstacles and problems and facilitates the performance of skills during learning or training and competition.[1]

Psychological rigidity emerges as a vital and important factor of the personalities of the players, which has a crucial role in improving the psychological and physical performance and face the various psychological pressures experienced by the volleyball player in training, competition and public life, whenever the players are able to face the stress and painful events with strength and hardness has an impact Negative accuracy on skill performance. One of the important pillars that keep the player strong in the face of difficult circumstances is the possession of psychological rigidity, which enables him to face stressful situations and adapt properly and that players who possess psychological strength are strong and interact with their coach more than others and able to achieve their goals as psychological rigidity is a key part of personal balance and stability.[2]

The game of volleyball from the sitting position is one of the games that follow the scientific planning strictly in order to upgrade the level and capabilities of its players, where the game of volleyball from sitting position requires speed in performance, in addition

Corresponding Author:
Zahra Mohammad Hadi
Post Graduate, University of Babylon/College of Physical Education and Sports Science/Iraq
e-mail: nab.orth@yahoo.com

to need accuracy during the implementation, as it is a double-edged game That is, it develops the concentration of the player and develops his scientific abilities at the same time; therefore, volleyball has entered in the sports forums and seriously, where it has become one of the games that take up a lot of space in the Olympics, sports competitions and volleyball from the seating position of one of the sensitive and important games where it is interested in a significant The segments of society are the disabled, as this disability does not constitute an obstacle for them in their lives where they have become recognized clubs and committees and federations and become involved in various sports Olympics and their disability is no longer a problem,[3] because the society has changed them because they did not dissuade them disability Apple on the contrary Researchers worked to select this category and study their condition and measure psychological variables. Hence the role of measurements and tests as an important tool of evaluation tools in the field of sports, which focuses on the training process and assess the level of performance and detect errors in competition and work on objectively developed to develop accurate performance skill for volleyball players from a seating position.[4]

Research Objectives:

1. Identify the degree of psychological integration and psychological hardness of volleyball players from the sitting position.
2. Identify the relationship between psychological integration and psychological rigidity of volleyball players from the sitting position.

Field Research Procedures: The researchers used the descriptive approach in the two survey method and comparative studies due to its relevance and nature of the research. The researchers selected the research sample randomly (75) players and a percentage (75%).

Psychological Integration Scale: The researchers built the psychological integration scale according to the scientific steps used in the construction of the measurements.

Table (1). Show areas, number of paragraphs and sequence of psychological integration scale

S	Domain Name	Sequence of Paragraphs	Number of Paragraphs
1	Social	1,2,3,4,5,6	6
2	Profile	7,8,9,10,11,12,13,14,15	9
3	Family	16,17,18,19,20,21,22,23,24	9
4	Cognitive	25,26,27,28	4
5	Economic	29,30	2
6	Religious	31,32,33,34,35,36,37	7
7	Health	38,39,40,41,42,43,44	7
Total			**44**

Alternatives were used to answer the paragraphs of the scale and reached four alternatives for each paragraph and table (2) shows that.

Table (2). Alternatives to answer and the key to the correction of the paragraphs of the measure of psychological integration

Alternatives	Always	Frequently	Sometimes	Rarely
Key correction	4	3	2	1

Psychic Hardness Scale: The psychological hardness scale prepared was prepared, the number of paragraphs (14) distributed over the four areas (cognitive assessment, psychological commitment, challenge). As shown in Table (3).

Table (3). Show Fields, Number, Paragraphs and Sequence of Psychometrics

S	Domain name	Sequence of paragraphs	Number of paragraphs
1	Cognitive assessment	1,2,3,4,5	5
2	Psychological commitment	6,7,8,9	4
3	The challenge	10,11,12,13,14	5
Total			**14**

Alternatives were used to answer the paragraphs of the scale and reached three alternatives for each paragraph and table (4) shows that.

Table (4). Show Alternatives of Answer and Correction Key for Psychiatric Hardness Scales

Alternatives	Always	Sometimes	Never
Key correction	3	2	1

Scouting Pilot Study: The researchers conducted an exploratory experiment on a sample of (10) players from the club of Babylon and Najaf, on Sunday 4/11/2018 and asked them to read the instructions and phrases and inquire about any ambiguity.[5]

Apply the two scales to the main sample: The two scales were applied to the main sample of (75) players, on Friday (23/11/2018), on the Golden Medal Hall in Baghdad during the participation of the subcommittees (research sample) in the Iraqi league volleyball league championship.

Statistical method used in the research: The researchers used the Statistical Portfolio of Social Sciences (SPSS) to process the data.

Results

Table (5). Shows the statistical description of the results of the psychological integration and psychological hardness measures

The scale	Mean	SD	Hypothetical mean	(t) value	Significance level	Statistical significance
Psychological integration	152.933	16.394	120	7.780	0.000	Sig.
Psychological rigidity	36.266	2.814	28	11.374	0.000	Sig.

Table (5) and Figure (1) show the statistical description of the results of the research sample in the measures of psychological integration and psychological hardness, where the value of the mean in the scale of psychological integration (152.933) and a standard deviation (16.394), while the value of the hypothetical mean of the scale was (120), This means that there are statistically significant differences between the arithmetic mean of psychological integration, which is greater than the hypothetical average of 120, which indicates that the sample has a high level of psychological integration.[6]

This result can be explained by the fact that the research sample has a high level of psychological integration and this represents harmony and self-integration and positive adaptation of the sample. Psychological integration is a positive psychological development that indicates psychological maturity helps the individual to overcome negative habits, as individuals who have a high psychological integrity have confidence in The same and the ability to take responsibility and awareness of attitudes and interpreted positively and individuals who have a integration less vulnerable to frustration and be able to meet their needs and desires and more in line with others and face life and have the ability to change and flexibility in behavior and modify it when faced with new situations and problems.[7] The

mean value of the arithmetic mean was 36.266 and the standard deviation was (2.814). The hypothetical mean value was (28), which indicates that the sample has a high level of psychological integration.

This result can be explained by the fact that the research sample has a high level of psychological rigidity and this indicates that the majority of the research sample are in good psychological condition and have a high and almost stable control power. Guide their behavior to always be the best and perform the best they have and work to complete the duties assigned to them successfully, strength, solidity and commitment by showing the greatest amount of activity and perseverance and willingness to excel.[8]

Table (6). Shows the correlation coefficient of the research sample

Variables	Correlation coefficient	Significance level	Statistical significance
Psychological integration with psychological rigidity	663. 0	0.000	Sig.

Table (6) shows that there is a close correlation between the psychological integration and the psychological rigidity of the volleyball players from the sitting position, as psychological integration clearly affects a positive in the practice of sports, self-confidence and self-esteem and courage and face the environmental conditions and awareness of the nature of his existing abilities enable them to Perform a high level of performance in the required sports activities, that the psychological integration helps the owner to be successful in his work, whatever the type of this work, although the level of performance requires the elements of the availability of fitness elements, but this does not reduce the importance of psychological integration in Time level of performance in all sports activities, whether individual or collective.[9]

Harder players are more resilient, more accomplished, more disciplined, more capable, more independent and able to make decisions, face crises and take personal responsibility for what happens to them in the interpretation and appreciation of stressful events. However, an athlete with psychological stiffness can go beyond physical pain and at the same time retain Strength and technique to the crucial moments of both training and competition. Lang emphasizes that each individual shows some levels of hardness and the high or low depends on the position and time that the individual is going through. Thus, hardness is an educated ability that can change depending on the situation to which the individual is exposed. Has a personal trait.[10]

Conclusions

1. Volleyball players enjoy a high level of psychological integration and psychological rigidity.
2. The results showed a significant correlation between psychological integration and psychological rigidity in volleyball players from the sitting position.

The Impact of Power Reserve Exercises in the Negative Range on the Development of Maximum Strength and Achievement of the Quartet with Special Needs

Mohammed Hamoud Abboud[1], Hussein Hassoun Abbas[1], Nidal Obaid Hamza[1], Sahira Aliawi Hussein[1]

[1]*Lecturer/University of Kerbala/The College of Physical Education and Sport Sciences/Iraq*

Abstract

The great power is one of the most important types of force, which is still the prevailing idea that it does not appear only under the presence of a particular emergency such as panic and fear and other things that pass on the human, but this is a fact tainted by some doubt, especially as scientific development in various fields of science, especially sports He did not leave an order to pass randomly, but some field ideas attempted to raise suspicion through experimentation and research into the reasons behind the results, including the problem of research that the superpower did not take the bulk of the research commensurate with its importance, it is not required to have an emergency to appear, but there Training Method The researchers, in coordination with the instructor, decided to give exercises to the lifters to reserve the force to remove the force stored in the quadrants, as well as to focus on exercises for the use of negative contraction. Negative according to force precautions to develop maximum strength and achievement, while the imposition of research there are significant differences of exercise in the method of negative range in accordance with force precautions to develop maximum strength and achievement for lifters with special needs and identified the research community Among the applicants in the governorate of Baghdad for the disabled and after the identification of the tests, the researcher conducted the pre-tests of power reserves in the negative range of the experimental research group in the Union Paralympic Hall in banks. The main experiment, which lasted for 6 weeks, was started. This section included a presentation of the results of the research and the variables that were analyzed and discussed, in a scientific manner supported by sources. Reserves in accordance with the negative force to the extent positively in the maximum power and achievement were the recommendations of the research: the need to use the units in specific periods of special preparation for the activities of the force.

Keywords: *Reserve exercises,negative range and special needs.*

Introduction

The training process in sports is one of the processes that require the following scientific method to prepare the athletes and that the success of the training process depends on the ability of trainers and take into account the individual characteristics of athletes and choose the best training method and the best stages of time division of sports preparation as it is very important when preparing training curricula Method, means and method appropriate for each stage of training as well as the choice of exercises that must be appropriate to the ability and capacity of the athlete. Specialists and researchers tried to care for the disabled by preparing integrated training programs for this purpose in order to serve this segment, which is part of the community,[1] which must be paid special attention and this is confirmed, The development that we observe today in all areas of life reflected on the sports field as well as simpler What is evidenced by this is the development of sports

Lecturer/University of Kerbala/The College of Physical Education and Sport Sciences/Iraq
e-mail: nab.orth@yahoo.com

achievement which is increasing day by day. We do not observe a championship at the global level or the local level, which is devoid of breaking numbers, especially in the artistic performance. Among them was a segment called specialists (private individuals). Olympic For people with disabilities in (1948 A.D) and was named Olympic Parallels, it was put a lot of programs and the fact that training curricula have a positive impact to lift their morale,[2] Perhaps (the superpower) is one of the types of force that left open debate is still the subject of discussion between the concerned as the wheel of human sports progress does not believe in doubt as much as trying to touch the actual reality within the field, but because of the link of the great power to the problems of interpretation must be highlighted all the hidden and method Field method to be shown in a field applicable and codified away from randomness and emergency conditions, which was believed to be under the weight of alert and the result of panic and fear and hypnosis and electrical stimulation and the like.[3]

Research Objectives:

1. Prepare negative range exercises in accordance with force precautions to develop maximum strength and achievement for people with special needs.
2. Recognize the impact of negative range exercises in accordance with strength reserves exercises in the maximum strength and achievement for people with special needs.

Hypothesis: There are significant differences for special exercises according to force precautions to develop maximum strength and achievement for people with special needs.

Research methodology and field procedures

Research Methodology:

The researcher used the experimental approach in one group method and the experimental approach represents the most honest approach to solve many scientific problems in a practical and theoretical way.[4]

Community and Research Sample: The research community is the advanced players of the physical strength of people with special needs and the number (15) quarters and the researcher chose a research sample randomly consisting of (10) lifters represented the following weight groups (49 kg - 54 kg - 59 kg - 65 kg - 72 kg - 80 kg), which represents 66% of Research community as shown in the following table.

Table (1). Shows the distribution of community members and the sample of the research

Community	Number	Percentage
Search community for advanced players	15	100%
The research sample	10	66%
Pilot sample	3	20%

Homogeneity of the research sample: The homogeneity of the sample in extraneous and research variables was verified using the law of the second torsion coefficient (Pearson) as shown in.

Table (2). Shows the homogeneity of the sample

Variables	Units	Statistics			
		Median	Mean	SD	Skewness
Mass	Kg	71.5	78.4	22.969	0.901
Length	cm	148.5	149.5	8.14	0.368
Age of training	Month	24	21.66	8.9	- 0.788
Age	Year	18	17.5	2.415	- 0.621
Achievement	Kg	116	104.7	47.25	- 0.717
Curl Larry	Kg	40	36.5	12.703	- 0.826
In front of Bryce	Kg	44.5	41	11.25	- 0.933

Define search variables:

Tests used in the research:

Achievement Test[5]: Purpose of the test: Measure the maximum strength of the muscles of the arms using (1RM) and using the exercise of force rises through the movement of full flexion of the arms to the chest with a stop (2 seconds) and then the full extension of the arms.

Used Equipment:

- Iron bar weighing (20) kg Alico type of Swedish origin.
- Iron tablets of different weights (0.5 kg up to 25 kg) Alico type of Swedish origin.
- A special stadium for the physical strength of the disabled in accordance with international standards.

Registration: The maximum weight of three attempts is legally recorded for the purpose of extracting the target difference coefficient and the highest one-time achievement according to the 1RM system.

Curry Larry Test: Purpose of the test: Measuring the maximum strength of the muscles of the front arms (baseball).

Used Equipment:

- Iron bar weighing 20 kg.
- Legal weights.

Registration:

- The laboratory performs three attempts with the maximum weight it can carry.
- The maximum weight of the laboratory shall be counted among the three attempts measured in kg.

Front pressure sitting bar[6]: Purpose of the test: to measure the maximum strength of the shoulder muscles.

Hardware and Tools:

- Regular iron bar weighing (20) kg.
- Iron weights of different weights.
- Wooden platform for performance.

Registration:

- The laboratory performs three attempts with the maximum weight it can carry.
- The maximum weight the laboratory raises is calculated among the three attempts measured in kg.

Field procedures used in the research:[7]

Pretests: Conducted on 20/6/2019 at 3:30 pm.

The sequence of tests was as follows:

1. Curl test Larry, where the player is given three attempts and calculate the best attempt
2. Test the front pressure sitting in the bar where the player is given three attempts and calculate the best attempt
3. Achievement test using the lifting force according to the international system three lifting and choose the best lift.

Main Experience: The training program was applied to the members of the research sample on Wednesday 21/6/2019, at three o'clock in the afternoon as follows:

1. The training curriculum lasted for 6 weeks and the training units ranged between (60-70) minutes with (2) two training units per week.
2. The researcher to conduct tests (1RM) after the end of every two weeks (15) days to find out the development in the maximum power level and then rationing of pregnancy according to the system (1RM) for the development.
3. The number of training units during the trial period is (12) training units.
4. The training program started on 12/6/2019 on Saturday and ended on 4/8/2019
5. The researcher adopted the method of repetitive training to suit the specificity of the game of physical strengths and was rationed training load according to the system (1RM).
6. The main experiment was applied and the exercises were given in agreement with the trainer.
7. Exercises were given in the special preparation period
8. The training program was varied and continued even with public holidays, which is adopted by the Central Unions of the Iraqi National Paralympic Committee to ensure continuity of training, which is one of the characteristics of regular training for the purpose of achieving.

Posttests: After completing the training program, the researcher conducted the post-tests of the research sample of the experimental group on 6/8/2019 and on the national team hall in Baghdad.

Results

Table (3). Shows the mean and standard deviations of the tests (achievement, Curl Larry, In front of Bryce)

Tests	Units	Pretest		Posttest	
		Mean	SD	Mean	SD
Achievement	Kg	104.7	47.255	116.2	46.713
Curl Larry	Kg	36.5	12.703	43	14.375
In front of Bryce	Kg	41	11.254	47.5	12.747

Table (4). Shows the groups of the teams and the standard deviations of the teams for the tests (achievement, Curl Larry, In front of Bryce) and shows the value of (t) calculated and tabular as well as the significance of the difference

Tests	Units	Mean	SD	(t) value		Significance of differences
				Calculated	Tabulated	
Achievement	Kg	11.5	9.49	3.829	2.262	Sig.
Curl Larry	Kg	6.5	2.415	8.505	2.262	Sig.
In front of Bryce	Kg	7.5	3.535	6.704	2.262	Sig.

All the previous variables have a significant difference between the pretest and posttests under the level of significance (0.05) and the degree of freedom (10 - 1 = 9) and in favor of the highest post-mean.

Discussions

Discussion of the results of pre and posttests of physical variables: By showing the results of Table (4) showed the superiority of the post-test on the pre in each of the test (achievement, Curl Larry, In front of Bryce) for the research group and researchers attribute the superiority of the results after the pre force in the use of exercises in the negative range of movement performed by the group The research, which was performed in a sufficient period due to the specificity of these exercises carried out commensurate with the type of performance practiced by the research sample to raise (Bing Press) as well as the levels of stress that exceed the maximum in this type of training formation of weight lifting exercises in which the orientation of the type at the expense of quantum In other words, increase the effect Effective in weight training exercises.[8]

This is consistent with the researchers used in the repetitions of Passive range exercises, which ranged from (3-4) repetitions, this requires us to use stressed At the same time, the intense use of this amount works within the first phospholipid energy system, which depends entirely on the excitability of the fast-rising white muscle fibers of higher efficiency and muscle groups differently from what is used in conventional exercises as well as these muscles.[9] It is mainly targeted by excitement of the nervous system higher than the maximum due to the number of repetitions and intensity targeted in exercises with a negative range of movement, as these exercises worked to stimulate the muscle fibers more and the reason is due to the beginning of its work under the roof of a higher intensity of tension The main objective of the training is to start the threshold of the motor units to reach a higher stress in the exercise to ensure that the muscle in the normal maximum exercises in all conditions does not reach the highest contraction, which confirms that there are physical efforts stored which is called (reserves of power) the player does not Used even in the highest training conditions,[10] but appear under specific circumstances and this is confirmed Although the muscle reaches its maximum contraction, the nervous system does not recruit all muscle fibers in the maximum contraction (100%) and thus can be reached by the effect of training Highest stress to units

"High mobility threshold, so high stress must be used to mobilize motor units through few repetitions to avoid fatigue and injury.[11]

This explains the use of exercises with a negative range of motion to employ a state of raising the ceiling of the intensity of training from the first set of repetitions performed by the player in order to mobilize the highest moving units with the highest difference threshold in muscle work, which works to employ a work of added energy more than the previous one to the player This energy is represented by increasing the maximum voltage of the first system of phosphate energy by increasing the effectiveness of the white fibers and their ability to mobilize more ATPase enzymes present on myosin heads, which increase the contractility as well as employ the ability of strings and This is positively reflected in the development of maximal achievement with intensity ratios ranging between (10-20%) above the maximum achievement in the type of exercise.[12] This is confirmed by some data from Russian researchers quoted by them which confirms that it is possible Development of the added energy of the maximum of (2 - 3.5) times more than normal, as the possibility of provoking work to stimulate the muscle fibers and increase their systolic efficiency and all soft tissues, as well as when working simultaneously, whether in weight lifting and throwing or compromises and on the other side of the good performance Which depends on what special exercises develop The energy, these additives can be used and increase in working conditions when implementing greater hold high art performance and can be reached (35-40%) of the potential energy and this energy will greatly affect accomplishment.[13] The weight lifting privacy service comes through increasing the abilities of a higher level of race and this makes coaches put their players under a higher atmosphere of competition (such as passive training) that imposes on players a higher amount of stress than usual. That relying on the basic procedures in the development of muscle strength, the need to subject the muscles to a degree of endurance beyond the muscular capabilities of them. The development of maximum strength through extra weight is a modern and serious way to train maximum strength for athletes with higher levels, the researchers said the field situation of the need to change the method, means, tools and method of training.[14]

Conclusions

1. The training units in accordance with the power reserves in the negative range positively affected the maximum strength of the muscles of the arms, shoulders and chest.
2. Not to exaggerate in giving the amount of high stress and sufficiency ranges effective stress within this method, which is (130%) and below and in specific periods of preparation and with the help of colleagues.
3. Conducting similar studies and researches for different activities.

First Record of Cryptococcus Gattii (VGI) that Causes Vulvovaginitis in Iraq

Yasir Ali Al-Khawaja[1], Fadhil Sami Zghair[2]

[1]M.Sc. Candidate, Department of Pathological Analysis Technique, Faculty of Health and Medical Technology/ Kufa, Al-Furat Al- Awsat Technical University/Iraq, [2]Assist. Prof., Department of Medical Laboratory, Babylon Technical Institute, Al-Furat Al-Awsat Technical University/Iraq

Abstract

Background and Purpose: *Cryptococcus. gattii* is a non-*Cryptococcus neoformans* species isolated from certain plants and some animals.

Case Report: This report describes a case of a 35-year-old Iraqi female with pruritus and vaginal irritation. Conventional tests and molecular analysis of the samples of vaginal discharge were performed. The mentioned analyses revealed *Cryptococcus gattii* as the causative agent of vaginal infection. The sensitivity tests revealed that this species is susceptible to clotrimazole and nystatin.

Conclusion: *C. gattii* was found to have the ability to cause vulvovaginitis. This is the first report of successful detection and treatment of vulvovaginal infection with *C. gattii*.

Keywords: *Cryptococcus gattii, Vulvovaginitis, 18 S r DNA gene.*

Introduction

Cryptococcosis is characterized by a chronic course and is usually caused by the ubiquitous yeast *Cryptococcus neoformans*, predominantly by its variety *C. neoformans* var. *grubii* and in endemic areas by *Cryptococcus gattii*. Other *Cryptococcus* species are rarely reported to cause infections and most of them are known to be low or non-pathogenic[(1)].

*C. gattii*can clearly be distinguished from other *Cryptococcus* spp. by ribosomal DNA sequence analysis[(2,3)].

The major reservoir for *Cryptococcus gattii* are eucalyptus trees and decaying hollows in living trees[(4)]. Eucalypts are in fact only one of more than 50 different species of tree that can provide an ecological niche for *C. gattii*[(5,6)].

Beside the environmental source, C. gattii can be isolated from the animals, sheeps often develop infection of the nasal cavity or CNS, while horses and goats present primarily with lung disease[(7,8,9)].

Dogs typically present with clinical signs involving more than one organ[(10)]. Case reports and moderate to large case series of C. gattii in cats [(11,12)].

C. gattii was traditionally a tropical and subtropicalorganism[(13)].

In humans C. gattii causes predominantly meningoencephalitis and other CNS and pulmonary diseases and is associated with substantial morbidity, especially in immunocompromised people[(14,15)].

Since the identification of *C. gattii* infection inimmunocompetent individuals on Vancouver Island, Canada, in 1999, the organisms have been found in many areas of Vancouver Island and the Pacific Northwest[(16)]

and very recently a singlecase was identified in the southeastern United States[17].

In most of these reports, the identification of *C. gattii* was confirmed by molecular method.

Herein, we present a case of vulvovaginitis due to *C. gattii* in a 35-year-old Iraqi woman and discuss the biology of this agent. To the best of our knowledge, this is the first report on *C. gattii* vaginal infection.

Case Report:

Case History: A 35-year-old married female patient presented to one of the out-patient clinics of Hilla city, Babylon, Iraq, due to severe itching and vaginal irritation. Vaginal examination revealed thick, curdle-like, white-colored discharge, edema and intense pruritus of the vulva. The vagina and labia were erythematous. She was using a depo provera injection as a contraceptive method.

Diagnosis: Due to the suspected diagnosis of vulvovaginal candidiasis, fresh samples of vaginal discharge were sent for mycological examination to the microbiology lab., Department of pathological analysis technique, Babylon technical institute, Al Furat al Awsat technical University, Babylon, Iraq. The samples were taken from vulvovaginal region by a sterile transport medium swabs. Two specimens were obtained under sterile conditions, one for microscopic examination and the other for fungal culture. A slide was prepared for Methylene blue staining. The vaginal swab was inoculated on Sabouraud Dextrose Agar (SDA; Merck, Germany)[18] and incubated at 37°C for 24 h. The produced cream-colored colonies were slightly mucoid, smooth, highly glossy and slim in texture that were indistinguishable from *Candida* spp. colony.

Microscopic examination of the culture after 48 h showed round to oval yeast, single or pairs of cells without true hyphae or pseudohyphae and with a capsule in Indian ink, see figure (1).

Figure 1: Cryptococcus gattii under microscope show capsules stained with Indian ink.

Genomic DNA was extracted from culture using glass bead method[19]. Then, the 18 S r DNA gene of isolates was amplified by the universal fungal primers, PFPRIM-F3 (5′-GACTCAACACGGGGAAACT -3′) and PFPRIM-R4 (5′-ATTCCTCGTTGAAGAGCA-3′)[20]. The PCR product was applied for the accurate identification of isolate (Promega, USA)[21,22]. For confirmation of species identity, the obtained sequences were compared with similar sequences in the open access NCBI database (http://blast.ncbi.nlmnih.gov/Blast.cgi).

Antifungal Susceptibility:

Inoculation of Test Plates:

1. Prepare the inoculum by making a direct broth or saline suspension of isolated colonies selected from an 18- to 24-hour agar plate .
2. Dip a sterile cotton swab into the suspension. Rotate the swab several times and press firmly on the inside wall of the tube above the fluid level. This removes excess fluid from the swab.
3. Inoculate the dried surface of the agar plate by streaking the swab over the entire sterile agar surface. Repeat this procedure by streaking two more times, rotating the plate approximately 60° each time to ensure an even distribution of inoculum. As a final step, swab the rim of the agar.
4. Leave the lid ajar for three to five minutes, but no more than 15 minutes, to allow for any excess surface moisture to be absorbed before applying the drug-impregnated disks [23].

Preparing the disks impregnated with antifungal drugs

Clotrimazole: We had used clotrimazole drug solution manufactured by (Coral Laboratories/India) with a concentration (10mg/30 ml) and by conversion the units from (mg) to (Mg) the concentration is equal to (10000 Mg/30 ml).

After that we was apply ten–fold dilution by adding (1ml) (1000Ml) from the drug solution to (9 ml) of ethanol, the resulting concentration is (50 Mg/10 ml) in the vial.

The next step was adding (5 Ml) from the vial to the disks and for 5 times (25 Ml for each disk), the resulting concentration in each disk is (250 Mg/25 Ml) because (50 Mg * 5 times = 250 Mg) [24].

Nystatin:

- We had used nystatin drug solution manufactured by Egyptian International Pharmaceutical Industries company/Egypt. Each (1ml) of nystatin contains 100000 International Unit (IU) and each (1Ml contains 100 IU).
- By using electronic international unit converter we had found that each (1 IU equal to 0.0002 mg). Then each (1 Ml) contains (0.02 mg) of nystatin.
- After conversion units from mg to Mg then each (1Ml contain 20 Mg) of nystatin.
- By applying ten – fold dilution by adding (1ml) (1000 Ml) of the solution to (9 ml) of methanol, the resulting solution is (2 Mg in each 1 Ml) and (10 Mg in each 5 Ml) of the solution.
- The next step is adding (5 Ml) from the vial to the disks and for (5) times (25 Ml for each disk).
- The resulting concentration in each disk is (50 Mg/25 Ml) because (10 Mg * 5 times = 50 Mg) [24].

Placing the Disks:

1. Using sterile forceps or disk dispenser, place antifungal disk on the surface of the inoculated and dried plate.
2. Immediately press it down lightly with the instrument to ensure complete contact between the disk and the agar surface. Do not move a disk once it has come into contact with the agar surface since some diffusion of the drug occurs instantaneously.
3. Position disks such that the minimum center - center distance is 24 mm and no closer than 10 to 15 mm from the edge of the petri dish. A maximum of six disks may be placed in a 9-cm petri dish and 12 disks on a 150 mm plate. Reduce the number of disks applied per plate if overlapping zones of inhibition are encountered[23].

Reading Plates and Interpreting Results

After 16 to 18 hours of incubation examine each plate. If the plate was satisfactorily streaked and the inoculum was correct, the resulting zones of inhibition will be uniformly circular and there will be a confluent lawn of growth.

If individual colonies are apparent, the inoculum would be too light and the test must be repeated. Measure the diameters of the zones of complete inhibition (as judged by the unaided eye), including the diameter of the disk. Measure the zones to the nearest whole millimeter, using sliding calipers or a ruler, which is held on the back of the inverted Petri plate. Hold the Petri plate a few inches above a black, nonreflecting background illuminated with reflected light.

The zone margin should be considered the area showing no obvious, visible growth that can be detected with the unaided eye. Ignore faint growth of tiny colonies

that can be detected only with a magnifying lens at the edge of the zone of inhibited growth [24].

Discussion

The present report describes an uncommon case of vulvovaginitis caused by vaginal infection with *Cryptococcus gattii*. Cryptococcosis was first reported in koalas in 1960[25] and is almost always due to *C. gattii*[26].

The first clinical case of cryptococcosis in which the name *C. gattii* mentioned was reported in 1970. It involved a 7-years old boy with leukemia from the Congo (formerly Zaire) who presented with meningitis[27].

Generally, the identification of yeasts is limited in histological preparation. Candida spp. often show budding yeasts, pseudohyphae and true hyphae in tissue. *C. gattii* can be identified based on its capsule[28], see figure (1).

A reliable method is required for the final identification of yeasts followed by mycological studies and confirmation by PCR and sequencing, especially for unusual pathogens.

To the best of our knowledge, the case described here is the first report of vulvovaginitis due to *C. gattii*.

Although Cryptococcus spp. rarely cause vulvovaginitis, there have been some articles on this issue (Table 1).

Table 1. Overview of seven reported articles of vulvovaginitis due to Cryptococcus species (1985- 2019)

No.	Age/ Year	Location	NO. Total/ case samples	Agent	Clinical presentation	Examination	Treatment	Case characteristics	Ref.
1	35/2019	Iraq	Case report	Cryptococcus gattii	Severe itching and vaginal irritation	Culture and sequencing	Clotri./Nyst.	NI	Current case

NI =Not indicated; spp.,و species; FLU, fluconazole;KCZ, ketoconazole; Clotri., Clotrimazole; Nyst., Nystatin.

Conclusion

C. gattii was found to have the ability to cause vulvovaginitis. This report could be of clinical significance and helpful for the management of similarcases. The case presented here is the first report of successful detection of vulvovaginal infection with *C. gattii*.

Evaluation of the Performance Level of the Defensive Skills of the Professional Players and their Relation to the Matches Result in the Handball Iraqi League

Mohammed Kadhum Salih[1], Haider Shakir Mizher[2]

[1]Lecturer/University of Diyala/Iraq, [2]Assist. Prof. Dr. University of Diyala/Iraq

Abstract

It is said that Handball is considered as one of the most interesting team games for both practitioners and spectators. Handball is widespread in many countries of the world, this is so, because it is characterized by the beauty of its technical defensive performance, in addition to the strength and speed of the performance level of players and teams too. There are plans to be conducted by the players collectively, i.e. as a team and plans to be conducted by the player himself individually. This requires that the player should have physical and skilful capacities that qualify him to deal with the situations requirements needed in the competition. The competitive activity often requires the player confront the opponent using different varieties of defensive skills. This, eventually, leads to reinforce the teams results, thus it is interesting for the coaches and players in training sessions. Since the professional player added incorporeal value and strength to the performance levels of teams and the performance of the defensive skills of the professional players were not stable in influencing on the level of the and hence on the matches result in Iraqi Handball Premier League; therefore, the current study is conducted in order to :

- Evaluating the performance level of the defensive skills of the professional player
- Recognizing the relation between the performance level of defensive skills of the professional player and the results of the matches in the Iraqi Handball Premier League.

The community of the study is represented in the Iraqi Handball Premier League Clubs that contain professional players: (Al'-Jiesh, Al-Karkh, Naft- Al-Janoob, Al-Shorta and Karbalaa). The sample of the study was the professional players from these five clubs; each professional player was noticed in eight matches.

The study came up with the following results, The skill of offending the offender achieved, high and positive, correlation factor with the result of the matches; it was (0.727) and fault percentage (0.000) . While in the skill of covering, the results showed that there is strong and positive relation between covering skill and the results of matches, the correlation factor was (0.586) and the fault percentage was (0.000). The skill of passing and receiving correlation factor was (0.508) and the fault percentage was (0.001). On the other hand, the blocking the fake skill has a correlation factor (0.542) and fault percentage of (0.000). This certifies that there is a positive incorporeal relation between the two variables. While the skill of blocking the shoot and distracting the ball has a correlation factor of (0.689) and a fault percentage of (0.000); which reflects good correlation factor.

Keywords: *Defensive skills, professional players and Iraqi Handball Premier League.*

Introduction

Handball is considered as one of the most interesting team games for both practitioners and spectators. Handball is widespread in many countries of the world, this is so, because it is characterized by the beauty of its technical individual and collective performance in strength and speed of the performance of the players and the teams. Thus, it is impossible to reach the desired

performance without the role of the defensive skilful performance. For this reason, it has attracted the attention of the coaches and players in training sessions. What is more, the skilful defensive performance in handball has a great and significant role in distracting the players of the opponent team, through the ability of the offending team players to conduct their defensive duties perfectly. The better performance the offenders do the easier control over the game they reach . The professional player is that player who dedicated his public and personal life to the hard work of continuous training .He also undergoes implementing stiff system for his everyday life, which is possessed by the training and competing rules .[1]Thus, the professional player added incorporeal value and strength to the performance levels of teams in the Iraqi Handball Premier League; to the extent that it became the topic of the media and those who are concerned. This is so, because of the great amounts of money paid by the clubs to their professional players. A reason that made many international players, from different countries of the world, move to play in the Iraqi league.[2]

The reasons behind the current study are:

1. Evaluating the performance level of the defensive skills of the professional player.
2. Recognizing the relation between the performance level of defensive skills of the professional player and the results of the matches in the Iraqi Handball Premier League.

Method of the Study

The used curriculum and the sample of the study: The researcher used the descriptive method of the correlated relations for its suitability to solve the problem of the study. The community of the study is represented in the Iraqi Handball Premier League Clubs that contain professional players: Al-Jiesh, Al-Karkh, Naft- Al-Janoob, Al-Shorta and Karbala. The sample of the study was the professional players from these five clubs; (10) professional players, two from each club. Each professional player was noticed in eight matches in the Iraqi Handball Premier League for the sport season of 2018-2019, which was conducted in (home and away round robin).

Means, Apparatus and Tools used in the Study:

- Resources and references.
- Tests and scales
- Internet websites
- Results input form
- Scientific notice
- Two Japanese Sony Video recording camera to film the matches
- Memory sticks with (32) gigabytes capacity.
- Dell laptop computer.

Procedures of the Study:

Having reviewing the handball specialized resources. A form was designed to specify the most important defensive skills in handball. The form was presented to a group of experts and specialists in handball.[3]those skills that got (70%) and over were taken into consideration; whereas the others were neglected in accordance with table (1).

Table (1). Shows the percentage of the selected defensive skills by the experts and specialists

No.	Defensive skills	Percentage
1	Offending the offender	81.81%
2	Covering	72.72%
3	Passing and receiving	74.54%
4	Blocking the fake	74.54%
5	Blocking the shoot and distracting the ball	74.54%

Setting the form of evaluating the performance level of the defensive skills: The form of evaluating the performance level of the defensive skills was designed for the professional players in handball as shown in table (2).

Table (2). The form of evaluating the performance level of the defensive skills

No	Defensive skills	Attempts	
		Successful	Failed
1	Offending the offender		
2	Covering		
3	Passing and receiving		
4	Blocking the fake		
5	Blocking the shoot and distracting the ball		

Method of Record: Each of the professional player has been watched and noticed in eight matches in the

Iraqi Handball Premier League for the sport season of 2018-2019 which is conducted in home and away round robin. The DVD recorded matches were shown to the experts and specialists to be analyzed and to evaluate the performance level of the defensive skills of the professional players in handball. Each skill of the defensive skills was given one (1) to the successful attempts and zero (0) to the failed attempts.[4] To know the performance level of the professional players in the defensive skills, the successful attempts scores, to each of the defensive skills, were summed in order to come with means and standard deviations of each skill.

Statistical Means: The researcher used the SPSS.

Displaying the Results: It is shown in the following tables the means, the standard deviations, the number of the professional players of the sample of the study for each of the selected defensive skills and the number of the matches for the professional players in the Iraqi handball Premier League who represent the clubs of : Al-Jiesh, Al-Karkh, Naft- Al-Janoob, Al-Shorta and Karbala, In table (3).

Table (3). Shows the means and the standard deviations to the evaluation of the sample of the study for the defensive skills of the professional players

Club	Times of watching	Defensive skills									
		Offending the offender		Covering		Passing and receiving		Blocking the fake		Blocking the shoot and distracting the ball	
		M	±DS	M	±DS	M	±DS	M	±DS	M	±DS
Al-Jiesh	8	8.750	2.087	8.063	1.208	8.125	0.954	7.875	1.217	7.563	1.374
Naft Al-Janoob	8	6.438	2.969	7.625	2.564	7.688	2.712	7.125	3.227	6.483	3.321
Al-Karkh	8	7.063	1.374	5.750	1.558	5.625	1.482	7.063	1.613	5.500	2.018
Al-Shorta	8	6.063	2.008	6.250	2.121	6.375	1.996	6.250	1.581	6.000	3.071
Karbala	8	5.938	1.148	6.875	0.876	6.813	0.961	6.875	1.664	6.063	1.990

Displaying the results of means, standard deviations, correlation factor, fault percentage and reference percentage between the defensive skills and the results of the matches for the professional players in the Iraqi Handball Premier League.

Table (4). Shows means, standard deviations, correlation factor, fault percentage and reference percentage between the defensive skills and the results of the matches for the professional players in the Iraqi Handball Premier League

Statistical variables Defensive skills	Unit	Matches	M	±SD	Correlation factor	Fault %	Reference
Results	Point	8	20.300	2.902	-	-	-
Attacking the offender	Point		6.850	2.179	**0.727	0.000	Incorporeal
Covering	Point		6.913	1.884	**0.586	0.000	Incorporeal
Passing and receiving	Point		6.925	1.893	**0.508	0.001	Incorporeal
Blocking the fake	Point		7.038	1.956	**0.542	0.000	Incorporeal
Blocking the shoot	Point		6.313	2.438	**0.689	0.000	Incorporeal

Discussing the Results

It is clear from table (4) that the results of correlation between the defensive skills and the number of scored goals of the professional players in each of the five clubs that have professional players, that the correlation factor in the skill of attacking the offender and the results of the matches has achieved the higher correlation factor than the other skills. In that, it achieved heigh and positive correlation factor (0.727). The fault percentage was (0.000) . The researcher states that the reason behind this is that the defending process requires high balance and correct timing. Therefore; it depends on the movement forward, back ward.[5] Thus it requires explosive strength to prevent the offender from breaking through nor shooting. The more the explosive strength in the feet the less the space the offender has for watching the goal.[6] As for covering skill, the results showed that there is a positive strong with the results of the matches, the correlation factor was (0.586). The fault percentage was (0.000). The researcher attributes this to the following idea: covering process is a prediction to the coming movement of the opponent. This requires from the defender to use the highest speed to the defensive covering. It also requires from the defender to have high concord, feet speed in addition to other parts of his body so that he can do the defensive duty. " It is the ability of neuromuscular system to respond quickly to the stimulus".[7] While the skill of passing and receiving has a correlation factor of (0.508), fault percentage of (0.001) this skill has positive relationship with the results of the matches. Despite achieving the least correlation factor, but it has no less importance than other defensive skills. The researcher attributes this decrease to the probability to decreasing level of fitness, or to the physical body mass of some players, or reaching the highest physical effort.

Developing the speed of the response is not the basic thing, but it should be linked with the correction and accuracy of the response. A quick wrong response and a slow correct response do not lead to the best results.[8]

The skill of blocking the fake has correlation factor of (0.542) and a fault percentage of (0.000). This certifies that there is incorporeal positive relation between the two variables. The researcher attributes that it is one of the most important defensive skills that the player should be trained to, continuously and all the week. And through which the defensive duty of the defending team may achieve success and make the planned offensive duty of the opponent. It can be implemented individually "the continuous training helps and the systematized training helps mastering the defensive plan of the player because each of them integrates the other and cannot be split during the training. Despite all that, training should be graded from the easy to the hard. According to what the player can accept as a habit. The coach should degrade from the individual to the team training play".[9]

While the skill of blocking the shoot and distracting the ball has a correlation factor of (0.689) and fault percentage of (0.000). The attribution of the researcher is the process of blocking the shoot can be individually and in group. In that, defender pretend, in front of the offender to tempt that there is a chance to shoot .But in fact it is a process used by the defender to get the ball and make the counter attack or, lessen the strength of the shoot so that it will be easier for the goal keeper control it.

Naturally this requires from the defender to have a good predicting to the skilful movements. Sometimes the offender can fake the offender and block in the suitable.[10]

Conclusions

The experience of some professional players in standing correctly and in the suitable time came from professional thinking reflects the higher interesting in such a skill in their training and competing to make the skill achieved high correlation. The skill of blocking the shoot and distracting the ball has achieved a high correlation marks because of the tall of some professional players in the accuracy of the correlation. There is no early and enough setting up to the competition.

And the contractions with the professional players who are not qualified in the aspect of fitness. The passing and receiving skill among the players needs harmony between all the players and the high fitness. This skill achieved less incorporeal correlation than other skills. The skill of blocking the fake did not achieve high correlation mark because of the body mass of some professional players. The passing and receiving has got less correlation marks because there is no harmony between some professional players and the rest.

Prevalence of Syphilis in Blood Donors Over One Year in Karbala Governorate, Iraq

Salim Hussein Hassan

Assist Prof. Community Health Department, Technical Institute of Karbala, AL-Furat Al-Awsat Technical University, Iraq

Abstract

Syphilis is the disease that caused by Treponema pallidum bacteria. Blood transfusion is the main ways of spreading the disease. A current study was planned to determine syphilis prevalence in the donor blood of Karbala by detecting Treponema pallidum antibodies in the serum of these people. The study included a blood sample of 30,716 Blood samples donated within one year to detect syphilis antibodies by ELISA testing. Out of 30716, 233 (0.76 percent) of blood screening results were positive for syphilis. Males (0.74%) were much higher than females (0.02%), $p < 0.01$. The association between the syphilis infection positivity and age group showed a high percentage of age group infection (25-55) years, but it was not significant. The prevalence of syphilis among voluntary blood donors in Karbala city, Iraq, was concluded to be low.

Keywords: *syphilis, Treponema, blood donor, spirochetes.*

Introduction

Blood is one of the primary constituents of the body, which flows all over the body and becomes a motive for survival. Because of the lack of artificial blood replacements, human blood transfusion is one of the most critical elements of treatment and process[1]. Donating blood is a major activity that saves millions of lives. Uncertain transfusion processes, however, carry the risk of transfusion-borne infections. Nevertheless, unclear transfusion approaches increase the risk of transfusion-borne infections. Estimate the prevalence between blood donors of transfusion-borne infections such as hepatitis B virus (HBV), hepatitis C virus (HCV) and syphilis antibodies or antigen,can detect the question of secret infections in prominent members of the general population and also provide a fact that is significant in the formulation of transfusion-borne infections. It can also provide us with a guide on the severity of certain venereal diseases in the population[2]. Treponema pallidum is a subspecies of spirochete bacterium which causes treponemal diseases including syphilis and yaws. It is not seen on a Gram-stained smear because the organism is too thin T. pallidum is a mobile spirochete usually acquired by near-sexual contact, reaching the host through squamous or columnar epithelium breaches[3]. It can also be spread by transfusion of blood. Blood screening is widely used and required before surgery and before marriage to prevent multiple blood-borne microbial infections among the general population. The World Health Organization (WHO) estimates that every year there are twelve million new cases of syphilis, with the largest number of reported cases in Asia[4]. Syphilis can be transmitted via sexual contact and indirect routes: infected objects, tattoos and blood transfusions[5,6]. Blood transfusion is one of the main routes of disease transmission; the incidence of syphilis antibodies in Asian and African blood donors

is relatively mild to moderate[7].Syphilis is an infection caused by the spiral-shaped, gram-negative, highly mobile Treponema pallidum bacterium.[8, 9]. It can also be transmitted during pregnancy or at birth from mother to baby, resulting in congenital syphilis [10].It is typically not possible to contact syphilis by toilet seats, daily activities, hot tubs, or utensils or clothing sharing [11], mostly because the bacteria die very quickly outside the body, making it extremely difficult to transfer objects.[12]. The World Health Organization (WHO) conducted a study on the prevalence of four sexually transmitted diseases: chlamydia trachomatis, Neisseria gonorrhea, syphilis and trichomonas vaginitis. Syphilis has been found to account for about 10 percent of these sexually transmitted diseases [13]. Syphilis can cause severe effects such as damage to the aorta, heart, ears and bones if not treated. Such results may be fatal in some cases [14]. In Iraq, several surveys created for the identification of syphilis among the general population, such as Saleh [15] (2010), which assessed the incidence of specific treponemal antibodies in blood donors in the city of Baghdad (1, 75 percent), While Al-Badry[16] was found to have syphilis among men in 2012, 165 (0.91%) were found to have reached 60 (0.32%) in 2010 and 90 (0.49%) with major differences in 2011. According to our knowledge, there is no study conducted in Karbala City to determine the rate of Treponema pallidum infections among blood donors and therefore, between January and December 2018, we conducted a survey of the prevalence of syphilis among all blood donors in Karbala over a one year period.

Materials and Procedures

The work population was the subject donating blood at the primary blood bank of Karbala Town. Maximum of (30716) blood donors from January to December 2018 at the main blood bank. The research covered different age groups;on the same day, analysis is always carried out. From each individual included in this study, 5-10 ml of blood was taken and placed in gel tubes to allow it to coagulate at room temperature (20-25 ° C), then the sample was isolated by centrifugation at 3000 rpm for 5 minutes. Syphilis has been tested for all blood samples by ELISA techniques using the automated process of Treponema pallidum Hemagglutination Assay (TPHA).

Inclusion Criteria: The population selected for this research includes physically healthy people between the ages of 20-65 with a weight of not less than 50 kg, hemoglobin not less than 12.5 g/dL, good pulse and blood pressure that came to give blood at the blood bank center.

Exclusion Criteria: Over the past two months, donors exempted from this fieldwork include blood donors. In addition, those with anemia and jaundice over the past six months and those involved in high-risk activities such as sexual abusers and drug addicts are removed.

Statistical Analysis: Until entering the data in Microsoft office excels worksheet, data were collected and checked to determine the prevalence rates and percentages. The data was then analyzed using the Social Sciences Statistical System (SPSS, v.18).

Results

Among 30716 blood donors, between 22 years of age and 65 years of age, who came to donate blood at bank, using the ELISA technique, 233 (0.76 percent) had a positive syphilis result. The prevalence of syphilis among men who came to donate the blood was 0.74% and the prevalence of syphilis among women who came to donate the blood was (0.02%) and there is no substantial difference between the numbers of blood donors over the months of the year as shown in figure (1).

Of the 233 anti-syphilis positives recruited in this sample, only 5 (0.02%) were females and 228 (0.76%) were males. On the other hand, as shown in Figure (2), statistical analysis showed a significant correlation, $p < 0.0001$.

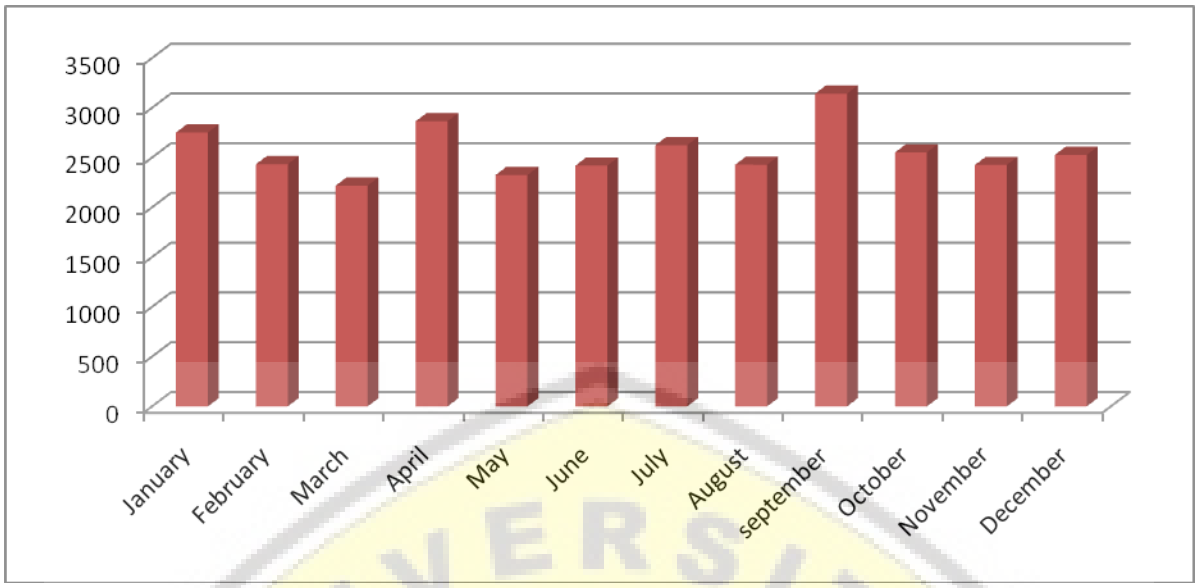

Figure (1): Show the number of donors according to month

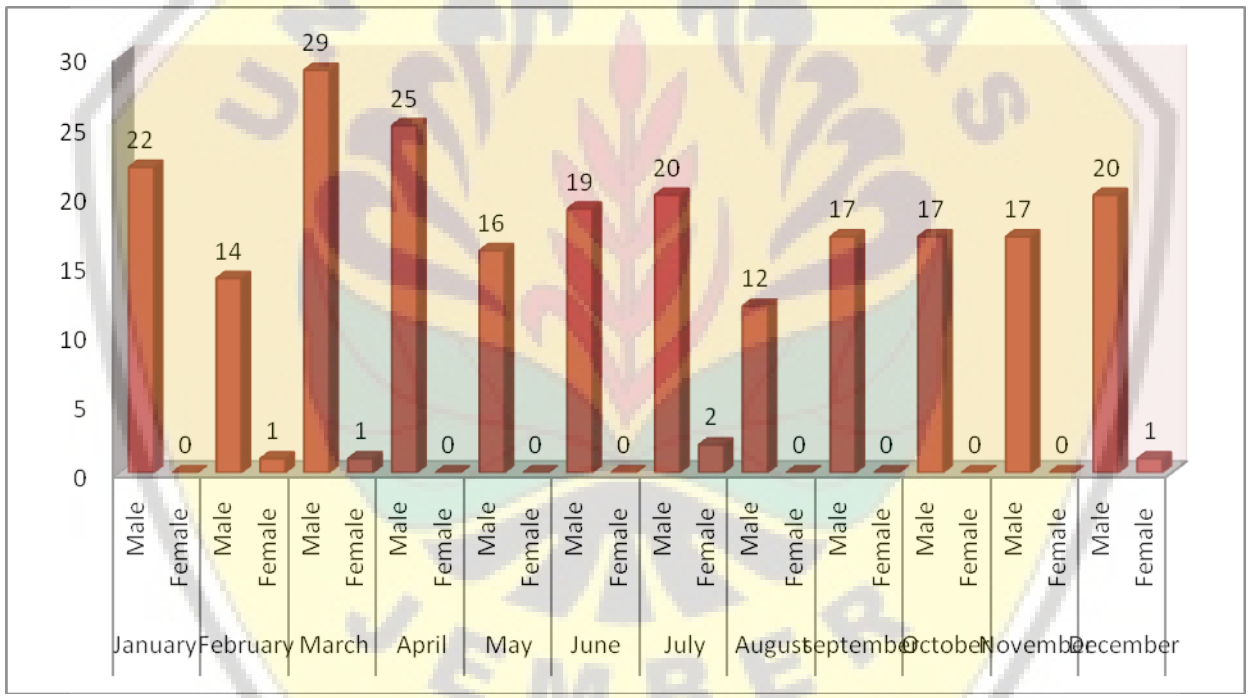

Figure (2): Show the number of positive cases according to gender

Discussion

The current study, which included 30,716 volunteers to donate blood within one year in the province of Karbala, found that the percentage of syphilis among these donors was 0.76 percent, as well as the plurality of infected donors in the 25-55 year sexually active age group. Several studies deal with the prevalence of syphilis in blood donors in Arab and foreign countries where the rate of prevalence varies. In a study conducted by[17] in Saudi Arabia, syphilis was shown to be 0.53 percent and [18] in China to be 0.88 percent and [19] to be 3.1 percent in Pakistan and [20] to be 1.09 percent in the city of Anbar and [21] to be 0.26 percent in Basra.

Compared to other studies, the prevalence of syphilis in blood donors in Karbala was low, although many people from within and outside Iraq visit the city,

which makes the chance of transmitting such diseases more than expected, resulting in this proportion of syphilis prevalence in healthy people. The increase in people's sexual performance mainly after the time of transition that has a major role in this change due to either emotional stress or the presence of invitations in the new lifetime that make many people overlook their conviction which makes it happen. The importance of blood donor syphilis seroprevalence is valuable information that will help us identify the unknown percentage of population that overcomes infections and reduce the risk of transfusion-borne infectious agents. The screening of all prospective blood donors for all transfusible infections is our recommendation. Blood sample positive for syphilis should be dismissed and treated properly by the affected donor. The prevalence of low population Treponema pallidum in Karbala city was concluded.

Ethical Clearance: The Research Ethical Committee at scientific research by ethical approval of both environmental and health and higher education and scientific research ministries in Iraq

Conflict of Interest: The authors declare that they have no conflict of interest.

The Effect of Some Teaching Strategies According to the Criteria for Ensuring the Quality of Teaching and Learning for Snatch and Jerk by Weightlifting for Students

Alaa Khaldoon Zaidan[1], Hasanain Aali Kadhim Al Hussein[2], Mohammad Faez Sahe[2]

[1]Lecturer, [2]Assist. Lecturer, University of Al-Qadisiyah/The College of Physical Education and Sport Sciences/Iraq

Abstract

The research contained the introduction and the importance of the research, as it touched on teaching strategies and the criteria for ensuring the quality of teaching and learning and its prominent role in the educational process, as well as identifying the hijacking and interchangeable lifters that researchers used in weightlifting. The importance of research lies in the impact of strategies on the criteria of ensuring the quality of teaching in the learning process.

The importance of research was demonstrated by using standards of quality assurance of learning to choose appropriate strategies in learning by teachers to expand their perceptions, which are reflected in their application of skill performance and reaching a better level in learning the effectiveness of weight lifting and delivery Modern information for them and thus their education in a strategy in accordance with the standards of quality assurance and this is what made this idea one of the ideas that invited researchers to go through to reach the educational process to the highest levels. As for the research problem, it is summarized that the researchers see that the many teachers do not take into consideration the strategies according to a correct standard in learning the snatchs and the winter. The main axes related to the research topic were also discussed, as they included the concept of learning and teaching, Teaching strategies, quality and standards and their role in the educational process and the activities in research. The researchers used the experimental approach it is appropriate for the nature of solving the research problem, as the results were presented, analyzed and discussed for the results of the activity evaluation of the three groups, through which the achievement of the research objectives and hypotheses was reached.

Keywords: *Teaching strategies,quality and weightlifting.*

Introduction

Due to the many changes and developments that the world is witnessing today in many areas of life, the tasks of teachers have multiplied and their roles and jobs diversified, all of which led to great interest in preparing teachers for the necessary professional preparation and developing the programs of institutions that prepare it to keep pace with new tasks and jobs.

The concept of quality is one of the modern concepts that have emerged as a result of intense global competition in various fields and it has become a guarantee of quality from the main issues in education at the global level and the weightlifting game that contains many lifts is considered one of the games that makes the learner feel happy while learning its activities. Various, weightlifting is a sporting activity that uses skills as an important basis for progress and player level integration.[1]

The quality of learning depends on choosing the optimal strategy in the learning process and thus delivering the information to the learner's mind in the correct manner and according to a real standard in the choice. The research problem lies in the lack of teachers 'reliance on real criteria in choosing the optimal strategy in teaching that corresponds to the requirements of the modern era in learning. To choose a problem, he was able to define the appropriate criterion for choosing the teaching strategy and to clarify which is better in the learning process for the colleges of physical education and sports science in general and the activities under

study in particular and this in turn helps in developing the process of Learn and reach out to the best levels.[2]

The Purpose of the Study: The importance of research was demonstrated by using quality assurance standards for learning to choose appropriate strategies in learning by teachers to expand their perceptions, which are reflected in their application of skill performance and reaching a better level in learning the effectiveness of weightlifting and the delivery of modern information to them and thus teaching them a strategy in accordance with quality assurance standards and this is what made this idea one of the ideas that researchers called for to take the educational process to the highest levels.

Method and Procedures

Society and Sample Search: The researchers have identified the research community as first-graders in the College of Physical Education and Sports Science - Al-Qadisiyah University for the academic year (2018-2019) and they are (168) students distributed among (6) people, with (25) students for each division which is (A-B-) C - D - E - F) As for the sample, it was chosen randomly and by lottery strategy, as three divisions (C - E - D) were chosen to be the research groups that work with the chosen method. (17) Students were chosen from each division, representing 10% of the parent community.

Study Design: The researchers used the experimental approach with a design (equal group's strategy) that suits the nature of the research problem.

Tests Used in the Search: The researchers prepared a questionnaire to determine the most appropriate test to evaluate the technical performance of each of the weightlifting activities, snatch and winter. This form, which contains (3) tests for each skill, was presented to a group of experts and specialists in the field of weightlifting. The (technical performance) test was nominated for the effectiveness the lift by the squatting method) for the hijacking efficacy, as well as the test (technical performance of the jerk lifting efficacy by opening the two legs way) was nominated for the jerk efficacy.[3]

For the purpose of specifying criteria for teaching method, researchers selected a set of criteria and designed a form for these standards, after which they were presented to a group of experts and specialists in the field of teaching method to indicate the validity or invalidity of the standards or to amend them and after collecting the form to identify the answers and observations of experts And with specialists, it was found that most experts agreed on the basic criteria found in the form after (4) of the paragraphs were modified and (5) of the paragraphs were deleted until the final criteria form was reached and Table (1) shows the percentage of experts agreeing on quality assurance standards.

Table 1: Determining the relative importance of the method according to the criteria for ensuring the quality of learning

S	Strategy	Estimated total	Relative importance	Type of indication
1	Training strategy	360	40.80	Does not depend
2	Strategy of the matter	310	34.00	Does not depend
3	Initiative strategy	420	46.70	Does not depend
4	Self-teaching strategy	400	49.1	Does not depend
5	Exchange strategy	600	77.55	Depends
6	Bifurcation strategy	730	82.54	Depends
7	Individual Program Strategy	310	34.35	Does not depend
8	Inclusion and inclusion strategy	410	46.56	Does not depend
9	Self-review strategy	355	40.9	Does not depend
10	Discovery strategy	735	85.9	Depends

Main Experience: The educational curriculum was implemented on the activities under study and the educational curriculum for the three experimental groups included (16) educational units distributed over (8) weeks and an average of two units per week. The work begins by dividing the sample into three experimental groups. The first group, Division (C), works in the exchange strategy, while the second group, Division (E), works with the bifurcation strategy, while the third group, Division (D), works with the discovery strategy.[4]

- The subject teacher explained the skill and presented it well and clearly to help identify the correct form of skills and how they are performed in the three experimental groups.
- The subject teacher, when performing the experimental group for the activities approved for them, monitors and follows to achieve order and calm.
- Upon completion of each educational unit, practical evaluation tests are conducted for the activities or duties that were carried out during the lesson and it is another educational method that introduces each student to the level he achieves and provides him with experiences that enable him to learn the characteristics, concepts and principles related to the skills to be learned and also helps to reveal strengths and weaknesses in performance.

Results

Discussions

Discuss the pre and posttests of the technical performance of the activities under discussion for the first experimental group (exchange strategy): By presenting the results of Table (2) and analyzing it, we notice that the exchange strategy has had a positive impact on learning the technical performance of events (snatch- jerk). Where researchers see that the exchange strategy is one of the strategies that depend on transferring information from the teacher to the observer student who is considered a leader in the educational process, which allows him to participate effectively in the lesson and thus create a spirit of learning and a desire to show tendencies and needs as this strategy worked to create social relationships and work with Others and students work for every two (two) spouses, one of whom performs and the other gives feedback and behavioral decision-making during the lesson. Thus, we can say that the teaching method and their classifications depend primarily on the amount of student participation in the lesson as well as that. This strategy provides the learner with a key role in the learning process by interacting with his colleague and teacher directly according to previously prepared duties and using direct feedback. This is confirmed this strategy provides frequent opportunities for learning on duty with someone who is particularly involved in the monitoring process.[5]

Discussing the pre and posttests of the technical performance of the skills in question for the second experimental group (the branch strategy): By presenting the results of Table (3) and analyzing it, we notice that the branched strategy has had a positive impact on learning the technical performance of the activities (snatch - the jerk).This indicates the effectiveness of the cross-learning strategy in learning, as this strategy allows the learner to discover and perform a number of options resulting from a set of mental responses that lead him to choose the optimal solution and the best result within the subject of the lesson as the learner makes decisions about the required duties within his ability to branch and search And the choice is given by more than one choice and since the fields of physical education and sports, including weightlifting, are rich in opportunities for discovery, as the learner here enjoys diversity, branching, movement and performance. The cross-sectional strategy that requires the learner because decisions about the required duties within its capabilities and its ability to bifurcation and research including beyond known things.[6]

The researchers also attribute the development that took place in the second group that used the branched strategy to that this strategy was close to the levels of the sample individuals, as well as that the branched strategy gives all freedom to the student and is not restricted in terms of the answer and it has a spirit of vitality, fun, love of competition and adventure. "One of the important method to increase the learner's motivation in learning is suspense and excitement and the need for it increases when doing mathematical skills education, which makes the student see education as an enjoyable thing and gives him activity and vitality.[7]

Discuss the pre and posttests of the technical performance of the skills in question for the third experimental group (discovery strategy): By presenting the results of Table (4) and analyzing it, we notice that the discovery strategy has positively affected learning the technical performance of the skills (snatch-jerk). The researchers attribute the reason for this development in the performance of snatch and winter activities to the strategy of discovery, which is one of the method that are in line with the requirements of development in the sports field, especially in learning the effectiveness of weightlifting for junior students, it is one of the method that depend on the relationship between the student and the teacher.[8]

Questions by the teacher, thinking and giving an answer by the learner and therefore this partnership in the process of discovery depends mainly on the mixing of the teacher's experience that appears by formulating questions about the skill to be learned. The researchers believe that the student, through the strategy of discovery, which increased his cognitive awareness of motor skill, as the student helped to get rid of delivery to others and the old dependency method, which led to the development of creativity and innovation and the development of mental and physical competence and arousing motivations through the love of discovery, as discovery is a process of thinking It requires the individual to reorganize and adapt his information in a way that enables him to see new relationships that he had not previously known.[9]

Discussion of the dimensional tests of the technical performance of the activities under discussion for the three experimental groups: By presenting the results of Table (5-6) in skill performance and analyzing it, we notice that the discovery strategy has affected positively and came first in learning the technical performance of weightlifting activities (snatch - jerk).And thus transfer the learner From the role of the imitator to the model given to him by the teacher to the role of the producer of movement through the conjunction of the learning process practical application with a process of thinking that comes from a complete awareness of each part of the skill as a result of the learner's thinking during the process of discovery with The details of the movement and hence the full realization of the movement Cognition plays an important role in solving the problems facing an individual who needs to be always aware of the elements of the situation he is facing so that he can always overcome changing circumstances and that correct thinking is only after a correct awareness of all parts of the educational situation.[10]

Conclusions

1. All teaching strategies are reliable in learning according to the teaching situation.
2. The preference for strategies in the learning process for hijacking and wintering is (discovery strategy - forked strategy - reciprocal strategy).
3. The discovery strategy is the best type of strategy in learning the activities of snatch and weightlifting.

The Effect of (Stairs, Gravity) Exercises in Developing Some Physical Abilities of the Muscles of the Legs and Improving the Achievement of the Long Jump Competition for Youth

Husam Abdulkadhim Raheema[1], Muslim Mohammed Sabit[2], Meqdam Abdulkadhim Raheema[3], Hayder Naji Habash Alshawi[4]

[1]Lecturer/The Islamic University/Iraq, [2]Lecturer/Ministry of Education/AL-Najaf education Directorate/Iraq, [3]Lecturer/University of Kufa/Faculty of Physical Education and Sports Sciences/Iraq, [4]Prof. University of Kufa/ Faculty of Education for Girls/Department of Physical Education and Sports Sciences/Iraq

Abstract

The study aimed to prepare exercises (stairs, weight) to develop the physical abilities of the muscles of the legs and to know the impact of the exercises in improving the achievement of the long jump competition for young people, during which the researchers used the experimental approach (and by designing the two equal experimental groups with pre and posttests) to suit the nature of the problem and reach the achievement of the research goals. After the research community identified the young players for the long jump competition, whose ages ranged between (18-19) years, they were divided for the purposes of the search experience by (4) players for each of the first experimental (ladders) and the second experimental (gravity) research groups and each player was given (3) Attempts with a total of (12) attempts per group and they represent the young players for the long jump competition in the provinces of the Middle Euphrates. After completing the testing and measurement process for the research variables, the results of the research were extracted after statistical treatment. Including the researchers reached several conclusions, the most important of which were the following:

The (stairs) exercises to develop some physical abilities of the muscles of the legs were more influential in the development of (explosive ability, the force characterized by speed, the maximum speed) and the achievement of the competition compared to the exercises used in the (weighting) method.

Keywords: *Stairs, weight training and long jump competition.*

Introduction

Athletics is witnessing a great development at the present time and world records and high levels of sports have been achieved based on natural and human sciences such as sports training science and kinetic learning and other sciences. In recent times, sports training has taken new perspectives and different dimensions as it represents an organized and sequential process that aims to developing physical and motor capabilities through continuity in the training process and adopting modern training method that give priority to the type of training and the best method.

The long jump competition is one of the distinguished competitions in athletics, as it requires high physical and mobility capabilities and that the tremendous development in the level of digital achievement of this competition indicates to us that it is not possible or difficult for the player and coach to exceed these high levels by relying on the traditional training method used but rather, by relying on modern training method within

Corresponding Author:
Hayder Naji Habash Alshawi
Prof. University of Kufa/Faculty of Education for Girls/ Department of Physical Education and Sports Sciences/ Iraq

the prepared training programs. Therefore, the trainers are required to place the developed exercises for physical and motor capabilities within the training program in a manner that is commensurate with the requirements of this competition.[1]

The researchers found that some long jump coaches in Iraq are still using traditional exercises such as weight training in their training programs, which are in fact exercises that increase the strength at the expense of speed and thus do not achieve the required results compared to the development taking place in the achievements during the world championships. Studying this problem and developing exercises that develop the physical abilities of the muscles of the legs in the long jump competition for youth in order to obtain the best results and improve achievement. One of the most influential physical abilities in achievement is the explosive ability, the strength marked by the speed of the muscles of the legs and the top speed, as the players 'victory is often attributed to their superiority in these abilities. Here lies the importance of research, especially when it is concerned with improving the achievement of young players in the long jump competition through training (stairs, gravity) dedicated to developing these capabilities and thus improving the achievement of this competition.[2]

Practical Part:

Field Search Procedures: All scientific research resorts to solving its problems to choose an approach appropriate to the nature of the problem and the method is the method or method used by the researcher in his research or study of his problem and access to solutions to it, researchers should use the experimental approach (and design the two experimental groups equal), as the experimental approach the most sincere approach to solving many scientific problems, in a practical and theoretical way, represents the young players of the long jump competition in the clubs of the Middle Euphrates governorates, who are between the ages of (18-18 years) and whose number is (12) players. (8) Players and They were randomly assigned to two experimental groups with (4) players for each group, after which the researchers found homogeneity between the two groups in variables (length, mass, training age) using the law of torsion, as the value of the torsion coefficient appeared to be confined between (±1), which indicates Homogeneity of the two individuals, as shown in Table (1):

Table 1: Shows the homogeneity of the sample

Variables	First Experimental (stairs)			Second Experimental (gravity)			Statistical significance
	Mean	SD	Skewness	Mean	SD	Skewness	
Length (Cm)	178	13.8	0.849	177	13.4	0.522	Homogeneous
Weight(Kg)	74.3	1.119	0.498	74.18	1.040	0.081	Homogeneous
Training age (Month)	26.4	2.854	0.913	24.9	2.901	0.415	Homogeneous

Table 2: Shows the mean and standard deviations for the first and second experimental groups in the study variables

Variables	First Experimental (stairs)		Second Experimental (gravity)		(t) value	Significant value	Statistical significance
	Mean	SD	Mean	SD			
The explosive power of the legs	2.301	0.121	2.279	0.115	1.573	1.257	Non sig.
Distinguished strength at the speed of the legs	33.253	2.214	33.452	2.148	0.975	1.146	Non sig.
Top speed (30) meters	3.322	.0610	3.332	0.059	1.265	1.251	Non sig.
Achievement	6.224	0.384	6.199	0.359	1.435	1.293	Non sig.

Also it was necessary for researchers conducting the process of parity to make sure that the two groups in the start line and one for the variables of the studied research which is (the ability of the explosive of the legs, distinctive and power as quickly as the legs, maximum speed (30 meters) and the achievement of the effectiveness of the long jump) as shown in the table (2).

Determine the physical abilities of the legs muscles and appropriate tests to measure them: After reviewing the relevant references and resources, the researchers identified some physical abilities of the men's muscles and the appropriate tests to measure them, as shown in the following table:

Table 3: Shows the physical abilities of the men's muscles and the appropriate tests to measure them

S	Ability	Tests
1	The explosive power of the legs	The long jump of stability
2	Distinguished strength at the speed of the legs	Long jump forward for 10 seconds
3	The maximum speed for the legs	Enemy (30m) from Flying Start

Description of the tests:

First: the explosive power of the legs, (the long jump of stability):[3]

- The purpose of the test: To measure the explosive muscle power of the muscles of the legs.
- The tools used: flat ground that does not expose the individual to slipping, a tape measure, drawing on the ground a starting line.
- Registration: calculates the distance.

Second: The force marked by the speed of the legs:[4]

Test name: Long jump forward for 10s:

- The purpose of the test: to measure the force distinguished by the speed of the legs.
- The tools used: a tape measure - the pitch - a stopwatch - a whistle.
- Registration: The laboratory records the largest distance traveled during the test time of (10) seconds and is given three attempts and the duration of rest between one attempt and another (5-7) minutes to restore recovery and the best attempt is recorded for him.

Third: The maximum speed for the legs:[4]

Test name: Enemy (30m) from Flying Start

- The purpose of the test: to measure the maximum speed.
- Instruments and devices used in measurement: a stopwatch and three parallel lines drawn on the ground. The distance between the first and second lines (10) meters and the second and third lines (30) meters.
- Registration: The recorder records the time taken by the runner tested on his form per second and for the nearest (0.01) second.

Fourth: Measuring achievement for long jump:[5]

Test name: Measurement of achievement for long jump:

- The purpose of the test: to measure the achievement of long jump.
- The tools used: a tape measure - a long legal jump court.
- **Performance specifications:** The player performs the long jump race in the legal way and the way in which it is accustomed to during training for the purpose of measuring the jump distance.

Pre-test: The researchers conducted the tribal tests on 20/12/2018 in the Najaf Sports Club stadium, as the research sample consists of (8) runners, ranging in age from (19-18) years.

Post-test: The post-test were conducted on 27/2/2019 for the individuals of the research sample in the Najaf Sports Club stadium, taking into account the conditions and instructions for carrying out these tests under the same available conditions and capabilities used in the initial (tribal) tests.

Statistical Means: The researchers used the Statistical Package for Social Sciences (SPSS).

Results and Discussion

Table 4: Shows the effect of stairs training in developing the most important physical abilities of the muscles of the legs and improving the achievement of the long jump competition for youth

Variables	Pretest		Posttest		(t) value*	Statistical significance
	Mean	SD	Mean	SD		
The explosive power of the legs	2.301	0.121	2.611	0.098	3.148	Sig.
Distinguished strength at the speed of the legs	33.253	2.214	36.568	2.187	4.051	Sig.
Top speed (30) meters	3.322	.0610	3.125	0.054	2.879	Sig.
Achievement	6.224	0.384	6.728	0.371	4.238	Sig.

* The tabular value (t) is (1.796) at the significance level (0.05), the sample size (12) and the degree of freedom (11).

Table (4) shows the statistical estimates obtained by the young long jump players. Which showed the effective effect in developing the physical abilities of the muscles of the legs and improving the achievement of the players included in the research and representatives of the first experimental group, which was trained in the style of stairs.

The progress in the physical abilities of the muscles of the two legs is attributed by the researchers to the use of stairs exercises that work effectively to develop (the explosive ability of the two legs, the force characterized by the speed of the two legs) by focusing their effect on the muscles of the legs, thighs and buttocks, so the stairs exercises have a great role in making muscles the legs are able to work with strong contractions and as quickly as possible and increase their systolic capacity, which helped in the development of their efficiency to achieve the required strength and speed during performance, as the amount of muscle strength exerted in training the stairs is large to overcome the force of attracting the Earth at the moment of pushing force The strength and speed that accompanied it to move the center of body mass, which gave in its final outcome the greatest possible ability exerted by the player during training.[6]

As for the maximum speed, the explosive power and speed-specific strength training for the legs in which the stairs exercises were specialized, especially exercises that develop strength and ability mainly worked in developing the maximum speed in terms of speed correlation and development with the explosive capacity and the distinctive speed of the speed for the legs (the speed and strength training leads to improved work The brain sends nerve signals to the motor units involved in the muscle work and then produces more speed and strength in the muscle work, because of its effective contribution to increasing the length and frequency of the step. One of the basic principles for improving the maximum speed is proportionality the optimum between step length and frequency.[7]

Table 5: Shows the effect of weight training in developing the most important physical abilities of the muscles of the legs and improving the achievement of the long jump competition for youth

Variables	Pretest		Posttest		(t) value*	Statistical significance
	Mean	SD	Mean	SD		
The explosive power of the legs	2.279	0.115	2.451	0.081	3.059	Sig.
Distinguished strength at the speed of the legs	33.452	2.148	35.126	1.987	3.984	Sig.
Top speed (30) meters	3.332	0.059	3.219	0.047	2.547	Sig.
Achievement	6.199	0.359	6.506	0.143	3.875	Sig.

* The tabular value (t) is (1.796) at the significance level (0.05), the sample size (12) and the degree of freedom (11).

Table (5) shows the statistical estimates obtained by the young long jump players. Which shows the effective impact in developing the physical abilities of the muscles of the legs and improving the achievement of the players included in the research and the representatives of the second experimental group, which was trained in the method of weighting.

The weight training exercises that researchers used is of great importance in developing the explosive capacity and the distinctive speed of the muscles of the legs, which depend on the basis of the lengthening and shortening of the muscle fibers, which led to an improvement in the speed of contraction and extensibility in the muscle.[8]

At the maximum speed, the researchers attribute the development of the individuals of the sample to the explosive power exercises and the speed's distinctive strength for the legs, as it included various exercises such as jumping, jumping and sprinting at different distances that led to the participation of the largest number of fast-rising muscle fibers and the improvement of the efficiency of the nervous and muscular systems in sending the neurotoxic to the working muscles Which had a great impact in increasing both the length and frequency of the step and thus improving the maximum speed of the players.[9]

Table 6: Shows the significance of the differences for the variables between the first two experimental groups (stairs) and the second (weighting) in the post measurement

Variables	First Experimental (Stairs)		Second Experimental (Gravity)		(t) value*	Statistical significance
	Mean	SD	Mean	SD		
The explosive power of the legs	2.611	0.098	2.451	0.081	2.295	Sig.
Distinguished strength at the speed of the legs	36.568	2.187	35.126	1.987	2.316	Sig.
Top speed (30) meters	3.125	0.054	3.219	0.047	2.264	Sig.
Achievement	6.728	0.371	6.506	0.143	2.521	Sig.

* The tabular value (t) is (1.717) at the significance level (0.05), sample size (24) and freedom degree (22).

From table (6) as for the maximum speed, the jogging exercises up the stairs were distinguished from all other jogging exercises, as the jogging steps in them were compelled by a fixed length by the factors that granted the privacy of development according to that method and among those factors that obligated that particularity are the angle of inclination of the ladders and the amount of degree of inclination angle The intensity of the performance rises and decreases accordingly.[10]

Among the requirements of these determinants when running stairs is the obligation of the player to take steps of approximately constant length imposed by the horizontal dimension between the degrees as well as raising the man's knee high to take the step and with almost constant heights and to raise the knee to the leader, it is imperative that the referee man take the full extension combined with the active pushing force of the instep and overcome On the force of the ground's attraction to the body, which leads to the intensity of the tension of the posterior muscles of the leg in order to obtain the force required for the movement of the player's body and among these compulsory measures taken by the members of the first experimental group of stairs exercises generate the optimum way to the art of running, as these movements are indications of good technique for the speed of players at the highest levels and the inevitability of those elected mechanical applications and the repeated practice of running upwards for the prescribed training period created the adaptations that happen to gain strength for the legs with the force of motivation and the skillful learning of fast running.[11]

Conclusions

The (stairs, weight) training to develop some physical abilities of the muscles of the legs had a moral effect in

improving the achievement of the players of the young long jump competition, as well as the (stairs) exercises to develop some physical abilities of the muscles of the legs were more influential in the development of (explosive ability, strength characterized by speed, Maximum speed) and achievement for the competition compared to the training used in the (weighting) method.

Comparison of Serum Levels of Male Sex Hormone between Smokers and Non-Smokers

Dlawer Ibrahim Ahmed[1], Aydin S. Ahmed[2], Khudhair Abbas Khudhair[3]

[1]Medical Laboratory Technician, Kirkuk Health Directorate-Ministry of Health/Iraq, [2]Assist. Prof., Medical Laboratories Dept. Technical College-Kirkuk- Northern Technical University/Iraq, [3]Assist. Prof., College of Medicine- University of Tikrit/Iraq

Abstract

Background: Male hormones played a key role in the differentiation and development of male sex. However, the effect of these sex hormones extends beyond their role in sex differentiation and growth. Cigarette smoking is considered one the main health problem and is predominant among males.

Aim: The aim of this study To elucidate the changes in the serum levels of male sex hormones due to cigarette smoking and its correlation with smoking.

Patients and Method :A comparative study conducted on 500 men - volunteers (250 smokers and 250 non-smokers) aged between 18 & 50 years .They investigated at Central Public Health Laboratory, Azadi Hospital and Kirkuk Hospital-Kirkuk using a personal interview and self-administered questionnaires from 1st of April to 15th of July 2019. Venous blood was collected and sera obtained and stored at -20°C for hormonal assay.

Results: There were significant (P<0.05) differences between the levels of TT, FT and FSH hormones in smokers and the levels of non-smokers, while LH level showed no significancy between smokers and non-smokers. Regarding the duaration of exposure to the tobacco, the correlation was negative for TT and FT with the amount of tobacco exposure (r-0.105). (r-0.078), but there was a positive correlation for FSH, LH (r 0.0008), (r0.037) TT, FT, FSH and LH levels are affected by the increase in cigarettes per day.

Conclusions: It is concluded that smoking is a positive and independent predictor of total testosterone, free testosterone and follicle stimulating hormone.

Keywords: *Total testosterone, luteinizing hormone (LH), follicle stimulating hormone (FSH), smokers.*

Introduction

Sex steroid hormones are produced in the gonads: (the testes in men and the ovaries in women). Sex steroid hormones are also produced from sex steroid precursors which origin from this adrenal cortex. Male hormones levels measured and reported in beat studies included total testosterone and unbound or free testosterone (FT). some studies have also demonstrated that men with low levels of free testosterone are at a higher risk of mortality[1-4] and that testosterone administration can increase the risk of cardiovascular adverse events as well.[5] In order to decrease the risks of sex hormones, it is necessary to identify the factors that influence hormone levels. Likely and potential relationship of a few elements, including age, cigarette smoking, weight list (BMI), liquor utilization and physical movement with hormone levels have been accounted for. It is accepted that ~34.9% of men overall are in the propensity for

smoking[7] and there have been broad Concerns in regards to the connection between testosterone levels and smoking. However, the reported effects of smoking on testosterone levels in men are debated, with some suggestion even signifying no association[8] and others reporting higher[9] or lower[4-6,10-13] levels of TT (total testosterone) among smokers compared to nonsmokers. These researches also recorded likewise incompatible reports concerning to correlations of smoking and free testosterone (FT), follicle-stimulating hormone (FSH) and luteinizing hormone (LH). Such divergences may be accredited to variation in results of these researches like; size of samples prospective confounders used for regulation and the procedures employed for assessing tobacco exposure. The aim of this study to correlate male sex hormones levels between smokers and non-smokers.

Materials and Method

A cross sectional study was carried out in Kirkuk city from April 1st 2019 to 15th of June 2019 on 500 smoker and non-smoker subjects. Their ages ranged between 18-50 years . They were presented in Azadi General Teaching Hospital, Kirkuk General Hospital and central health public laboratory An interview was carried out with these men using questionnaire form designed for study purpose and consisted :age, smoking, alcohol consumption and physical activity,present history, family and medical histories. A sample of 10 ml of intravenous blood was obtained from each individual and placed into two test tubes. The first tube contained 5ml for hormone test another tube contained 5ml for biochemistry test. Overnight fasting venous blood specimens were drawn between 7:00 and 10:00 AM. All serum samples were stored at -20°C until required for processing in the laboratory. Glucose, total cholesterol, triglycerides and albumin were measured enzymatically on a spectrophotometer (Biotech - U.S.A.) in the central health public laboratory, using original reagents form Les Hautes Rives 02160, Maizy, France. Serum luteinizing hormone, follicle stimulating hormone, free testosterone and total testosterone was measured by ELISA instrument (Biotech - U.S.A.) using reagents from Monbind, Inc. Lake forcest, ca 92630, usa.

Results

As shown in table 1 there was a difference between the smokers BMI (29.6+5.6) more than nonsmokers BMI (26.5+12.8) appeared to have significant P <(0.005). Regarding fasting blood sugar there was a difference between the level of serum sugar(mg/dl) in smokers (123.8±35.9) more than the level of serum sugar of nonsmokers (103.4±17.3) but no significant (p0.1868) . and there was a difference between the level of serum cholesterol (mg/dl) in men smoker (199.1±25.4) more than the level of serum cholesterol of nonsmokers (173.6±14.1) but it was non significant (p0.7346) . The level of serum triglyceride showed a significant difference (p<0.005)between the level of smokers serum (173.1±20.8mg/dl) more than the level of nonsmokers serum (151.8±11.1mg/dl).

Table (1): Mean values ± SD of age, fasting blood glucose levels, serum cholesterol, triglyceride of 500 adult men

Parameters	Total Number N = 500	Smokers N = 250	Nonsmokers N = 250	P
	M±Std	M±Std	M±Std	
Age	31.216±7.709	32.5±9.4	33.04±8.7	0.4354
Serum sugar (gm/dl)	113.6±29.9	(123.8±35.9)	(103.4±17.3)	0.1868
Alcohol consumption	35.2%	20.4%	14.8%	-----
Serum cholesterol (gm/dl)	186.3±2.41	199.1+25.4	173.6±14.3	0.7346
Serum triglyceride (gm/dl)	162.5+19.8	173.1±20.8	151.8±11.1	<0.005

Regarding total testosterone hormone there was a significant (p<0.005) difference between the level of total testosterone in smokers (5.03±2.16 ng/ml) less than nonsmokers (7.26±1.53ng/ml) table (2).Free testosterone hormone level showed a significant (p<0.005) difference between the level of total testosterone in smokers (15.15±2.16pg/ml) less than nonsmokers (25.42±6.37 pg/ml).Regarding Follicle-stimulating hormone level,

our results recorded a significant (p<0.005) difference between the level of the hormone in smokers and nonsmokers. It was 7.57±3.20mlU/mLand 9.3±3.13 mlU/mL, respectively. Inspite of nonsignificant differences were recorded in mean values of luteinizing hormone level between smokers and nonsmokers but it was obvious differences in the levels of two groups. These values were 1.54±0.58 mlU/mL and 1.40±0.35 mlU/mL, respectively. there was no significant difference in luteinizing hormone between smokers and nonsmokers (p<0.1336) .

Table 2: Mean values of serum levels of estimated Hormone in the smokers and nonsmokers after grouping

Hormones	All sample N=500	Smokers N=250	Nonsmokers N=250	p-values
Luteinizing hormones (mlU/mL)	1.47+0.4	1.54+0.58	1.40+0.35	0.1336
Follicle stimulating hormone (mIU/mL)	8.46+3.2	7.57+3.20	9.3+3.13	<0.005
Total testosterone (ng/mL)	6.15+2.17	5.03+2.16	7.26+1.53	<0.005
Free testosterone (pg/dl)	20.28+8.35	15.1+2.16	25.42+6.37	<0.005

Discussion

Smoking is a pernicious killer that disappears behind thick smoke curtains, leaving at least 4 million victims in one year and so fearful that this rate could reach 10 million (in 2020)[4]. Tobacco smoke contains more than 4000 hazardous agents, including nicotine, tar, carbonic monoxide, polycyclic aromatic hydrocarbons and heavy metals. Most studies have recorded decline in the quality of semen, reproductive hormone system and diminished spermatogenesis, sperm maturation and spermatozoa function as result of reproductive system in smokers.[14,15]

Several studies have reported that smoking may affect sex hormones. A study analyzed 255 men (90 smokers and 165 nonsmokers), aged 30 to 70 years, seen as in outpatient in a primary health service in Canoas and Nova Santa Rita cities, Southern Brazil, demonstrated that smoking could stimulate acutely the release of gonadotropin-releasing hormone (Gn RH) and LH moreover. It has also been suggested that smoking can increase testosterone levels by reducing estradiol[16,17] additionally, the effects of smoking on male sex hormones levels are related to personal smoking history and TT, FT. Follicle-stimulating hormone and LH are synthesized in the pituitary gland and act as important regulating hormones in Sertoli cell and Leydig cell function the 17 beta-estradiol (E) level was elevated and the levels of FSH, LH, were lower in smokers[18].

FSH and LH levels appeared to be inversely associated with heavy and light smoking in our study the effect of smoking on male sex hormones levels may be also mediated indirectly through another mechanism. Yardimci, et al studied the effects of long-term cigarette smoking reduces TT, FT, FSH biosynthesis[4] .Their findings implicit that smoking may result in a gradual decrease in male sex hormones levels following long – term exposure to the tobacco probably related to the toxic effects of smoke on Leydig cell[13]. These studies implied that a decline in serum levels of testosterone due to increase in liver metabolism in chronic cigarette smokers. In conclusion, secretory dysfunction of Sertoli and Leydig cells in the testis because of increased oxidative stress, DNA damage and cell apoptosis could play significant roles collaboratively in the overall effect of tobacco smoking on male fertility as a result of diminished sperm quality[19] .

Investigation the Physiological Role of Some Inflammatory and Anti-Inflammatory Biomarkers as Early Predictor Markers of Acute Myocardial Infarction

Mahdi H. Hammadi[1], Mustafa A. Al-Sheakh[1], Hiba Shaker Ahmed[2]

[1]Researcher/Ph.D./Department of Microbiology, [2]Researcher/Department of Microbiology, College of Science, AL-Karkh University of Science, Baghdad, Iraq

Abstract

The aims of our study are to evaluate the predictive value of plasma fibrinogen, C-reactive proteins (CRP) and interleukin -10 (IL-10) as early vascular risk markers in patients with myocardial infarction. To elucidate the subject, total 50 patients complained clinically from myocardial infarction (Forty patients of myocardial infarction and Ten healthy subjects as control group) were subjected to ELISA analysis for C-reactive protein detection. The following results were observed:

1. Highly significant increase ($p<0.01$) concentration levels of serum hs C-reactive protein (hs CRP) in AM.I.
2. Highly significant increase ($p<0.01$) concentration levels of plasma fibrinogen in AM.I
3. Significant increase ($p<0.05$) concentration levels of serum IL- 10in AM.I.

Highly significant increase in concentration of serum levels of CRP and plasma fibrinogen at AM.I. These biomarkers are important for ACS early detection. In addition, the elevated levels of serum IL-10 revealed the important role as anti-inflammatory markers use as early predictor of vascular risk markers in AM, I. We recommend doing further studies using another biomarkers to clarify the relationship between acute phase protein levels and anti-inflammatory cytokine and the CHD severity.

Keywords: *Myocardial infarction, C-reactive protein, fibrinogen, IL- 10.*

Introduction

Heart diseases are the major cause of mortality and morbidity in the world[(1)]. Myocardial infarction is an inflammatory disease induces an initial pro- inflammatory response in which immune mechanism interacts with metabolic risk factors to initiate and activate lesions in the coronary artery[(2)]. Inflammation is play important role in the pathogenesis of atherosclerosis and the value of assessing the levels of inflammatory biomarkers has risen. The presence of inflammatory element in the atherosclerotic lesions and elevated concentrate levels of inflammatory biomarkers such as C-reactive protein and fibrinogen in the peripheral circulation correspond to an activation of the inflammatory process in the body[(3-6)]. Myocardial cell damage stimulates inflammation in response to tissue damage. High-sensitivity C-reactive protein (hs-CRP) levels might act as anearly marker of inflammatory response severity that provides prognostic information[(7)].

In recent years, many inflammatory biomarkers have been studied to determine whether increased levels

Corresponding Author:
Mahdi H. Hammadi
Researcher/Ph.D./Department of Microbiology, College of Science, AL-Karkh University of Science, Baghdad, Iraq
e-mail: mahdihaiderhammadi@gmail.com

of these molecules are related to a poor prognosis in patients who have had myocardial infarction. Many studies have shown relationship between C-reactive protein (CRP) and recurrent coronary events in patients with acute myocardial infarction (MI)[8, 9].Fibrinogen is the major coagulation protein in human blood by mass, fibrin threat formation precursor and blood viscosity determinant[10, 11]. Furthermore, coronary artery disease risk factors were manipulated by some authors trying to find the relationship between plasma fibrinogen concentration and premature myocardial infarction (MI) [11].

The aim of our study is try to determine the predictive value of serum IL-10, C-reactive protein and plasma fibrinogen as vascular risk markers in myocardial infarction.

Material and Method

Patients Groups: A total of 50 patients complain from M.I. Who were admitted to Baghdad teaching hospital (coronary care unit), were investigated biochemically from September 2018 to January 2019. Andpatients age between 30 –80 years.

Control Group: Total of 10 individuals were taken as a control group apparently healthy with no complain of myocardial infarction or other diseases, compatible with patients groups from age of the same age groups.

Collection of blood Samples: Draw 4ml of blood from each patients complain from M.I were aspiration by syringe 5 ml, then serum was separated by centrifugation at 3000rpm for 10 minutes, then collected serum was divided into 1ml small aliquots and immediately frozen at - 20ºC until used and thawing of each frozen sample was allowed only one at a time of the test

Detection of C-reactive protein by ELISA: Immunoenzymometric assay for quantitative determination of C-reactive protein and IL-10 in human serum has been carried out. The kit used was provided by monobind INC-company-USA-1, and Plasma fibrinogen level was determined by using kit provided by (TECO GmbH, Neufahrn, Germany)

Statistical Analysis: Data were collected and analyzed using SPSS version 10(package for social science). All data are expressed as mean ± SD. Comparisons between groups were performed with the use paired t-test. P. value of p<0.05 was considered statistically significant

Results

Table (1) shows increase in the means of C-reactive protein (CRP) In-patient with acute myocardial infarction (14.39±1.24) when compared with control group (6.59 ± 0.90).In addition, the compared statistic between CRP and control group by using t-test revealed the statistical analysis present high significant differences (p<0.01) (Table 1).

Discussion

Various inflammatory biomarkers that can detect accurately the damage in myocardium at early stage are important and necessary to improve current strategies and detect who are risks for acute myocardial infarction[12].

Our results show highly significant increase in concentration levels of C-reactive protein (CRP) in patients of acute myocardial infarction compared to control groups (Table 1).These results agree with other observation its reported fibrinogen and hs-CRP used as an early stage detecting biomarker and prognosis decision for CHD[13,14].

CRP is an acute phase protein, release in human blood stream in response to present various inflammatory and infective states. Elevated the mean concentrations of CRP in human blood stream may indicate widespread inflammation and instability of plaques in blockage arteries[19,20].

Moreover, some authors mention a strong relationship between high-sensitivity C-reactive protein and mortality after myocardial infarction [7, 13].

Several studies have indicated that major inflammatory biomarkers such as CRP are an important risk marker in patients with ST segment elevation of myocardial infarction (STEMI)[15, 16, 19].

The present study revealed highly significant increase in concentration mean levels of plasma fibrinogen in acute M.I versus control groups (table 2). These results agree with other authors like (Li-Feng H. et al., 2014) who reported a relation of plasma fibrinogen to the severity of coronary artery disease (CAD)[17].

Fibrinogen plays a key role in the final step of the coagulation cascade such as the formation of fibrin. It is also a major determinant of plasma viscosity and erythrocyte aggregation[21]. Moreover, some authors mention a positive correlation between high circulating plasma fibrinogen and adverse outcome in patients with myocardial infarction[17,18].

Recent studies suggested fibrinogen markers plays an important role in pathophysiology of atherosclerosis plaque and elevated level of plasma fibrinogen was an independent indicator for the severity of CAD [17, 22].

On the other hand, our study show significant increase in concentration mean levels of serum IL- 10 in acute M.I versus control groups (table 3).These results agree with some studies shows increase serum levels of IL-10 during attack of myocardial infarction are related with improve endothelial vasodilator function[25]. Moreover, increased in concentration levels of serum anti-inflammatory cytokine (IL-10) are related with improvedendothelial vasodilator in patients with elevated CRP serum levels,so the balance between pro- and anti-inflammatory mediators is essential determinant of endothelial function. In addition, primary pro-inflammatory cytokines play a pivotal role in plaque formation in human arteries and can be used as predictor of inflammation. Moreover, stimulate the production of IL-6, a secondary pro-inflammatory by effect of primary pro-inflammatory which causes blockage stimulates the formation of acute phase proteins by the liver such as CRP, serum amyloid A (SAA) and fibrinogen. These proteins can be used as early predictor markers of inflammation [23, 24].

During atherosclerosis, release of proinflammatory cytokines causes initiating inflammation process in response to tissues damage while the anti-inflammatory cytokinesare also released to limit the excessive inflammatory reactions [26].

Overall, our study found that serum C-reactive protein and plasma fibrinogen levels were higher in patients with AM.I compared to normal subjects. These results proved that there is a significant relationship between biomarkers CRP and fibrinogen levels and the progress of CHD. The significant increase in the anti-inflammatory cytokine may be useful markers for predicting vascular risk in patients with AM.I.

Conclusions

Highly significant increase in concentration of serum levels of CRP and plasma fibrinogen at AM.I.

These biomarkers are important for ACS early detection. In addition, the elevated levels of serum IL-10 revealed the important role as anti-inflammatory markers use as early predictor of vascular risk markers in AM, I. We recommend doing further studies using another biomarkers to clarify the relationship between acute phase protein levels and anti-inflammatory cytokine and the CHD severity.

Estimation of the Effect of Temperature Change on Blood Bag in the Blood Bank in Al - Zahra Hospital in Diyala

Sami M. Dawood[1], Ali H. Hadi[2], Nabaa H. Ahmed[3]

[1]Surgeon, Head of the Surgical Department, Al-Muqdadya General Hospital/Iraq, [2]Researcher Chemist, Head of Blood Bank, Al- Zahra Hospital/Iraq, [3]Lecturer, PHD Chemistry Department, Collage of sciences, Diyala University/Iraq

Abstract

Background: The blood warming before transfusion is important and very necessary. The blood warming is done by using putting test tube that contains blood inside the water bath. Also, it could use others alternative methodis check the same purpose, it is included immerse the blood unite in a bowl of water, in spite of that is said to be dangerous. The current study was investigated about the effects of this method.

Objective: In this study, was to estimate the Complete Blood Count(Hb, PCV, MCV, MCH, MCHC, RBC and Hemolysis) and metal (K, Na and Cl) in blood donors.

Patients and Method: This study is a probable clinical study in which one donerwas included in the study. The investigation was started from August 2019 during November 2019 at the segment of AL-ZAHRAA Hospital in Diyala their ages from (35) years.

Results and Discussion: The blood warming is studied before the blood transfusion by immersing it into the water bath. The blood was warmed with 4° C, 25° C, 37°C and 40 °C with Ethylene Di amine Tetra Acetic Acid (EDTA) anticoagulant when determining the Complete Blood Count (CBC). The procedure repeated after 5 days and 2 weeks. In case of rapid blood, giving blood with 37°C because otherwise cases emergencies. As for children and cases of blood transfusion, altogether prefer a 25°C and 37°C. In this study conducted in the blood bank of Al- Zahra Hospital in Muqdadiya the room temperature was determined to be suitable for giving blood to the hospitalized persons.

Keywords: *Transfusion, Temperature, warming, stored blood.*

Introduction

The blood is usually stored at temperatures (2-6)°C[(1)]. Some clinical cases required transfusion of the blood at a large amount in intensive care and operating room[(2-4)]. Cold Blood transfusion especially at large amount is dangerous, influences metabolism and hypothermia. In addition, leads to cardiac arrest and coagulopathy arrhythmia especially in elderly patients[(5-8)]. (50-90)% of the patients felted hypothermia after an operation in knee replacement surgery due to cold air in the operation room lead to heat loss. Moreover, application the disinfectant such as alcohol on the skin leads to heat loss therefore the temperature of body decrease. Liquid transfusion at large amount results in a decrease in the temperature[(9)]. Some of the current reports found if transfused one litter liquid at (4)°C, the temperature of body decrease 0.25°C[(10-12)]. Some of the others studied founded that (50-70)% of the patients drop (1-3)°C at the general anaesthesia state.Heat loss leads to interfering with cardiac activation. Furthermore, low body temperature may lead to hypokalemia. The hypokalemia is main causes increase heart rate, arrhythmias diseases

Sami M. Dawood
Surgeon, Head of the Surgical Department, Al-Muqdadya General Hospital/Iraq

and ventricular fibrillation. The operative hypothermia increases the catecholamines in the blood, resulting in the blood vessels vasoconstriction[13]. Also, the infection rate is increased in the patients with hypothermia more than normal temperature body about (6.3) times. The hypothermia has a direct effect on the coagulation; and decreases of the platelets, leads to loos of the blood clotting, therefore the bleeding time become longer[14,15].

Warming blood for transfusion has been a common practice since the early 1960s when a group of papers appeared on the dangers of hypothermia following cold blood transfusions [16].

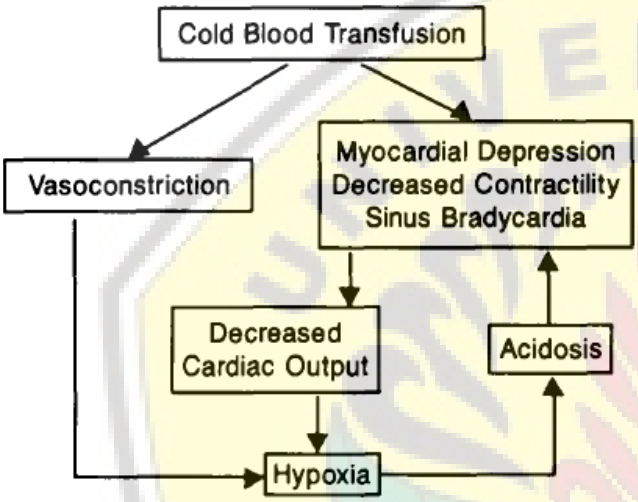

Figure (1): A cycle of effects caused by hypothermia[17]

Material and Method

This study is a likely,Clinical study, in which one status, with the blood bank, included in this study. The Study was started from August 2019 during November 2019 at the segment of AL-ZAHRAA Hospital in Diyala. That status was male their aged (35) years.

These procedures from blood film to determine the complete blood count:

1. Theblood smear is done by taking fresh blood (5) mL. The samplesare taken from the vein or the capillary. Then it stored in the plastic box contained on (EDTA). EDTA prevents the clotting of the blood. Then, sent to the lab within two hours.
2. Preparation of the microscopic slide is perform by trained personnel such as a pathologist, medical laboratory technologist, hematologist, or laboratory assistant. These personnel use a base slide, a blood spreader by capillary tube on slide. The common method, which used slide, is the wedge method. The wedge method used blood (1-2) mm and placed on the edge of the slide, that called the base slide.
3. While anotherslide called a spreader slide, which has chipped edges. The side of the spreader slide with chipped edges is put on the original slide (base slide). This makes the blood spread on the slide base.
4. The smear is made with the spreader inclined at an angle of approximately 30° to the blood. The smear should cover two-thirds of the base slide and should have a feathered end. The smear should then be air-dried. The frosted end of the slide should be label with the patient's name, identification number and date. The dried smear is fixingby the alcohol and stained.
5. The smear is immersed in the stain for approximately (10) min, then diluted with water and allowed an additional ten minutes for the cells to properly stain. Following the stain application, the slide is rinsed under running water. The slide shouldwipe underneath by cotton to removing excess stain. Then, the slide is kept in the rack.

The procedure to determine the Potassium: Potassium reacts with sodium to form turbid potassium tetraphenyl boron. The turbidity of the potassium level was read by the electro photometer.

Assay:

Wavelength …….578 nm Hg 578 nm

Optical path ……..1 cm

Temperature ….. 20-25°C

Measurement ……. Against reagent blank

	STD	Sample	STD	Sample
Working reagent	2000µl	2000µl	1000µl	1000µl
STD	200µl	-------	100µl	------
Supernatant	-------	200µl	------	100µl

To produce homogeneous turbidity, The STD or the clear supernatant has to be added to the center of the surface of the working reagent in the cuvette. Mix each cuvette before proceeding to the next sample and stand for five minutes. Measure absorbance of the standard (ΔA_{sample}) against working reagent blank between (5-30) min.

Calculation of the potassium concentration

$$C=5 \times \frac{\Delta A\ Sample}{\Delta A\ standard}$$

These procedure to determine the Chloride: Chloride reacts with a mercury II to form mercury II chloride complex. The complex reacts with iron ions to form a blue coloured complex, wherever, the resulting absorbance change at (590) nanometer.

Assay:

The wavelength ..... (590) nm (560-600 nm), HG 578 nm

The optical path …….. (1) cm

The temperature ……. (20-37) °C

Measurement …… Against reagent blank, only one blank per series is required

Pipette in to cuvettes	Macro		Semi micro	
	STD	Sample	STD	Sample
STD	50µl	------	20µl	-------
Sample	-----	50µl	-------	20µl
RGT	2000µl	2000µl	1000µl	1000µl

Mix, incubate for 5 minutes in the dark and measure the absorbance of the sample (A_{sample}) and STD (A_{STD}) within 60 minutes against the reagent blank. Do not expose to light

Calculation of the chloride concentration

$$C=100 \times \frac{A\ Sample}{A\ standard}\ [mmol/L]$$

$$C=355 \times \frac{A\ Sample}{A\ standard}\ [mg/L]$$

These procedure to determine the Sodium: Sodium is sediment with magnesium and urinal acetate complex, the Urinal icons changed to yellow due to reaction with thioglycolic acid.

Assay:

Wavelength ……410 nm (360-410)

The cuvette ….. Lightpath (one cm)

The temperature ..37°C

1. The instrument is Adjust on zero.
2. The pipette put into a cuvette

	Standard	Sample
Standard (µL)	20	-----
Sample (µL)	-----	20
Precipitating sol (ml)	1.0	1.0

3. The tubes are closed and mix then stand for five minutes then shake for (30) second then stand for (30) minute then centrifuge for (5-10) minute.
4. Separation the clear suspension and pipette on another

	Blank	Standard	Sample
Precipiting (µL)	20	----	-----
Supernatant (µL)	----	20	20
Reagent (ml)	1.0	1.0	1.0

5. Mixing and incubate at 25 °C for (5-30) minute.
6. The absorbance is read for sample, standard and blank.

Calculation of the sodium concentration:

$$C = \frac{\text{Absorbance of sample}}{\text{Absorbance of standard}} \times \text{standard conc.}$$

Results

Table one show the results after storage for five day and two weeks and measure with room temperature, 4°C, 37°C and 40°C, increase on sodium and chlorine potassiumand chlorine level.

The hemoglobin was decreased after storage and heating caused a small difference. Red Blood Cell was decreased after storage and decrease after heating.

Table (1): Results after storage and heating

	Storage Time	Temperature (°C)			
		4°C	25°C	37°C	40°C
Hb(g/dl)	5 days	11.7	11.8	11.5	10.9
	2 weeks	8.2	9.9	9.8	10.1
PCV% of blood	5 days	37.1	37.2	36.4	34.7
	2 weeks	23.8	29.4	29.1	30
MCV(fL)	5 days	77	78	78	79
	2 weeks	79	79	78	78
MCH(pg)	5days	24	24.9	24.8	24.7
	2 weeks	26.7	26.5	26.3	26.5
MCHC(g/dl)	5 days	31.7	31.8	31.7	31.3
	2 weeks	31.8	33.7	33.7	33.8
RBC	5days	4.75	4.7	4.65	4.41
	2 weeks	3.55	3.73	3.4	3.28
Hemolysis	5 days	0.03	0.03	0.02	0.03
	2 weeks	0.06	0.09	0.1	0.09
K(g/dl)	5 days	17.8	25	22	23
	2 weeks	32	33	30	37
Na(g/dl)	5 days	146	134	133	133
	2 weeks	150	147	148	144
Cl (g/dl)	5 days	78	81	77	79
	2 weeks	99	90	88	80

Discussion

The blood stored at (4)°C produced progressive academia and hyperkalemia[18][19]. Heating causes increasing in Na and Cl level and some changes in Potassium level.

Some of the studies showed the time between the heating and the hemolysis assay have a great effect on the degree of hemolysis[20]. The hemolysis depended on the heating blood during transfusions[21][22]. But, Determining the threshold is very difficult[23][24].

The risk of the hemolysis becomes harmful and dangerous if the blood heat lessthan (46) °C. Furthermore, blood warming more than (43) °C be believed safe. Our results don't discuss temperature more than (46) °C, because it is very high. However, these results suffer from some bias. In fact, the studies we used to reach these conclusions were based on small samples. Other biases were also present, like the nonrandom selection of blood units. However, most of the blood samples were matched and in most studies, samples for comparison were from the same blood bag and thus had the same characteristics. Moreover, many factors that related to the hemolysis varied among the studies. Furthermore, the results were explained by several causes such as used unite ages, the comparator temperature, the interval time between blood heating and haemoglobin concentration, used preservatives and anticoagulants, the type of infusion of the blood's exposure to heat, the pressure and the stagnant character of the blood. Some reports examined the separation effects of the transfusion machine from the temperature by measuring hemolysis after transfusion with cold blood. These bias are related to the many used procedures.

The transfer of heat from the warmer to the blood is critical to the effectiveness of any unit. The temperature of the blood being transfused to the patient is inversely related to the flow rate and immediately related to both the temperature of the warmer and the initial temperature of the blood[25].

Some advantages of in-line systems are:

1. They can mostly be used as well with RBCs as with WB units, although flow rates may be slower with RBCs.
2. Time the warmer is set up, new units can be started at once.
3. Entry ports must puncture before warming, so warmed blood cannot mistakenly return to the blood bank for the issue to other patients.

Prevalence of Migraine Headache among Secondary School Students in Ramadi City, West of Iraq

Ruaa Qais Al-Hadeethi[1], Sahar Kahtan Al-Ani.[2], Rafi Khaleel Al-Ani[3]

[1]Academic Degree: CIB/Pediatric Department/Ramadi Teaching Hospital for Gynecology and Childhood; Ramadi City/Iraq, [2]CIB/Researcher/Pediatric Department, Ministry of Health-Anbar Health Directorate Al-Ramadi Teaching Hospital/Iraq, [3]CIB/Researcher/Pediatric Department, Ministry of Health-Anbar Health Directorate Al-Ramadi Teaching Hospital/Iraq

Abstract

Background: Migraine is the most common primary headache in children which leads to disturbance of school performance and impaired quality of life.

Objective: To identify the prevalence of migraine headache in secondary school students in Ramadi city and to study some precipitating factors.

Patient and Method: A cross-sectional study was done on secondary school students in Ramadi city, Iraq for studying the prevalence of migraine headaches during the studying year, 2019. Data about age, gender, family history of migraine, precipitating factors of headache like diet (chocolates, cheese and coffee), sleep deprivation, stress and menstruation in girls were collected by a special questionnaire paper.

Results: The prevalence of migraine headaches in this study was (6.5%). Girls were reported significantly more than boys. Higher age students were reported with significant-high prevalence. A family history of migraine was reported positive in (66%) of student's migraine cases.(22%) of migraine headache precipitated by sleep deprivation, (20.2%) of them precipitated by stress and (13.8%) precipitated by diet. In girls, (28.8%) of migraine headache was precipitated during menstruation.

Conclusion: High prevalence of migraine headaches among secondary school students in Ramadi city. Consultations are recommended for the treatment of acute cases and how the students and their families can minimize the symptoms and so improve the quality of life.

Keywords: *Migraine headache, secondary schools, Ramadi city.*

Introduction

Headache is a common complaint in children and adolescents. Headaches can be a primary problem or occur as a symptom of another disorder (secondary headache). Primary headaches are most often recurrent and the most common forms of primary headache in childhood are migraine and tension-type headaches.[1]

Migraine is characterized by episodic attacks that may be moderate to severe in intensity, focal in the location on the head, have a throbbing quality and associated with nausea, vomiting, light sensitivity and or sound sensitivity. Migraine can also be associated with an aura that may be typical (visual, sensory, or dysphasia) or atypical (hemiplegic, Alice in Wonderland syndrome).Migraine without aura is the most common form of migraine in both children and adults.[2,3]

Corresponding Author:
Ruaa Qais Al-Hadeethi
Academic Degree: CIB/Pediatric Department/Ramadi Teaching Hospital for Gynecology and Childhood; Ramadi City/Iraq
e-mail: dr.ruaaqais@gmail.com

Migraine has been reported to occur in up to 10.6% of children between the ages of 5 and 15 years and up to 28% of older adolescents. Migraine typically runs in families with reports of up to 90% of children having a first or second-degree relative with recurrent headaches.[4,5]

Triggering factors that may precipitate migraine headache include; skipping meals, inadequate or irregular sleep, dehydration, weather changes, menstrual periods in female adolescents, feeling of irritability, tiredness and food cravings.[6,7]

Diagnosis of migraine headaches is by history and physical examination, including a neurologic examination. The history needs to include triggering events, the timing of the headaches, associated neurologic symptoms and detailed characterization of the headache attacks, including frequency, severity, duration,associated symptoms, use of medication, disability and a family history of migraine. General health conditions are also important for the identification of possible secondary headache disorders.[6,8]

Treatment aims to reduce headache frequency, severity, duration and disability. These include the treatment of acute headaches by non-steroidal anti-inflammatory drugs and triptans. When the headaches are frequent (more than one headache per week) or disabling (causing the patient to miss school, home, or social activities) a preventive or prophylactic therapy may be warranted.[4] Behavioral evaluation and therapy are essential for effective migraine management. This should include adequate fluid intake without caffeine, regular exercise, not skipping meals and making healthy food choices and adequate (8-9 hour) sleep regularly.[9,10]

The aim of this study are:

1. Identify the prevalence of migraine headaches among secondary school children.
2. Identify the prevalence of migraine among age and gender.
3. Show some triggering factors on the disease.

Subject and Method

A cross-sectional study was done during studying year, 2019, to assess the prevalence of migraine headaches among secondary school students in Ramadi city, after taking permission from the Directorate of education in Ramadi city. This study was done only on migraine headache without aura type. The total number of secondary school students in Ramadi city is (39047) Boys are (21625) and girls are (17422). The study done after visiting different primary schools for boys and girls selected randomly.

All students in secondary schools, direct questions about the history of headaches were taken and the diagnosis of migraine headaches was made based on the diagnostic criteria of the International Classification of Headache Disorders III (ICHD-III).[11]

Diagnostic criteria for migraine without aura (ICHD-III):

A. At least five attacks fulfilling criteria B–D

B. Headache attacks lasting 2–72 hours (untreated or unsuccessfully treated)

C. Headache has at least two of the following four characteristics:

   1. Unilateral location
   2. Pulsating quality
   3. Moderate or severe pain intensity
   4. Aggravation or causing avoidance of routine physical activity (e.g., walking or climbing stairs)

D. During headache at least one of the following:

   1. Nausea and/or vomiting
   2. Photophobia and phonophobia

E. Not better accounted for by another ICHD-III diagnosis.

All diagnosed migraine headache students in secondary schools,a list of questions and information taken directly from the students and from the family by the indirect way which includes filling papers sent by the student's hand and received in the next day and or by taking the mobile address and speaking with the family, including;

1. Age.
2. Gender.
3. Family history.
3. Precipitating factors; diet (chocolate, cheese and coffee), stress, sleep deprivation and menstruation in females.

Exclusion Criteria: Headaches of causes other than migraines.

Data collected were checked for accuracy and completeness and were coded and entered into the Statistical Package for Social Sciences (SPSS), Descriptive statistics for all studied variables and Chi-squared test were used and P-value level <0.05 was considered significant throughout the study.

Results

The total number of students in visited secondary schools included in this study was 1445, the number of students who diagnosed as a migraine was 94 (6.5%). Figure 1.

Boys were diagnosed asmigraine in 35 (4.9%) cases from 747 male students. Girls were diagnosed in59 (8.5%) cases from 698 female students.

Age distribution of migraine cases revealed that most of the cases reported in higher age students. Table 1.

Positive family history was found in 62 (66%) of cases. Figure 2.

Precipitating factors of migraine cases showed that sleep deprivation recorded in 21 (22%) of cases, the stress in 19 (20.2%), diet in 13 (13.8%) and in girls, menstruation reported in 17 (28.8%) of (59) migraine cases. Table 2.

Figure 1. The prevalence of migraine patients among all secondary school studied students.

Table 1. Distribution of migraine cases among age and gender.

Gender	13 Year	14 Year	15 Year	16 Year	17 Year	18 Year	Total
Boys	4	4	4	3	11	9	35(4.9%)
Girls	4	10	9	9	13	14	59(8.5%)
Total	8(8.5)	14(14.9)	13(23.4%)	12(26.6%)	24(13.8%)	23(12.8%)	94

p-value among genders and deferent age group are significant <0.05.

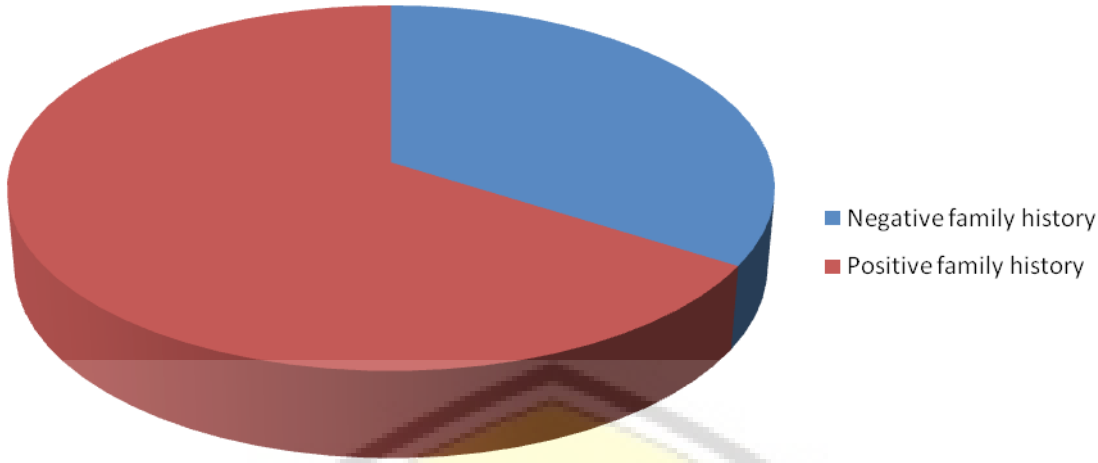

Figure 2. Positive family history reported in 66% of migraine cases.

Table 2. Precipitating factors of migraine headaches among secondary school students.

Character	Precipitate Migraine	Not Precipitate	Total
Diet (chocolates, cheese and coffee)	13 (13.8%)	84 (91.5%)	94
Sleep deprivation	21 (22%)	79 (78%)	94
Stress	19 (20.2%)	81 (79.8%)	94
Menstruation (girls)	17 (28.8%)	42 (71.2%)	59

Discussion

Headache is the most common pain condition in children and adolescents and migraine is one of the most common causes of primary headache[12]. No previous study conducted previously in our city about the prevalence of migraine, this study revealed that (6.5%) of secondary school students had a diagnosis of migraine. Studies in Turkey showed a prevalence of (8.8%) [13], Sri Lanka (7.8%)[14] and Kuwait (10.9%)[15]. The lowest reported rates were in Jordan (2.9%)[16], Hong Kong (3%)[17]. The differences are probably due to genetic predisposition, environmental factors and used diagnostic criteria.

Girls were reported more prevalence than boys diagnosed migraine cases, most of the other studies [18,19] showed that the overall migraine prevalence is twofold higher in adolescentgirls than in adolescent boys. This increase in the female group is likely due to secondar yhormonal changes that take place around this age and that hormonal effect triggers migraines in female adolescents.[20]

This study demonstrates that the prevalence of migraines more in older age students than that of lower ages. Other studies in Germany [4,21] and Turkey [13] studies suggest that the increase of migraine headache prevalence with age in adolescents may reflect the biology of brain development.[4] Further reasons for the high prevalence could be increased school stress with diminished leisure time. Furthermore a change in lifestyle factors like increased consumption of coffee and smoking in adolescents which could trigger headache.[22,23]

Concerning the family history of migraine, (66%) of migraine students had a positive family history of migraine. A positive family history also obtained in studies in Iran [24] Pakistan [25]. Researches showed that first degree relatives of subjects with migraine have a 1.9 times higher risk of developing migraine compared to the general population,[26] and the concordance rate for migraine in monozygotic twins is 34% compared to 12% in dizygotic twins, [27] suggesting the importance of genetic factors in migraine development.

A migraine trigger is any factor that on exposure or withdrawal leads to the development of an acute migraine attack in a susceptible individual.[28] Sleep deprivation and stress were recorded as big trigger factors in this study. Different precipitating factors for migraine had

been described by several authors previously. Sleep deprivation was reported as the most frequent trigger in France[29] study and that stress was reported as the most trigger in India [30] and Barazel[28] studies. Sleep deprivation is likely to be common among school students because of the need to prepare for examinations or class tests. Stress may be related to school activities friends and bullying or may be related to family problems. The mechanism of these triggers to precipitate headache is unknown, but many hypotheses showed that most triggers excite cortical neurons, which leads to an inhibitory response in the periaqueductal gray matter and the nucleus raphe magnus through the trigeminal nucleus, which can be perceived as migraine pain.[31,32] Diet was also recorded as precipitating factors for a migraine headache in this study. Many other studies also record multiple types of dietary triggers for migraine[29,30]. Studies showed that diet can play an important role in the precipitation of headaches in children and adolescents with migraine. The list of foods, beverages and additives that trigger migraine includes cheese, chocolate, citrus fruits, fatty foods, ice cream, caffeine withdrawal and alcoholic drinks.[33] The pathophysiology of dietary triggers may due to the release of serotonin and norepinephrine, causing vasoconstriction or vasodilatation, or by direct stimulation of trigeminal ganglia, brainstem and cortical neuronal pathways.[33,34] Menstrual cycle in girls was an important triggering factor for a migraine headache in this study, same results were reported in many other studies.[35] Researches proved that normal hormonal changes in adolescents girls caused by the menstrual cycle can trigger migraine.[36]

Conclusion

Migraine is an important neglected disease among children in Ramadi city, high prevalence of this problem had been diagnosed among secondary school students, with higher prevalence among girls. Sleep deprivation and stress were recorded as important triggering factors for the disease. In girls, a higher percentage of migraine headaches was precipitated during menstruation. Explaining to patients the probable precipitating factors for this disease and how to deal with them is recommended. Health education sessions are also recommended inside schools to seek for the underestimated cases and manage them.

Acknowledgment: I would like to express my deepest gratitude and respect to the directors of secondary schools in Ramadi city, all teachers in these schools and students' families for their helpful advice, patience and guidance throughout the execution of this study.

Ethical Clearance: The Research Ethical Committee at scientific research by ethical approval of both environmental and health and higher education and scientific research ministries in Iraq.

Conflict of Interest: The authors declare that they have no conflict of interest.

Abstract

Background: Neonatal period is the most dangerous period during child life. Neonatal deaths in Iraq account for more than half of under-five children deaths. There is a variation in neonatal death according to the causative factors in a different area of the world.

Objective: To show the rate of neonatal death among newborn babies admitted to the neonatal care unit in Salahadin teaching hospital and studying some related factors.

Patient and Method: Across section hospital-based selected study was done on a neonatal patient admitted to the neonatal care unit in Salahaldin Teaching Hospital during the period from the first of January to October 2016.

Results: The total number of admitted cases in the neonatal care unit was (262). (61.8)%were male, (38.2)% were female. Most of the neonate discharged well (75.6%), (6.5%) discharged on parent's responsibility,(2.3%) were referred to other more developed hospitals. The neonatal death rate was (15.6%), with a male to female ratio of 2.4:1. RDS represents a major cause of death (53.6%), followed by neonatal septicemia (22%). Most of the death occurs among neonate with the gestational age of fewer than 28 weeks (31.7%).

Conclusions: A high neonatal death rate was recorded in Salahaldin Teaching hospital in Tikrit city. This needs a big effort to treat this problem with the introduction of new equipment.

Keywords: *Neonatal death, neonatal care unit, Salahaldin Teaching Hospital.*

Introduction

The neonatal period is defined as the first 28 days after birth which is the stage for the creation of physiological adaptation to extra uterine life and this period is a vulnerable period during neonatal life.[1] Neonatal death now account about more than two- thirds of deaths in the first year of children life and half of deaths in children under five years old.[2] During 20th century the mortality death of neonate had been relatively decreased, however still there was a gap between the developed and developing countries and between the same country in different geographical area [3,4]. About two-thirds of the world's neonatal deaths occur in just (10) countries, mostly in Asia & Sub-Saharan Africa as these two regions represent more than 2 million of the

e-mail: drsaharkahtan2020@gmail.com

annual deaths[5,6]. So that the death rates are widely used to compare the health and well-being of populations across & within countries.[7] There are many causes involved in neonatal death but in general, the most common causes of mortality rate in low-income countries were prematurity, sepsis, pneumonia and birth asphyxia.[8] While in high-income countries leading causes of death are preterm birth and congenital malformations[9].

Many studies have shown that neonatal mortality is influenced by multiple factors such as maternal health (before, during and after pregnancy), neonatal conditions at the time of delivery and postnatal care of babies, all these factors play a significant role in reducing neonatal mortality [10].

Other important and indirect determinants of neonatal mortality aresocioeconomics, demographics, health care system,cultural practices and technology[10,11].

Aim of the study;

1. Clarify the death rate among newborns admitted into Salahaldin Teaching Hospital.

2. Study the distribution of death cases regarding age, gender, gestational age, maternal age and antenatal care.

PATIENTS AND METHOD

Across section, a hospital-based selected study was done on neonatal patients admitted to the neonatal care unit in Salahaldin Teaching Hospital in Iraq during the period from the first of January to October 2016. Before attending the study, acceptance from the director of Salahaldin Teaching Hospital and the parents of each neonate was taken.

Exclusion Criteria:

Newborns who died immediately after birth: Each neonate included in the study were assessed by a prepared questionnaire and that data includes the following;

1. Gestational age,assessed by Ballard scoring system.
2. Gender.
3. Age of admission.
4. The fate of baby, including; discharging well, death or discharge on parent's responsibility.
5. History of maternal antenatal care, maternal age and history of maternal infections during pregnancy.
6. Type of disease of dead neonates.

The Statistical Package for Social Sciences (SPSS, version 18) was used for data entry and analysis. Chi (χ^2) square test of association was used to compare proportions of different factors among different groups of the study sample. A p-value of less than 0.05 was regarded as statistically significant. The pie chart used to present the data.

Results

The total number of cases taken in this study was 262. (61.8)% of them were male and only (38.2)% were female.

Most of the admitted cases discharged well 198(75.6%), while 17(6.5%) discharged on parent's responsibility, 6 (2.3%) were referred to other more developed hospitals, the dead neonate represent 41(15.6%) from the total admissions. Table 1.

Neonatal death distribution according to gender shows that most of the dead babies were male 29(70.7%) versus 12(29.3%) were female, as shown in table 2.

The most common causes of death were respiratory distress syndrome (RDS) 22(53.6%), followed by sepsis (22%), as shown in table 3.

The neonatal death distribution according to gestational age shows that most of the dead neonates had a gestational age of fewer than 28 weeks 13(31.7%). Table 4

The patient distribution according to Age of admission and outcome shows that most of the dead babies were at aged 0-3 days 32(78%). Table 5.

Most of the dead patients occur from mothers of (20-40) years old 157(79.3%) and in maternal infection during pregnancy 6(14.6%) and 24(58.5%) with irregular antenatal care. Table 6.

Discussion

Neonatal death is still considered an important indicator for both maternal and neonatal health care[12].

In the present study, neonatal death was recorded in (15.6%) of all neonates admitted to the neonatal care unit. This was similar to that reported in a study in India,[13] in which neonatal death (16.1%). But it was lower than reported in a study done in the Neonatal Care Unit in Saudi Arabia[14] in which neonatal death was (22.4%) and higher than of that reported in USA study (6.9%).[15]The reason why we had a high death rate is probably due to lack of medical equipment and advanced techniques and also due to a delay in seeking medical help by neonate families.

In this study male had higher death rate than female with male to female ratio (1.4:1), this maybe attributed to that male is more labile to perinatal insult, infections, RDS and other problems.[16,17] Similar results were obtained in a study in Nigeria, with male to female ratio was (1.5:1).[16]

In this study the major cause of death was RDS. This result was similar to what reported in a study done in Iraq[18] and the United Arab Emirates.[19] But it disagrees with a study inNorway,[20] in which congenital malformations were the leading cause of death (54%). In this study sepsis account for 22%of fetal death, this result wassimilar to a study done in Pakistan (23%)[21], while its account in Niger (42%).[22] Most of the cases admitted in

the neonatal care unit were preterm babies and with RDS and that most of the recorded death due to lack of update facilities in the management of prematurity.

In this study, neonatal death according to the gestational age occur mostly among preterm babies of less than 28 weeks gestational age, the same results were obtainedin Bangladesh (59.59%) [23] .This is probably due to more liability of preterm babies to complication like apnea, RDS, respiratory failure, hypoglycemia, heat instability.[24]

Most of the neonatal death recorded in the present study occurs during the first three days of life, this goes with another study done in Pakistan[25]. This can be explained as the first three days of neonatal age are the most dangerous time during the neonatal period in which there are more risks for mortality and morbidity and that the neonates at this age are also liable to pregnancy and delivery-related complications like complications of prematurity, birth asphyxia & infectious disease.[2]

Regarding the effect of maternal age on the increasing rate of neonatal death, the present study showed that most of the neonatal death occurs with 20-40 maternal age groups, this differs from another study in Saudi Arabia [14] in which neonatal death occurs mostly among maternal age below 20 years. In our community, most of the pregnancies occur between 20-40 years old women.

Most of the neonatal death occurs among women with irregular antenatal care which agree with another study done in Egypt[26] and New Guinea[27]. This is probably because most of the mothers in this study were from low educated families and from rural areas with difficulty in seeking medical help.

Conclusion

The neonatal death rate recorded in this study was (15.6%). The male death rate recorded more than females. RDS was the major cause of neonatal death. Lower gestational age, lower age babies, maternal irregular antenatal care visit are increased risk of neonatal death. More attention to the Neonatal Care Unit by providing each unit with necessary devices that are important for resuscitation and follow up of patients is recommended.

Acknowledgment: I would like to express my deepest gratitude and respect to the director of Tikrit teaching hospital, laboratory staff in the hospital and all staff in the neonatal care unit for their helpful advice, patience and guidance throughout the execution of this study.

Head of women health center, AL-Alwiyaa maternity teaching hospital/Iraq, [5]Senior Resident, Dept. of radiology/Iraq

Abstract

Background: Breast cancer is the commonly diagnosed cancer among women globally and the major reason of deaths related to cancer in developing world, although breast cancer in young women is less common and often overlooked, it is still considered a major health concern. This study aimed to study breast cancer among young Iraqi women.

Methodology: A retrospective study done on 50 diagnosed breast cancer cases below 40 years during period of 2017 and 2018 among women records of attendees to women health center in AL-ELWYIA maternity teaching hospital.

Result: Out of total diagnosed breast cancer case during period of 2017 and 2018 (264), 50(18.9%) patients were below 40 years. the peak age at presentation ranged from 35-39 years (50%),family history was detected in 24% of cases, early menarche before age of 12 years was detected in 26% of cases,68% of patients presented with painless palpable mass, stage 2 disease were recognized in 76% of the studied sample and 86% were ductal in origin.

Conclusion: the breast cancer among young Iraqi women under 40 years had high incidence rate but might be less aggressive than what was reported in western countries.

Keywords: *breast cancer, incidence, young age, Baghdad, Iraq.*

Introduction

Breast cancer is the most common malignancy among the Iraqi population constituting one third of the registered female cancer and 17.8% are diagnosed in patients under 40 years [(1)]Although the diagnosis of breast cancer is much less common in women under the age of 40 years, it remains a great challenge to patients, families and health care providers and it can have a greater impact than in older women[(2,3)]. In woman under 40 years of age, delay breast cancer diagnosis is a common problem due to various factors such as a lack of information about the disease and consequent delay in seeking medical care,lack of screening programs in this age group and fast tumor growth and pattern of breast parenchyma, which can hinder the identification of lesions both on clinical examination and on certain imaging method[(4,5)] so the Knowledge of the clinical and imaging forms of breast cancer in young woman and correlation with the pathological finding of these cancers is important for improving the detection of mammary lesions in this group[(6)]. Tumors in young women are more likely to be of a higher histological grade [(7)] and to be classified as estrogen receptor and progesterone receptor negative[(8,9)]. In addition, young women are more likely to have local recurrences, to be diagnosed

at a more advanced stage and to have an inferior 5 year survival compared to their older premenopausal counterparts[9,10].

The differences in tumor characteristics and clinical outcomes suggest that breast cancer arising in young women may be a distinct clinical entity. A study by Anders and colleagues [8] looked at tumor gene expression between two age specific cohorts (young, ≤ 45 years; and older, ≥ 65 years) and identified 367 gene sets that could differentiate tumors in young women from tumors in older women. This suggests that breast cancer in young women may be distinct with a unique underlying biology[11].

Objectives: To describe the clinical profile, image findings and pathological aspects of breast cancer in young women, to enhance early detection of cancer in young Iraqi women.

Patients and Method

A retrospective study done among women records of attendees to women health center in AL-ELwyia maternity teaching hospital. The required data obtained from the information system data base during a 2-years period starting from January 2017 and December 2018. 50 patients were enrolled in this study, patients proved to have breast cancer by histo-pathological study. The evaluated variables included age at diagnosis, marital status, age of menarche, number of parity, history of lactation and first degree family history of the breast cancer, clinical presentation, clinical and radiological diagnosis were also recorded. Statistical analysis was performed and different variables were analyzed.

Result

A total of 50 breast cancer patients below 40 years were enrolled in this study, the mean age of patients was 33.8(±3.7) years, 50%(25) of patients were between 35-39 years, figure -1.

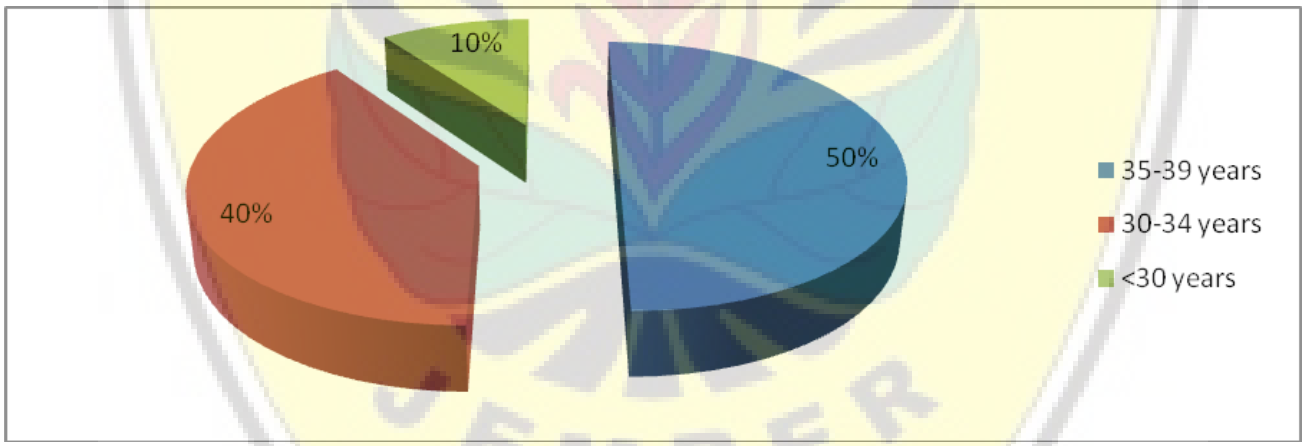

Figure 1: Age distribution of studied patients.

Study of some risk factors showed, 76%(38) were married and from those 12%(6) had one or two child and 76%(38) had three or more children, only 4%(2) of patients had age of menarche more than 14 years. 24% (12) had positive first degree family history and 86%(43) of patients had lactation history more than 6 months, table 1.

The ultrasound finding of those patients revealed that 76%(38) of patients had only mass, the mass was in UOQ among 70%(35) of patients and no one patients had lesion in both breast, table 2.

Table 1: Risk factors for studied group.

Variable		Number (%)
Marital status	Married	38(76%)
	Divorced	5(10%)
	Single	4(8%)
	Widow	3(6%)
Parity	Nil	6(12%)
	≤2	6(12%)
	≥3	38(76%)
Menarche age	≤11 years	13(26%)
	12 or 13 years	35(70%)
	≥14 years	2(4%)
Family history	+ve	12(24%)
	-ve	38(76%)
Lactation history	+ve	43(86%)
	-ve	7(14%)

Table 2: Ultrasound finding of studied patients.

Variable		NO(%)
Ultrasound finding	Mass	38(76%)
	Mass with associated features	12(24%)
Site of tumor	UOQ	35(70%)
	UIQ	7(14%)
	LOQ	0
	LIQ	1(2%)
	Retroareolar	6(12%)
	More	1(2%)
Laterality	Right breast	36(72%)
	Left breast	14(28%)
	Both	0

Majority of patients had stage II breast cancer (76%) and only one patient had stage IV and I. Grade 2 represent 78%(39) of studied patients and invasive ductal carcinoma found in 86%(43) of patients, table -3-.

Table 3: Histopathological finding of studied patients.

Variable		NO(%)
Tumor stage	Stage I	1(2%)
	Stage II	38(76%)
	Stage III	10(20%)
	Stage IV	1(2%)
Tumor grade	Grade 1	1(2%)
	Grade 2	39(78%)
	Grade 3	10(20%)
Histopathological type	Invasive Ductal carcinoma	43(86%)
	Invasive Lobular carcinoma	7(14%)
	Other	0

The clinical presentation of studied patients was showed that 68% (34) of patients had lump and 42%(21) of patients had pain, other showed in figure 2.

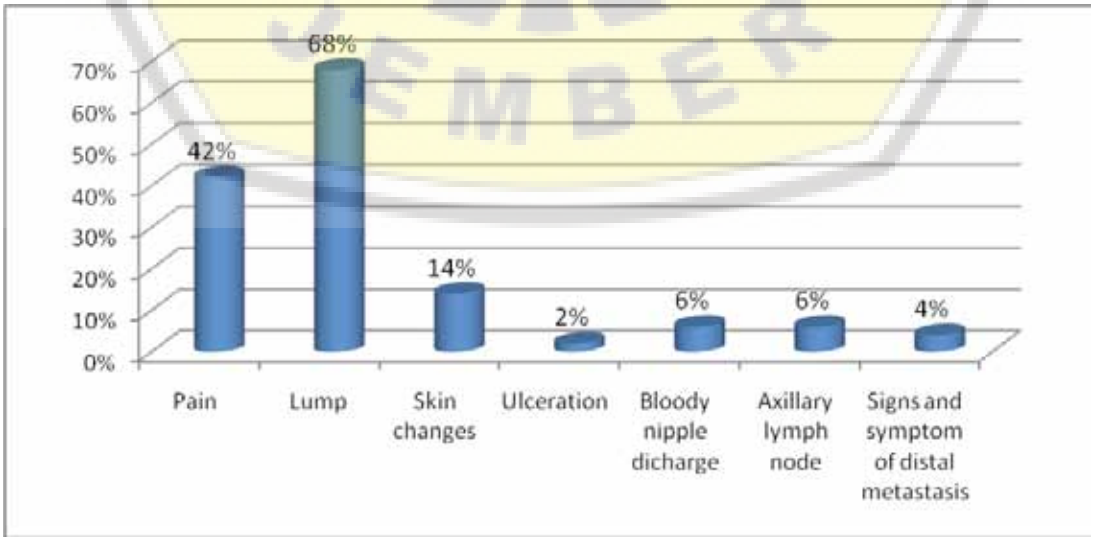

Figure 2: Clinical presentation of studied patients.

Discussion

Breast cancer incidence increases with age with vast majority of women being diagnosed after age of 40 years[11], the comparison of clinic-pathological and radiological features of breast cancer arising in young women with those older ones has been the subject of discussion in several studies[12]. In the present study we have chosen to define early onset breast cancer when diagnosed at age of 40 years and younger, breast cancer is described as young women disease in Arab World and other developing countries[13,14] compared to that observed in Western countries in which the median age for breast cancer is a decade younger and approximately two third of patients are aged under 50 years [15] this may be due to clear social, economic and population differences. A total of 264 breast cancer patients were enrolled in this study 81.1% were 40 years and above while 18.9% were below 40 years. The latter is slightly lower than other Asian countries such as Korea[16], Iran[17] and Saudi Arabia[18] but is significantly higher than that of western population [19]. This suggest the possibility that certain differences in pathogenesis of breast cancer may exist between young Iraqi patients and women in western population these differences may be related to race,social back ground factors, dietary habits, economic development level and environmental exposure among other. In this study 76% of our patients were married or had married. Married women were more likely to receive a breast examination within the last years than single (never married) or no longer married women[20]. 76% of those below 40 years had 3 or more child, Rodriquez et al found that women aged less than 35 years with early child bearing and multiparty are risk factors probably due to short term elevation in breast cancer risk for several months immediately following a birth[21]. In this study 26% of those below 40 years had early menarche before age of 12 years in compare to Najmeh et al who found that 17.6% of patients had early menarche which is considered one of the possible risk factors of breast cancer[22]. Presence of familial background has been identified as an important risk factor for developing breast cancer at an early age and to be suggestive of hereditary syndrome [23]. In this study 23.5% of those below 40 years had positive family history of breast cancer in accordance with previously reported data from sidoni et al study who found that (24%)of patients below 40 years had positive family history [24], larger series have reported much higher proportions up to 48%[25], while McAree et al study reveals only 13.4% had a positive family history [26]. Antoniou et al found that breast cancer at an early age is more likely to be associated with an increased familial risk, especially in women harboring a BRCA1 mutation[27], however BRCA1 analysis was not available in our center at time of study there for the relationship between a positive family history and a positive BRCA1 mutation not properly assessed, the genetic component should be more explored,since genetic studies including young women are very scarce nationwide and there is insufficient data to provide conclusive evidence . Currently, there no routine screening program in Iraq for women less than 40 years of age for that reason most women in this age group are symptomatic and presented mostly with palpable lump. The examination finding in this study were palpable lump in 68%, pain, axillary node, skin changes no breast cancer diagnosed in a symptomatic women which in agreement with Agnese et al that reported that young patients under 40 years were much more likely to present with palpable lump 70%[28]. Ultrasound study reveals that 76% of patients presented with mass. Histo-pathological review of the sample of the study revealed that 86% of breast cancer were ductal (invasive ductal carcinoma) in compare to Cj Fisher et al. who found that 88% of those aged below 40 years were ductal[29] and McAree et al. found that 85.5%of breast cancer were invasive ductal type [26].In this study 20% of patients are diagnosed at grade 3 which is lower than the result of Abdullateef et al. who found that 32.8%of patients below 40 years were grade 3[1] and also lower than the result obtained by fernandopulle et al. study that identified that 60% of patients are grade 3 in young Asian women [30] the later tumor grade at diagnosis might be related to delay diagnosis in young patients, which can be explained by work pressure or low index of suspicion by the patients and primary physician.

Conclusion

The breast cancer among young Iraqi women under 40 years had high incidence rate .Larger studies are warranted to confirm our findings. We have to increase awareness of women regarding this disease and start screening to high risk patients in this age group.

Abstract

Background: The Gail Model is a statistical breast cancer risk assessment algorithm that was developed in 1989 by Dr. Mitchell Gail and colleagues with the Biostatistics Branch of the National Cancer Institute's Division of Cancer Epidemiology and Genetics. The Gail Model looked at a woman's personal medical history, familial history and reproductive history. The Gail model has been widely used and validated with conflicting results.

Method: A Gail model were assessed for 200 convenient patients, 100 patients with history of breast cancer diagnosed during the last year (case) and other 100 patients with benign breast disease (control) and who attended the oncology hospital in medical city and Imamin Al-kadhimin medical city during 2019. The relative risk was measure for each patients and calculated 5 year risk >1.7% was regard as high risk, chi-square and student T test was used to find association between two groups.

Results: Calculated 5 year risk >1.7% found in 21% of case and in 11% of control and no association was found between two groups in the relative risk of breast cancer ($\chi^2 = 3.7$,df=1, p= 0.054)

Conclusions: The Gail model is not useful in identifying risk of breast cancer in women and should not be used for that purpose.

Keywords: *Gail model, breast cancer, relative risk, Baghdad, Iraq.*

Introduction

Breast cancer is the most frequent cancer among women, impacting 2.1 million women each year and also causes the greatest number of cancer-related deaths among women. In 2018, it is estimated that 627,000 women died from breast cancer – that is approximately 15% of all cancer deaths among women[(1)]. And in Iraq it regard as second cause of cancer-related deaths[(2)].

Thus the increasing in breast cancer rate has enhanced global breast health initiatives and attention towards breast cancer risk assessment and awareness[(3,4)]. Breast cancer causes serious concerns even in healthy women, both because of its incidence and mortality. The steps that should be taken in order to decrease this threat can be arranged as following: assessment of breast cancer risk of women, determination of risk groups, careful monitoring of such high-risk groups, informing individuals with risk factors and extending screening and reachable treatment programs in every society[(5,6)]. Breast cancer risk factors have been defined by previous studies. Age and female sex are important risk factors for breast

cancer. Other factors can be increase breast cancer risk including personal and family history of breast, ovarian and endometrium cancer; history of lobular carcinoma in situ-matched biopsy of atypical hyperplasia; positive BRCA 1 and BRCA 2 genes; early menarche (<12 yr), late labor (>30 yr); induced abortion; late menopause (>55 yr); hormonal replacement treatment (HRT); alcohol over-consumption; smoking; lack of physical activity; diet rich in fat; body mass index (BMI); and high socio-economic level [7-9].

Over the past two decades, a number of statistical models that predict the risk of breast cancer have been designed to select high risk women for risk reduction strategies based on some risk factors that are associated with increased risk. There are two main types of models. The first type assesses the probability of BRCA mutations such as Claus model in which all predictions are only based on family history [10]. The second type used risk factors of breast cancer includes Gail model (GM) and its modified one (GM2) which calculates 5-year and lifetime invasive breast cancer risk [11]. The GM is the most commonly used risk prediction model and has been well studied, validated and applied in various studies worldwide [12, 13].

Objective: To evaluate the performance of model in estimating the risk of breast cancer in the clinical setting.

Material and Method

A total of 200 patients equal or above 40 years, 100 patients with history of breast cancer diagnosed during the last year (case) and other 100 patients with benign breast disease (control) and who attended the oncology hospital in medical city and Imamin Al kadhimin medical city between June and December 2019. The required information was age, age at menarche, age at first live birth, first degree relative numbers with breast cancer, previous breast biopsies with or without atypical hyperplasia, BRCA mutations and woman race. Unknown BRCA mutations and the white race/ethnicity variables were used for all the women in this study in estimating their risks [14]. The relative risk was measure for each patient which available at (http://www.cancer.gov/bcrisktool/) and calculated 5 year risk >1.7% was regard as high risk[15], chi-square and student T test was used to find association between two groups.p≤0.05 was considered significant.

Results

The mean age of breast cancer patients was 51.3±9 years which was higher than the mean age of control benign patients (49±6.5 years) and it was statistically significant(p=0.02).Distribution of participants in different categories of age atmenarche, age at first lived baby and family history was almost similar in both groups and no association were observed between the two groups (P= 0.62, 0.717, 0.27 respectively).Higher frequencies of previous breast biopsy were recorded in control patients compared to breast cancer patients (P<0.001), Gail model scores, that predict 5-year risk of invasive breast cancer, in breast cancer patients and control patients were 1.25±0.7 and 1.26±0.7, respectively and nostatistically difference existed between them (P = 0.9) table -1-

Table 1: Difference in Risk factor used in Gail model among studied groups.

Variable		Participants (No)		P Value
		Breast Cancer Patients	Control Patients	
Age	40-49 years	53	55	0.02*S
	50-59 years	25	36	
	≥60 years	22	9	
	mean±SD	51.3±9	49±6.5	
Age at menarche	≤11 years	10	13	0.62*
	12-13 years	73	74	
	≥14 years	17	13	

Variable			Participants (No)		P Value
			Breast Cancer Patients	Control Patients	
Ageat first live birth	Nil parity		17	12	0.717*
	<20 years		20	17	
	20-24 years		26	25	
	25-29 years		21	26	
	≥ 30 years		16	20	
Family history of breast cancer	Negative		78	84	0.27*
	Positive	One	21	14	
		≥ Two	1	2	
Previousbreast biopsies	Negative		94	77	0.001*s
	Positive		6	23	
Gail score			1.25±0.7	1.26±0.7	0.9**

*Chi-square test, ** Student T test, ^{S}significant ≤ 0.05.

Using the cut-off value of 1.7 in Gail score, patients were categorized into high andlow risk groups. The model was able to correctly characterize 21 patients in the breast cancer group as having high risk of breast cancer(sensitivity = 21%) and the model was correctly characterize 89 patients in control group as having low risk of breast cancer (Specificity =89%) and no association was found between two groups in the relative risk of breast cancer (χ^2=3.7, df=1, p= 0.054).

Discussion

As the incidence of breast cancer is rising in Iraq, it is important to detect women with a high risk for early detection, timely treatment and prevention. Mitchell Gail, a biostatistician, developed a mathematical model in 1989 to assess the risk of breast cancer risk based on the results from the BCDDP–a large screening study that included 284,780 women who had been undergoing annual mammographic examination [16]. Later, it was modified by involving atypical hyperplasia in breast biopsy, race and ethnicity [17]. Most Western countries use the Gail model to assess the risk of breast cancer. The drawbacks of the Gail modelwere that it does not consider lobular neoplasia, family history of breast cancer in second-degree relatives and family history of ovarian cancer. This led to the development of various other models considering the factors that were neglected in the GM such as history of breast cancer in second-degree relatives, which was included in the Tyrer–Cuzick model. To many countries and cities around the world validated the GM apart from the United States like Canada[18], Italy [19] and England [20]. Several reports focused on the performance of the Gail model in Asian population and the results of these reports were in agreement with the finding of the current study, there are no studies in Iraq to date assessed predictive breast cancer risk models.In this study, Gail model was assessed by case control study to validated in risk prediction for breast cancer and different components of the Gail model were compared between patients with confirmed breast cancer and control patient, In this study, the two groups differed significantly in terms of age, number of previous breastbiopsies, sensitivity of model was 21%, specificity was 89% and it failed to differentiated between breast cancer patient and control patients, this resembled to A study of Gail model in Turkish women compared 650 breast cancer patients with 640 healthy women as control group. In this study,age and first live birth (≥30) were statistically significant between caseand control groups but other risk factors used in Gail model were not different between two groups, sensitivity of model 13.3% and specificity was 92%. They concluded that Gailmodel is not appropriate for risk estimation inTurkish population [21], Iranian study on 560 women that showed a significant association of patients age, age at first baby and history of previous biopsy, no association was found between age at menarche, first degree family history and Gail model also showed very low sensitivity (13.9%) and high specificity (91.4%) of the Gailmodel in Iranian population and Indian study [22]

that showed Gail model is not useful in identifying the risk of breast cancer in Indian women. Several points noted regarding the limitations of the current study. Most importantly, that a sample of patients selected from are ferralcenter in Bagdad might not be representative of Iraqi female population. Larger studies including women from different parts of country should be conducted in order to obtain anaccurate assessment of the Gail model performance in Iraqi women, the relatively small number of patients that were included in current study, may hinder detection of significant association between the variables and risk of breast cancer and limit proper interpretation of results, Case-control nature of the study and lack of patients follow-up, do not allow researchers to assess absolute risk of cancer development among study population. Based on the results of the current study, it could be suggested that current version of Gail model should be modified to make it applicable for breast cancer risk estimation in Iraqi women.

Conclusion

The Gail model underestimate risk of breast cancer in Iraqi women and should not be used for that purpose.

Incidence of Vitamin D Deficiency in Children in Babylon Province

Lecturer Bashar S. Khalaf

Pediatric Dept., Hammurabi Faculty of Medicine, University of Babylon,
F.I.B.M.S, C.A.B.P General Pediatrician/Iraq

Abstract

Purposes of Study: analysis and measurement of incidence and to show clinical factors that association vitamin D deficiency in children between < 1 year - 11 years old.

Design and Method: This study is prospective, total children 172 with 108 male and 64 female. Age group of children extend from <1-11 years old and planned into four groups: < 1, 1-3, 4-7, 8-11 years old. Serum 25-OHD assay, serum calcium and alkaline phosphatase were measured. Vitamin D deficiency were arrange into three groups according to severity of vitamin D as following : mild vitamin D deficiency is 20-30 ng/ml, moderate vitamin D deficiency is 10-20 ng/ml and severe vitamin D deficiency is< 10 ng/ml.

Results: Among 172 children, 95 of children were healthy, 77 children had vitamin D deficiency. 25-OHD deficiency showed 16.8%, 38.9% and 44.2% in mild, moderate and severe cases respectively. Age of children was older age (5.59±3.42) in vitamin D deficiency. Mean vitamin D deficiency is much lower with highly significant association (P value = 0.00) in compare to normal children. Male gender were predominant in normal and deficient vitamin D respectively but with independence association. Serum calcium and alkaline phosphatase measurement showed hypocalcaemia with elevated level of alkaline phosphatase in vitamin D deficiency and both of them had highly significant difference (P value = 0.00).

Conclusion: Vitamin D deficiency is very common (44.76%) in age group between <1-11 years old and severe vitamin D deficiency (< 10 ng/ml) is the commonest vitamin D deficiency (44.2%) specially older age group (8-11years). vitamin D deficiency is associated with significant hypocalcaemia and elevated alkaline phosphatase.

Keywords: *Vitamin D deficiency, children, incidence.*

Introduction

Vitamin D is a vital source for formation of healthy bone[1], it is not found in many food and so sunlight exposure is main source of vitamin D[2] .

1,25 dihydroxyvitamin D3 (1,25-OHD) is active compound of vitamin D, responsible for calcium and phosphate absorption from small bowel and vitamin D deficiency is a leading etiology of rickets and osteomalacia[3-6] .

Exact definition of vitamin D deficiency is not established[7-9]. There are range of diagnostic values of vitamin Ddeficiency, less than 50 nmol/L is a more frequent value[10,11] and less than 20-37 nmol/L is other depending value[12,13] .Consequently vitamin D deficiency prevalence are wide-ranging 15%-60% over the different countries of world [14,15]. Vitamin D deficiency is a common disease in adult and children and this may related to insufficient sunlight exposure [16].

25-hydroxyvitamin D (25-OHD) is reliable guide for investigation of vitamin D deficiency [17] and 1,25-OHD is not suitable as laboratory marker of vitamin D because short half-life of serum 1,25-OHD[18].

Vitamin D deficiency is the etiology of rickets in age group mostly more than 5 years [16]. The Centers for Disease Control and prevention (CDC) show that vitamin D deficiency are 9%-11%, 19%-22%, 22% and 22%-28% in age group 1-8 years, 9-13 years, 14-18 years and adult age old respectively when CDC is depending that value of vitamin D deficiency is less than 20 ng/ml [19].

Current study aimed to evaluate incidence and to show clinical factors that association vitamin D deficiency in children between < 1 year- 11 years old.

Materials and Method

This study is prospective, total children 172 with 108 male and 64 female,were admitted in Babylon teaching hospital for gynecology and pediatrics between February/2018 to June/2019.Age group of children extend from<1-11 years oldandplanned into four groups: < 1, 1-3, 4-7, 8-11 years old. Clinical and laboratory investigation for admitted children were done.

One sample of blood was taken, put in gel and clot activators tube, then centrifuge and serum25-hydroxy vitamin D (25-OHD),serum calcium and alkaline phosphatase were investigated to all children.

Serum 25-OHDassay were measured by cobas e 411 analyzer (serial No. is 18P8-03) while serum calcium and alkaline phosphatase were measured by cobas c 111.

Vitamin D deficiency were arrange into three groups according to severity of vitamin D as following : 1) mild vitamin D deficiency : 20-30 ng/ml, 2) moderate vitamin D deficiency : 10-20 ng/ml, 3)severe vitamin D deficiency : < 10 ng/ml as in table 1. normal concentration for 25-OHD, calcium, alkaline phosphatase are 30-100 ng/ml, 8.4-11 mg/dl and < 300 U/L respectively.

SPSS program (version 22) was using for Statistical measurement. continuous variable were represented by Mean ± SD and median and calculated by independent sample T or Mann-Whitney U tests according to normal distribution of the data. Chi square (X2) were used to calculated the association between categorical parameters and P value < 0.05 was Significant.

Results

Among 172 children, 95 of children were found to have normal concentration of vitamin D, 77 children had vitamin D deficiency. 25-OHD deficiency showed 16.8%, 38.9% and 44.2% in mild, moderate and severe cases respectively (Table 1).

Table 1: Clinicopathological basic characteristic in children with vitamin D status (total n. =172).

	Characteristics	Total N (%)
Age (Years)	< 1 year	32(18.6%)
	1-3	51(29.7%)
	4-7	44(25.6%)
	8-11	45(26.2%)
Gender	Male	108(62.8%)
	Female	64(37.2%)
25-OHD	Normal	95(55.2%)
	Deficiency	77(44.8%)
25-OHD deficiency	20-30 ng/ml mild deficiency	13 (16.8%)
	10-20 ng/ml moderate deficiency	30(38.9%)
	< 10 ng/ml severe deficiency	34(44.2%)

Mean age of children was older age (5.59±3.42) in vitamin D deficiency, age < 1 year was least percentage and age 8-11 years is highest percentage of vitamin D deficiency (Table 2).

Mean vitamin D deficiency is much lower (13.375±5.99) and had highly significant association (P value = 0.00) in compare to normal children. Male gender were more frequency and showed 58.9% and 67.5% in normal and deficient vitamin Drespectively but with independence association (Table 2).

Serum calcium and alkaline phosphatase measurement showed hypocalcaemia (8.218±0.612) with elevated serum concentration of alkaline phosphatase (269.157±14.41) in vitamin D deficiency and both of them had highly significant difference (P value = 0.00) as in table 2.

Table 2: Compare incidence and association between sex and age groups according to vitamin D status.

Vitamin D status				
Parameters		**Normal 25-OHD**	**25-OHD deficiency**	**P value**

Discussion

In current study, we assessment incidence and association of 25-OHD deficiency in children (≤11 years) in compare to originally normal 25-OHD concentration inmatched healthy children.

Our result of sex distribution areis more frequent in male (67.5%) in both categories of 25-OHD (normal and deficient 25-OHD) and the older age group (8-11 years, 5.59±3.42 years) is most frequent in children with 25-OHD deficiency . There are insignificant association in compare age groups, age (mean±SD) and sex to both categories of 25-OHD(P value are 0.071, 0.119 and 0.247 respectively). Young et al [20] showed that 25-OHDdeficiency were predominant in female in both normal and deficient 25-OHD, 25-OHD deficiency are common in age 6-12 years and there are insignificant associated of age and sex with 25-OHD. The 25-OHD

deficiency evaluation in Birmingham reported high percentage in male [21] and Craig et al [16] was also reported 55% of male with 25-OHDdeficiency.

Mild cases of 25-OHD deficiency in current study have high percentage in 1-3 age group, while moderate and severe cases of 25-OHD deficiency are more in older age group (8-11 years), there are insignificant association of age groups with three categories of 25-OHD deficiency (P value = 0.057).Many researchers reported high frequency of well-being children and adolescent[22,23].

Our study reported 25-OHDdeficiency are 16.8%, 38.9% and 44.2% for mild, moderate and severe cases respectively. Catherine et al [24] showed 40%, 12.1% and 1.9% for 25-OHDconcentration ≤ 30, ≤ 20 and ≤ 8 ng/ml respectively.

In our result, the mean serum concentration of 25-OHD(normal and deficiency conditions)) are 38.211±4.186 and 13.375±5.99 respectively and incidence of 25-OHDdeficiency is 44.76%. Young et al [20] presented that mean concentration of 25-OHD were 27.01±5.59 and 14.86±3.2 for children with normal and deficient 25-OHD respectively and prevalence of 25-OHD deficiency are 59.1%, these data are near to our result.

The current research showed 42.8% (total patients are 33) and 57.1%(total patients are 44) of 25-OHDdeficiency in age group <1-3 and 4-11 years old respectively. 25-OHDdeficiency in children reported 50% and 70% of 1-5 years and 6-11 yearsage old respectively in united states of America[25,26].

Clinical manifestation of 25-OHD are various, so the accurate incidence of 25-OHDdeficiency will affected and resulting to different incidence rate among the world [27] .

Also in current study, there are both hypocalcaemia(8.218±0.612) and higher concentration of alkaline phosphatase (269.157±14.41) in children with 25-OHD deficiency. Both of serum calcium and alkaline phosphatase have significant association to 25-OHD status .

Many studies showed serum hypocalcaemia and elevated serum alkaline phosphatase children with vitamin D deficiency [28,29] . Craig et al [16]demonstrated that vitamin D deficiency rickets were found to have elevated alkaline phosphatase (range 229-5443 IU/L) and hypocalcaemia (12%).Young et al [20]exhibited lower concentration serum calcium (9.67±0.36 mg/dl) and elevated alkaline phosphatase (257.96± 65.89 IU/L), there were significant (P value, 0.018) and insignificant (P value,0.073) association between serum calcium and alkaline phosphatase respectively with vitamin D status.

In conclusion, vitamin D deficiency is very common (44.76%) in age group between <1-11 years old and severe vitamin D deficiency (< 10 ng/ml) is the commonest vitamin D deficiency (44.2%) specially older age group (8-11years). vitamin D deficiency is associated with significant hypocalcaemia and elevated alkaline phosphatase.

Abstract

Background: Chronic back pain is a very common global health problem and a major cause of disability. Although the facet joint disease is one of the most common causes, diagnosis is a bit difficult and needs a high index of suspicion.

Aim of the Study: To assess the prevalence of facet joint disease in patients with chronic back pain in Basrah and to determine the accuracy of diagnosis by therapeutic injections.

Patients and Method: In this follow up cross sectional study, (238) patients with chronic back pain were examined at the Medical Consultation Center of Basrah University. Ninety eight patients were diagnosed as facet joint disease and received a single therapeutic injection (medial branch block), of local anesthetic mixed with long acting steroid and followed for three months. Only 88 patient were followed for three months, 10 patients were missed.

Results: The prevalence of facet joint disease in our sample was 33.6%, with regional prevalence of cervical, thoracic and lumbar regions as (26.4%), (13.6%) and (42%) respectively. We found no significant association between having positive outcome results and the characteristic variables like gender and age of the patient, onset and duration of pain and the region being involved. Other variables like BMI, distribution and type of pain, number of affected levels and presence of radiological abnormalities, showed a significant association with the results.

Conclusions: Facet joint disease can be diagnosed clinically by collecting specific clinical and radiological features. Confirmation of the diagnosis and treatment can be done by local injection with high accuracy.

Keywords: *Chronic back pain, facet joint, medial branch block.*

Introduction

Chronic back pain is a common, yet exhausting problem affecting many patients. The differential diagnosis is very wide and the pain generator(s) may be hard to differentiate from the history, physical and routine diagnostic studies, in some cases. Diagnosis and treatment is complicated, as numerous studies express a poor correlation between imaging findings and patient symptoms[1,2]. In spite of the advancement in imaging of the spine, the amount, type and location of pain gathered by the history and the physical examination are the most important part of a patient's evaluation. Imaging studies are mainly for confirmatory only[3]. The facet joints

are one of the most common elements of chronic LBP (15-45%)[4-6].

The facet joint is a true synovial joint with a fibrous hyaline capsule, articular cartilage menisci and synovial lining[7,8]. It takes dual innervation from medial branches originating from posterior primary rami at the same level and one level above [8,9].

The history in patients with facet joint pain is often nonspecific, but may report pain in the spinal region affected, which is worse with extension and torsional loads and when radiation is present, it does not follow, but may mimic, a radicular pattern [9-11].

Diagnosis is not easy always, it is the set of clinical and imaging features rather than any single sign [12,13]. Spinal intervention is only effective when the patient's symptoms, physical findings and diagnostic imaging matching together[14-16].

The accepted standard incorporates clinical judgment with a diagnostic or therapeutic facet joint injection with steroid. Though liable to operator error, multiple studies establish that skillful use of facet joint injections can provide dual diagnostic and therapeutic objectives in returning patients to function[16-21].

Patients and Method

This follow up cross sectional study was conducted in Basrah center of orthopaedic surgery, (Medical Consultation Center of Basrah University) during the period from the first of June 2017 to the 31st of October 2018.

In this study we evaluate 238 adult patients complaining from chronic back pain.Inclusion criteria was an adult patient (aged 20 – 80 years old) complaining from back pain last more than 3 months duration.

Exclusion criteria, if the patient was a known case of inflammatory arthritis (rheumatoid arthritis, ankylosing spondylitis…etc.), a recent history of trauma or spinal surgery (less than 3 months) and in patients with severe or progressive neurological impairment (cauda equina syndrome)

After taking an informed consent, a detailed history was obtained from all patients and a physical examination was performed with review of all needed radiologicaland laboratory investigations, reaching the diagnosis and suggesting treatment for each case.

For every symptomatic level, we inject that level and one level above, because every facet joint innervated from 2 roots. Figure (1) below shows a case example.

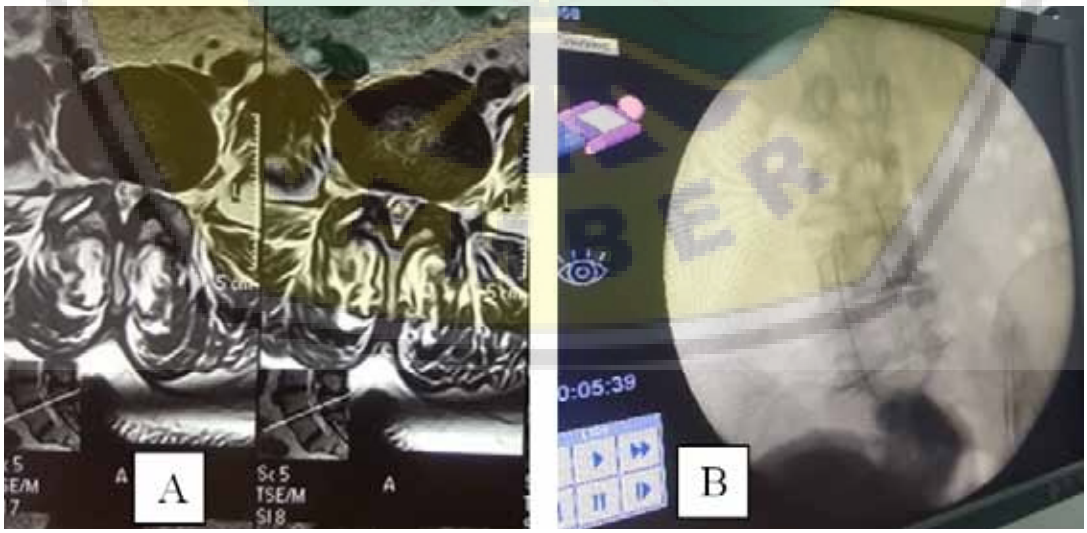

Figure 1: A 64 Y/O female with chronic LBP, diagnosed as a Lt. side L4-5 facet joint arthritis, treated by local injection. (A) Axial T2 MRI of the affected level L4-5, Rt. Facet joint arthritis and effusion. (B) Flouroscopic image at time of injection.

After the intervention, we keep the patients for 30 minutes to 1 hour under observation, then discharge, to re-evaluate again after 2 weeks, 1 month and 3 months periods.

A positive response was considered if the patient had a greater than 50% relief of pain and the ability to perform previously painful movements. Data were recorded on a Microsoft Access 2013 database. The SPSS version 21 Statistical Package was used to generate frequency tables. The prevalence and 95% confidence intervals (CI) were calculated. Differences in proportions were tested using the Chi-square test. Fischer's exact test was used whenever the expected value was less than five. Results were considered statistically significant if the P value was <0.05.

Results

A total number of 238 patients with chronic back pain, (87 patients cervical, 22 thoracic and 129 lumbar regions), meeting inclusion criteria were studied. Female patients were 131 (55%) with a mean age of (51± 9 yrs.), while male patients were 107 (45%), with a mean age of (49± 11 yrs.). Patients age was classified into 3 groups; 20-39 yrs. 34 (14%), 40-59 yrs. 121 (51%) and 60-79 yrs. 83 (35%).

After a thorough examination and review of all investigations we diagnose 98 patients with facet syndrome as the main pathology or pain generator for them, with regional involvement as 27, 5 and 66 patients in the cervical, dorsal and lumbar regions, respectively. Demographic characters for patients with facet joint arthritis intable (1).

Table 1: Gender, age and BMI characteristics of the patients n=98.

Gender			Age (Yrs.)			Total
			20-39	40-59	60-79	
Male	BMI	Normal	3(60%)	1(20%)	1(20%)	5(100%)
		Over wt.	3(16.6%)	10(55.6%)	5(27.8%)	18(100%)
		Obese	3(19%)	5(31%)	8(50%)	16(100%)
		Morbid obesity	1(20%)	3(60%)	1(20%)	5(100%)
	Total		10(23%)	19(43%)	15((34%)	44(100%)
Female	BMI	Normal	1(25%)	3(75%)	-	4(100%)
		Over wt.	1(5%)	17(80%)	3(15)	21(100%)
		Obese	2(9.5%)	15(71.5%)	4(19%)	21(100%)
		Morbid obesity	-	5(62.5%)	3(37.5%)	8(100%)
	Total		4(7.5%)	40(74%)	10(18.5%)	54(100%)
Total	BMI	Normal	4(45%)	4(45%)	1(10%)	9(100%)
		Over wt.	4(10.5%)	27(69%)	8(20.5%)	39(100%)
		Obese	5(13.5%)	20(54%)	12(32.5%)	37(100%)
		Morbid obesity	1(8%)	8(61%)	4(31%)	13(100%)
	Total		14(14%)	59(60%)	25(26%)	98(100%)

Pain characteristics shown in table 2.

Table 2: Distribution of the sample by region of involvement according to presenting pain characteristics (n=98). (Axial+* refers to patients with axial and no true radicular pain)

Region	Onset		Duration			Distribution		
	Sudden	Gradual	3-<6 Months	6 M - 1 yr.	> 1 yr.	Axial	Axial+*	Neuro. Claud.
Cervical	8(33.3%)	19(25.7%)	2(16.7%)	7(25.9%)	18(30.5%)	11(52.4%)	16(24.2%)	0(0.0%)
Thoracic	1(4.2%)	4(5.4%)	1(8.3%)	1(3.7%)	3(5.1%)	5(23.8%)	0(0.0%)	0(0.0%)
Lumbar	15(62.5%)	51(68.9%)	9(75.0%)	19(70.4%)	38(64.4%)	5(23.8%)	50(75.8%)	11(100%)
Total	24(100%)	74(100%)	12(100%)	27(100%)	59(100%)	21(100%)	66(100%)	11(100%)

After doing the pain therapy injection for the 98 patients, we followed them for 3 months. At the 3 months follow up, 10 patients didn't reach the final examination and only 88 patients were re-examined and documented as the main target of the study, table (3).

Table (3): distribution of patients according to the outcome of the intervention by region of involvement after 3 months. (n=88, 10 patients missed in the follow-up)

Cervical (25 patient)		Thoracic (3 patients)		Lumbar (60 patients)		Total (88 patients)	
Positive	Negative	Positive	Negative	Positive	Negative	Positive	Negative
23(92%)	2(8%)	3(100%)	0	54(90%)	6(10%)	80(90.9%)	8(9.1%)

From this table we can calculate the prevalence of facet joint arthritis in our sample as (33.6%). Regional prevalence, in cervical (26.4%), thoracic (13.6%), lumbar (42%).

Chi square analysis, (table 4), showed **no significant association** between having positive outcome results and the characteristic variables (like **gender and age of the patient, onset and duration of pain and the region being involved, cervical, dorsal, or lumbar regions**). That's means the result of pain therapy in patients with facet arthritis didn't significantly affected by the age or gender of the patient, the onset or duration of pain and the region involved by this disease. On the contrary, we found that **BMI, distribution and type of pain, number of affected levels and presence of radiological abnormalities**, showed a **significant association** with the results. That's means having a mechanical type of pain was significantly associated with positive results (P value 0.044), while having neurological claudication was significantly associated with negative results (P value 0.005). As for the number of levels affected, having one level of involvement showed a significant association with positive outcome results (P value 0.048). In relation to radiological abnormalities, the presence of facet arthritis alone was associated with positive results, while presence of other features like spinal stenosis or large disc bulge was associated with negative results (P value 0.000).

Table 4; Distribution of the sample by outcome (3 months follow-up period) according to demographic features/characteristics (n = 88, 10 patients missed in the follow-up).

Variable		Negative	Positive	Total	P value
Gender	Male	4(10%)	36(90%)	40(100%)	Not significant
	Female	4(8.3%)	44(91.7%)	48(100%)	
Age	Below 60	6(9.2%)	59(90.8%)	65(100%)	Not significant
	60-79 yr.	2(8.7%)	21(91.3%)	23(100%)	

Variable		Negative	Positive	Total	P value
BMI	Normal or over wt.	0	42(100%)	42(100%)	Fisher's Exact Test0.006
	Obese and morbid obesity	8(17.4%)	38(82.6%)	46(100%)	
Onset	Sudden	1(4.5%)	21(95.5%)	22(100%)	Not significant
	Gradual	7(10.6%)	59(89.4%)	66(100%)	
Duration	3- 6 months	1 (10%)	9(90%)	10(100%)	Not significant
	6m – 1 year	1(4%)	24(96%)	25(100%)	
	> 1 yr.	6(11.3%)	47(88.7%)	53(100%)

	More than one level	6(18.2%)	27(81.8%)	33(100%)	
Region	Lumber	6(10%)	54(90%)	60(100%)	Not significant
	Cervical & Dorsal	2(7.1%)	26(92.9%)	28(100%)	
Radiology	Facet arthritis	0(0%)	75(100%)	75(100%)	Fisher's Exact Test 0.000
	Facet arthritis + spinal stenosis	8(61.5%)	5(38.5%)	13(100%)	

Discussion

In this study we consider clinical diagnosis of facet joint arthritis in 98 patient, then confirming the diagnosis by diagnostic and therapeutic medical branch blocks, remarking positive results as pain relief of greater than 50%, with ability to perform previously painful movements, as in the systematic review which was conducted by Manchikanti et al, in 2016 [22], pain relief of greater than 50% was the outcome measure for diagnostic accuracy assessment of the controlled studies with ability to perform previously painful movements. This review provided significant evidence for the diagnostic validity of facet joint nerve blocks.

While Mark V. Boswell et al in 2015[23], postulated that the available evidence is Level I for lumbar facet joint nerve blocks, with at least 75% pain relief with an average prevalence of 16% to 41% and false-positive rates of 25% to 44%.

It's difficult to get 75% or even more pain relief from a single pain therapy injection to the facet joint because the spine problem is multimodal in most and not a single pathology.

The follow-up period in our study was a three months' time, because we believe that is the average time for a single injection to make its effect and to decrease the number of escaped patients from follow-up visits.

Manchikanti et al [24], in a randomized, double-blind, controlled trial with one-year follow-up on 120 patients to determine the clinical effectiveness of therapeutic local anesthetic cervical medial branch blocks with or without steroid in managing chronic neck pain of facet joint origin. The average number of treatments for 1 year was 3.5 ±1.0 in the non-steroid group and 3.4 ± 0.9 in the steroid group.

The prevalence of facet joint arthritis in our study was 33.6%,with regional prevalence in cervical (26.4%), thoracic (13.6%) and lumbar region (42%). In a prospective study done by Manchikanti et al in 2004 [25], on (500) patients with chronic non-specific spinal pain, the prevalence of facet joint pain in patients with neck pain, thoracic and lumbar was 55%, 42% and 31% respectively. The difference in percentages with our sample was probably because of the place where the study conducted.

Another study done by AC Schwarzer et al[26] in 1995, a diagnosis of zygapophysial joint pain was made in 23 of 57 patients (40%).

Regarding variables that affect the outcome of facet joint blocks, Manchikanti et al [27], found that factors like gender, age of the patients, mode of onset of the pain and duration of the pain, all had no significant correlation on the diagnosis, while the presence of previous surgery was significantly affect the diagnosis. While Alfred C. Gellhorn et al [28], suggested that the prevalence of facet-mediated pain in clinical populations increases with increasing age, suggesting that facet joint osteoarthritis might have a particularly important role in older adults with spinal pain.

Conclusion

We believe that facet joint disease has received far less studies than other important osteoarthritis phenotypes such as knee osteoarthritis and other features of spine pathologies such as degenerative disc disease.

It can be diagnosed by careful clinical and radiological assessment and confirmation by diagnostic blocks with a reasonable accuracy.

The Effect of Silver Nanoparticles on Biofilm Formation in Environmental Isolates of Pseudomonas Aeruginosa

Huda Abbas Mohammed M. AL-Jaryawi[1], Ayaid Khadem Zgair[2]

[1]Lecturer/Center for Environmental Research and Studies Center, Babylon University, Babylon, Iraq, [2]Assistant Professor Department of Biology, [3]Lecturer/Department of Biology, College of Science, University of Baghdad, Baghdad, Iraq

Abstract

Alternative therapeutic agents such as silver nanoparticles are considered as a desirable agent to help manage and prevent the biofilm formation of different bacterial species.In the present study, eleven environmental strains of bacteria from water samples were identified as *P. aeruginosa* using classical method. We synthesized silver nanoparticles (AgNPs) by using*Myrtus communis* leaf extract as anti-biofilm formation agent. Using a tube method we have determined the minimum inhibitory concentrations (MIC) valueof AgNPs against planktonic growth of *P. aeruginosa*.the AgNPs were exhibited significant inhibition activity against PAE1 (environmental strain) with MICvalue of 150 µg/ml. Moreover, 0.5x MIC of AgNPs were separately tested to examine their anti-biofilm formation activities. We found that 100% (11/11) of environmental isolates were revealed a significant reduction in the rate of the biofilm production in the presence of 0.5x MIC of AgNPs. Thus, these results highlight an inhibitory role for synthesized AgNPs by using *Myrtus communis* leaf extract on biofilm formation of environmental of *P. aeruginosa* isolates and suggest that it can be added to the list of a potential anti-biofilm formation targets.

Keywords: *P. aeruginosa, Clinical isolates, Environmental isolates, biofilm, silver nanoparticles.*

Introduction

P. aeruginosa is a Gram-negative rod-shaped bacterium leading for many contagions immune compromised persons, burned patients and individuals hardship from cystic fibrosis(1). Overall there was a higher prevalence of biofilm-like formations in chronic wounds. This was the first evidence suggesting that biofilms are present in chronic leg wounds. Follow up studies suggest that while wound infections may be polymicrobial, the distribution of bacteria within wounds favors monospecies biofilms(2). Silver nanoparticles (AgNPs) are nanoparticles of silver of between 1 nm and 100 nm in size. Frequently, described as being 'silver' some are composed of a large percentage of silver oxide due to their large ratio of surface-to-bulk silver atoms(3). Numerous shapes of nanoparticles can be constructed depending on the application at hand. Commonly used are spherical silver nanoparticles but diamond, octagonal and thin sheets are also popular. Their extremely large surface area permits the coordination of a vast number of ligands(3).

Materials and Method

Materials: $AgNO^3$ was purchased from (Himredia, India) and *Myrtus communis* was obtained from a local farmer in Hilla, Iraq.

Identification of suspected P. aeruginosa: Seventy water samples were collected from Shatt al-Hillah and Al-yahudia. The samples were placed in sterile glass containers until they were cultured onto nutrient media

(HiMedia, India).Suspected isolates were grown on cetrimide agar to detect pigment (yellow-green to blue-green) production and an ultraviotet lamp was used to detect for fluorescein production [4]. Then, these colonies were cultivated on MacConkey agar [5].They identified strains were sub cultured on nutrient agar plates/slants and stored at 4°C for short-term storage until required for the study.

Preparation of Plant Extract: Ten grams of fresh leaves from *Myrtus communis* was obtained and confirmed to have been grown in Hilla (a central province in Iraq). The identity of the plant was confirmed by a taxonomist working at University of Baghdad. To obtain the plant extract, the leaves were washed andchopped into small pieces and soaked in baker containing 100 ml of distilled water. The mixture was heated at boiling point for 10 minutes and then cooled and sprinkle twice with whateman-1 filter paper and then the extract was filtered with Millipore filter (0.45 µl) which was stored at 0–4℃ for further use.

Synthesis of Silver Nanoparticles (AgNPs) Using M. communis Extract: The silver NPs were prepared by adding 10 mL of *M. communis* extract to 250 mL aqueous solution consist of 1.69 mg of silver nitrate (0.001 M) in a 250 mL round-bottom flask. The round-bottom flask was equipped with a magnetic stir bar. The reaction mixture was heated and stirred. The reaction mixture was allowed to cool down and 100 ml of reaction mixturewas dried out for 4 hours at 80ºC in an oven to remove water. 20-30 ml of ethanol was added to remove plant extract residues and obtain pure nanoparticles by forming them with ethanol. The reaction mixture was centrifuged at 5000 rpm/15min for six times. A black precipitate of nanoparticles was formed, which was dried out at 80ºCfor 8 hours. 0.06 g of silver nanotubes and ions was taken in a quantity of distilled water and put in ultrasonic water bath. The mixture was put in water bath ultrasonic for 60 mins to disruption the particles of silver and to ensure the recovery of particles nanoparticles are once again as small as they can be then measured size of Nano silver particles on (SEM)[6].

Scanning the Silver nanoparticles under the SEM: A 100µl comprising 250ppm of silver nanoparticles were laid on the aluminum slide and dried in a dark place at room temperature and then tested with SEM [7]. The images of nanoparticles were obtained in the scanning electron microscope (Quanta^{TM}, USA, 450-FEI in Faculty of Pharmacy, University of Babylon, Hilla). The information regarding magnification utilized, applied voltage and the size of the content of the images were confined on the photographs itself.

Minimum Inhibition Concentration (MIC) of AgNPs: Minimal concentration of AgNPs which shows inhibition of visible bacterial growth or turbidity was referred as MIC. In vitro MIC testing of strains (environmentalstrains) was determined by dilution tube method according to [8]. This assay is typically performed on planktonic (free floating) bacterial cells. AgNPs was diluted into various concentrations, 450, 150, 50, 16.6, 5.5 µg/ml, in sterile TSB broth in test tubes. The inoculate were prepared as follows: environmental isolates of *P. aeruginosa* were cultured in TSB broth for 24 hours at 37ºC and harvested in a centrifuge (18,900 x g for 15 min) and washed three times with sterile TSB broth. The pellet was re-suspended in a direct TSB broth containing approximately 2 x 10^7 CFU/ml. The inoculum tube and the 0.5 McFarland standard were compared visually [9].A UV-9200 spectrophotometer (UK) was then used to confirm that the inoculum tube was at the required turbidity of between 0.08-0.1 at OD600nm.2 ml of inoculum suspension was inoculated into test tubes containing 1 µl of the various concentrations of AgNPs. Each individual experiment was included a growth control tube (no AgNPs) and a sterility (no inoculated) tube. The tubes were incubated at 37°C for overnight and afterward the tubes were examined for growth or turbidity using unaided eye. These experiments were repeated three times.

Biofilm formation assay in the presence of AgNPs: The Biofilm formation was estimated before and after adding Nano silver particles in the following steps: The biofilm quantification assay was carried out using a microdilution method according to[10]. The inoculumenvironmental isolates were prepared as described in the previous paragraph (MIC of AgNPs).For microtitration, the environmental bacterial suspensions were titrated in at least three times in 96 flat-bottom wells. A test well, 100 µL of inoculum suspension contain approximately 2 x 10^7 CFU/ml was inoculated into well containing 100 µL of the 0.5x MIC of AgNPs which was diluted by TSB broth.A negative control, TSB broth without bacterial inoculum was included. A positive control, TSB broth with bacterial inoculum was included to quantify the biofilm formation of isolates without AgNPs.

The 96-well plates were then incubated at 37ºC. At

24 hours post incubated, the bacterial suspensions were aspirated and each well was washed three times with 220 µL of sterile PBS (0.1 M, pH 7.2). Subsequently, fixation of adhered cells was performed at 80 ℃ for 30 mins. The plates were removed from the oven and left at room temperature to cool down and then they were stained with 220 µL of crystal violet solution (0.5%) for 1 min. The plates were then washed with distilled water and dried at room temperature. In order to quantify adhered cells, 220 µl of decoloring solution (ethanol/ acetone solution, 80:20% respectively) was added to each well for 15 min.

Afterwards, absorbance readings the assimilation of the eluted stain were taken in an ELISA reader (BIOTECH ENGINEERING, Spectrophotometer UV-9200) at wavelength of 490 nm and the samples were classified according to [11].Three replicates of experiments were carried out. Reading of *P. aeruginosa* biofilms, strains were classified into the following categories: weak biofilm producers, moderate, strong biofilm producers. environmental isolates were classified into four categories, by using the mean optical densities (OD) relative to the ODc results. The categories to determine a positive isolate using this approach were based on the following criteria: non-adherent if ODt ≤ ODc; weakly adherent (+) if 2 x ODc < ODt; moderately adherent (++) if 3 x ODc < ODt; or strongly adherent (+++) if 4 x ODc < ODt.

Statistical Analysis: All values were taken as the mean value and standard deviation calculated. The differences were analyzed by using Student's t test employing Origin 8.0 version Software. A value of $P<0.05$ was considered to be statistically significant [12].

Results and Discussion

Identification of environmental bacterial isolates: It was of interest to study environmental isolates of *P. aeruginosa*, obtained from Shatt al-Hillah and Al-yahudia. eleven environmental isolates were chosen for further identification. The environmental isolates were PAE1, PAE2, PAE3, PAE4, PAC5, PAE6, PAE7, PAE8, PAE10, PAE11 and PAE12.

AgNPs synthesis:

Nanoparticles size determination by SEM: The SEM micrograph was used to measure the size of silver nanoparticles that prepared in present study. In this image observed spherical nanoparticles in the size range 33.9 to 41.98nm which is proved strongly that the particles prepared in our laboratories are nanoparticles (Figure 1)**.** The nanoparticles were not in direct contact even within the aggregates, indicating stabilization of the nanoparticles.In a recent paper by [13], the SEM micrograph revealed that the size of AgNP was found to be too small (5-30nm) in the case of AgNP prepared from *Myrtus communis*.

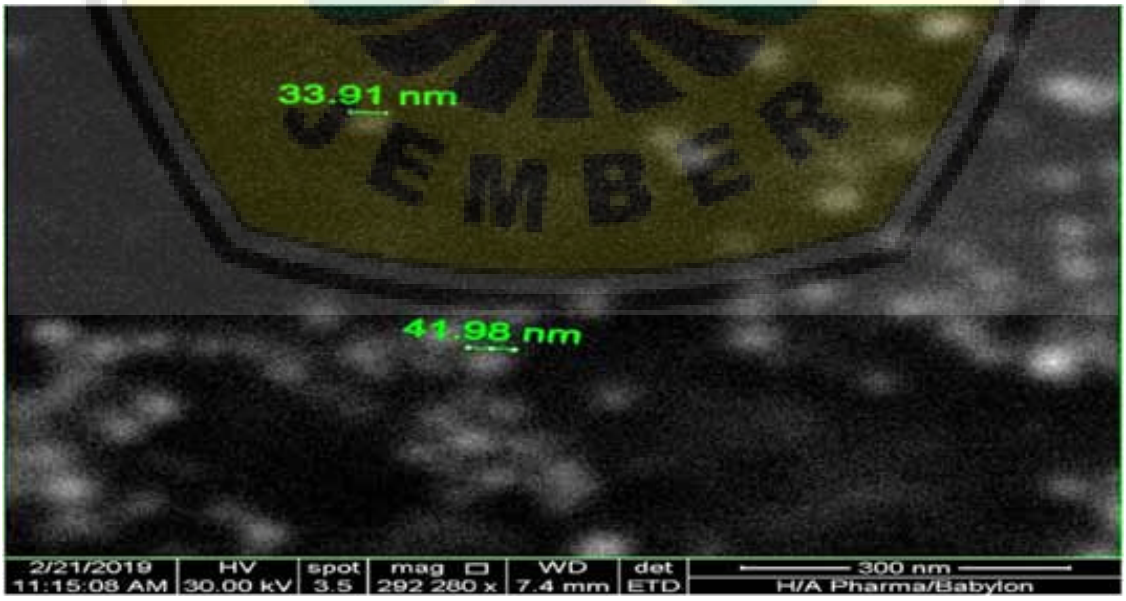

Figure 1. The SEM micrograph of AgNPs formed by Myrtus communis leaf extract.

Determination of Minimum Inhibition Concentration (MIC) of AgNPs: The results revealed that silver nanoparticle exhibited significant inhibition activity against PAE1 isolates with MIC value of 150 µg/ml. While, all of the isolates were found to be sensitive to the AgNPs with MIC value of 450 µg/ml (Table 1). These results are in good agreement with other studies which have shown that the silver nanoparticles synthesized using *M. communis* leaf extract had better or comparable antibacterial activity compared with other inorganic antibiotics [14]. The UV photo-reduction method was used for the synthesis of silver nanoparticles and the MIC value of nanoparticleswas found to be 2 µg/ml against *P. aerogunosa*[15].

Evaluation of the Effect of 0.5 x MIC of AgNPs on Biofilm formation: Initially bacterial suspensions were titrated in at least three times in 96 flat-bottom wells. To monitor this, the optical density ratio for each isolate (ODt) versus the optical density of the negative control (ODc) was determined. The screen was carried out three times and the mean data, expressed into the following categories: weak biofilm producers, moderate, strong biofilm producers, are shown in Table 3.Biofilm quantification analyses showed that 100% (11/11) of the environmental isolates were biofilm producers, indicating that this technique was efficient for the detection of biofilm production. The environmental isolates of this study had the following results for the categories of biofilm production: 81.8% (9/11) were moderately adherent and 27.2% (3/11) were strongly adherent. The results from this study are shown in the table 2.

Table 1. MICs of AgNPs for P. aeruginosa environmental strains.

Environmental isolates	MIC(µg/ml)
PAE1	150
PAE2	450
PAE3	450
PAE4	450
PAE5	450
PAE6	450
PAE7	450
PAE8	450
PAE10	450
PAE11	450
PAE12	450
PAE14	450

Table 2. Evaluation the rate of the biofilm formation of P. aeruginosa environmental strains.

Isolates	O.D	Biofilm Response	Biofilm Response
Control	0.013 ± 0.006	No biofilm	-
PAE1	0.286 ± 0.08	strongly biofilm	+++
PAE2	0.2 ± 0.11	moderately biofilm	++
PAE3	0.3 ± 0.09	strongly biofilm	+++
PAE4	0.17 ± 0.04	moderately biofilm	++
PAE5	0.22 ± 0.1	moderately biofilm	++
PAE6	0.34 ± 0.18	strongly biofilm	+++
PAE7	0.24 ± 0.107	moderately biofilm	++
PAE8	0.26 ± 0.05	moderately biofilm	++
PAE10	0.23 ± 0.04	moderately biofilm	++
PAE11	0.25 ± 0.04	moderately biofilm	++
PAE12	0.23 ± 0.06	moderately biofilm	++
PAE14	0.19 ± 0.04	moderately biofilm	++

The previous section has shown MICs of synthesized silver nanoparticles were 150 µg/ml against isolates (PAE1) and 450 µg/ml against all of other isolates. Thus, the effect of 0.5x MIC of AgNPs on the biofilm-forming ability of *P. aeruginosa* clinical and environmental strains *P. aeruginosa*was further investigated. of the two environmental isolates (PAE6 and PAE3) considered to be the highest valueof biofilm producers (in the absence of 0.5 x MIC AgNp) with OD readout (0.34 ± 0.18 and 0.3 ± 0.09) respectively. Whereas, treated PAE6 and PAE3 isolate with 0.5 x MIC of AgNps was shown a significant reduce in biofilm production with OD readout (0.047 ± 0.013 and 0.062 ± 0.01), respectively. The overall measurement results are summarized in the table 3 and figure 2.

Table 3. Biofilm Formation of environmental isolates of P. aeruginosa post treating with 0.5 x MIC AgNp.

Isolates	O.D	Biofilm Response	Biofilm Response
Control	0.011 ± 0.001	No biofilm	-
PAE1	0.058± 0.009	No biofilm	-
PAE2	0.051 ± 0.004	No biofilm	-
PAE3	0.062 ± 0.01	No biofilm	-
PAE4	0.061 ± 0.013	No biofilm	-
PAE5	0.05 ± 0.013	No biofilm	-
PAE6	0.047 ± 0.01	No biofilm	-
PAE7	0.068 ± 0.008	No biofilm	-
PAE8	0.08 ± 0.019	No biofilm	-
PAE10	0.088 ± 0.010	No biofilm	-
PAE11	0.07 ± 0.017	No biofilm	-
PAE12	0.098 ± 0.002	No biofilm	-
PAE14	0.076 ± 0.002	No biofilm	-

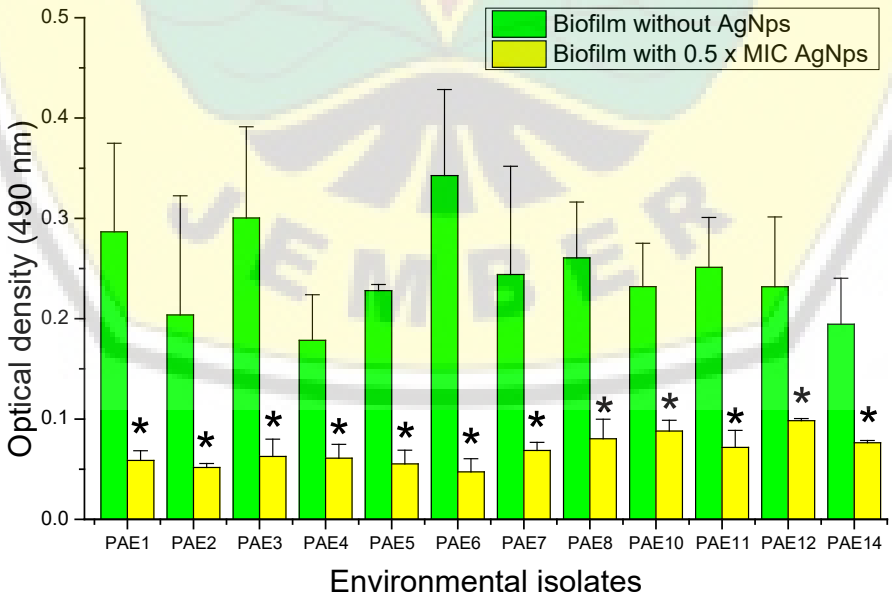

Figure 2. Inhibitory Effect of 0.5 x MIC of AgNPs on Biofilm formation of P. aeruginosa environmental isolates. P. aeruginosa environmental isolates were inoculated into a 96-well plate and either treated with the 0.5x MIC of AgNPs or untreated, the negative control was TSB broth only. Data were analysed against negative control by oneway t.test (*p≤0.05).

Conclusion

These results support the importance of further studies on using silver nanoparticles to control nosocomial infections caused multidrug resistant to most antibiotics. In regards to the results implied in this work concerning the action of synthesized silver nanoparticles from *M. communis* leaf extract, their use can be recommended as a potential alternative therapeutic agent for the control of microorganisms, with less risk of toxicity to mammalian cells.

Diagnostic Role of 2D Speckle Tracking Echocardiograghy in Detection of Subclinical LV Systolic Dysfunction in Asymptomatic Patients with Type 2 Diabetes Mellitus

Abbas AL Sharif[1], Abdulla J. Khashin[2]

[1]Prof. Consultant Cardiologis/Mustansyriah University/College of Medicine, Baghdad, IRAQ,
[2]MBCHB, FIBMS/Ministry of Health/Iraq

Abstract

Background: Left ventricular longitudinal systolic dysfunction has been identified even in asymptomatic patients with diabetes mellitus (DM) and preserved LV ejection fraction (LVEF). Subclinical LV systolic dysfunction may be identified by reduction in longitudinal function which can be assessed using 2D speckle tracking.

Aim: Early detection of LV systolic dysfunction in asymptomatic diabetic patients assessed by 2D speckle tracking and its correlation with diabetic duration.

Patients and Method: cross sectional study include 50 diabetic patients with normal EF compared with 50 age-matched healthy volunteers. To determine longitudinal function, three LV apical views were acquired in both diabetic group and healthy volunteer group .Using 2D strain software, end systolic LS were measured in 18 LV segments.

Results: No significant difference in LVEF was noted between two groups. Diabetic patients had more advanced diastolic dysfunction and increased LV mass compared with normal subjects. Basal, middle and apical LS were significantly lower in diabetic patients compared with control subjects,with 52%(26/50) of the diabetic patients showing abnormal global LS values (cut off value -18.4,mean -2SD in control subjects). Diabetic duration was correlated with reduction of global LS.

Conclusion: In addition to diastolic dysfunction subclinical LV longitudinal dysfunction is frequently observed in asymptomatic diabetic patients with normal LVEF. The decrease in LS correlated with duration of diabetes.

Keywords: *Diabetes mellitus,speckle tracking, longitudinal function.*

Introduction

Diabetes mellitus (DM) refers to group of common metabolic disorders that share the phenotype of hyperglycemia. Several distinct types of DM are caused by a complex of interaction of genetic and environmental factors(1).

DM is a major burden upon health care facilities in all countries, the incidence of DM is rising globally it is estimated that 366 million people had DM in 2011(approximately 8.3% of word population and this figure is expected to reach 552 millions by 2030(2).

Death and disability due to cardiac dysfuntion perhaps the most common complication of DM(3).

DM is a major contributor of the development of

College of Medicine, Baghdad, IRAQ
e-mail: ali_abd54144@yahoo.com

heart failure despite absence of coronary artery disease and hypertension even in patient with preserved (LV) ejection fraction. This condition is known as diabetic cardiomyopathy[4-6].

Patient with early diabetic cardiomyopathy often have evidence of global diastolic dysfunction but preserved systolic function as reflected by normal LVEF, compared with LV ejection fraction, myocardial velocity, strain and strain rate analysis are more sensitive indexes of LV function and have been demonstrated to be abnormal in patients with DM[7,8].

The presence of impaired longitudinal function in diabetic patients has been reported when using tissue Doppler imaging [9].

However, tissue Doppler imaging has it's own limitation including angle dependency and 1D nature of it's measurement. The recent development of 2D speckle tracking echocardiography overcome some of these limitation and it's accuracy have been reported [10,11].

Myocardial strain echocardiography can detect myocardial damage beyond that indicated by EF by assessing myocardial deformation in any direction. Furthermore newly developed layer-specific tracking imaging can evaluate myocardial function layer by layer[12].

LVEF is not a sensitive for subclinical LV systolic dysfunction Myocardial strain echocardiography can detect myocardial damage beyond that indicated by EF by assessing myocardial deformation in any direction. Early manifestation of diabetic LV systolic dysfunction can be appeared longitudinally because subendocardial fibers which are prone to vulnerable to myocardial ischemia have longitudinal trajectory [13-15].

Recent investigation have found that 2D speckle tracking echocardiography including LV longitudinal myocardial systolic dysfunction rather than LV diastolic dysfunction should be considered the first marker of preclinical form of diabetic cardiomyopathy in DM patient with preserved LVEF without overt HF[16-19].

The aim of this study was to asses the longitudinal strain in asymptomatic diabetic patients using 2D speckle tracking echocardiography to detect any subclincal LV systolic dysfunction even before impairments of other echo parameters like pulse and tissue Doppler and its correlation with diabetes duration.

Patients and Method

Cross sectional study conducted in Al-Yarmouk and Baghdad teaching hospitals, started from 1st of June 2016 to 30 April 2017

Inclusion Criteria:

1. Group 1 normal healthy people (control group)(50 persons) mainly hospital staff or patients relative.
2. Group 2 patient with established DM type2 of variable duration (50 persons).

Exclusion Criteria:

1. History of coronary artery disease.
2. Presence of moderate to severe valvular heart disease.
3. Significant rhythm disturbances
4. Moderate to sever hypertension

Echo Cardiography: Two dimensional transthoracic echocardiography was performed using available equipment (Vivid E9).

LV volumes and EF was measured using modified simpson method from apical four and two chamber views.

Relative wall thickness, LV mass and LV mass index according to Devereux' formula, were measured the following formulae relative wall thickness =2x PWT/LVDd

$$\text{LV mass (g)} = 0.8 \times (1.04 \times ((\text{LVDd}+\text{PWTd}+\text{SWTd})^3 - (\text{LVDd})^3)) + 0.6$$

LV mass index (g/m^2)=LV mass/body surface area where LVDd is LV diastolic dimension PWTd is posterior wall at end–diastole and SWTd is septal wall thickness at end diastole.

Left atrial volume was calculated atrial area and length (L) in apical 2-chamber view (A_2) and 4-chamber (A_1) views using the formula ($0.85X\ A_1XA_2$)/L.

LV volume was indexed to BSA (g/m)

Two Dimensional Speckle Tracking: Using available 2D strain software (Vivid E_9) the endocardial border in the end systolic frame was manually traced. A region of interest was then drawn to include the entire myocardium. The software algorithm automatically

segmented the LV into six equidistant segment and selected suitable speckles in the myocardium for tracking. The software automatically generated time-domain LV strain profile for each of the six segments of each view,from which end-systolic strain was measured . The average value of strain at each level (basal, middle and apical) and global strain obtained from averaging the strain value of 18 LV segments was calculated.

For GLS assessment, three LV apical views, apical four- chamber, two-chamber and long axis views were acquired at high frame rates. In each plane three consecutive cardiac cycles were acquired during a breath hold and digitally stored for off-line analysis using 2D software (Echopac PC available equipment (Vivid E9).

Statistical Analysis: Statistical analysis was done using computerized statistical software, statistical package for social sciences (SPSS) (version 24).

1. Mean and standard deviation was done for all quantitive continuous variables.
2. Pearson correlation with 2-tailed analysis were used to test association between continuous data sets.

Significant result is considered when P-value <0.05 and highly significant when <0.001 and non-significant when >0.05.

Results

Table 1 shows the clinical characteristics of the studied group, the mean diabetic duration was (7.09+3.4y). The study included 50 age matched control people 29 male (58%) and 21 female (42%) with male to female ratio was 1.3:1 and 50 diabetic (type 2) patients, 27 male (54%) and 23 female (46%) with male to female ratio was 1.1:1The mean age of control group (61.9+3y) and mean age of diabetic type 2 group (57.5+7y) without significant statistical difference .-The mean BSA of the control group was (1.63+0.06m^2) which is nearly similar to diabetic type 2 group (1.66+0.09m^2).

The mean HbA1C in diabetic group was 7.5+2.4.64% of diabetic patients have mild hypertension,68% of diabetic patients were taken oral hypoglycemic drugs, while 32%were on insulin. 42%of diabetic group have dyslipidemia versus 32% of control group while 62% of them were smokers versus 22% of control group.

Table 1: Demographic characteristics of DM patients and control subject

Table 2 shows standards echocardiographic parameters. The LV wall thickness, LV mass index and LA volume index were significantly higher in diabetic group in comparison with control group(P-value<0.05). There was no difference in LV systolic function of both groups, LVEF was nearly similar(62.8±1.6 versus 64.7±1.1).E/A was significantly higher in diabetic patient compared to control group (P value<0.009) while DCT, IVCT and IVRT assessed by pulse doppler echo were not different between both groups.

Tissue Doppler study showed that peak systolic and early diastolic annular velocity (E') was significantly lower in diabetic group resulting in a higher E/E' compared with control subjects.

LVEF was not different between two groups. LV mass index, relative wall thickness and left atrial volume index were significantly higher in diabetic patients. Peak systolic and early diastolic annular velocity (E') was significantly lower in diabetic group, resulting in a higher E/E' compared with control subjects.

Table 2: Standard echocardiographic data

	Diabetic Patients n=20	Control Subject n=50	p-valu
IVC (mm)	10.8±1.05	9.3±0.5	<0.001

S,Velocity (cm/s)	8.2±0.7	9.00±0.001	<0.001
E,Velocity (cm/s)	6.6±0.7	7.8±0.7	<0.02
E/E,	12.3±1.9	9.4±0.99	<0.009

Global longitudinal strain in control subjects was -20.8+1.2 These data was used to establish abnormal cut-off value of global LS. This was calculated as the value of the mean - 2SD using the cut- off value of 18.4, 52% (26/50) of diabetic patients showed abnormal global LS values,as shown in fig 1.

GLS and regional longitudinal strain at the apical, mid and basal LV levels were significantly lower in diabetic patients compared with control subjects as shown in figure 2-4 (P value<0.05).

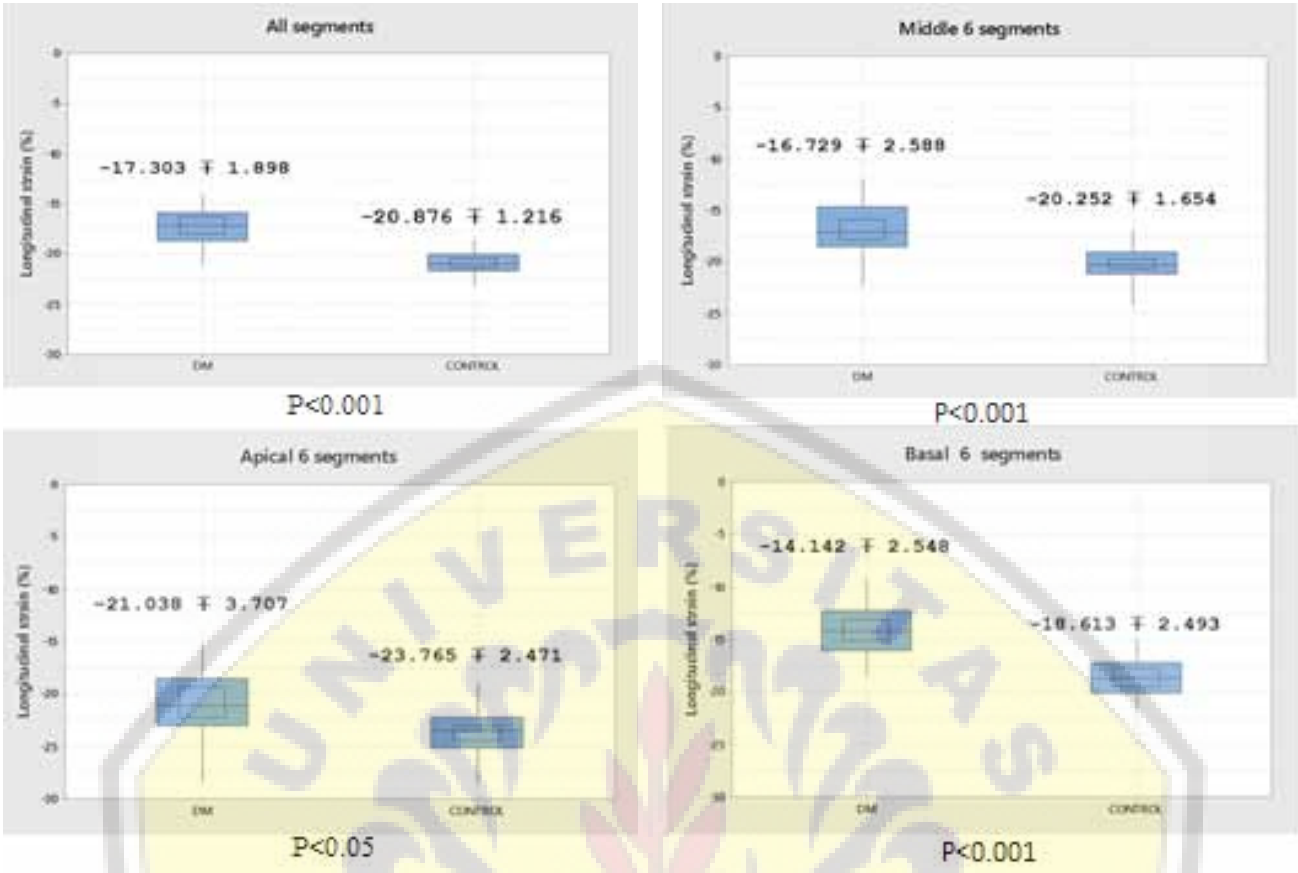

Figure 1: Boxgraph showing global and reginal strain values of diabetic patients and control subject numerical values are presented as mean±SD

Table 3: Pearson correlation of global LS with echo findings data and duration of DM

Global LS	Pearson Correlation (r)	P-value
E,	0.59	0.03
RWT	0.44	0.02
E-wave velocity	0.35	0.01
Duration of DM	0.75	0.04

Correlation is significant at the 0.05 level (P-value)

Statistical analysis revealed that global LS was correlated with LV diastolic dysfunction, E· (P-value=0.03) and with E-wave velocity (P-value=0.01) and with LV hypertrophy, relative wall thickness (P-value = 0.02). Reduction of the global LS was correlated with diabetic duration (P-value <0.05).

Table 4: Difference in GLS between short and long duration of DM

Duration of DM	Number of DM patients	GLS	P-value
<5years	18	-18.7+2.1	<0.05
>5years	32	-16.6+2.3	

Diabetic patients were divided into two groups according to the duration of the disease (<5 years and >5 years), we found global LS was significantly lower in the diabetic group with longer disease duration (-16.6+2.3) compared with short disease duration (-18.7+2.1) the difference was statistically significant (P-value less than 0.05

Discussion

Diabetes mellitus is known to be associated with the development of heart failure even without the presence of co-existing coronary artery disease, so detection of early stage of diabetic heart disease is necessary, because early treatment will prevent overt heart failure, The development of myocardial fibrosis,glucose toxicity and microvascular disease have been called upon to explain abnormalities in diabetic cardiomyopathy, however,detectable at an early stage only using GLS[20,21]

Global LS were significantly reduced in diabetic patients compared with age matched control subject, the reduction in LS was evenly distributed in the LV. Average global LS in diabetic patients was -17.3+1.8 compared to -20.8+1.2 which was statistically significant (P-value <0.05),also regional LS at base, middle and apical LV level were significantly lower in diabetic patients compared to control subject as shown in figure 5.

LVEF was not different between control and diabetic group: The hemodynamic impact on LV systolic function can therefore be largely underestimated if using only indices such as EF (which is affected by the geometry of the chamber and of changes in preload and afterload) or tissue Doppler (which has limitations primarily related to angle dependence and tethering).

The development of myocardial fibrosis,glucose toxicity and microvascular disease have been called upon to explain abnormalities in diabetic cardiomyopathy, however, detectable at an early stage only using GLS[20,21].

Similar to previous tissue Doppler studies [22] we observed that global and regional LS were significantly reduced in diabetic patients, 52% (26/50) of patients showed LV longitudinal systolic dysfunction determined as global LS < 18.4%.

Erande et al. showed that 23% of DM patients with preserved LVEF had LV longitudinal systolic dysfunction determined as GLS <18%.[16]

Nakai et al. reported that global longitudinal strain in DM patients was significantly lower than that in age-matched normal subjects despite of similar LVEF and 43% of DM patients showed LV longitu-dinal systolic dysfunction determined as global LS <17.2%.[19]

Mochizuki et al showed that 37% of patients with preserved LVEF had LV longitudinal systolic dysfunction determined as GLS <18.[23]

Although the prevalence of subclinical LV longitudinal systolic dysfunction in DM patients with preserved LVEF varied among studies, this may depend on patient characteristics such as severity of DM or DM related complications.

This study showed that LV mass index was higher among the DM patients than control people which is attributed to effect of left ventricular hypertrophy which is related to hypertension because 64% of DM patients were hypertensive.

Reduction in global LS was correlated with early diastolic indices (E- wave velocity and E') and correlated with relative wall thickness as shown in (table3).

Significant correlation between global LS and E' confirm the link between systole and diastole which has been confirmed in previous studies [24].

This study showed that diabetic duration was correlated with global LS as shown in table (3).

When dividing diabetic patients into two groups according to the duration of the disease (<5 years and>5years) GLS was significantly lower in diabetic group with longer disease duration (-16.6+2.3) compared with short disease duration (-18.7+2.1) (P-value less than 0.05) as shown in table (4).

The correlation between global longitudinal LS and diabetic duration highlights the relationship between long-term hyperglycemia and the im.

Conclusion

1. Subclinical LV longitudinal dysfunction is frequently observed in asymptomatic DM type2 patients with normal LVEF.
2. There is positive correlation between decrease in GLS and duration of DM type2.
3. GLS is a useful echocardiographic indicator for early detection of subclinical LV systolic dysfunction in

DM type 2 patients.

Estimating Serum Levels of Hepatitis B Surface Antibodies among Vaccinated Individuals with Various Post-Vaccination Duration

Raid D. Hashim[1], Israa Nathir[2], Abbasabdulmueed Mustafa[3]

[1]Corresponding Author, Tutor, FICMSchemical pathology, Al-Rasheed, University College, Department of Dentistry, Hay Al-Hussein, Baghdad, Iraq, [2]Tutor, MSc Clinical Pharmacy, Al Rasheed University College, Department of Pharmacy, Hay Al-Hussein, Baghdad, Iraq, [3]Tutor, PhD Microbiology, Uruk University, Faculty of Pharmacy, Al-Karrada, Baghdad, Iraq

Abstract

Introduction: Infection with hepatitis B virus represents a global health problem due to its both acute and chronic presentation that might be catastrophic, as it contributes to around 50% of cases diagnosed with hepatocellular carcinoma worldwide. Its prevalence is highly variable but can be extremely horrible as in Vietnam where it reaches 30%. The introduction of hepatitis B vaccine as an integral part of the global immunization program has a grave impact on the reduction of both vertical and horizontal transmission of HBV although the seroprotective level of anti-HBs seems to be affected by many factors at the top of which is the duration after the last dose of vaccination.

Aim of the Study: To evaluate serum anti-HBs in vaccinated individuals against HBV with various duration after the last dose of vaccine.

Materials and Method: A total number of 178 healthy individuals who have received the 3 doses of HBV vaccine were randomly selected. The upper limit of duration after the last dose of HBV vaccine was 18 years and the lower limit was 1 year. For all participants, both HBs Ag and anti-HBs were assayed and the results were statistically evaluated.

Results: The results of the current study have shown a significant decline in serum level of anti-HBs with increasing duration after the last dose of vaccine (r_s= - .648, P = .001). It was evident that the prevalence of seroprotective level of anti-HBs was decreasing with age to reach 31% only in those received the last dose of vaccine 18 years ago. In the few years after the last dose of vaccine, the seroprotection was 88%.

Conclusion: There no need to confirm the seroprotective level of anti-HBs in fully vaccinated individuals as the efficacy of the vaccine seems to be sufficient. The declining in anti-HBs with time is an expected finding but it has not proved that this has an impact on subsequent HBV infection.

Keywords: *Anti-HBs, seroprotection, HBV vaccine, hepatitis B, HBs Ag.*

Introduction

Hepatitis B is regarded as a major health problem worldwide and is associated with catastrophic sequelae due to the potential severe impairment of liver function secondary to chronic liver disease, liver cirrhosis, or even hepatocellular carcinoma (HCC). Hepatitis B virus (HBV) is highly contagious, with about 50–100 times

more infectious compared to Human Immunodeficiency Virus (HIV)[1]. By the use of hepatitis B vaccine, an enormous benefit has been gained in the battle against HBVfor being safe and effective with the protective ability of 98-100% against hepatitis B virus[2]. According to World Health Organization (WHO), it is estimated that 1.3 million people died as a result of hepatitis B or C viruses in 2015 and 1 in 3 people is thought to be infected with one of these viruses worldwide, furthermore, the majority of these cases are unaware of their infection[3]. Around 2 billion people are reported to have a history of infection with HBV, of these, nearly 20 million are infected with hepatitis E and 185 million are infected with hepatitis Cas well[4]. After infection with HBV, the immune system plays a pivot role in the clearance of the virus and in hepatocellular damage as well. The terms ''immune tolerant'' phase and the ''non-replicative phase'' have been replaced with the new terms: "high replicative" and "low inflammatory" phase respectively with limitation of the use of term ''inactive carrier'' phase which was formerly used[5]. With the application of the recommendation of the WHO in 1991 regarding the widespread use of hepatitis B vaccine, the prevalence of infection with HBV in children and fulminant hepatitis has been significantly decreased in many countries[6]. In most countries, the second-generation hepatitis B vaccine is routinely used in three doses (0, 1 and 6 months duration) and the protective level of anti-HBs antibody is ≥10 IU/L[7]. Many factors have been implicated in the immune response to HBV vaccine including age, body mass index and smoking where increasing age, obesity, use of immune-suppressive drugs and smoking are associated with poor anti-HBs production in response to HBV vaccine[8,9].

Aim of the Study: To evaluate serum anti-HBs antibodies in individuals received 3 doses of hepatitis B vaccine.

Materials and Method

The current study enrolled 178 apparently healthy individuals aged <18 years, attended a private medicallaboratory for routine checking, who had received the 3 standard doses of hepatitis B vaccine according to the schedule recommended by WHO, during the period from April 6, 2019, to July 10, 2019. Individuals with chronic diseases, on immune-suppressive drugs or smokers, were excluded from the study in addition to those who were uncertain about their vaccination status. From each participant, 5 ml of venous blood was collected under sterile condition, centrifuged at 3000 rpm after being clotted and serum was stored at -20 centigrade. Serum anti-HBs was quantitatively measured using ELISA technique. Individuals with serum anti-HBs concentration of ≥10 IU/L were considered as protected while individuals with serum anti-HBs concentration of <10 IU/L were considered as non-protected. To exclude a coincident hepatitis B infection, all participants were examined for the presence of HBs Ag. Data were analyzed using SPSS software version 23. After testing the normality of distribution, Spearman's test was used to assess the effect of duration after the last dose of HBV vaccine onserum concentration of anti-HBs, p-value ≤0.05 at 95% CI was considered significant statistically. Kruskal-Wallis test and Mann-Whitney test were applied to investigate the presence of a significant difference among groups of participants.

Results

A total of 178 participants have been included in the current study with a mean age of 10.2 years (range: >1.5 years to<19 years). The age distribution of participants is shown in table 1. For better clarification, participants were grouped according to age into 3 groups as shown in table 2.

Mean serum anti-HBs was 33.3IU/L but noticeable differences were observed in respect to age, so, we have calculated the of means of all of three groups as shown in table 3. of the total 178 participants, only 110 were discovered to have the protective level of anti-HBs in serum which represents around 62% of the total participants.

Using Kruskal-Wallis test and Mann-Whitney test, there was a significant difference among the 3 age groups in respect to their anti-HBs titer ($p<0.05$) where the group of age 1-6 years had the higher titer (mean 64.2 IU/L, range 10.6-143.2 IU/L) followed by the group of age 7-12 years (mean 31.9 IU/L, range 7.4-129.2 IU/L) while the group of age 13-18 years had the lowest titer of anti HBs Ab (mean 11.2 IU/L, range 5.7-48.4 IU/L. In orderto determine the relationship between serum concentration of anti-HBs and duration after the last dose of HBV vaccine, Spearman's rank-order correlation has been applied which revealed a strong, negative correlation between these two variables, which was statistically significant (r_s= - .648, P = .001).

Table 1: Age distribution of participants

Age in years	Frequency	Percent	Cumulative Percent
< 2.0	7	3.9	3.9
< 3.0	13	7.3	11.2
< 4.0	4	2.2	13.5
< 5.0	6	3.4	16.9
< 6.0	12	6.7	23.6
< 7.0	8	4.5	28.1
< 8.0	4	2.2	30.3
< 9.0	12	6.7	37.1
< 10.0	10	5.6	42.7

Table 2: Groups of participants according to their age

Age (Year)	Frequency	Percent
1-6	50	28.2
7-12	62	34.8
13-18	66	37

Table 3: Percentage of immunized participants according to their age group

Age (Year)	Frequency	Mean	Percentage of immunized participants
1-6	50	64.2	88
7-12	62	31.9	74
13-18	66	11.2	31

Discussion

Despite the increasing use of HBV vaccine all over the world and improvement in the preventive plans against HBV transmission, the prevalence of hepatitis B infection is still recording astonishing records which might be attributed to many factors. One of these implicated factors is the decline of anti-HBs below the protective level with increasing duration after the last dose of HBV vaccine. The results of the current study have shown a reasonable initial response to HBV vaccine with 88% of vaccinated individuals who achieved the seroprotective level of anti-HBs. At the same time,

it was evident that anti-HBs titer was progressively declining with increasing duration after the last dose of vaccine where only 31% of participants aged 13-18 were still achieving the seroprotective titer which reflects the prominent negative correlation between serum anti-HBs titer and time. In general, there is a wide variation in the results of studies that have discussed post-vaccination anti-HBS levels. Bookstaver and colleagues, for instance, have observed around 84% of vaccinated individuals were still achieving the protective serum level of anti-HBs10 years after the last dose of the vaccine[10]. In China, various studies have shown that 90-92% of college students were stillachieving the seroprotection level of anti-HBs[11,12], with slightly higher percentage in children and adolescents[13], these results were much higher than the results of the current study for college-age group which might be explained by the many factors that can negatively affect the efficacy of the vaccine including obesity, smoking, chronic diseases, genetic factors and method of vaccine preservation[13,14] although some of these factors were taken in consideration in the current study. Francesco P. Bianchi and his colleagues have evaluated anti-HBs in medical students (aged >18 years of course) and their study has revealed that only 62% of the participants were still achieving the seroprotective level of anti-HBs at the age of medical school[9]. When compared to researches conducted in the 20th century, the substantial improvement in the prevention of HBV infection represented by increased prevalence of immunized individuals has been confirmed by many studies conducted in the last decade, unfortunately, the prevalence of seroprotection of anti-HBS Ab is relatively low in certain age groups. In 2009, a large survey has been conducted in China and involved around 82000 participants to evaluate the distribution of many HBV markers among participants; this study has detected 4-fold increase in anti-HBs in children aged 1-4 years (from 15.8% to 72.3%) and about 90% decrease in prevalence of HBs Ag in the same group compared to previous studies in 1992 which is attributed to the improvement in vaccination program[15]. The durability of protection against HBV infection in response to HBV vaccination has been retrospectively investigated in Japan by Nori Yoshioka and his colleagues who concluded that the higher initial post-vaccination anti-HBs titer, the longer the duration of protection against HBV infection. In the latter study, 93% of vaccinated individuals have become seropositive after the third dose, 54% after the second dose and only 4% after the first dose[16].Many strategies are advised for those who are initially non-responders to HBV vaccine including repetition of the standard doses, giving an additional dose, doubling the dose, intradermal administration or use of the new version of HBV vaccine with higher antigen content[17-19]. These findings will obligate two logical questions: first, is it indicated to give a booster dose of HBV vaccine at a certain time after the last dose of the primary vaccine? second, is it necessary to serially check anti-HBs to ensure the sero-protective levels in vaccinated individuals? Although there are no universal recommendations in this respect, it is suggested that there is no need for neither routine booster dose for healthy individuals nor serial evaluation of serum titer of anti-HBs as there are many shreds of evidence demonstrate that persistent concentration of serum anti-HBs at ≥10 IU/L is not mandatory for protection, as it is thought that it is the immune memory that matters[20]. The immune memory cells that are specific for HBs Ag have the ability to outlast the existence of vaccine-induced antibodies, awarding effective protection against both development of an HBs Ag carrier state and the acute disease, even in those showing declining or total disappearance of anti-HBs[21-23].

Conclusion

Seroprotective level of anti-HBs in response to primary vaccination to HBV is a highly prevalent condition that requires no confirmatory test, although the declining in the serum anti-HBs with age is very expected. Whether this declining in anti-HBs is associated with a significant increase in HBV infection or not, this requires specific investigation to determine the need for a booster dose.

Nutritional and Biological Evaluation of Low–Calorie Cake Prepared by Beeswax-Sunflower Oil Formulated Fat

Rafiq Mohammed Salih Rashid[1], Aveen Jalal Ahmed Barqi[2]

[1]1 Assistant Professor at University of Sulaimani/College of Agricultural Sciences Engineering, Food Science and Quality Control Department, Sulaimani, Iraq, [2]Assistant Lecturer. at University of Sulaimani/College of Agricultural Sciences Engineering, Food Science and Quality Control Department, Sulaimani, Iraq

Abstract

In this study, a new proposed cake has been prepared by beeswax and sunflower oil formulated fat as completely replacing of shortening to produce a sweet with low calorie, and evaluate its impact on weight and serum lipid profile such as Total Cholesterol, Triglyceride, HDL-Cholesterol, and LDL-Cholesterol. The cakes were prepared in 75:25 ratio of beeswax and sunflower oil respectively based on weight compared with the control cakes. The study included some biological and nutritional indicators after feeding cakes to laboratory rats. Weight gain, organ weight, food efficiency ratio, and serum lipid profile were evaluated. Proposed cake had the effect of lower weight gain for Experiment group as compared with Control Groups. Accordingly, the food efficiency ratios were 3.33 and 10.86 for Experiment and Control groups respectively. The heart, kidney and spleen weights had not significantly influenced by fat replacer level, except lungs that were significantly different at $P<0.05$. No significant change was detected in the mean of organ weight with respect to body weight. The proposed cake composition had low calories indication as compared with normal cake. Namely, it created low calorie structured lipids effectually and altered the plasma cholesterol levels of experimental rats. Total Cholesterol, Triglyceride TG, and LDL values were less in Experimental Group while HDL value was the highest in the same group.

Keywords: *Low-Calorie cake (LCC); weight gain; food efficiency ratio (FER); lipid profile.*

Introduction

Obesity is one of today's most omitted health problems[(1)]. The prevalence of obesity and overweight have become worrying and increasing worldwide, thus consumer demands nowadays for low calorie foods increased to prevent diseases and obesity that caused about 3.4 million deaths worldwide in 2010 [2)].

Cake is a sweet baked food prepared from a blend of flour, sugar and other ingredients such as butter and eggs. It stands for a product that is high in fat with about 18 %, calorie where there is a need to reduce a calorie in such product in the market[(3,4)]. Therefore, there is urgent need to develop non-digestible processed fat which can substitute fat in such products and produce low calorie cake.

Fatty foods are popular in the daily diet, principally the using of solid fat such as shortening that has been widely used in bakery products. However, there are numerous benefits of fat in our diet such as giving a distinctive texture, flavor, and aroma. Excessive intake of fats is associated with intensified risk of obesity, gallbladder diseases, and several types of cancer [(5)], due to the high level of saturated fatty acids and also a presence of trans fatty acids, while solid fats may cause adversative health influences such as increased hazard of cardiovascular diseases, extraordinary cholesterol levels and coronary diseases[(6)]. The American Heart

Association and health organization have called for reduction in total dietary fat to 30% of calories[7]. Accordingly, there is need for solid fats with low calorie to give the same properties and quality that the original fat would give.

In the theme of food science, they began to use fats which allow liquid vegetable oils to be structured with solid such as beeswax[8]. The fats were used firstly in ice cream, chocolate and spread[9]. Waxes have been widely used in structuring oils [10].

In study[11], the quality features of white button mushroom powder enhancement in sponge cake has been evaluated. Substituting flour in cakes was investigated with numerous protein-rich constituents to develop the nutritious quality of cake despite the restrictive success as it comes to sensorial tolerability. Mushroom powder has been integrated in the formula to enhance sponge cakes with the reduced post-harvest losses in mushrooms and improved nutritious status of society.

In [12], the outcomes of included dietary of grape seed cakes on performance and plasma biochemistry parameters as healthiness pointers along with some markers interrelated with inflammation and antioxidant defense in the liver of fattening-finishing pigs have been investigated. Modulatory capacity of bioactive mixtures from diverse wastes was barely studied in pigs. Low-calorie jelly puddings have been developed in study[13] by replacing milk cream by whey protein isolate or soy protein isolate, beet sugar by fructose and gelatin by non-starch polysaccharides. Physical and chemical features of low-calorie jelly desserts were determined and they had shown worthy food palatability. In study [14], carrageenan, plant fibers and starch concentration on mechanical effects and synthesis records of low-calorie dairy desserts has been investigated based on the response surface approach. Bamboo, inulin, apple, wheat, and psyllium fibers have investigated by five separate tentative designs. Diet dessert without supplementary fiber have shown greater syneresis and lessened mechanical features than regular formulation. Also, carrageenan, starch, and fibers have depicted effective roles in recompensing the observed reduction on the syneresis experiment and mechanical features of low-calorie desserts. On the other hand, starch and carrageenan have shown greater effect on dropping gel syneresis, while fiber adding has reduced the negative effect on mechanical properties resultant from the fat/ sugar exclusion of the diet preparation.

In this paper, beeswax of more than 26% of hydrocarbon and 58% of wax ester [10],has used in three different ratios with sunflower oil to make a solid fat. Also, the other goal of this study is tonutritionally and biologically evaluate the using of beeswax-sunflower oil formulated fat in (75:25 beeswax - Sunflower oil) ratioin production of low calorie cake, and to examine its impact on weight and serum lipid profile such as Total Cholesterol, TG, HDL-C, and LDL-C.

Materials and Method

Preparation of Cakes: Cakes were prepared according to the standards of[15] with some modifications. About 122gm flour, 221gm sugar, 100gm of shortening, 169gm of whole eggs, 70gm of dry milk, 10gm of baking powder, 10gm of vanilla, and 130gm of water, were used in the control cake formulation. All ingredients were gradually added to a kitchen- aid mixer and they were mixed at medium speed. The cake better was placed in a metallic baking pan with 20.4 cm of diameter and baked at 180c for 40 minutes. The same procedure were used in preparation of the experimental cake with exception of using an experimental fat formula of beeswax and sunflower oil 100 g, where they blended in a ratio based on W/W, the used ratio was (75 beeswax: 25 Sunflower oil).

Experimental Diet: The control and experimental cakes were dried and milled with addition of 1% of vitamins and minerals mixture for survival [16]. The powdered cakes were kneaded and finally they were converted into tablets by using extruding machine followed by another drying processing to become ready for feeding the rats.

Experimental Design: Fourteen male Sprague Dawley rats (albino rats) of 12 week old with initial weight ranged from 269.6 to 359.2 gm, were purchased from the School of Science Education / Biology Department / University of Sulamani, Iraq. After acclimatization for 2 days, the animals were randomly divided to two groups; each group included 7 rats and they were all housed individually in standard plastic cages. Cages were maintained in a ventilated room at 23±2 C and 50% relative humidity. They were exposed to 12 hours cycle of light and darkness. The first group is the control group with weight of 315.91 gm as average fed on a standard cake. Second group is an experimental group with weight of 316.10 gm fed on the experimental cake. Rats were provided freely with drinking water ad

libitum throughout the experiment.

Biological Assay Evaluation: Dried cakes were provided to rats daily. Food intake and body weight were recorded for each group every 2 days over the 28 days of experimental periods using a precision weighing balance. Absolute organs weight for heart, lungs, spleen, kidney, and liver as well as organ to-body weight were measured. Body weight gain and food efficiency ratio (FER) were calculated by:

Weight Gain (gm) = initial weight - Final weight

$$\text{Food Efficiency Ratio (FER)} = \frac{\text{weight gain (g)}}{\text{diet intake}} \times 100$$

Blood Collection and Serum Lipids:

At the end of the 28 daysof the experiment, rats were fasted for 12 hours, then, became anesthetized by chloroform. After opening the abdominal cavity surgically, about 1 ml of blood was taken from heart directly using the sterile syringe, of belief it's enough to conduct lipid profile analysis of the rats. The blood was placed in the gel tubes for biochemical tests. The serum levels of Triglyceride (TG), Total Cholesterol, HDL-C, LDL-C were determined using commercial kit by Auto analyzer (Cobas C 311, HITACHI) in Mahan laboratory, ISO certified from UK (ISO 15198) and (ISO 9001).

Statistical Analysis: All data in replicates were statistically analyzed by (ANOVA), using SPSS version 24 program for windows. All data were expressed as Mean ± SEM. P-value ≤ 0.05 was considered significant.

Results and Discussion

Weight Gain and Food Efficiency Ratio: Table 1 explains the results of weight gain and growth rate of both control and experimental groups. It is clear from this table that LCC positively affected to lower the weight gain from 40.84 to 14.742 g/28days, and the growth rate decreased from 1.45 to o.52 g/day. All results in table indicated that the beeswax found to be responsible for the positive effects during the period of feeding with LCC. As result of indigestibly of beeswax, the calories yielding of LCC decreased. The findings of this study agree with[17],[18].

Table 1: Results of Weight Gain and Growth Rates of Control and Experimental rats Groups

Rats Groups	Initial Weight (g)	Final Weight (g)	Weight Gain g/28 Day	Growth Rate g/Day	Weight Gain (%)/ 28 Day
Control	315.91±11.02 [a]	356.75±13.72 [a]	40.84±16.70 [a]	1.45±0.59 [a]	12.92±6.33[a]
Experimental	316.1±10.43 [a]	330.84±9.02 [a]	14.74±2.69 [a]	0.52±0.09 [a]	4.66±1.17 [a]

- Magnitudes followed by the same letter in columns are not significantly different at P<0.05 between Experimental and Control Groups.
- Growth rate (g/day) =weight gain/28 days

Table 2 showed the results of weight gain and FER of both groups. Both had a positive relation. However, FER showed reverse relation of experimental and control groups as in diet intake in comparison with control group which significantly differ at p≤0.05. Accordingly, the FER ratios were 3.33 and 10.86 for experiment and control groups respectively. The variable values of FER were probably influenced by the low digestibly of LCC which prepared by beeswax-sunflower oil formulated fat. These results are close to the value of FER ranged 11.4-17.41 of different types of bread feeding young rats reported in study [19].

Table 2: Results of Food Efficiency Ratio (FER) of Control and Experimental Rats groups

Rats Groups	Weight Gain/28(g)	Diet Intake (g)	FER
Control	40.84±16.70 [a]	376.05±7.04 [a]	10.86±4.83[a]
Experimental	14.74±2.69 [a]	442.4±12.28 [b]	3.33±0.78 [a]

Magnitudes followed by the same letter in columns are not significantly different at P<0.05 between Experimental and Control Groups.

Lipid Profile: Table 3 has shown the recorded lipid profile parameters. Evaluations amid groups have shown important variance between the control and the investigational groups. The obtained Cholesterol data were 82.56±3.71, 72.4±2.90 mg/dl for Control and Experimental Groups respectively, while the resultant Triglyceride TG were 97.58±16.95, 71.24±8.262 mg/dl for the same Groups. On the other hand, computed HDL values were 40.04±2.12, 44.15±3.44 mg/dl for Control and Experiment Groups, while for LDL, the values were 21.35±2.29, 14.27 ±1.92 mg/dl respectively. Accordingly, Cholesterol, Triglyceride TG, and LDL values are less in Experimental Group, while HDL value is higher in the same group. Based on these results, the proposed cake composition has low calories indication as compared with normal cake. Namely, it created low calorie structured lipids effectually and altered the plasma cholesterol levels of experimental rats. The finding of this study agrees with [20].

Table 3: Blood Recorded Data of Control and Experimental Rats Groups

Rats Groups	Triglyceride	Total Cholesterol	HDL-C	LDL-C
Control	97.58±16.95[a]	82.56±3.71[a]	40.04±2.12[a]	21.35±2.29[a]
Experimental	71.24±8.26[a]	72.4±2.90[b]	44.15±3.44[a]	14.27 ±1.92[b]

Organ Weights: As values, based on Tables 4-5, LCC had no effect on organ weights as compared with final weight. Statistically, no significant change was observed in the mean weights of organs (final body, liver, heart, kidney, spleen) except lungs that significantly differat P<0.05 between Experimental and Control Groups. On the other hand, no significant change is found regarding ratios of organ weight with respect to body weight as shown in Table 5. The findings of this highly agree with[21] that stated that heart, kidney and spleen weights have not significantly influenced by fat replacer level.

Table 4: Absolute body and organ weights of control and Experimental Rats Groups

Rats Groups	Final Body Weight (g)	Heart (g)	Lungs (g)	Kidney (g)	Spleen (g)	Liver (g)
Control	356.75±13.72[a]	1.41±0.00[a]	1.93±0.01[a]	2.75±0.02[a]	0.72±0.00[a]	10.00±0.01[a]
Experimental	330.99±9.02[a]	1.40±0.00[a]	1.89±0.00[b]	2.73±0.02[a]	0.71±0.00[a]	8.72±1.28[a]

Table 5: Organ weight with respect to body weight as ratios of Control and Experimental Rats Groups

Rats Groups	Heart	Lungs	Kidney	Spleen	Liver
Control	0.39±0.01[a]	0.54±0.02 [a]	0.77±0.02[a]	0.19±0.02[a]	2.82±0.11[a]
Experimental	0.42±0.01[a]	0.57±0.01[a]	0.82±0.01[a]	0.21±0.00[a]	2.63±0.07[a]

Magnitudes followed by the same letter in columns are not significantly different at P<0.05 between Experimental and Control Groups.

Conclusion

Low- calorie cake has been firstly prepared by beeswax and sunflower oil formulated fat as fully replacing of shortening in this study. Statistical studies about the effect of proposed cakes on weight and serum lipid profile such as Total Cholesterol, Triglyceride, HDL-Cholesterol, and LDL-Cholesterol by including biological and nutritional indicators after feeding

proposed cakes to laboratory rats have been presented. The cake was prepared in 75:25 ratio of beeswax and sunflower oil respectively based on weight as compared to control cake. Weight gain, organ weight Food efficiency ratio, and serum lipid profile were evaluated. Proposed cake had the effect of lower weight gain for Experiment group as compared with Control Groups. In view of that, the food efficiency ratios were 3.33 and 10.86 for Experiment and Control Groups respectively. The heart, kidney and spleen weights were not significantly influenced by fat replacer level, except lungs that had been significantly differed at $P<0.05$. No significant difference was detected in the mean of organ weight with respect to body weight. The proposed cake composition had low calories indication as compared with normal cake. Total Cholesterol, Triglyceride TG, and LDL values have been less in Experimental Group while HDL value was greater in the same group. All above findings have agreements with other related studies in this field in the literature.

Ethical Clearance: The Research Ethical Committee at scientific research by ethical approval of both environmental and health and higher education and scientific research ministries in Iraq

Conflict of Interest: The authors declare that they have no conflict of interest.

Effect of an Educational Program According to the Visual Thinking in Learning the Skill (Receiving and Shooting) Handball for Students

Alaa Yousif Hiwar Al-Tafili[1], Dr.Nizar Hussein Gafar Al-Nfakh[2]

[1]Post Graduate, [2]Prof., University of Kufa/ College of Education for Girls/Department of Physical Education and Sports Sciences /Iraq

Abstract

The research contained several axes where it focused on the importance of the educational program and how to prepare it in a scientific manner so that it has an effective effect in the development of motor skills and the development of skill level, as well as the importance of visual thinking which has the mental capacity associated with the visual sensory aspects when there is a mutual harmony between what the learner sees Different forms and drawings, and the importance of research through the use of composite exercises auxiliary and appropriate in learning the composite skill performance (Receiving and shooting) handball.

As for the field research procedures, the researcher used the experimental method in order to be consistent with the methodology of the two-pronged (experimental and control) two-pronged and post-test methodology to suit the requirements of the research. Statistically processed using statistical bag (SPSS).

As for the presentation, analysis, and discussion of the results, the researcher unloaded the results of the pre- and post-test tests and statistically processed. The results obtained showed that there were significant differences between the pre- and post-tests of the research variables and in favor of the post-test.

Keywords: *Educational program,visual thinking, Receiving and shooting.*

Introduction

Education is an important aspect that plays an important role in the progress of peoples because it affects positively and comprehensively in the formation of a new generation, especially if it is based on advanced scientific foundations and modern, and that the program and scientific preparation accurately have an effective impact in the development of motor skills and the development of skill level, And that the learner is the focus of the educational process and that the development of abilities and capabilities is the basic goal as it requires comprehensive attention and careful in providing requirements that serve the learning process and provide the opportunity to achieve the optimal performance of the various mathematical skills that reflect the learner's ability to understand parts The path of movement or skill, and that visual thinking is a mental ability linked to the visual sensory aspects where it occurs when there is a mutual harmony between what the learner sees forms, drawings and relationships and what happens from the link and mental output depends on the vision of the drawing displayed and that the way of thinking in learners depends on the focus on development Their abilities to translate the visual language that the visual form carries into written or spoken verbal language.[1]

The game of handball is one of the most important competitive collective games that have gained wide interest and popularity due to the nature of the game and the rapid strength of the defense and attack because it contains many basic skills and complex where the performance of skills requires a high degree of accuracy and mental motivation, so it became necessary to detect One of the basic offensive skills in the game of handball skills (Receiving and shooting), where the skill of receiving the ball of the basic skills in the game of handball, so the player must be at any moment of the Match is ready to receive the ball from his teammate in any direction and any distance, the skill of the shooting

is the outcome of technical performance and plans individual or collective it represents the end of the attack with all the skills and whatever the variety of types and method of performance, it performs one purpose and is to pass the entire ball around the limits of the goal.[2]

The Study Objectives:

1. Preparing an educational program according to the visual thinking in learning some complex skills (receiving and shooting) handball for students.
2. Identify the impact of the educational program according to visual thinking in learning some of the composite skills (Receiving and shooting) handball for students.

Practical Part:

Field Research Procedures: The researcher used the experimental method in order to be consistent with the methodology of the two groups (experimental and control) with pre and posttests to suit the requirements of the research. The number of students (37) students, the sample of the research must be determined in a scientific manner accurately to be representative of the research community and determine the sample well and appropriate to the nature of the community and the study to be conducted where give results as close as possible to what exists in the community, and therefore has been the sample of the research community was (30) students from the original research community.3

Main Experiment Procedures:

Pretests: The researcher conducted the pre-tests of the sample of the students of the second stage, which was divided into two experimental and control groups on Monday 3/12/2018 for the skill of the handball ball (receiving the ball _ aiming) on the goal at 10:30 am as the test was conducted in the closed field Department of Physical Education and Sports Science, College of Education for Girls, University of Kufa.

Posttests: The research was conducted after Tuesday 22/1/2019 in the closed stadium in the Department of Physical Education and Sports Sciences / College of Education for Girls.

Statistical Means: The statistical package (SPSS) was used to analyze the results.

Results and Discussion

Presentation, analysis and discussion of research results: After the researcher unloaded the results of the pre and post tests and processed them statistically for the purpose of knowing the development of the research variables, the data were analyzed using the statistical bag (SPSS).

Presentation, analysis and discussion of pre and post test results of the handball skill test of the experimental group:

Table (1). The description and statistical reasoning of the pre- and post-test results are shown in the research variables of the experimental group

Variables	Units	Pretest		Posttest		(t) calculated	Sig.	Significance Level
		Mean	STD. EV	Mean	STD. EV			
Receiving and shooting	Grade	5	0.84	7.53	0.63	11.76	0.000	Moral

Table (1) of the description shows the statistical reasoning of the results of the pre- and post-test variables of the experimental group. The calculated value of t (11.76) and the sig value of (0.000) is smaller than the level of significance (0.05) at freedom degree (14) .This indicates a significant difference between the pre and posttests in favor of the post test.

The results showed that there were significant differences between the pre and posttests in the variables under consideration and in favor of the post tests in the experimental group. This is due to the presence of the differences in the post tests is the effect of the educational methodology followed by the researcher and what pointed out that the process of listening to the explanation of the student is associated with the pictures and film clips of the performance which leads to the link between these two senses (vision and poison) To form a clearer picture of the brain in the form of motion so that it helps to form corrective information about performance.[4]

Presentation, analysis and discussion of the results of the pre- and post-test of the handball skill of the control group:

Table (2). The description and statistical reasoning of the pre- and post-test results in the research variables for the control group

Variables	Units	Pretest		Posttest		(t) calculated	Sig.	Significance level
		Mean	STD.EV	Mean	STD.EV			
Receiving and shooting	Grade	5.06	0.70	6.73	0.59	6.16	0.000	Moral

Table (2) of the description shows the statistical reasoning of the results of the pre- and post-research variables of the control group. The calculated (t) value of (6.16) and the sig value (0.000) are smaller than the level of significance (0.05) at the degree of freedom (14).

The results showed that there were significant differences between the pre and posttests in the variables under consideration and in favor of the post tests in the control group. In addition to repetitions of exercises and continuity led to the development of technical performance of the composite skills of students that making repeated attempts and many organized and different conditions help to develop skill and participate effectively in learning and performance.[5]

Presentation, analysis and discussion of the test results (posttest) of the skills of the handball skills of the experimental and control groups:

Table (3). The description and statistical reasoning of the test results (Posttest) in the research variables of the experimental and control groups

Variables	Units	Experimental group		Control group		(t) calculated	Sig.	Significance level
		Mean	STD.EV	Mean	STD.EV			
Receiving and shooting	Grade	7.53	0.63	6.73	0.59	3.55	0.001	Moral

Table (3) of the description and statistical inference of the results of the research variables in the post-test of the experimental and control groups shows that the arithmetic mean of the composite skill test (receiving and correct) in the post-test of the experimental group is (7.53) and a standard deviation (0.63), while the arithmetic mean in the post-test of the control group. (6.73) and a standard deviation (0.59) and the calculated value of (t) of (3.55) and since the value of (sig) of (0.001) is smaller than the level of significance (0.05) at the degree of freedom (28) This indicates a significant difference between The experimental and control groups in favor of the experimental group.

Table (3) shows the results of the post-tests of the experimental and control groups of the skills of the handball as it shows the existence of significant differences between the post-tests of the two groups and for the benefit of the experimental group. This led to the development of technical performance of composite skills, where the experimental group was more developed and improved than the control group in all research variables, and this is due to motivate and encourage students to practice skills accurately,[6] which led to raise Level of skill performance, and learning and mastery of the skill and the frequent attempts and repetitions during the skill performance leads to the understanding and understanding of the skill more accurately, and that the learning process requires repeated attempts to successfully complete the skill.[7]

Conclusions

1. The inclusion of visual thinking using the visual method of the educational program has a positive impact in learning some skills composite handball.

2. The application of the educational program followed, which led to better understanding and learning skill among the members of the research sample.

Ethical Clearance: The Research Ethical Committee at scientific research by ethical approval of both environmental and health and higher education and scientific research ministries in Iraq

The Impact of Preventive Exercises in Terms of Electrical Activity of the Muscles of the Lower Limbs to Develop Walking and Jogging in Learning Some of the Skills of the Movements of the Ground Gymnastics Technical Students

Amal Abdalhamzah Hadi[1], Ali JawadAbed[2]

[1]Post Graduate, [2]Assist Prof., University of Babylon/The College of Physical Education and Sport Sciences/Iraq

Abstract

The research problem lies in the difficulty of learning some of the skills of the technical gymnastics for students and this is due to many reasons, including with regard to the psychological aspect in general and the possibility of injury in particular, which leads the students to not make enough effort or try to perform skills for fear of injury. To solve this problem and facilitate the learning of some technical skills gymnastics for students, so the researcher suggested the development of preventive exercises in terms of electrical activity of the muscles of the lower limbs to develop walking and jogging in learning some of the skills of ground movements in the technical gymnastics for students. The researchers also used the approach of the two equal groups, the control group and the experimental group. The research sample was chosen randomly from the research community, and the number of (30) students, as they were divided into two equal groups (experimental, control) and by (15) students for each group.

The researchers reached the most important conclusions. There are significant differences between the posttest tests for both groups (control and experimental) and for the benefit of the experimental group in electro-electrocardiogram (EMG) indicators of the lower limbs.

Keywords: *Preventive exercises, electrical activity and lower limbs.*

Introduction

The world has witnessed a scientific development in all areas of life, including sports, through scientific planning programmed and codified, and the game of gymnastics is one of the games included in this development in the innovation of modern scientific method of training and prevention of injury risks that can affect students as a result of excessive physical effort Natural limitation and reality on individual organs and functional devices. Through the optimal use of mechanical analysis, the level of technical, physical, psychological and functional performance can be improved. Electromyography (EMG), which is an important method for studying the characteristics of the activity of the muscular system, is mainly based on recording the electrical activity of muscles during contractility, through the relationship between the work of both the nervous and muscular system and through the recording of electrical changes that occur in the muscle during systole.[1]

It is known that muscle contraction is determined by the excitation of the nervous system to the muscular system by the motor nerves that in turn deliver the excitation to the surface of the muscle and then the difference in voltage occurs on both ends of the membrane due to permeability in the membrane.

Here, the importance of research is necessary to protect students from the possibility of injury so the researcher will prepare a preventive program in terms of electrical activity of the lower limbs to develop walking and jogging in learning some of the skills of ground movement's Artistic gymnastics.[2]

The research problem lies in the difficulty of learning some of the skills of the technical gymnastics for students

and this is due to many reasons, including with regard to the psychological aspect in general and the possibility of injury in particular, which leads the students to not make enough effort or try to perform skills for fear of injury. To solve this problem and facilitate the learning of some technical skills gymnastics for students, so the researcher suggested the development of preventive exercises in terms of electrical activity of the muscles of the lower limbs to develop walking and jogging in learning some of the skills of ground movements in the technical gymnastics for students.[3]

Research Objectives:

1. Identification of biomechanical variables for the analysis of walking and jogging among students of the Faculty of Physical Education and Sports Science the third stage.
2. Identification of the variables of electrical muscle activity of the lower limbs among students of the Faculty of Physical Education and Sports Science The third stage.
3. Preparation of preventive exercises in terms of electrical muscle activity of the lower limbs to develop walking and jogging in learning some of the skills of the movements of the ground Gymnastic art students.

Research Hypotheses: Preventive exercises have a positive impact in the development of walking and jogging and some skills of the movements of the ground sample of research in the artistic gymnastics for students.

Research Methodology and Field Procedures

Research Methodology: The researcher used the experimental method to suit the nature of the problem to achieve the objectives of the research and hypotheses, as the experimental method is the real test of the relationships of cause or effect and represents the most sincere approach to solving many scientific problems in practice, as what distinguishes the exact scientific activity is the use of experience.

The researcher also used the approach of the two equal groups, the control group and the experimental group, as it must be the two groups are completely equal in all circumstances except the experimental variable that affects the experimental group.[4]

Research Community and Sample: The research community was determined by the students of the third stage in the Faculty of Physical Education and Sport Sciences University of Babylon for the academic year (2018-2019). The research sample was chosen randomly from the research community, and the number of (30) students, as they were divided into two equal groups (experimental and control) and by (15) students for each group, enter the experimental variable using (preventive exercises) permeated educational units during the preparatory section and part From the applied section in the main section as well as in the final section on the experimental group as the control group learns the usual method followed by the school and before starting to work exercises was calculated homogeneity of the sample and parity between the two groups measurements and tests as follows.

Homogenization of the Sample: In order to control the variables that affect the accuracy of the research results, the researcher used to verify the homogeneity of the research sample in the variables related to morphological measurements (length, mass, age) as shown in Table (1).

Table (1). Shows the values of morphological variables and torsion coefficient

Variables	Units	Mean	SD	Mode	Skewness
Length	Cm	155.67	1.78	165.50	0.62
Weight	Kg.	61.25	1.93	61.50	0.32
Age	Year	21.44	0	6.23	0.24

Table (1) shows that the values of the torsion coefficient are limited to (± 1), which indicates the homogeneity of the members of the research sample in these variables, the moderation of their normal distribution.

Means, tools and devices used in the research:

- Technical performance evaluation form for your technical skills.
- Measuring tape number (1).

- Electronic manual calculator (1) type (Casio) .Casio.
- Colored adhesive tape.
- Medical balance (kg) to measure weight.
- Video camera type Sony (1).
- Laptop computer type (Compact precarious 700) *hp* (1).
- German-made electric treadmill for walking and jogging analysis.
- Wooden chair (4).
- CD and DVD.
- Medical alcohol and cotton for cleaning.
- Electrical activity device EMG German-made (1).
- Stopwatch number (1).
- Balance beam number (1).
- Glove number (1).
- Artistic squishy carpet.

Technical Performance Tests for Technical Gymnastics Skills:

1. **The name of the test:** the skill of diving on the device of ground movements.[5]
   - Objective of the test: To measure the technical performance of the diving skill on the ground movement's device
   - Tools used: Sponges.
   - Performance Specifications: Upon hearing the start signal, the tested student performs the diving skill on the ground movement's device.
   - Method of registration: Each student has three attempts and the best attempt is calculated from (10) grades.
2. **Name of the test:** the skill of the Arab jump on the ground movement's device.[6]
   - Objective of the test: to measure the technical performance of the skill of the Arab jump on the ground movement's device.
   - Used tools: sponges.
   - Performance Specifications: Upon hearing the start signal, the tested student performs the Arab jump skill on the ground movement's device.
   - Method of registration: for each student tested three attempts and calculated the best attempt of (10) degrees.
3. **Electromyography test (EMG):**
   - Objective of the test: To determine the electro-physiological variable and EMG of the lower limb muscles under study.

Main Search Procedures: Pre research procedures: Pretests and special exercises used on the experimental group and then conduct the post test.

Pretests: Pre-measurements and pretest tests of the control and experimental research sample were performed on two days.

In the closed sports hall and the biomechanical laboratory of the Faculty of Physical Education and Sport Sciences at the University of Babylon, where the first day was performed physical measurements (mass, length, age) as well as physical tests for research, and on the second day were conducted tests (EMG) for lower limb muscles.

Preventive Exercises: The researcher has prepared three preventive exercises (*) after consulting the experts and specialists in a scientific manner according to the weaknesses that were diagnosed by the researcher with the supervisor through EMC tests and analysis of walking and jogging through which the muscles that need strength or characteristic were identified at speed or The EMC test with the walking and jogging analysis gives direct and clear results to the laboratory about the sample status and the problems experienced by each examined student. The duration of the curriculum was (8) weeks (2) teaching units per week (Monday, Thursday) on 25 / any (16) units of education unit duration for the training of (20-45) minutes and finished the application of the training curriculum in the history of 23/5/2109

Posttests: The researchers conducted the post-test and was in two days in the closed sports hall of the Faculty of Physical Education at the University of Babylon, at the same time and under the same conditions under which the tests were conducted before, on 27/5/2019.

Results

Table (2). Shows the mean, standard deviations and the calculated t-value for walking and running between the two pre-tests of the experimental group

Variables	Legs	Pretest		Posttest		Sig.	Type of significance
		Mean	SD	Mean	SD		
Step time	Right	0.75	0.04	0.76	0.04	0.45	Non sig.
	Left	0.83	0.05	0.74	0.02	0.021	Sig.
Attribution time	Right	72.7	2.2	70. 1	1.8	0.33	Non sig.
	Left	74.6	4.3	69.4	1.9	0.52	Non sig.
Weighted time	Right	27.3	2.2	29.9	1.8	0.041	Sig.
	Left	25.4	4.3	30.6	1.9	0.02	Sig.

Table (3). Shows the mean, the standard deviations and the value of t calculated between the pre-test of skill performance in the technical gymnastics of the control group

Skills	Pretest		Posttest		Calculated (t) value*	Type of significance
	Mean	SD	Mean	SD		
Diving on the ground movements	1.75	0.790	5.30	0.78	11.43	Non sig.
Arab jump on the ground movements	1.57	0.790	5.82	2.00	2.07	Non sig.

*The value of (t) tabular (2.04) at the degree of freedom (14) and the level of significance (0.05).

Table (4).Shows the mean, the standard deviations and the value of (t) calculated between the pre- and post-test of skill performance in the technical gymnastics of the experimental group

Skills	Pretest		Posttest		Calculated (t) value*	Type of significance
	Mean	SD	Mean	SD		
Diving on the ground movements	1.6	0.567	6.20	0.65	18.80	Sig.
Arab jump on the ground movements	3.75	0.438	6.71	4.23	2.14	Sig.

*The value of (t) tabular (2.04) at the degree of freedom (14) and the level of significance (0.05).

Table (5). Shows the mean, the standard deviations and the value of (t) calculated between the post-tests of the control and experimental research groups of the researched skills

Skills	Control group		Experimental group		Calculated (t) value*	Type of significance
	Mean	SD	Mean	SD		
Diving on the ground movements	5.30	0.78	6.20	0.65	3.34	Sig.
Arab jump on the ground movements	5.82	2.00	6.71	4.23	5.21	Sig.

*Tabular value (t) (2.14) at freedom degree (28) and significance level (0.05).

Discussions

From Table (5) shows that there are significant statistical differences between the pre and posttests of members of the experimental group in the performance of gymnastic skills under research. The researcher attributes this to the preventive exercises applied to the members of the experimental group, which includes exercises added to educational alternatives, which increased the information received by the learner. As well as the good reception, organization, storage and retrieval, which

increased the speed of acquisition of movement and this is consistent with the views of some (receiving information on the learning environment is optimized by the existence of a psychological atmosphere appropriate to the learning environment). [7]The researchers attributes statistically significant differences between the pre and posttests of the experimental group in learning the skill of diving on the ground movement's device to preventive exercises by increasing the ability to improve the reaction of the glove and the leg joint and overcome the external forces affecting the body in flight such as gravity. And control the position of the body in the case of flight that there is a very light flexion of the hip, and arms are extended to the top and head between the arms and end the flight period when the palms touch the ground and begin the process of rolling on the back.[8]

The researcher attributes the statistically significant differences between the pre and posttests of the experimental group in learning the skill of the Arab jump on the ground movements device to preventive exercises to increase the ability of the student to increase the sense of pushing hands and the performance of the jump from standing and running with emphasis on interest in strong hand push Leave the ground recently.[9]

During what was exposed to the results of the post-test of the two research groups and the existence of differences between the two groups and for the benefit of the experimental group, the researcher attributes this reason to the fact that the experimental group has undergone preventive exercises, which was prepared to teach students the skills of technical gymnastics, as the group was without a goal achieved only in the pre-test and then Preventive exercise and post-test, without a goal you seek to achieve, only requires the student to exert maximum effort in the performance of skills, he pointed out that practice without aim such as moving objects in the vacuum, so we do not know where the starting point and what is the horizon of the end.[10] This to develop to the number of educational units scheduled within the preventive exercises and the number of appropriate repetitions during the educational unit and take advantage of its organization to increase the learning of skills and the application of appropriate exercises to the degree of difficulty in skills and take into account the level of the age of the learner according to the capabilities of learners, in addition to the process of error correction at the first and away from giving exercises Difficult because it may not take into account the individual differences between learners, as the teacher adopted the use of multiple method and various exercises to increase the opportunity to have fun and participate in the performance of motor skills, as this improvement The one who got the control group may be due to the exercise of preventive practice and the content of educational units, the exercises and correct errors, guidance and remodeling skills affect gymnastic learn and improve skill performance and form.[11]

As well as cultivating confidence in the same student by praising some of the movements that have done well, the feedback from the basics of learning and its existence is essential to improve the level of the learner, and believes that feedback shows that it is the strongest variable and controlling performance, and learning has turned out to be There would be no improvement in performance without them, which showed an evolution of the research sample, but it is less difference than the total experimental.[12]

Conclusions

1. There are significant differences between the post tests for both groups (control and experimental) and for the benefit of the experimental group in the electromyography (EMG) indicators of the lower limbs.
2. The emergence of a positive development between the pre and posttests in the skill performance and in favor of the post tests for the two control groups and experimental.

A Surveillance of Varicella Zostervirus among School-age Children in Al-Diwaniyah Governorate

Adnan H. Aubaid[1], Ahmed S. Abed[1], Mohsen A. Alrodhan[2]

[1]*Department of Medical Microbiology, College of Medicine/University of Al-Qadisiyah, Diwaniyah, Iraq*
[2]*College of Pharmacy/University of Al-Qadisiyah, Diwaniyah, Iraq*

Abstract

Background: Chickenpox is the primary infection of *Varicella-Zoster Virus*. It is usually a childhood infection providing life-long immunity. High-risk group of individuals is more likely to develop serious complications. The aim of current study was to find out the prevalence rate of chickenpox infection caused by *Varicella-Zoster Virus*among school-age children in Al-Diwaniyah Governorate.

Method: A total of 4545 children with an age range of 6 to 10 years were enrolled and data about those children obtained form 10 primary schools in Al-Diwaniyah governorate in the Mid-Euphrates region of Iraq. Informationabout age, gender and residency about each child were introduced into an excel spread sheet.Skin crusted lesion was taken for purpose of analysis.

Results: Infection documented in 800 out of 4545 children making the prevalence rate (17.6 %). No significant difference was obtained of VZV infection with respect to age and gender. The mean age of the 43 children selected was 8.44 ±1.65 years and the age range was 6 – 10 years. The study sample included 23 male children (53.5 %) and 20 female children (46.5 %). The slight difference in male proportion from that of female proportion was statistically insignificant ($P = 0.67$).

Conclusion: The most prevalent VZV genotype in Diwanyia governorate was B genetic subtype (wild type) than others. So, it is recommended to give an attention to this genotype in the further studies.

Keywords: *Varicella-Zoster virus, school-age children, chickenpox, genotype.*

Introduction

Varicella zoster virus (VZV) causes a primary infection known as varicella (chicken pox). The virus then migrates from the skin lesions *via* nerve axons and, probably also by viraemic spread, to spinal and cranial sensory ganglia where it becomes dormant. Later in life, in some individuals the virus is reactivated (usually within a single ganglion) to cause a secondary infection known as herpes zoster (HZ; shingles). Individuals with HZ can transmit VZV to their seronegative contacts, who may develop varicella, but not HZ. Thehousehold transmission rate of HZ (to cause varicella) is 15%, making it significantly less contagious than varicella but nevertheless of relevance to at-risk contacts [(1)].

The estimated average overall incidence of HZ is about 3.4–4.82 per 1000 person years which increases to more than 11 per 1000 person years in those aged at least 80 years. HZ-associated mortality is rare, with reported yearly incidence ranging from 0 to 0.47 per 100,000 persons, and the majority of deaths occur in those aged at least 60 years[(2)].

Varicella zoster virus (VZV), which is a human alphaherpesvirus of the genus *Varicellovirus*, causes

e-mail: adnanalhamdani65 @gmail.com

varicella (also known as chickenpox) and zoster (also known as shingles) [3].

The primary infection with VZV is varicella, commonly known as chickenpox. Varicella is highly contagious; it is most commonly seen in children under the age of 10 years in countries where live attenuated varicella vaccine is not routinely administered[4].

The infants of women with varicella in the first 20 weeks of pregnancy are at about 2% risk of developing the congenital varicella syndrome. These infants often have a variety of severe abnormalities of their brain, eyes, extremities and skin and most of them succumb in infancy or early childhood. They frequently experience recurrent VZV reactivation and may have multiple cases of clinical zoster. Fortunately, the syndrome is unusual in that only about 2% of women who develop varicella in pregnancy give birth to an infant with the congenital varicella syndrome [1].

The aim of current study was to find the occurrence of VZV in primary school children in Al-Diwaniyahgovernorate.

Materials and Method

Out of the many primary schools in Al-Diwaniyah governorate, 10 schools were randomly selectedincluding rural and urban areas. A total of 4545 children were enrolled with an age range of 6 to 10 years, 800 of them were diagnosed clinically to have VZV infection, then information about age, gender and residency about each child were introduced into an excel spread sheet.Skin crusted lesion was taken for purpose of analysis. The samples of crusted lesions were obtained by crust lever then transferred into a tube (Texwipe'sAbsorbond® Swab) which is made of polyester (hydroentangled) nonwoven material. Then, samples transferred into freeze at -20°C. PCR technique was performed for direct detection of *Varicella Zoster Virus* (VZV) based on amplification of major capsid protein gene in VZV from skin crusted lesions samples. This technique was done according to company instructions (Table 1).

Table (1) The PCR detection primers with their sequences and amplicon size

Primers	Sequence (5'-3')		Amplicon
Mcp	F	TGACAAATGCTAGGCGGGTT	520bp
	R	CGACGCAACGATTCGGTAAC	

Viral DNA was extracted from transport media of skin lesions scrap samples by using Genomic DNA mini kit extraction tissue, and done according to company instructions. PCR master mixwas prepared by using (AccuPower PCR PreMix Kit) and this master mix done according to company instructions.

After that, these PCR master mix components, mentioned above, were placed in standard AccuPower PCR PreMix Kit thatwas containing all other components needed for PCR reaction. Then, all the PCR tubes transferred into Exispin vortex centrifuge at 3000rpm for 3 minutes, then placed in PCR Thermocycler (Mygene. Bioneer. Korea).

PCR thermocycler conditions were done by using conventional PCR thermocycler system. The PCR products were analyzed by agarose gel electrophoresis.

Statistical Analysis: Data were summarized, analysed and presented using two software programs;the statistical package for social sciences (SPSS version 23) and Microsoft Office Excel 2010. The level of significance was considered significant at $P< 0.05$ and highly significant at $P< 0.01$.

Results and Discussion

In the present study, infection was documented clinically in 800 out of 4545 children making the prevalence rate (17.6 %) as shown in Figure (1).

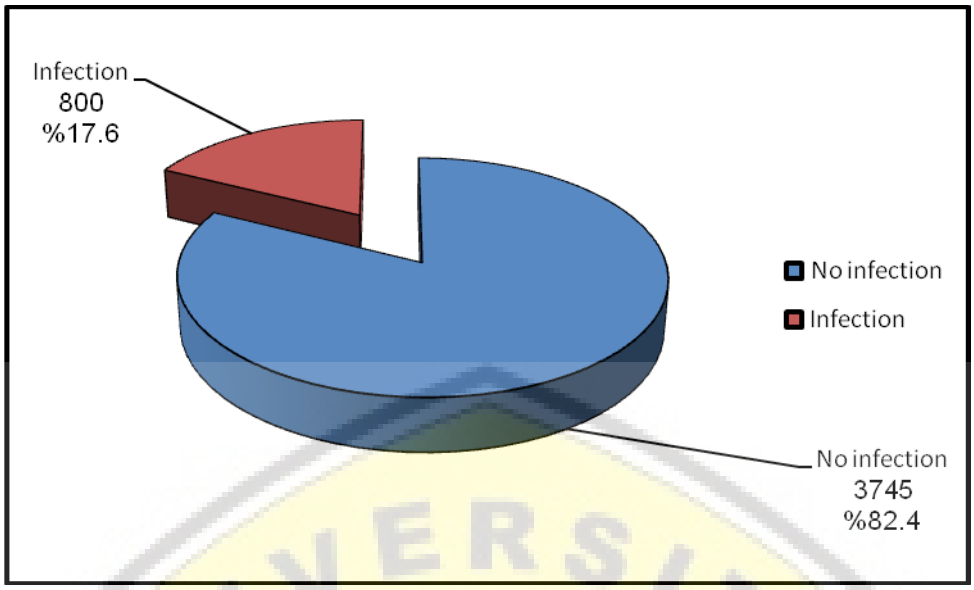

Figure 1: Pie chart showing the prevalence rate of Varicella Zoster Virus (VZV) infection among children in 10 primary schools in Al-Diwaniyah province (Mid-Euphrates region, Iraq)

Schools were arranged according to prevalence rate so that the highest rate (27.2%) was seen in school number one and the lowest prevalence rate (6.2%) was observed in school number 10. So far, the prevalence rate of VZV infection rate ranged from 6.2 % to 27.2 %.

According to residency, the prevalence rate of VZV infection in urban areas was 16.5 % and in rural areas was 18.1%. Despite some differences in the prevalence rate between rural and urban areas, the difference was statistically not significant ($P = 0.207$; Table 2).

Table (2) Association between child residency and prevalence rate VZV infection

Infection with VZV according to clinical findings	Total n = 4545	Urban n = 1299	Rural n = 3246	χ^2	P *
Positive, *n* (%)	800(17.6 %)	214(16.5 %)	586(18.1 %)	1.594	0.207 NS
Negative, *n* (%)	3745(82.4 %)	1085(83.5 %)	2660(81.9 %)		

n: number of cases; *: according to Chi-squared test; NS: not significant at $P \leq 0.05$

According to gender, the prevalence rate of VZV infection in male children was 17.4 % and that of female gender was 18.0 %. Despite some differences in the prevalence rate between male and female children, the difference was statistically not significant ($P = 0.600$; Table 3).

Table 3: Association between child gender and prevalence rate VZV infection

Infection with VZV according to clinical findings	Total n = 4545	Male n = 2787	Female n = 1758	χ^2	P *
Positive, *n* (%)	800(17.6 %)	484(17.4 %)	316(18.0 %)	0.275	0.600 NS

n: number of cases; *: according to Chi-squared test; NS: not significant at $P \leq 0.05$

Out of 800 children with clinical manifestations of VZV infection, 43 were selected normally for the purpose of molecular diagnosis and identifying genetic strains. Conventional PCR method (Figure 2) showed that all the 43 children were positive for VZV. PCR product analysis for major capsid protein (*mcp*) gene in *varicella-zoster virus*

Figure 2: Agarose gel electrophoresis image that showed PCR product analysis for major capsid protein (mcp) gene in varicella-zoster virus. M (Marker ladder 2000-100bp), Lanes (1-10) some positive varicella-zoster virus isolates at 520bp PCR product size.

The mean age of the 43 children selected for molecular study was 8.44 ±1.65 years and the age range was 6–11 years. Also, the distribution of children according to one-year age interval was also shown in Figure (3).

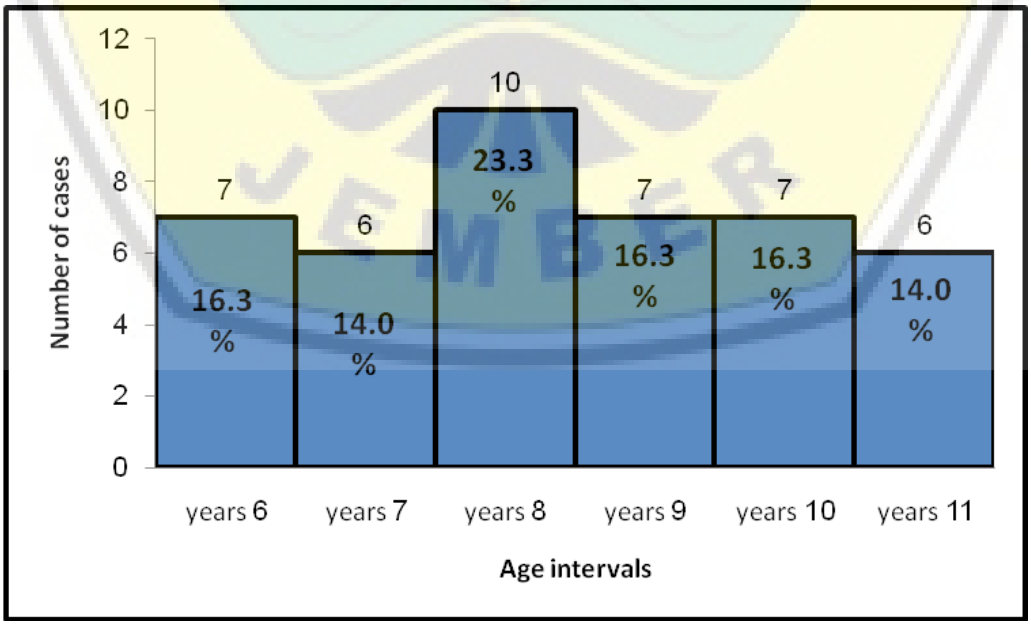

Figure 3: Histogram showing the distributionof children infected with VZV according to one-year age intervals.

Varicella-zoster virus (VZV) is a pathogenic human alpha-herpesvirus that causes chickenpox (varicella) as a primary infection, which usually occurs in children in locales where vaccination is not practiced [5]. Following the primary infection, this neurotropic virus becomes latent, primarily in neurons in peripheral autonomic ganglia throughout the entire neuroaxis including dorsal root ganglia (DRG), cranial nerve ganglia such as trigeminal ganglia (TG), and autonomic ganglia including those in the enteric nervous system [6]. Up to decades later, latent VZV may reactivate, either spontaneously or following one or more of a variety of triggering factors to cause herpes zoster (shingles), which usually appears as a painful or pruritic cutaneous vesicular eruption that occurs in a characteristic dermatomal distribution [1]. This viral reactivation becomes more frequent with increased age of the human host, because of diminished cell-mediated immunity to the virus in such individuals[7]. Other specific triggers for viral reactivation include immunosuppression from disease or drugs, trauma, X-ray irradiation, infection, and malignancy [1]. While the main and most important complication of herpes zoster is postherpetic neuralgia (PHN), it has been increasingly recognized over the last decade that VZV reactivation causes a variety of acute, subacuteand chronic neurological syndromes, so its clinical manifestations are protean [7]. The reality of subclinical reactivation was demonstrated when it was determined that one-third of astronauts developed reactivation of VZV transiently during space travel. The diagnosis was made by finding VZV DNA in saliva; the astronauts had no symptoms of zoster and the viral DNA disappeared within a few weeks after return to Earth [8]. Importantly, it is very rare to isolate infectious VZV from saliva of patients with active or subclinical VZV infections [9]. Since the introduction of widespread childhood varicella vaccination, no impact has been observed on the incidence or age distribution of HZ. Other studies [10]have reportedan increasing trend in the general population as well as in immune-compromised populations, but this trend preceded the implementation of childhood varicella vaccination (Long-term surveillance will be necessary to establish if there will be an increased incidence of HZ [11]. Further analysis of viruses from around the world confirmed that the *Bgl*1-positive genotype was present in 100% of 100 viruses collected from different countries in Africa, East Asiaand the Indian subcontinent, but accounted for <20% of viruses collected in Europe, the United States and other countries inhabited by Europeans.A prospective study of >400 patients presenting with clinical zoster allowed us to type VZV from 200 white British-born subjects aged 5–98 years[12].

Conclusion: The most prevalent VZV genotype in Diwanyia governorate was B genetic subtype (wild type) than others. So, it is recommended to give an attention to this genotype in the further studies.

Abstract

Background: Varicella-Zoster virus (VZV) is one of the human herpes viruses (HHVs); its official name known as (Human Herpes Virus -3) HHV-3, a member of DNA-containing Herpesviridae family. VZV causes varicella (chickenpox) as a primary infection and herpes zoster (HZ) after the reactivation of a latent VZV. The aim of the present study was to figure out the genetic strains of *Varicella Zoster Virus* (VZV) that are common in the Middle district region of Iraq.

Method: A total of 43 samples selected randomly for molecular diagnosis and identifying genetic strains in laboratory. Conventional PCRshowed that all the 43 children were positive for VZV.

Results: Three single nucleotide polymorphism (SNP) alleles were estimated and these were ORF34, ORF54 and ORF62. All the cases were positive for ORF34 (100.0 %) and the number of cases that were positive for ORF54 were 31 out 43 (72.1 %), whereasnone of the cases positive for ORF62 (0.0%). Accordingly, virus genotype strains were identified. Cases positive for ORF34 and ORF54 SNPs were considered genotype B, whereas cases positive for ORF34 only were labeled as genotype A. However, no case was labeled as genotype C (ORF62).

Conclusion: The most prevalent VZV genotype in AL-Diwanyiah region was B (ORF34 & ORF54) genetic subtype (wild type) accounting for 31 out of 43 (72.1 %), whereasthe A genetic subtype accounted for 12 out of 43 (27.9 %). Genotypes A and B were neither correlated significantly to age nor to gender of children.

Introduction

Varicella-Zoster virus (VZV) is one of the human herpes viruses (HHVs); its official name known as (Human Herpes Virus -3) HHV-3, a member of DNA-containing Herpesviridae family. VZV causes varicella (chickenpox) as a primary infection and herpes zoster (HZ) after the reactivation of a latent VZV. Varicella is a childhood illness with highest incidence between 1 and 9 years of age, characterized by fever and a generalized pruritic vesicular rash. Varicella is a worldwide infection more prevalent in temperate climates than tropical onesand often occurs in late winter and spring seasons. Furthermore, varicella is transmitted by respiratory aerosols from infected individuals and by direct contact with skin lesions of individuals affected by VZV.

The VZV genome was originally reported to encode 65 unique viral genes, three of which are located in the duplicated IRS/TRS region[(1)]. Four additional VZV genes have since been identified including ORF0[(2)], ORF9A[(3)], ORF33.5[(4)] and the newly discovered VZV latency-associated transcript (VLT) [(1)]. An under appreciated feature of VZV is that transcription of

several genes, including ORF0, ORF42/45, ORF50, and VLT, requires the host-splicing machinery to remove introns from pre-mRNA and have also shown evidence of alternative splicing resulting in the synthesis of alternative proteins[5]. It, thus, seems likely that the full transcriptional potential of VZV has yet to be revealed and we predict that the latest technological advances (e.g., full length sequencing of native RNA) will yield further novel discoveries. It is also worth noting that the encoding of additional RNA types, including microRNAs and small non-coding RNAs, is still an area of active study with contrasting results [6]. The aim of present study was toconfirm the identification of major capsid protein gene of Varicella-Zoster virus by using conventional polymerase chain reaction (PCR) and genotyping of Varicella Zoster Virus of ORF34, ORF54 and ORF62 in Chickenpox patients using Restriction Fragment Length Polymorphism (RFLP) Technique.

Materials and Method

Out of the many primary schools in AL-Diwaniyah governorate, 10 schools were randomly selected from rural and urban areas. A total of 4545 children were enrolled with an age range of 6 to 10 years, 800 of them were diagnosed clinically to have VZV infection. In addition, information about age, gender and residency about each child was introduced into an excel spread sheet. After that, 43 children were selected for genetic assessment of the VZV.Skin crusted lesion was taken for purpose of analysis. The samples of crusted lesions obtained by crust lever then transferred into a tube (Texwipe'sAbsorbond® Swab) which is made of polyester (hydroentangled) nonwoven material. Then samples transferred into freeze at -20°C.

Polymerase Chain Reaction (PCR): PCR technique was performed for direct detection of Varicella Zoster Virus (VZV) based on amplification of major capsid protein(mcp) gene (Table 1).

Table (1): PCR detection primers with their sequence and amplicon size

Primers	Sequence (5'-3')		Amplicon
mcp	F	TGACAAATGCTAGGCGGGTT	520bp
	R	CGACGCAACGATTCGGTAAC	

Viral DNA was extracted from transport media of skin lesions scrap samples by using Genomic DNA mini kit extraction tissueand done according to company instructions .

The extracted DNA was checked by using Nanodrop spectrophotometer (THERMO. USA), that check and measurepurity of DNA through reading absorbance in at (260/280nm). PCR master mix was prepared by using (AccuPower PCR PreMix Kit) and this master mix done according to company's instructions.

After that, these PCR master mix components, mentioned above, were placed in standard AccuPower PCR PreMix Kit containing all other components needed for PCR reaction. Then, all PCR tubes were transferred into Exispin vortex centrifuge at 3000rpm for 3 minutesthen placed in PCR Thermocycler (Mygene. Bioneer. Korea).

PCR thermocycler conditions were done by using convential PCR thermocycler system. The PCR products were analyzed by agarose gel electrophoresis and visualized by using UV Transilluminator.

RFLP-PCR Genotyping Technique: RFLP-PCR technique was performed for genotyping positive Varicella Zoster Virus (VZV) in direct PCR. VZV genotyping depends on amplification of ORF54, ORF34 and ORF62(Table 2). RFLP-PCR master mix was prepared by using (AccuPowerPCRPreMix Kit) and this master mix done according to company's instructions.

Table (2): RFLP-PCR genotyping primers with their sequence and amplicon size

Primers	Sequence (5'-3')		Amplicon
ORF54	F	CGTAATGCATAACAGGCCAACAC	-
	R	AAACCTGGCGTCAAACATTACA	
ORF38	F	AAGTTTCAGCCAACGTGCCAATAAA	-
	R	AGACGCGCTTAACGGAAGTAACG	
ORF62	F	TTCCCACCGCGGCACAAACA	-
	R	GGTTGCTGGTGTTGGACGCG	

After that, these PCR master mix components, mentioned in Table (2), were placed in standard AccuPower PCR PreMix Kit .Then, all the PCR tubes were transferred into Exispin vortex centrifuge at 3000rpm for 3 minutes. Then, placed in PCR Thermocycler (Mygene. Korea). PCR thermocycler conditions were done for each gene independent .

RFLP-PCR mix was prepared by using BglI, PstI, and SmaI restriction enzymes for ORF54, ORF34 and ORF62, respectively, and this master mix done independently according to company's instructions.

After that, this master mix was placed in Exispin vortex centrifuge at 3000rpm for 2 minutesthen transferred into incubation at 37°C for overnight. After that, RFLP-PCR product was analyzed by 3% agarose gel electrophoresis method mentioned in PCR product analysis.

Statistical Analysis: Data were summarized, analysed and presented using two software programs; the statistical package of social sciences (SPSS version 23) and Microsoft Office Excel 2010. The level of significance was considered at $P < 0.05$ and highly significant at $P < 0.01$.

Results and Discussion

Molecular and genetic analysis: Three single nucleotide polymorphism (SNP) alleles were estimated. All the cases were positive for ORF34 (100.0 %). The number of cases positive for ORF54 was 31 out 43 (72.1 %), whereasnone of the cases were positive for ORF62 (0.0%) (Figure 1).

Accordingly, virus genotype strains were identified. Cases positive for ORF34 and ORF54 SNPs were considered genotype B, whereas cases positive for ORF34 only were labeled as genotype A (Figure 1).

The correlation between VZV gene SNP alleles with age and gender of children: These correlations were not possible for both ORF34 and ORF62 since ORF34 was positive in all cases and ORF62 was negative in all cases. Therefore, we linked ORF34 only to age and gender of infected children.

There was no significant association between age of child and ORF54 SNP allele frequency ($P = 0.951$; Figure 1). In addition, the association between ORF54 and gender of infected children was non-significant ($P = 0.078$).Genotypes A and B were also correlated significantly neither to age nor to gender of children.

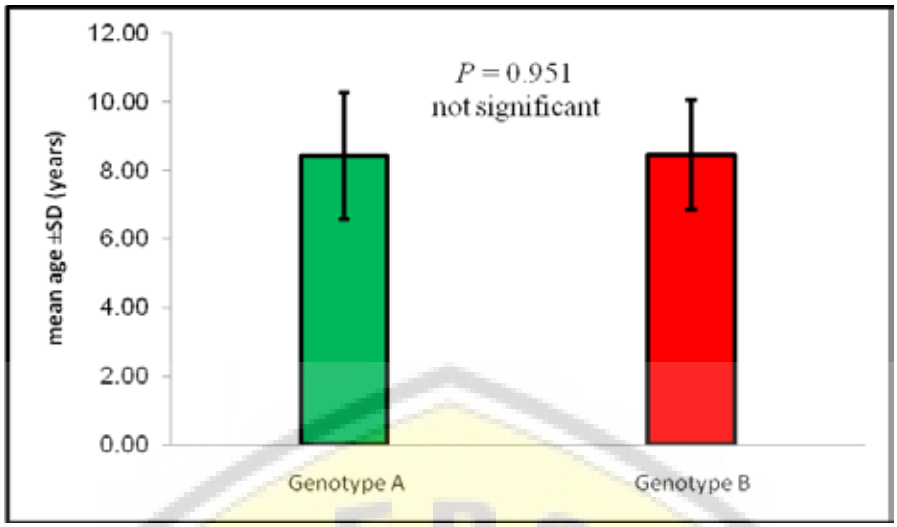

Figure 1: Comparison of mean age according to VZV genotype (A versus B)

PCR product analysis for major capsid protein (mcp) gene in positive varicella-zoster virus isolates at 520bp PCR product size (Figure 2).

Figure 2: Agarose gel electrophoresis image showing PCR product analysis for major capsid protein (mcp) gene in varicella-zoster virus. M: Marker ladder 2000-100bp. Lanes (1-10): some positive varicella-zoster virus isolates at 520bp PCR product size.

Genotyping of Varicella-zoster virus by RFLP-PCR: Figure (3) showed PCR product genotyping analysis for ORF54in varicella-zoster virus. The positive ORF54 varicella-zoster virus isolates gave 497bp PCR product size.

Figure 3: Agarose gel electrophoresis image showing PCR product genotyping analysis for ORF54in varicella-zoster virus. M: Marker ladder 2000-100bp). Lanes (1-10): some positive ORF54varicella-zoster virus isolates at 497bp PCR product size.

Figure (4) showed RFLP-PCR product genotyping analysis for ORF34in varicella-zoster virus. The positive ORF34varicella-zoster virus isolates gave 647bp PCR product size.

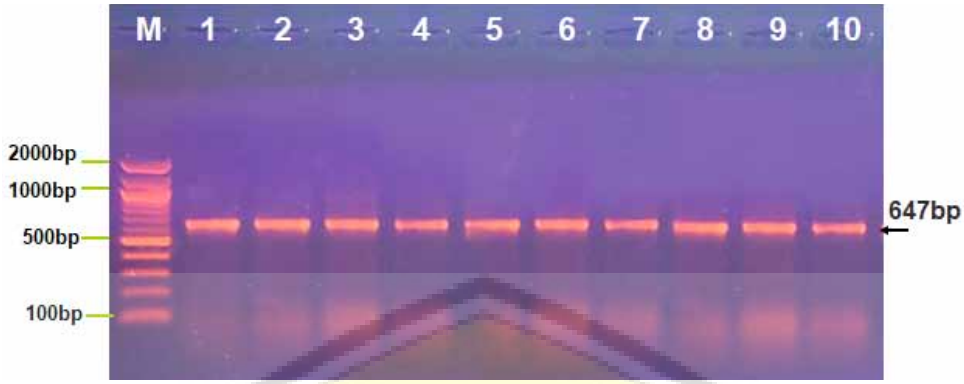

Figure 4: Agarose gel electrophoresis image showing PCR product genotyping analysis for ORF34in varicella-zoster virus. M: Marker ladder 2000-100bp). Lanes (1-10): some positive ORF34 varicella-zoster virus isolates at 647bp PCR product size.

VZV encodes at least five transcriptional regulatory proteins specified by four putative IE genes (ORF4, ORF61, ORF62 and ORF63) and, one L gene, ORF10. All except the ORF61 protein (IE61) are part of the VZV virion[7]. Our understanding of the transcriptional regulation of VZV genes remains incomplete, in part due to the high cell-associated nature of VZV that precludes synchronized infections using cell-free viruses. The dominant transcriptional regulator and possibly only true immediate-early protein encoded by Varicella virus is homologous to VZV IE62 [8,9]. Consistent with this idea, the VZV IE62 major viral trans-activator protein can activate all three kinetic classes of VZV genes in the absence of other viral proteins, including all IE genes (ORF4, ORF61, ORF62, and ORF63), while IE4, IE61 and IE63 either do not or minimally stimulate the ORF61 promoter [10,11]. Host transcription factors, either by themselves or through interactions with viral transcriptional regulatory proteins, also contribute to viral gene expression [11]. VZV virion proteins, delivered into newly infected cells upon entry, are not absolutely required to initiate VZV gene expression, as evidenced by the resulting VZV replication upon transfection of cells with viral DNA [12]. Notably, near identical VZV transcriptomes are detected during productive infection of diverse cell types, including neurons. The latter suggested a prominent role for either commonly expressed cellular transcription factors or viral proteins in coordinating VZV gene expression [13,14,15].

Repeat the Exercise Effect Tactical Sentences in the Evolution of Some Indicators and Performance Sustainability of Specialized School Handball Players

Hasanain Jawad Abdullah[1], Hassim Abdul Jabbar[2], Ali Hussein Ali[2]

[1]Ministry of Education/Directorate General of Karbala Education/Iraq,
[2]University of Kerbala/Faculty of Physical Education and Sports Sciences/Iraq

Abstract

The importance of research in preparation of repeat exercises and testing Tactical sentences on specialized school players handball in Karbala province to develop some indicators and bear performance, this study aimed to identify the impact of repeat exercises Tactical sentences in the evolution of some indicators and bear Performance specialist school handball players, as well as identify the differences between experimental groups and priority control in the evolution of these variables, we used experimental design with experimental groups and control subjects, researchers identified a community search specialist school in handball players Karbala reconstruction (14-15) of the year (21) a player without goalkeepers, was chosen (16) players randomly sampled randomly search and been equally into two groups and pilot officer with 8 players per group, the researchers found that exercise repeated sentences Tactical has had a positive impact on the evolution of some indicators and carrying players performance specialist school handball, as well as training by repeating sentences Tactical payoff is better than traditional training in the evolution of search variables for the players.

Keywords: *Exercise, Tactical sentences and performance sustainability.*

Introduction

The word Tactical used in many areas of life such as war, politics, games, sports training tactics in General Tactical playing handball. We can say that Tactical are those maneuvers and dispositions and moves by players in defense and attack by match or are basic method and techniques of individual or collective that can be used during the attack and defense with the ball and without it to direct control on the happenings Play and thus win the game. The handball closely and directly (Physiology) the science of great importance in the process of evolution in the field of athletic training, as well as to cardiovascular indicators and developed its direct role sports have big and influential in sports level and therefore will result in this evolution. Good performance contributes to win the game, as the sophistication level of the player, whether physical or skill development or plans related to the adaptation of functional devices for cardiac indicators are the most important of these directories you can infer how evolution as a result of sports training.[1]

The researchers learned about the scientific sources of sports training, as well as by observing and following up the various training processes. The researchers were one of the former players and coaches of the handball. They noticed that there is little use of tactical training in clear sentences for the young age groups. Cardiac indicators, which have a clear impact on the performance of the performance and thus all work to develop all the physical abilities, mobility and skill in the basic handball. Therefore, the researchers considered the use of repetitive exercises in the development of some cardiac effects and performance of the players of the school specialized handball, may this research help coaches in training their players in the future.[2]

Objectives of Research:

1. Identifying the impact of repeat exercises Tactical sentences in the evolution of some indicators and performance sustainability of specialized school handball players.

2. Identify the differences between experimental groups and priority control in the evolution of some indicators and performance sustainability of research sample members.

Research Methodology and Field Procedures

Research Methodology: We used experimental design with experimental groups and control to fit it to the nature of the problem.

Research community and sample: Researchers identified a community search specialist school players handball in Karbala reconstruction (14-15) of the year (21) a player without goalkeepers, was chosen (16) players randomly sampled randomly search and been equally into two groups and pilot officer in reality (8) players each A group, use the first pilot group repeat exercises Tactical sentences, and the second set of exercises for your coach, and was the work of harmonization and equivalence of sample members search for both groups.

Method, tools and devices used in research:

- Tests and measurements.
- The note.
- Whistle type (FOX) number (2).
- Handball (12) a stake in number (12) measuring tape.
- My echo type SIEMENS-ACUSON SC2000 stopwatch type (SEWAN) number (3). Calculator HP LENOVO type number (1).

Procedures for field research:

Characterization tests:

First test, measure cardiovascular indicators:[3]

Objective of the test: measurement of cardiac indicators.

Devices and instruments: Echo device, medical cotton, gel material.

Performance description: These measurements were performed using an ultrasound scanner (Echocardiogram) by a specialist doctor for this purpose.

Test Two, Performance endurance test:[4]

Purpose of the test: carrying the defensive and offensive performance:

The tools used: the number of (12) - legal hand balls number (6) - stopwatch number (2).

Performance mode: The player stands on the line (6 m), and when giving the starting signal, the defensive movements between the plastic cones between the line (6 m) and line (9 m) three times, and then proceed to a flash attack in the other half of the stadium, The previous performance between the line (6 m) and the line (9 m), and then take a handball placed on the line (6 m) and lead the pitcher of the ball from the rapid running up to the line (9 m) in the other half of the pitch to score from outside the goal and performance for two consecutive cycles non-stop .

Registration: Calculates the performance time from the moment the start signal to the moment of leaving the ball to the player during the correction end of the second session.

Pilot Study: The researchers conducted their exploratory experiment on Thursday and Friday, 20-21/12/2018 on a sample selected from the research community of (6) players.

Pre Test: The pre-test of the research sample was conducted on Saturday and Sunday (29-30/12/2018) on the gym and the Echo laboratory.

The Main Experience: After the completion of the pre tests, the researchers introduced the exercises by repeating the tactical sentences they prepared, in the training program dedicated to the research sample at the beginning of the main section of the training unit and then the main part is completed together with the same exercises of the coach, and will be as follows:

1. The date of starting the exercise on Thursday (3/1/2019).
2. Exercises were applied in the special numbers stage.
3. The duration of the experiment (8) weeks distributed over (24) training units at the rate of three units per week.
4. A special trainer has been assigned to each group who are given special exercises scheduled for them at the beginning of the main section and the gymnasium on Saturdays, Mondays and Thursdays. At the same time, after the completion of the special exercises, they are merged again to complete the training unit under the supervision of their instructor.

5. The researchers determined the intensity of exercise between (80-90%).
6. The researchers used high-intensity infant training.
7. The date of the end of the experiment on Monday, 25/2/2019.

Post-test: The post-test was conducted on Thursday and Friday (28/2-1/3/2019) on the gym and the Echo laboratory, taking into account the same conditions and conditions in the pre test as possible.

Results

View and analyze the results and discuss them: This section contains the presentation, analysis and discussion of the results obtained from the research sample, after the data were processed statistically.

Table (1). Shows the mean, standard deviations, the calculated value (t), and the level and type of significance of the control group in the pre and post tests

Tests	Units	Pretest		Posttest		(t) calculated	Level of significance	Type of significance
		Mean	SD	Mean	SD			
Volume of cardiac output	Liter	5.15	0.05	5.30	0.04	8.302	0.000	Sig.
Heart rate	Blow/Min	74.50	1.60	73.88	1.25	3.416	0.011	Sig.
Single-shot blood measurement	Cm^3	73.88	2.36	75.25	1.67	4.245	0.004	Sig.
Endurance performance	A second	55.45	0.83	50.62	0.53	16.381	0.000	Sig.

The results showed that the computational values of the variables (cardiac size and single-stroke blood measurement) were higher in the post-test than in the pre-test. There was a significant difference between the tests and for the post-test, the higher the mean, the better.

As for the variables (heart rate and performance tolerance), the value of the arithmetic mean was smaller in the post-pre test. There was a significant change between the two tests and for the post-benefit, since these variables have an inverse value the lower the arithmetic mean the better the level, The mean levels were less than the significance level (0.05) for all the variables of the research, which indicates the existence of significant differences between the two tests.[5]

Table (2). Shows the computational, standard deviations, the calculated value (t), and the level and type of significance of the experimental group in the pre and post tests

Tests	Units	Pretest		Posttest		(t) calculated	Level of significance	Type of significance
		Mean	SD	Mean	SD			
Volume of cardiac output	Liter	5.15	0.04	5.45	0.04	14.341	0.000	Sig.
Heart rate	Blow/Min	74.50	1.41	69.88	1.25	10.044	0.000	Sig.
Single-shot blood measurement	Cm^3	74.25	1.28	79.88	1.13	8.275	0.000	Sig.
Endurance performance	A second	55.28	0.90	47.88	1.60	9.299	0.000	Sig.

The results showed that the computational values of the variables (cardiac size and single-stroke blood measurement) were higher in the post-test than in the pre-test. There was a significant difference between the tests and for the post-test, the higher the mean, the better.

As for the variables (heart rate and performance tolerance), the value of the arithmetic mean was smaller

in the post-pretest. There was a significant change between the two tests and for the post-benefit, since these variables have an inverse value the lower the arithmetic mean the better the level, the mean levels were less than the significance level (0.05) for all the variables of the research, which indicates the existence of significant differences between the two tests.[6]

Discuss the results of the tests in the pre and post measurement of the two research groups: The researchers attributed the cause of the development to the members of the two groups that the physical effort that is exposed to the members of this group, which constitutes the daily training load and various goals, but directly affects the development of performance of players and thus affect the adaptation of these devices to enhance the development of their performance, Many studies have unanimously agreed that training in an organized manner works to develop physical variables.[7]

And the training is organized by adopting the correct training rules and in accordance with the level of the technical player and the age of training and time is working to develop well and regularly. "The number of repetitions of the performance of skill and plan accurately in each exercise, as well as repeated in the following training units and fit this number with the Sunni stages for players and their level of performance".[8]The researchers also attribute the evolution of all cardiac functions to the continuous training process, as training has a clear effect on the rate of heart rate at rest.

Some studies have confirmed that continuous and regular training leads to a slowdown in heart rate and resting time for players. Other studies added that "exercise improves the functional capacity of the heart and develops the adequacy of oxygen transmission, and the process of oxygen transmission here is the result of the volume of blood paid in each blow, and through which the blood reaches the muscles to do its work to the fullest."[9]

Results

Table (3). Showing significant differences between the results of tests for measuring the dimensional control and experimental groups

Tests	Units	Control Group		Experimental Group		(t) value	Level of significance	Morality of differences
		Mean	SD	Mean	SD			
Volume of cardiac output	Liter	5.30	0.04	5.45	0.04	7.111	0.000	Sig.
Heart rate	Blow/Min	73.88	1.25	69.88	1.25	6.418	0.000	Sig.
Single-shot blood measurement	Cm 3	75.25	1.67	79.88	1.13	6.497	0.000	Sig.
Endurance performance	A second	50.62	0.53	47.88	1.60	4.610	0.000	Sig.

When reviewing the results of the tests, it is clear that there are significant differences between the measurement of the post tests and the interest of the experimental group since the values of the level of significance were less than the level of error (0.05) and this is consistent with the second hypothesis of the research.

Discussing the results of measuring the post tests of the two research groups: The researchers attribute the reason for the superiority of the experimental group on the control group to the effect of repetitive and continuous tactical exercises, which was carried out by this group, which led to its impact on the physical, emotional and mental, as these positions engines to create a state of positive thinking, The behavior of the player and increase self-confidence and the ability to control his actions in situations that provoke reactions, and this is confirmed that "the control of the emotions and emotions of man and control indicates emotional maturity".[10]

The researchers also attributed the development of the experimental group to the use of new exercises that were not trained by the players, which led to the development of the abilities of the players, and this was

confirmed that the level of sports performance increases quickly when the implementation of new exercises unfamiliar to the athlete. In this context, the trainers of the training process must use new training and strategies to keep abreast of the great development that the world is witnessing in this game, including the tactical training of the young age groups, in order to perform the required role in the games, whether physically, skillfully, psychologically or tactically."[10] The use of exercises that are consistent with the nature of their performance with the general shape of the performance of specialized skills leads to better results in the acquisition of physical variables.[11]

The closer the exercise circumstance is to the match, the more useful and effective the player will achieve the goals of reaching the level of the match," said Mufti Ibrahim.

In addition, this type of exercise is based on the utilization of physical and skill gains within a single performance, which is very similar to the requirements of the effective motor performance in the games. Thus, these exercises significantly improve the efficiency of the work of the functional apparatus, Good that the physical performance skill (composite) improves the work of the heart and circulation and internal organs of the body as a whole, as the development of muscles in a consistent way and paves the way to acquire skills and movements and the ability to economize in physical effort and applies to a large extent on the sport yen and youth.[12]

The repetition of the tactical exercises imposed the reality that the performance of the performance in the performance of special endurance and this helped improve the efficiency of the heart and functions, and Sharkey points out that the endurance exercises and endurance, especially in the loads of less than the maximum, lead to reduced heart rate in the case of rest, And to increase the size of the heart attack. An increase in the size of the heart leads to increased contractile strength, resulting in an increase in blood volume from the heart during contractions.

Conclusions

1. Exercise repetition of the tactical sentences had a positive impact in the development of some heart indicators and performance of the players of the school specialized handball.
2. Training repetition of tactical sentences better than the usual training practiced by the coach in the development of some heart indicators and performance of the players of the school specialized handball.

Molecular and Biochemical Characterizations of *Staphylococcusaureus* ß-Lactamase Recovered from Iraqi Patients with UTI

Ruqaya M. Hassan[1], Maha H. Abdullah[1], Ghazi M.Aziz[2], Ali J. Al-Sa'edy[2]

[1]College of Biotechnology/Al-Nahrain University, [2]College of Science/University of Baghdad

Abstract

A total of 126 samples (wound, urine) were collected and only sixty one isolates were detected phenotypicallyas *Staphylococcusaureus.* All *Staphylococcusaureus* isolates were screened for their ability to produce β-lactamase. The best isolates for produce β-lactamase was RU57 isolated from urine with activity 134.5 U/ml. Molecular identification for *bla Z* was donefor the highest 12activities of the β-lactamaseand only 10 isolates were found to be chromosomal origin *bla Z* andothersplasmid origin.β-lactamase was partially purified by ion exchange chromatography in CM cellulose column, the Overall purification fold was 1.65 with 52% yield for wash step and 4.8 with 26% yield for elution step. The maximum enzyme activity was recorded at pH 7.0 and 37° C, while the maximum enzyme stability was recorded at pH range from 6-7.5 and temperature degree ranged from 25-40°C. A phylogenetic tree was used To elucidate the diversity and evolutionary of chromosomally-located *blaZ*, of *S.s aureus* isolates RU57 from Iraqi patients with others from different country and the results showed that *blaZ* was have similarity 100% with China, France, South Korea,United Kingdom, and Brazil. The sequence of *blaZ*was differsfrom *blaZ* of Australia, Japan and USA. Today therapeutic control of ß-lactamase-producing bacteria has been a major clinical problem.

Keywords: *ß-lactamase, bla Z, Staphylococcus .aureus, polymerase chain reaction, resistance genes.*

Introduction

Staphylococcus belongs to the low GC content division of Gram positive bacteria. Three species, *S. aureus*, *S. epidermidis*, and *S.saprophyticus*, are recognized as both a commensal bacterium and a opportunistic human pathogen on host skin [(1)]. Multiple studies have now documented the prevalence, prognosis, and outcome of *Staphylococcus aureus* bacteremia in industrialized guregions of the world[(2,3)]. Many strains of *Staphylococci* are secrete a group of enzymes and cytotoxins such as nucleases, proteases, lipases, hyaluronidase, and collagenase [(4)]. The main function of these enzymes may be to convert local host tissues into nutrients required for bacterial growth. ß-lactamase and penicillin-binding proteins are enzymes located in the cytoplasmic membrane and responsible for penicillins and cephalosporins resistance [(5)]. Other enzyme such as protease, lipase, and hyaluronidase, that destroy tissue and may aid the spread of infection to other tissues. Coagulase, an enzyme Its contributed to the virulence of bacteria [(6)].The *blaZ* has also been identified as the cause of penicillin resistance among Staphylococci[(7,8)]. Today, *S. aureus* has develop resistant to many commonly used antibiotics. The best-known mechanism of bacterial resistanceis resistance to β-lactam group, such resistance may be chromosomally or plasmid-mediated or may be constitutive or inductive. The aim of this research to identify and characterization of β-lactamase isolated from Iraqi clinical samples at molecular and biochemical levels.

Materials and Method

Samples Collection: A total of 126 samples (wound and urine) were collected, from the Ear-Nose-Throat

(ENT) consultant Unit at Al-Kindy teaching Hospital and Al-Yarmouk Teaching Hospital in Baghdad city from February to March, 2017. The samples obtained from subjects of various ages, gender and infection sites, were transferred to the laboratory for analysis.

Diagnosis of Staphylococcus aureus:

Microscopic examination[9]: All isolates were subjected to Gram staining technique and only Gram (+ve) coccus cells grouped mainly in clusters were considered as belonging to *Staphylococcus sp.*

Morphological Examination[10]: Each of the suspected bacterial isolates was streaked on mannitol salt agar and incubated at 37°C for 24 h. After incubation. The colour and texture of the colonies are observed.

Biochemical tests[11]: Standard microbiological procedures were used for the identification of *S. aureus*.

Microbiologic Procedure: In vitro antimicrobial susceptibility testing was done by disc diffusion method using the penicillin Gand interpreted according to the Clinical and Laboratory Standards Institute (CLSI 2008)[12]

PCR amplification for Staphylococcus aureus: DNA was extracted as previously described [13]. Polymerase chain reaction for detection of genes *bla Z* was carried out using the following primers: 5'CAAAGATGATATAGTTGCTTATTCTCC-3',5'TGCTTGACCACTTTTATCAGC - 3'respectively. Amplification cycles for *bla Z* was done according to Coelho et al. [14] considering 35 cycles of 94ºC for 30s, 56ºC for 30 sec, 72ºC for 1 min. with a final extension at 72ºC for 7 mins. The amplicons were evaluated by agarose gel electrophoresis followed by staining in ethidium bromide (0.5mg/mL), visualized on UV transilluminator and documented by the program Quanti One (BioRad) using molecular weight markers of 1000 bp.

Sequence Homology and Phylogenetic Analysis: The Sequencing of PCR product was performed by national instrumentation center for environmental management using BLAST system.Phylogenetic tree was constructed using the program Neighbor-Joining in the same software.

Protein determination[15]: Protein concentration was determined by Bradford using BSAas standard.

Determination of β-Lactamase activity:

Quantitative determining of ß-Lactamase activity: β-Lactamase was detected by measuring the enzyme activity according to a micro-iodometric assay at 620 nm[16].

International Unit (IU): the amount of enzyme needed to hydrolyzed 1µmole of penicillin G per minute at 25ºC and PH 7.0.

$$\text{Enzyme activity} = \text{U/ml} = \frac{\Delta E \times 121.9}{\Delta t \times 1}$$

Enzyme purification: The purification was carried out at 4°C on the cell lysate according to Hedberget al. (1995).

Dialysis of crude enzyme: The crude enzyme put in dialysis tube with 10000MW cutoff against, after dialysis, the enzyme after concentrated by sucrose use for purification by ion exchange chromatography.

Purification by ion exchange chromatography: The dialyzed β-Lactamase was further purified by ion exchange chromatography technique using CMC-Cellulose column (1.57X15 cm) which prepared according to[17].

Characterization of purified β-lactamase.

Determination of the optimal temperature for β-lactamase activity and stability: ß-lactamase activity was determined after incubation of substrate at different temperatures (25,30,37,40,45, 50ºC) for 30min. for determine enzyme stability the enzyme was transferred into ice bath.

Determination of the optimum pH for β-lactamase activity and stability: This can be achieved by using acetate buffer, phosphate buffer and tris buffer. pH was adjusted in each one, penicillin Gwas added to buffer solution at different pH values(4-9) the activity of β-lactamase was assayed.

Results and Discussion

Total of 61 isolates were identified as *S. aureus* depended on the morphological features and biochemical test. Only 49 isolates from Urine and wound isolates were positive for production of β-lactamase by inhibition zone for Penicillin Gand edges around the penicillin G disk ((inhibitor standard) and according to disk diffusion method (Oxoid, Basingstoke, England) and as shown in

table (1). The test was defined as negative when thefuzzy edge like a beach and as positive when the edge was sharp like a cliff[18].

Table 1: Highest ten S. aureus isolates of positive β-lactamase

No.	No. Isolates	Inhibition Zone (mm)	Enzyme Activity
1	RW14	23	19.3U/ml
2	RW21	21	80.3U/ml
3	RW 34	20	97.5U/ml
4	RW35	23	70.4U/ml
5	RW36	20	57.5U/ml
6	RU44	19	55.8U/ml
7	RW47	22	61.5U/ml
8	RU51	21	90.2U/ml
9	RU52	22	62.4U/ml
10	RU57	20	134U/ml
11	RU59	21	89.3U/ml
12	RU60	22	4.59U/ml

The β-lactamase positive *S. aureus* isolates recovered from the urine and wound samples were screened for *bla Z*gene. The result was shown the *bla Z* was approximately 421 bp in length. The optimum temperature for amplifying this gene was 56°C. However, a large inhibition halo did not rule out the presence of the *blaZ* gene, as also noted by Feghaly[19]. This result was agreed with Ferreira[20] how mentioned that the *bla Z* 421bp in *S.aureus. ATCC 29213.* Other study had shown the PCR product of the *blaZ* geneisolated from isolates from Australia was 326 bp[21]. Recently, many studies carried out in different countries describing the characteristics of ß-lactamase gene from different bacteria types,since there results were seem to be geographical variations in the occurrence of different β-lactamase gene, including *E. coli* and,*P. mirabilis*, and *E. Aero* genes[22].As shown in fig. 1, some of the isolates were shown negatives amplicons, indicating that, the *bla Z* genes were not contained in the genomic of these isolates or these isolates may contain other resistance gene but not expressed as reported byJoseph[8].

Figure 1: Agarose gel electrophoresis of the amplified bla Z gene of RU57 on (1%) agarose under UV (1.15 h. and 110 Volts)

Sequence Homology: We performed genome analysis on the *bla Z* gene of different *S. aureus* isolates (3 isolated from wounds and 3 isolated from urine) in comparison with that of *S. aureus* strain by using inverse PCR-based sequencing analysis. The results shown that two genomic structures of *S. aureus* isolated from wounds, was 100% similar to the genomic structure that was found in the chromosomal region encoded to *bla Z* geneand the remaining isolated shown the difference in the *bla Z* gene in one nucleotide (Table 2). The *bla*

Z gene of *S. aureus* of 3 urine samples have shown single nucleotide changes in three analyzed isolates such change known as Missense and lead to change the amino acid which β-lactamase consist from it. Such Type ofamino acid substitution in β-lactamase is considered Trans version because both amino acids are from the same group

Table 2: Sequencing analysis of bla Z gene

Identities	Predicted Effect	Amino Acid Change	Nucleotide Change	Nucleotide	Sample
99%	Missense	Serine > Arginine	AGT > AGG	T > G	57
99%	Missense	Glycine > Valine	GGT > GTT	G > T	
100%	Missense	Serine > Arginine	AGT > AGG	T > G	

Phylogenetic Analysis: The *blaZ* genes encode enzymes of the β-lactamase of Staphylococci. The *blaZ* genes of the *S. aureus* species group formed a separate cluster from the other S. According to the phylogenetic analysis the evolutionary relationship among the group of *S. aureus*. *thebla Z* genes*of RU57*in the tree was occurred on the same line with others bla Z genes isolated from *S.aureus* from China, South Korea, United Kingdom and Brazil.

Partial purification of β-lactamase: Partial purification which was produced by the locally isolated *S.aureus*. R57 isolated was partial purified through purification steps. These include the dialysis of crud and concentration by sucrose and ion exchange chromatography Carboxyl methyl cellulose (CMC Cellulose) as follow: Results indicated in figure (2) showed that there are two peaks appeared in washing step, while two protein peaks appeared by the gradient concentration of sodium chloride. All these four protein peaks were detected by measuring the absorbance at 280 nm. Result showed peak in washed protein after concentration by sucrose 57.2 U/ml, while peaks eluted proteins after concentration by sucrose 36.33 U/ml. The results were shown that there are two forms of enzyme (isozymes) which were appeared through the separation techniques. The purification fold of this experiment was 10.83 and the yield was 64.69%.

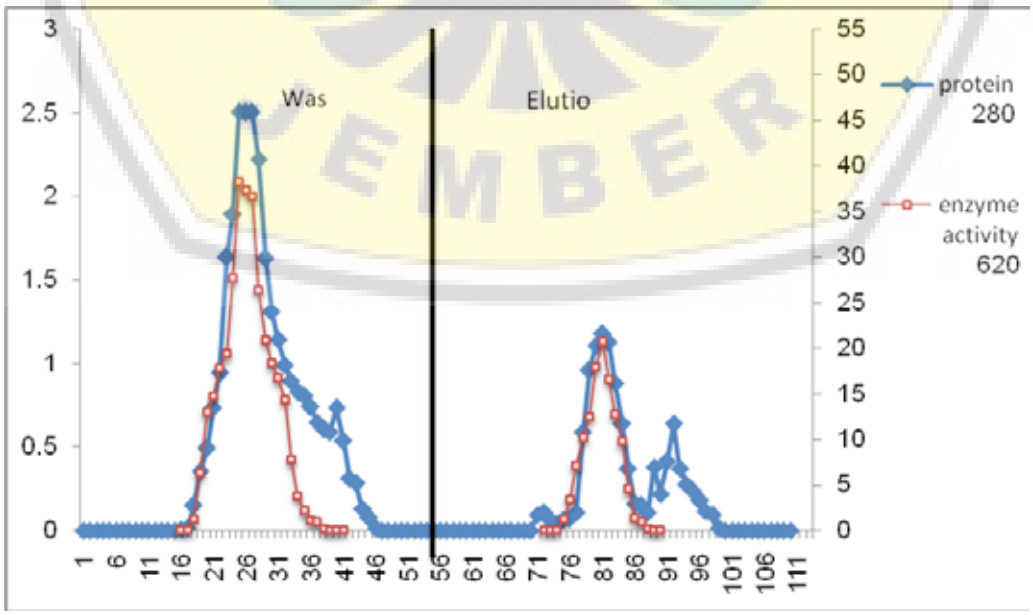

Figure 2: Purification of βlactamase from RU57 by CMC Cellulose

Effect of temperatureand pH on the activity and stability of β-lactamase: The effect of temperature on β-lactamase activity was studied by performing the enzymatic reaction at different temperatures in the range 25 – 50°C. The purified β-lactamase was shown good stability and retained about 100% of its initial activity after incubation for 30 min from range 25-40 °C, and then the activity was decreased with increasing the degree of temperature and lost more than 70% of its activity 40°C, (Fig.3). These results were disagreed with [25] that it was shown the optimum temperature for enzyme activity was found to be 30°C. Other study shown an optimal temperature of β-lactamase isolated from local isolate from asopharyngeal region of healthy individuals from Basra city, at25, 30,and35°C[26]. Results showed that the highest ß-lactamase activity was 4.9 ± 0.17 and at 37 °C. The statistical analysis also illustrated that there was significant difference between the activity and stability at different degrees of temperature ($p<0.01$).

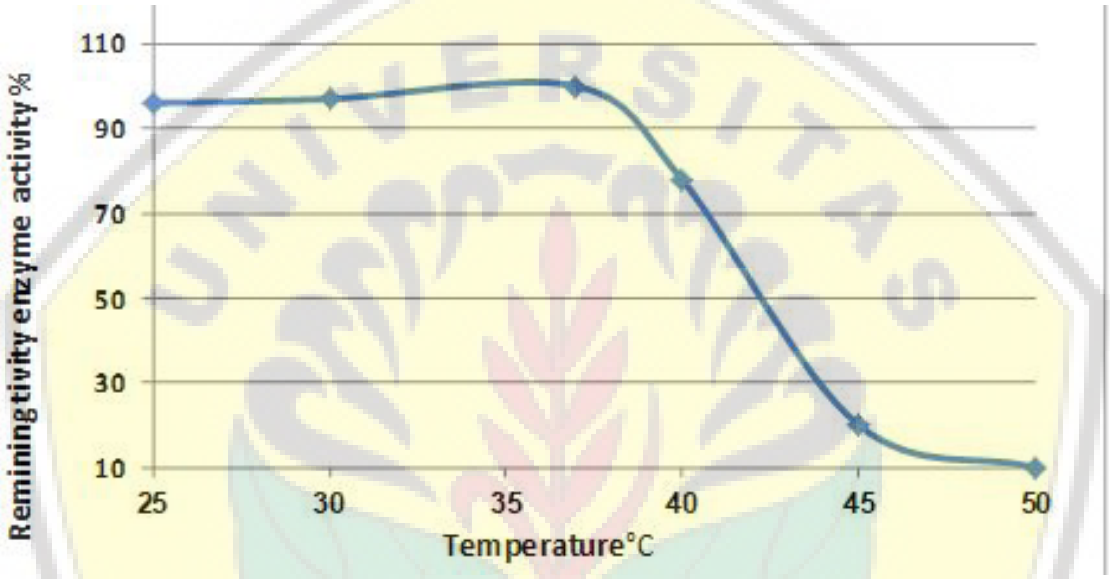

Figure 3: Thermal stability of β-lactamase purified from RU57.

β-lactamase was found to beactivein the pH range 4.0–9.0 at 37°C. The maximum activity was shown 4.3 ± 0.16 and recorded at pH 7.0 (Fig.4A). Any further increase resulted in the loss of β-lactamase activity due to the alteration in the ionization of groups responsible for substrate binding. pHcan have an effect on the ionization state of the acidic or basic amino acid group. Basic amino acids have amine functional groups in their side chains, acidic amino acids have carboxyl functional groups in their side chains. If the state of ionization of amino acids in a protein is altered, then the ionic linkages that help to determine the 3-D shape of the protein can also be altered and lead to a change of protein recognition.At alkalin pH (8, 9) and the low acidity(4,5)of the reaction media would result in the denaturation of the enzyme or decrease in it reaction rates [25,26]. This was consistent with the behavior of other β-lactamase from *S. aureus* isolated from Lebanese Community[26]. However, the enzyme was stable at pH range from 5-7, only 50%and 20% of optimum activity β-lactamase was retainedat pH 8,pH 9 respectively (Fig.4B). The influence of pH on enzyme stability was significantly differentat ($p<0.01$) and these different were related to the effect of pH on the enzyme structure. This leads to the denaturation of enzyme molecular or to change in the ionic state of the active site, as well as it effect on secondary and tertiary enzyme structure which lose the activity.

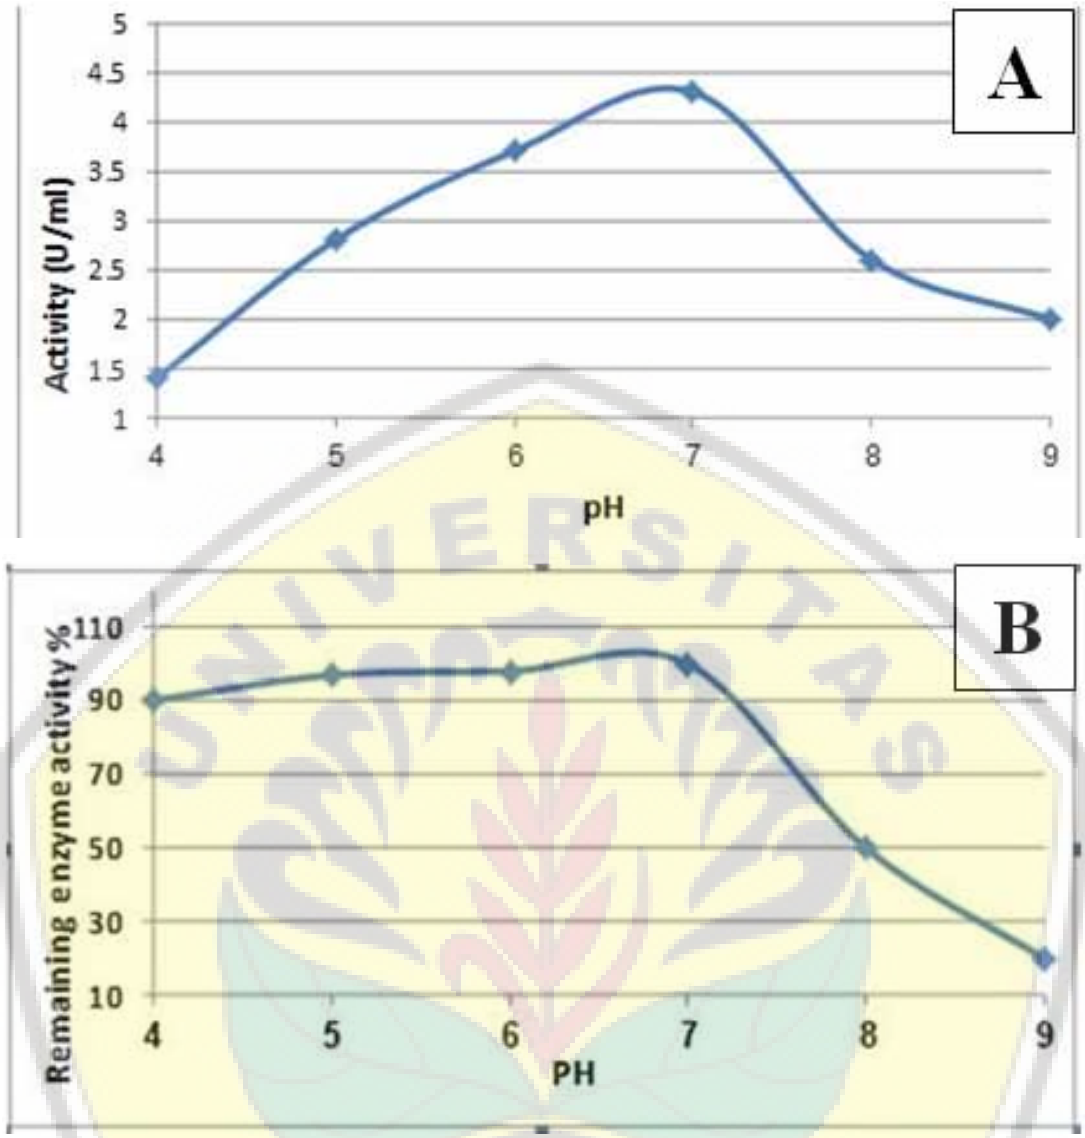

Figure 4: A: Optimum pH for β-lactamase activity purified RU57. B: Stability of purified β-lactamase from RU57

Conclusions

S. aureus isolates are different in their ability to produced β-lactamase. The local isolate RU57 which isolate from urine had the highest β-lactamase activity. The bla Z of β-lactamase which isolated from local *S. aureus* isolates was similar to that found in china, France, South Korea, United Kingdom, Brazil according to sequencing and phylogenetic tree analysisβ-lactamase was partially purified by concentrated using sucrose and ion exchange chromatography. The optimum temperature and pH for β-lactamase activity were 37°C and 7respectively. The optimum temperature and pH for β-lactamase stability were range from 25-40°C and 6-7.5 respectively

College of Medicine, University of Babylon, Iraq

Abstract

A one-year study that had been performed in the Emergency Department of Al-Hilla Teaching Hospital that tries to spot the light on the feasibility of non-operative treatment of acute appendicitis and the pros and cons of this modality of treatment. It has been used and widely-accepted for many decades far appendicular masses but its use is considerably new for other presentations of acute appendicitis.

Keywords: *Hilla; Acute Appendicitis ; Non-Operative Management.*

Introduction

Appendectomy is one of the most commonly performed emergency surgeries as 500,000 appendectomies are performed in the UK each year [(1)] and it has been accepted as the best treatment option for acute appendicitis since 1886[(2)]. Many of the patients that are operated on for acute appendicitis can be spared the risk of surgery and its complications by treating them non-operatively and this was advocated for "appendicular mass" by Ochsner in 1901[(3)]. Some authors indicate that as with other intra-abdominal pathologies eg. salpingitis, diverticulitis and entero-colitis, an infectious etiology and treatment by antibiotics alone can be assigned for acute appendicitis[(4)]. The reluctance to rely on conservative treatment is attributed by many surgeons to the risk of perforation which carries a high mortality rate[(5)] and missing the real diagnosis due to the lack of surgical exploration and pathological examination[(6)]. Complicated acute appendicitis which is defined as perforation, appendicolith, abscess or a suspicion of tumor requires emergency appendectomy except for abscess which is initially treated by drainage and antibiotics[(7)].

Materials and Method

Seventy seven patients who visited the emergency department of Al-Hilla Teaching Hospital during the period between October 2012 and October 2013 were divided into two groups that were statistically-matched regarding age, sex and clinical features (Table 1). The 1st group was managed non-operatively by using only antibiotics (cefotaxime 1 gm i.v.b.d. and metronidazole 500mg t.d.s. for 2 days followed by cefixime orally 400mg once daily and metronidazole 500mg t.d.s for another 3 days). Proper consent had been taken and after thorough explanation, the patients were offered the choice between the two forms of treatment and they were told of their right to withdraw at any time and have surgery performed. Thirty of the patients chose non-operative treatment and 47 surgeries. The outcome of the two groups (regarding hospital stay, return to normal activities and complications rate) was compared. The recurrence rate following non-operative treatment was also studied in a 30 days follow up period and the patients were told to come to hospital in case of any new event and to call in case of emergency.

Exclusion Criteria were:

1. Patients > 60 years < 18 years.
2. Collection or perforation of appendix on ultrasound.
3. Faecolith.
4. Immuno-compromised and diabetic patients.

The diagnosis of acute appendicitis depended on the Modified Alvarado Score (>7) (Table 2) and abdominal ultrasound examination. All of the patients were admitted to hospital and thoroughly monitored. In case of any failure of response or deterioration, appendectomy was performed.

Statistical analysis was carried out using SPSS version 20. Continuous variables were presented as (Means ± SD). Independent sample t-test was used to compare means between two groups. Categorical variables were presented as frequencies and percentages. Pearson's chi square (X^2) and Fisher-exact tests were used to find the association between categorical variables. A *p*-value of ≤ 0.05 was considered as significant.

Table 1: Demographics

	Non-operative management	Operative group	P value
Mean age in years	10	12	0.46
Female, number (%)	12(39.9)	12(25.5)	0.18
Average duration of pain in hours	13	14	0.52
White blood cell count/ml average	12700	13200	0.33

Table 2: Modified Alvarado Score[8]

Symptoms	Score
Migratory right iliac fossa pain	1
Nausea and vomiting	1
Anorexia	1
Tenderness in right iliac fossa	2
Rebound tenderness	1
Fever	1
Increased white blood cell count	2
Total	**9**

Results

Non-operative management was successful in 93% (n= 28/30), thirty days following the initial presentation. Only two of the 3 failures required appendectomy during the initial presentation and the 3rd presented with recurrent abdominal pain that required an appendectomy 16 days after leaving hospital. None of the 3 had perforation or gangrene of the appendix. The non-operative group had fewer disability days (4 versus 17, P < 0.0001) and had returned to work significantly earlier (three versus five days, P= 0.008).

Compared to surgery group, average hospital- stay length was significantly longer in the non-operative group 38 versus 20 hour (Table 3).

Two (6.7%) developed antibiotics-related gastroenteritis.

Average cost for the non-operative treatment group was 80 USD/patient and 250 USD/patient for the operation group.

Table 3: Outcome after one month of treatment

	Non-operative Management	Operation Group	P value
Hospital stay duration in hours, average (Range)	38(31.0-42.0)	20.0(16-34)	< 0.0001
Return to normal activity in hours average (Range)	30(2.5-6.5)	16.5 (9- 21)	< 0.0001

Discussion

Non-operative management is certainly the preferred option for any pathology because it would spare the patient the risks of surgery. The 1st concern when adopting such treatment for acute appendicitis would be recurrence and failure. The success rate in the current study was 93% which was very encouraging. A Taiwanese study shows a similar recurrence rate of 5.1% after the initial hospital admission and of these, 85.8% managed to recover with another non-operative treatment session(9). Other studies give recurrence rates that range between 5 and 37%[10,11].

The main advantages of non-operative management were the disability days which was a significant (3 vs 17, p< 0.0001)and the fast return to work (3 vs 5 days, p=0.008). Balzarotti and colleagues found higher rate of complications in the urgent appendectomy group and longer hospital stay in the antibiotics group[12].

Another concern was the complications of perforation and gangrene following the adoption of the non-operative management which did not happen in any of the 3 patients which had a recurrence after the initial conservative trial. Stahlfeld and colleagues found no significant difference in the outcome of the patients who underwent surgery before or after 10 hours. Also, Yardeni and colleagues concluded that delaying surgery up to 24 hours did not significantly affect the complication rate [13]. On the other hand some other studies demonstrate reduced morbidity when doing early appendectomy compared with non-operative treatment with or without interval appendectomy[14].

Another issue was missing the real diagnosis after conservative management which might have been cancer or Crohn's disease[15] due to the lack of surgical exploration and pathological examination[6] but depending on the Modified Alvarado Score which has a PPV of 80.7% and negative appendectomy rate of 11.3%[16] and abdominal ultrasound examination which has a high sensitivity rate (86-100%), specificity of (80-100%) and accuracy of (91-93%) [15], this can be highly-reduced. Hospitals with better facilities can also use CT scans and inflammatory markers(C reactive protein has the highest sensitivity rate 100%)[17]. CT scan is more accurate than ultrasound examination for perforated acute appendicitis but is not always available and carries radiation hazards[18].

All of the patients in the surgery group had been treated by the classical open appendectomy method. Some studies state that doing laparoscopic appendectomy would decrease the hospital stay, wound infection and intestinal obstruction[19].

The average cost for the non-operative group was 80 USD/patient and 250USD/patient in the surgery group (keeping in mind the hospital stay and the missed work days) while a study in Europe showed saving of 2545 Euros/patient favoring the non-operative management group[7].

Conclusion

Non-operative treatment of acute appendicitis is more efficient with less disability days and economic but require a bit longer stay at the hospital.

Therapeutic Method for the Use of Some Psychotropic Substances in Athletes

Assaad Falih Hassan[1], Mohsen Ali Moussa[1]

[1]*University of Dhi Qar/Faculty of Physical Education and Sports Sciences/Iraq*

Abstract

These days, there are many of these dangers in which the person puts himself in that destroys himself and his health, and leads himself to death. The habits of misconduct and bad behaviors of some players in the use of psychotropic substances take their taxes from the lives of individuals, as they affect the body and lead to the incidence of many serious diseases, including psychiatric diseases and physical diseases, which are dangerous in the increase in recent years spread in the human societies developed from them And the development of both as the increase in the number of players with addiction to psychotropic substances and sedatives and smoking is increasing and is a great loss to society, and that such individuals fall within the productive and public groups in society, and their injury leads to social and psychological condition disorder, which made this case of social, psychological, health and humanitarian problem worthy of study and attention. Hence the importance of the study in the construction of a measure of the therapeutic method of psychologically influential substances among athletes in the field of sports and then help them to quit and reduce their negative impact on them and maintain their physical and psychological health.

Keywords: *athletes; psychotropic substances; Therapeutic.*

Introduction

Genetic factors: Researchers believe that there is a link between addiction of parents and the occurrence of their children as well, and many studies support this view (e.g. genetic theory), but so far there is no conclusive proof and definitive evidence[(1-9)].

1. The personality of the addict: psychologists see that drug abuse may be an alternative to avoid deprivation and frustration, and that the compensatory activity to restore the balance between disability on one hand and achievement and work on the other these psychological characteristics that push the person to the area of dealing in search of balance aimed at identifying Features confirmed by many studies, about the personality of the abusers.
2. Failure to study: The failure in education is one of the most important reasons that support the move of adolescents and young people towards the doors of deviation, the most important drug abuse, because of the psychological effects of young people and the sense of failure and lack of value, especially if accompanied by the pressure of parents, and negative ratings of personality, compared to school failure, which alienates him from the house in search of social support found in the companions may encourage him to engage in activities such as diversion, for example, and presented Mustafa Suif model to explain the relationship between the failure in school and drug abuse. And the explanation of the relationship between academic failure and the use of drugs and others that the failure of the school, and the accompanying frustration, and resentment coming from the family leads to the aversion of the failed student of the educational situation, which leads to the experience of alternative activities to

e-mail: asaad.f.h.a.80@gmal.com

relieve the sense of psychological tension, and these activities include skipping school, The commission of perverse activities, or the use of drugs, the abuse of natural drugs in turn increases the failure of the study, so the relationship between the failure of the study, and the use of drugs is in the form of a vicious cycle or movement in a circular track does not stop.

3. Psychiatric and physical diseases: These are conditions in which the patient has to deal with some types of drugs, but repeated use without medical supervision can result in the use of these drugs for a purpose other than to cure, which sign the owner in the focus of abuse. Therefore, it is not possible to determine the existence of a specific personal element that can lead to abuse, but the combination of these characteristics and personal motives can be expected to be in the possession of drugs[10-15].

Thus, the abuse of psychotropic substances, of any kind, is a material of great danger, direct and indirect damage to the human society in general and to athletes in particular and the damage these materials leave on the individual athlete. Therefore, solutions to this problem must be found through the use of some therapeutic method to abuse substances Psychologically Affective.

Methodology

The researcher used the descriptive method of the survey method because it is more appropriate to the nature of the problem and to achieve the research objectives. Thus, the sample of the research was chosen in a deliberate manner, which consisted of (300) players of clubs in the southern region and for individual and team games within the research community. The sample of the research was distributed for the construction and design of the scale and its application to the initial application sample, the construction sample and the application sample. The researcher used the following method to get the data needed: the International Information Network (Internet), personal interviews, Arab and foreign sources

The researcher tried to formulate the paragraphs for the scale, the researcher also tried to take into account the ease and clarity of its content and the difference of individuals in the interpretation and shortness then the number of paragraphs was;[16-20] paragraphs as initial and then the presentation of the paragraphs of the scale on the arbitrators, correcting the paragraphs for the scale, and finished preparing the meter in its final form, when the scale Ready for Application, The researcher conducted the exploratory experiment

The purpose of this experiment is to apply the scale (the measure of therapeutic method for psychotropic substances to athletes) in its final form with a view to analyzing the paragraphs statistically. “This process includes the detection of the level of difficulty of the paragraph and the strength of the discrimination of the paragraph and the effectiveness of alternatives in the test paragraphs”. In order to achieve thisA measure of the therapeutic method for the use of psychotropic substances in athletes was applied to the building sample of (180) players. After the completion of the process of distributing the forms and answering them, each form was checked to verify the answer and the required form.

The distinguishing force of the paragraphs in the statistical analysis of paragraphs was extracted, in light of which, the paragraphs that were able to distinguish between individuals with high scores and low scoreswere found.

After the completion of all the requirements and procedures of the design of the scale, the scale is ready to be applied and consists of [20] paragraphs, where the researcher applied the standard in its final form on the sample of the application (150) players. After analyzing the responses of the research sample, the data was collected in a special form. The researcher used SPSS for statistical information and Excel

Results and Discussion

Showing, analyzing and discussion of the educational method: The table shows that there are significant differences between the responses at the level of (0.01) for the educational method and for the answer (fully agree) in the two paragraphs (7.2) with the value of Ca^2calculated (178.246), (22.908) respectively, and the differences were significant at the level of significance (0.01) and for the answer (agree) in the paragraphs of the sequence (13,9,1) where the value of $Ca^2$was (19.068), (43.899), (63.802) respectively, and the differences were significant at the level of significance (0.05), (21.5) and (251.676) respectively, while the differences were significant at the level of (0.01) and in favor of the answer (do not agree) in paragraphs Tuberculosis (11,10,8,6,4,3), with the value of the calculated Ca^2 (67.787), (56.290), (74.478) (121.556) (76.362), (60.831), respectively.

Table (1): The score (Ca^2 Calculated) shows the responses in the educational method

Paragraphs	Totally Disagree	Disagree	Slightly Disagree	Agree	Totally Agree	Ca^2 Score	Level of significance
I change some of your daily habits.	78	82	63	116	75	19.068	0.001
Stay as far as possible from the places you are used to.	27	38	108	65	176	178.246	0.000
I reward myself for every day without abuse.	31	136	75	83	89	67.787	0.000
Spend money on useful stuff	68	120	114	74	38	56.290	0.000
Better pay the money for the needy	36	50	196	47	85	209.744	0.000
I feel that I sleep more than usual as a result of taking off	72	120	111	90	21	74.478	0.000
I seek to gradually stabilize my psychological mood	50	97	71	95	101	22.908	0.000
I try to walk in open places and breathe pure air	30	163	77	89	55	121.556	0.000
I think a lot about the advantages of taking off	56	56	72	117	113	43.899	0.000
Take-off brings health benefits to me and my surroundings	45	146	93	74	56	76.362	0.000
I smoke and drink alcohol without my father's knowledge	49	137	91	84	53	60.831	0.000
It makes me take off the pleasure of life	37	70	208	68	31	251.676	0.000
Be sure to eat on time	61	80	69	146	58	63.802	0.000

Table (2): The measured score (Ca^2) shows the responses in the psychological method

Paragraphs	Totally Disagree	Disagree	Slightly Disagree	Agree	Totally Agree	Ca^2 Score	Level of significance
Always look for a clean environment	32	43	49	124	166	168.198	0.000
use my free time in my favorite places of entertainment	31	38	50	86	209	262.111	0.000
I try to keep my hands doing something useful.	28	37	57	95	197	228.947	0.000
I am able to cope with the anxiety that sometimes afflicts me	44	72	100	118	80	38.222	0.000
I try to control my nerves in the early days of taking off	48	94	128	76	68	44.019	0.000
Keep myself busy with anything when I have the desire to use drugs	67	109	98	97	43	35.662	0.000
I prefer using of chewing gum or anything else is most of the time	36	47	75	106	150	103.705	0.000
Many patients are encouraged to observe diseases resulting from the abuse of drugs	27	44	50	110	183	198.971	0.000
I care about my mental health	69	48	38	47	212	258.246	0.000
Be quiet	119	81	102	41	71	43.101	0.000
I deal with my friends transparently	64	29	44	70	207	245.686	0.000

The table shows that there are significant differences between the responses at the level of (0.01) for the psychological method and for the answer (fully agree) in the paragraphs (24, 22, 21, 20, 16, 15, 14) with the value of Ca^2equals (168.198), (262.111), (228.947), (103.705) (198.971), (258.246) and (245.686) respectively. The differences were significant at the level of (0.01) and for the answer (agreed) in the sequence (17) the difference was significant at the level of significance of (0.01) and in favor of the answer (somewhat agree) in paragraph (18). The calculated value of Ca^2 was (44,019) and (43.101) respectively, And in favor of an answer (do not agree) in the paragraph Concatenate (19), with the value of the calculated Ca^2 (35.662) and the difference was significant at the level (0.01) in favor of an answer (never agree) in paragraph sequence (23).

The psychological approach used to treat players of clubs to stop psychologically exploiting substances is a good and effective method that is related to the culture of societies, understands and agrees with their beliefs, religion and values, supports the human view of life, and the mentor or therapist to be aware of the specificities of culture of the person responsible for the process of treatment and his values and culture and the psychological aspect is one of the most important cultural values. There is a difference between the psychological method and the educational method. The educational method is the method in which the education of the person and guidance, often is one-sided, which is as we hear in educational and psychological programs on radio and television, for example. The educational and psychological preaching aims at collecting and directing organized information only. As for the psychological method, it is concerned with the formation of an integrated psychological state in which the behavior is consistent and integrated with the beliefs of the guide. This leads to harmony of personality and happiness and leads to mental health through the avoidance of psychotropic substances and the things that Damaging the players

The researcher thinks that the choice of psychological method or psychological guide in helping players to take off psychotropic substances

Table (3): (Calculated T) shows the relationship between the theoretical and the arithmetic mean of the measure of therapeutic method

Measurement Paragraphs No.	Theoretical mean	arithmetic mean	Standard deviation	Calculated T	Level of significance
24	30.000	33.504	6.077	8.895	0.000

The table shows that the number of paragraphs after the therapeutic method scale is (24) paragraphs, the theoretical mean (30.000), while the mean of the research sample (33.504) and the standard deviation (6.077), and (calculated) between the theoretical and the arithmetic mean of the research sample (8.895) with level of significance (0.000), indicating its significance at the level of significance (0.01). This means that there is a significant difference between the therapeutic method and for the mean of the calculation of the research sample, which means that the therapeutic method used on the players to stop taking psychotropic substances and solve the problem of abuse as psychologically And behavior possible.

The researcher attributed this to the psychological trends of the personality of the abuser, who tend to pretend and show off and run behind personal adventures and love of experimentation and all of what is forbidden desirable, and the appeal of the new, and exciting in everything. In his study of the personality traits of smokers, Muhammad Khalil notes that they are rebellious against standards and social values in an attempt to assert themselves, and that they conform to the standards of the group of comrades, which they create for themselves as a condition for admission to the membership of this group. Their personalities are also impulsive in their relations without being aware of the behavior of others, who may exploit the impulse, and the lack of understanding of others in directing the behavior of those who use the direction deviant.(22,25)

Conclusion

- The construction of a measure of therapeutic method for the use of psychotropic substances in athletes was reached.
- The scale of therapeutic method should be adopted for the use of psychotropic substances on athletes.
- Similar studies should be conducted on treatment method for drug abusers and other samples.

Effect of Using Modified Training Equipment to Developsome Soccer Skills for Youth

Qays Banwan Shareef[1], Jabbar Ali Jabbar[1], Saleh chuaied Hilaiel[1]

[1]University of Thi-Qar, Faculty of Physical Education & Sports Science

Abstract

Purpose: The study aimed to identify effect of using training equipment which were made and modified by the researcher with specific exercises to be applied in pre-season on the sample .

Method: Twenty four youth boys : (n=24: age=16.04±0.9 years) were recruited for the study, The sample is divided randomly into two groups (control and experimental) by (12) players for each, Both were tested pre testing for (zigzag, ball control, scoring, middle pass and ball juggling). Then the two groups attended total (24) sessions for (8) weeks by (3) sessions weekly, Only the experimental group are trained by the equipment, followed by identical retesting.

Results: Both groups elicited development in pre-post tests in total five tests for the benefit of post-test, The experimental group elicited significant improvement in (control & experimental post-post tests).

Conclusion: The experimental group elicited higher results in post-test, The researcher attributes the reason to the effectiveness of training equipment in developing skills, And how motivated players to work harder.

Keywords: *Training, Equipment, skills, football, youth.*

Introduction

Football is a sport that is characterized by varied complex dynamic kinesiology activities that are characterized by a large of cyclic and acyclic movements(1), and the important aspects that have developed significantly are the educational and training equipments used in training, where the training equipments is everything used in training process Helping players to achieve goals with high degree of proficiency(2). Good results have been achieved as a result of using training equipments by shortening the time and effort in learning and acquiring skill and provided an environment of fun and motivation for exercises because it gives a lot of fun especially for youth who tend to link learning to play and enjoyment.

The lack of training curricula to the training equipment has shown a remarkable decrease in the desire of the youth in continuity and motivation in the performance of exercises and attendance, which reflected on their levels physically and skillfully, so the researcher tried to make and modify some training equipments that would raise the level of skills of the players of Al Bat'ha Football Academy for youth.

To know the effect of using the modified training equipments in developing some skills capabilities in the preparation period for football players for the youth 15-17 category.

There is a positive impact by using modified training equipment in developing some skills capabilities in the preparation period for football players for the youth.

Method

Experimental method was used by designing two groups (experimental and controlled) and two tests pre and post to achieve targets of the research. The objectives set by the researcher for his research and the procedures he uses will determine the nature of the selected sample (khuraibut, 2017). The research sample represented by Al Bat'ha youth 15-17 years old academy players, which contain 24 youth footballers with 100% participation, therefore the sample represented the whole population. The sample divided randomly into two groups (experimental and controlled) 12 players for each. The researcher started the main experiment through the implementation of the pre-tests on sample at Bat'ha stadium Club on 20/10/2018, and then began to apply the exercises designed which using the training equipment on 22/10/2018 until 17/12/2018, where included (24) Training sessions by (3) sessions weekly, the post- test were conducted on 19/12/2018.

The researcher used the following tests:

l Mid-range passing test [3]:

Tools: Specific area for testing, football balls (5), measurement tape.

Test Descriptions: drawing three circles have the same center and the Diameters for the circles as follow: (2, 4, 6) meter respectively, as well as we numbered the circles as (6, 4, 2) respectively, where the center of the circles is the distance point between the starting line and the three circles, which is at a distance of 20 m, (5) consecutive attempts, calculated the number of points obtained by the player of the five attempts, if the ball fall on the lines of circles given grades according to the sequence of circles (5,3,1) score, the attempt is unsuccessful in the case of the ball out of the circles.

l. Ball dribbling test[4]: Performance Method: running with the ball zigzagging between (10) cones, the distance between the cones (2) meters back and forth.

Tools:

- The distance between the starting and finishing line is (25) meters.
- 10 cones placed at equal distances (2) m between the cone and the starting line and the end at a distance of (2) meters from the first cone.
- Football ball.
- Stopwatch.

Test Instructions: Running in zigzag motion between the cones in two directions (back and forth).

The player is given two attempts.

Calculates the best time to score.

Run between the cones in any way and on any side to the right or left of the person.

- Ball control test for (30) seconds[5].

Tools: Specific area for testing, one football ball, stopwatch, two assistants.

Performance Method:

1. When instructed by the test conductor the player will throw the ball in his hands and then start to control the ball with the foot so that the ball does not fall to the ground and counts the number of times the ball is hit in (30) seconds.
2. The player loses one point for each drop for the ball on the ground.

Index:

One point for each (10-12) correct strike

Two points for each (13-14) correct strike

Three points for each (15-16) correct strike

Four points for each (17-18) correct strike

Five points for each (19-20) correct strike

Six points for each (21-22) correct strike

Seven points for each (23-24) correct strike

Eight points for each (25-26) correct strike

Nine points for each (27-28) correct strike

Ten points for each (29) and above is a correct strike

- **Shooting accuracy test[6]:**

Tools: tape measure, football balls (10), goal divided by ropes.

Performance method : 10 balls are placed in specific places of the penalty area where the player shoots these balls one after another in a sequential manner on the goals of a square length (1,50 × 1) meters specified

within the target is marked on the corner and the attempt is not correct in case the player doesn't hit any of the four goals, the test starts from the ball number (1) and ends at the ball number (10).

Test instructions: The player must kick the ball behind the starting line and the kick is not counted correctly if the player passes the starting line when the kicks are performed.

Test Management: A recorder that calculates the number of errors and correct kicks.

Registration: The number of kicks that enter or touch the four goals specified.

Description of the test: The laboratory stands 11 meters away from the target and when the start signal is given, the laboratory tests.

- Stopping the ball movement from a distance of (6) meters within (2)m[7]:

The test aims at: Putting down the ball (stop the movement of the ball)

Tools: (5) balls, square of (2)meters, and drawing (6) meters line away from the Square.

Performance Procedure: A player stands behind the selected test area and the tester bounces the ball high to the player who comes close into the testing area, trying to stop the movement of the ball and start again and thus repeat the player five consecutive movements,The movement of the ball must be stopped within the selected test area. If the tester fails to throw the ball then re through it again and the attempt is not considered correct in any of the following cases:

- If the player failed to stop the ball.
- If the player cross over the selected test area.
- If the ball touched the player's arm while he is trying to stop it.

Scoring: Two scores for each correct attempt from the first touch, one score for each correct attempt from the second the touch, and zero if the ball is out of the selected test area.

Results

Presentation of test results (pre and post-test) of the experimental group: Table (1) Shows the means, standard deviations, (t) value, significance level of the pre-post-tests of the experimental group of the research variables.

Table (1) shows that the tests of skills of the experimental group were all significantly in favor of the post-test

Variables	Pre test		Post test		(t) value	Sig
	S	Q	S	Q		
Mid-range passing	22.000	2.522	26.666	1.614	7.252	0.000
Ball dribbling	23.736	2.043	18.849	2.196	9.536	0.000
Ball control	6.083	1.831	9.666	1.922	6.010	0.001
Shooting accuracy	17.500	3.477	27.333	1.557	11.096	0.000
Stopping the ball	5.083	1.505	10.000	1.758	11.317	0.000

Presentation of tests results (pre and post) of the control group: Table (2) Shows the means, standard deviations, (t) value, significance level of the pre-post-tests of the control group of the research variables.

Table (2) shows that the tests of skills of the control group were all significantly in favor of the post-test .

Variables	Pre test		Post test		(t) value	Sig
	S	Q	S	Q		
Mid-range passing	21.333	2.774	23.666	3.312	2.620	0.024
Ball dribbling	24.080	3.277	22.301	3.708	1.680	0.121

Stopping the ball	6.000	0.852	10.000	1.758	7.091	0.000

Discussion

The results and analysis show that there is a remarkable development in the level of skills (Mid-range passing,Ball dribbling, Ball control, Shooting accuracy, and Stopping the ball). The researcher attributes this development to the effect of the special exercises carried out through the auxiliary training method prepared by the researcher which contributed to raising desire levels and motivation of the players to perform the exercises and attendance, All possible uses of available resources contribute greatly to the learner's ability to acquire, master, and install motor skills[8]. The selection of appropriate exercises and their rationing according to the scientific basis and the appropriate type of the sample and the training stage in developing the physical level of the players,Selecting the appropriate exercises enables the trainer to develop physical qualities while at the same time working on the skill of the player [9].

The players practiced most of the exercises with the ball to increase the sense of playing football in addition to increase desire to perform perfectly without being bored of the performance of high repetitions, so the exercises was highly motivated, which gave players a greater chance to master the skills and proficiency[10].

Conclusions

The researcher concluded the following:

1. The use of training equipments has had a positive role in the development of the technical skills under study for young footballers (ages 15-17).
2. The research sample showed a great desire to apply the exercises by using the training equipments.

The Diagnostic Value of Motor Evoked Potential in Patient with Cervical Radiculopathy

Sura Mahdi Abed[1], Abdulnasir Hussin Ameer[2]

[1]Department of Physiology, University of Baghdad, College of Medicine, Baghdad, Iraq, [2]Department of Physiology, University of Baghdad, College of Medicine. Neurophysiology Clinic, Baghdad Teaching Hospital, Baghdad, Iraq

Abstract

Objectives: our objective is to evaluate the role of motor evoked potential in diagnosis of cervical radiculopathy.

Method: MEP test was performed in 74 patients with clinical diagnosis of cervical radiculopathy and 30 healthy control, we analyzed the data and compare it with MRI findings.

Results: the results revealed a statistically significant prolongation of CMCT, PMCT and MRCT for patients group ($p<0.05$). The sensitivity of MEP test was ranging (68% - 84.2%) and the specificity was (81.6% - 98.2%).

Conclusion: MEP test plays an important role for evaluation of radiculopathies since it monitors injury to the motor fibers.

Keywords: *Motor evoked potential, cervical radiculopathies, transcranial magnetic stimulation.*

Introduction

Cervical radiculopathy is a neurological disease characterized by dysfunction that could involve a nerve, root, or both. It is clinically appear as a pain in the neck and one arm, with sensory or motor loss of function, or reflex changes in the affected nerve-root distribution[(1)].

In order to help the patient to returnto their normal state of health, the aim for clinicians should be the rapid diagnosis and the proper treatment of this condition[(2)]. A recent study reported the average annual (ageadjusted) incidence rate of cervical radiculopathy to be 83.2 per 100,000[(3)].

In order to achieve a proper managment of cervical radiculopathy, a combination of clinical, electrodiagnostic, and radiological evaluation are required[(2)].

Electrophysiological tests for patient with cervical radiculopathy help to establish the diagnosis, identify the root, determine the presence of axonal loss or conduction block, grade the severity of the process, estimate the duration of disease and exclude other disorders that could mimic radiculopathy[(4)].

Electrodiagnostic tests are operator dependent, several method and different reference values are used by laboratories. One of these tests is MEP study which evaluate motor fibers. In fact, it is not sensitive to sensory radiculopathies. Root injury from any structural pathology (disc herniation, tumor encroachment, and scarring) can produce similar electrophysiological findings andalthough MRI is considered as (gold standard) for diagnosis of radiculopathies structural abnormalities in MRI do not necessarily reflect the underlying pathology of the clinical symptoms, alsosometimes the disease present itselfwith noevident structural pathology seen on MRI, Thus, depending solely on singlediagnostic method may be misleading or counterproductive. In addition, there is a possibility of presence of dual underlying pathology. therefore, more viable strategies are needed in the diagnosis of cervical radiculopathies[(5, 6)].

Transcranial magnetic stimulation (TMS) is a neurostimulation and neuromodulation technique, the principle that it based on is the electromagnetic induction of an electric field in the brain[7].Because it activates the proximal parts of peripheral motor pathways by magnetic paravertebral stimulationin a noninvasive and painless manner, it may be useful in addition to the traditionally used techniques (EMG, NCS) in the diagnosis of radiculopathies and in the assessment of peripheral nerves that cannot be directly assessed usingstandard electrophysiological techniques[8].

The aim of this study was to evaluate the role of motor evoked potential in the diagnosis of motor dysfunction in patient with cervical radiculopathy and tomatch the electrodiagnostic data with imaging data in localization of cervical roots lesion.

Materials and Method

This study was conducted at the unit of neurophysiology in Baghdad teaching hospital, in the period from November/2018 to May/2019.

Two groups were included, the control group consists of (30) healthy volunteers (20 males and 10 females) the mean of age (52.4 ± 9.03) years. All subjects were healthy and symptoms free. And (74) patients with clinical diagnosis of cervical radiculopathy, with exclusion of other causes (44 males and 30 females), with a mean of age (49.8 ± 10.1) years. The duration of symptoms of radiculopathy is ranged between (4 months – 3 years), with a mean of (18 months).

The exclusion criteria included Patients with other diseases like CVA, diabetic polyneuropathies, neuropathies, plexopathies, and musculoskeletal disorder.

Both groups were subjected to MEP study, using Trascranial magnetic stimulator device. The following muscles were examined: Abductor pollicisbrevis, Biceps brachii and Triceps.

The room temperature was monitored and kept between 26-28C during the test and the patients were studied in a semi sitting position, with a circular coil, capable of generating a (2 -T) maximum field intensity. The MEPs were studied with conventional surface electrodes attached to the examined muscle, The responses were recorded by a conventional electromyography the usual filters were used for motor conduction. The TMS technique and the measurements of latencies were performed with maximal stimulation output, at least five consecutive trials were recorded and superimposed. The shortest latency of the evoked CMAP after cortical and cervical stimulation was recorded for each muscle tested. The MEPs were recorded from upper extremity for both cases and control groups.

After the procedure of magnetic stimulation, electrical stimulation was delivered to the median nerve at the wrist,axillary nerve and musculocutaneous nerve at erb's point, to elicit F and M waves the trials repeated 20 times to obtain and measure F wave from axillary and musculocutaneous nerves, and it was difficult to discriminate F wave from M wave in some patients so they were excluded from calculation of MRCT. The peripheral conduction time was determined using the following formula: (F+M–1)/2, where F and M were onsetlatencies of the F wave and the M response, respectively. CMCT, PMCT, MRCT were measured for both groups.

MRI was performed with a (Philips Ingenia 1.5-T unit) using a standardized cervical spine protocol (sagittal and transverse T1- and T2- weighted sequences with a 4-mm slice thickness) and the results were interpreted by aboard-certified radiologist who was blinded to the patients history and physical examination.

Statistical analysis was performed using SPSS (Statistical Package for Social Sciences, version 18) and Microsoft Office Excel 2007. Mean and SD were used for numeric variables, while nominal data were presented as frequency and percentage. Independent sample (t) test was used to compare the data of patients and control group. The number and percentage were calculated using Chi-square test. And the level of statistical significance was defined as (P) value < 0.05. Descriptive statistics for all data were expressed as mean± SD, recording were classified pathologic when the MRCT is exceeding 1.4 msec or when side to side differences in MRCT more than 1.5 msec, and if either PMCTm or CMCTm or both are exceeding the mean value of matched control group for those whom MRCT couldn't be obtained. The validity of the test were also applied (sensitivity, specificity, positive predictive value, negative predictive value). And the statistical significance was ($p < 0.05$).

Results

The demographic characteristics of 74 patients with cervical radiculopathy and those for 30 control group are shown in table (1), in which there are no significant differences in the age and gender of the patients versus the control group (p>0.05).

Table (1): Demographic data of the studied groups

Subjects		Case	Control	
Age	Mean ± SD	(49.8 ± 10.1)	(52.4 ± 9.03)	0.2
Gender	Male Female	44 (59.5%) 30 (40.5%)	20 (66.6%) 10 (33.3%)	0.4

The results of our study show significant differences between patients and controls regarding the central motor conduction time measured by magnetic stimulation (CMCT), peripheral motor conduction time (PMCT) measured by F wave method and motor root conduction time (MRCT) in the form of prolongation of latencies in cases group when recording from biceps, triceps and ABP muscle, also regarding PMCT measured by cervical stimulation recorded from biceps brachii. While non significant differences regarding CMCT measured by F method as shown in table (2, 3, 4).

Table (2): Comparison of MEP parameters between cases and control groups recorded from biceps muscle.

Parameters	Stimulation and Recording Sites	Case (Mean±SD)	Control (30) (Mean±SD)	P value
PMCT	Magnetic PMCT	6.87 ± 1.26	5.33 ± 1.15	0.001
CMCT	Cortical-cervical(R.)	7.9 ± 1.85	5.53 ± 1.89	0.001
	Cortical-cervical(C.)	5.03 ± 1.23	3.83 ± 2.76	0.02

	Cortical-(f+m-1)/2(C.)	3.51 ± 1.32	3.54 ± 2.33	0.94
PMCTf	(Fmin+M-1)/2	9.36 ± 1.43	7.03 ± 1.05	0.001
MRCT	(PMCTf-PMCTm)	2.76 ± 0.45	1.06 ± 0.23	0.002

Table (3): Comparison of MEP parameters between cases and control groups recorded from triceps.

Parameters	Stimulation and Recordingsites	Case (Mean±SD)	Control (30) (Mean±SD)	P value
PMCT	Magnetic PMCT	5.50 ± 1.43	5.34 ± 2.33	0.66
CMCT	Cortical-cervical(R.)	9.46 ± 1.36	7.09 ± 3.55	0.001
	Cortical-cervical(C.)	7.60 ± 0.87	6.06 ± 1.04	0.002
	Cortical-(f+m-1)/2(R.)	6.20 ± 1.80	6.84 ± 1.41	0.07
	Cortical-(f+m-1)/2(C.)	5.22 ± 1.57	5.19 ± 1.36	0.92
PMCTf	(Fmin+M-1)/2	8.86 ± 0.65	5.83 ± 1.28	0.002
MRCT	(PMCTf-PMCTm)	3.06 ± 0.40	1.03 ± 0.65	0.003

Table (4): Comparison of MEP parameters between cases and control groups recorded from ABP.

Parameters	Stimulation and recording site	Case(74) (mean±sd)	Control (30) (mean±sd)	P value
PMCT	Magnetic PMCT	12.75 ± 1.82	12.33 ± 2.66	0.43
CMCT	Cortical-cervical(R.)	9.66 ± 1.97	7.71 ± 2.91	0.002
	Cortical-cervical(C.)	7.48 ± 1.54	4.98 ± 1.59	0.001
	Cortical-(f+m-1)/2(R.)	6.51 ± 1.47	6.78 ± 2.11	0.8
	Cortical-(f+m-1)/2(C.)	4.93 ± 0.6	4.28 ± 1.03	0.34
PMCTf	(Fmin+M-1)/2	15.83 ± 1.51	13.34 ± 1.79	0.001
MRCT	(PMCTf-PMCTm)	3.15 ± 1.16	1.12 ± 1.31	0.004

*R = Relaxed, *C = Contracted

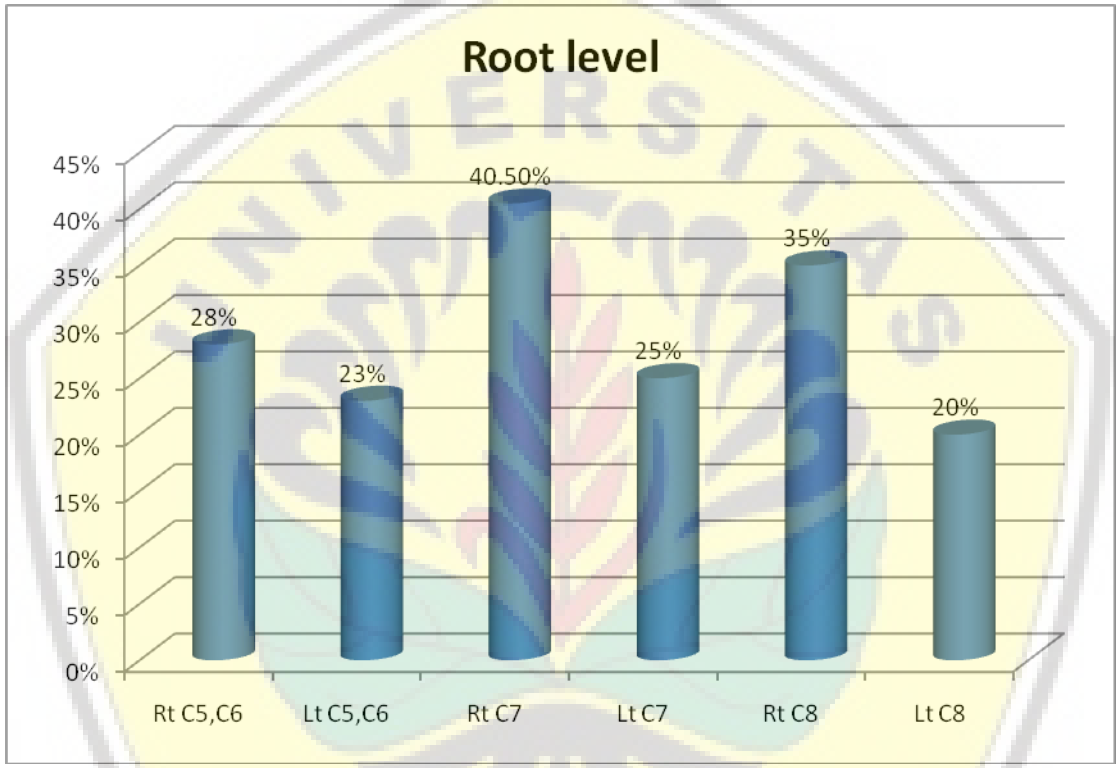

Figure (1) explores the different percentages of cervical radiculopathy from C5 to C8 levels for both right and left sides, using MEP abnormalities of the upper limbs muscles, in which the higher percentage was recorded for C7 (40.5% - 25%) then C8 (35% - 20%) then C5, C6 (28% - 23%).

Table (5): Validity of upper limbs MEP with corresponding MRI as a gold standard.

Level of radiculopathy	Sensitivity	Specificity	PPV	NPV
Rt C5,C6	76.2%	90.6%	76.2%	90.6%
Lt C5,C6	84.2%	98.2%	94.1%	94.7%
Rt C7	74.2%	83.7%	76.7%	81.8%
Lt C7	78.3%	98%	94.7%	90.9%
Rt C8,T1	68%	81.6%	65.4%	83.3%
Lt C8,T1	73.3%	93.2%	73.3%	93.2%

Regarding the validity tests, the sensitivity of MEP was (68% - 84.2%) and the specificity was (81.6% - 98.2%).

Discussion

Most studies of MEP in cases of cervical radiculopathy routinely use distal hand muscles to obtain MEP latency usually ABP and ADM muscles which is not enough to detect the roots affected as the diagnosis of radiculopathy needs to include all roots in examination[9], So in this study the proximal and distal muscles were examined to identify the affected root and improve both the accuracy and sensitivity of TMS in the diagnosis of cervical radiculopathy.

In this study, the prolongation of both PMCT and CMCT agree with study done by Eun S. Parkwhich was performed on 27 normal healthy person and 17 patients with radiculopathy found that mean peripheral and central motor conduction time was significantly prolonged in lesion side of patients group[10]. Also there was prolongation of PMCT which is obtained by cervical stimulation in some patients, this agree with study of S Chokroverty who studied five patients presenting with sensory-motor disturbances consistent with a clinical diagnosis of radiculopathy and concluded There was a significant difference in latencies between the affected and unaffected sides after paraspinal stimulation of nerve roots and he concluded that surface stimulation of the roots by a magnetic coil is a potentially useful technique for the non-invasive evaluation of root function[11].Disk herniation affect the nerve roots proximal to the neural foramen would be expected to prolong CMCT-M rather than PMCT-M, where as more distal lesions may cause prolongation of PMCT-M, this can explain why some patients show prolonged central latency while others show prolonged peripheral latency.

some patients show significant prolongation of CMCT-M while no prolongation of central conduction time when measured from latency of F wave and this is in consistence with study done by Wehling in patients with cervical radiculopathy studied by MEP recording from biceps brachii and abductor pollicisbrevis and founded that CMCT-M was delayed in patients with clinical motor involvement as it involves the time of impulse traveling through the proximal root segment that affected by root compression[12]. And agree with Bischoff who studied 42 patient with monoradiculopathy and recorded from deltoid, biceps, extensor digitorumcommunis and FDI on both sides majority of patients with muscle weakness show prolonged CMCT-M or PMCT-M by absolute value or side to side differences[13].

In addition to that this study shows that majority of patients with radiculopathy resulted in prolonged root conduction time more than normal values or by side to side comparison, this is in agreement with T.K.Banerjee who calculated the MRCT in 26 patients with lumber spondylosis and founded that in all patients with motor deficit and 36% of those without motor deficit the MRCT was significantly prolonged on the affected side[14]. Prolongation of cervical MRCT has been attributed to the segmental demyelination of proximal nerve segments or loss of F waves in the fast-conducting motor axons[15].

MRCT makes the conduction slowing at a small proximal nerve part apparent, which may not be detected by F latency measurement alone as it is diluted by the normal conduction at remaining longer nerve segment. Also it can help to demonstrate the motor root origin of a slowing at central motor conduction time (CMCT) instead of a corticospinal tract dysfunction. Observing a delay in MRCT proportional to the prolongation in CMCT can exclude central pathologies[16].

Moreover, our results show good MEP sensitivities (68% - 84.2%).This agree with Herdmann J who stated that MEP is sensitive test for diagnosis of lower motor neuron disease including radiculopathies[17]. The obtained specificity of MEP in the present study was higher than sensitivity for all the levels by comparing MEP abnormalities to the MRI (as a gold standard) and it was between (81.6% - 98.2%) and it goes in parallel to Aleksandra Bryndal who resulted in specificity between (86%-100%).

Clinical neurophysiology and neuroimaging focus on different aspects of spinal root damage. Neurophysiological tests detect functional pathology, while neuroimaging detect structural pathology.it is therefore believed that these two diagnostic method may be highly complementary[9].

Conclusion

MEP test plays an important role for evaluation of radiculopathies since it monitors injury to the motor fibers that are mostly affected and responsible for the signs and symptoms in radiculopathies.

Green and Efficient Composition and Diagnosis of Pentdentate Schiff Base Donative Metal Complexes: Antimicrobial, Antifungal, Antioxidant Screening and DNA Binding

Waleed Khalid Mahdi[1], Jameelah Kadhim Taher[1], Rehab Kadhim Al-Shemary[1]

[1]*College of Education for Pure Science/University of Baghdad, Iraq*

Abstract

Background: Enforcement of sustainable and green chemistry protocols has seen colossal surge in recent times, the development of an effective, eco-friendly, simple and novel methodologies towards the synthesis of valuable synthetic scaffolds and drug intermediates. Recent advances in technology have now a more efficient means of heating reactions that made microwave energy. Efforts to synthesize novel heterocyclic molecules of biological importance are in continuation. Microwave irradiation is well known to promote the synthesis of a variety of organic and inorganic compounds. The aim of current study was to conceivea mild base mediated preparation of novel Schiff base of 2-Acetylpheno with trimethoprim drug (H_2TPBD) and its complexes with Cu(II),Co(II),Zn(II),Cd(II) and Ni(II).

Method: The products are likening with traditional processes for reaction time and their yield. (H_2TPBD) and the complexes were diagnosed by spectroscopic (Mass, NMR, UV–vis, IR spectral studies, analytical and magnetic data.

Results: All complexes were found to be six co-ordinate mono-hydrate as[M(TPBD)(H_2O)] [1:1(ligand:metal) ratio] type. The complexes exhibited biological activity against (B.subtilis, P.aeruginosa, C.albicansand Staphylococcus aureus) bacterial strains as compared to (H_2TPBD). The antibacterial efficiency showed the following trend: M(II)-complexes > (H_2TPBD) > parent drugs. Cu(II), Co(II), Zn(II), Cd(II)andNi(II) complexes had good antioxidant efficiencies than the free ligand (H_2TPBD). DNA binding study of complexes with (CT)-DNA utilizing binding nature of the complexes with CT DNA has moreover inveterate by viscometer and emission which then bespoken that complexes bound with CT DNA. The complexestook effective scavenging impact during the DPPH process.

Conclusion: [H_2TPBD] has been prepared by the condensation of trimethoprim drug and Acetylphenol and characterized by electronic absorption spectra, ^{1}H and ^{13}C-NMR and IR,mass UV-spectroscopies.

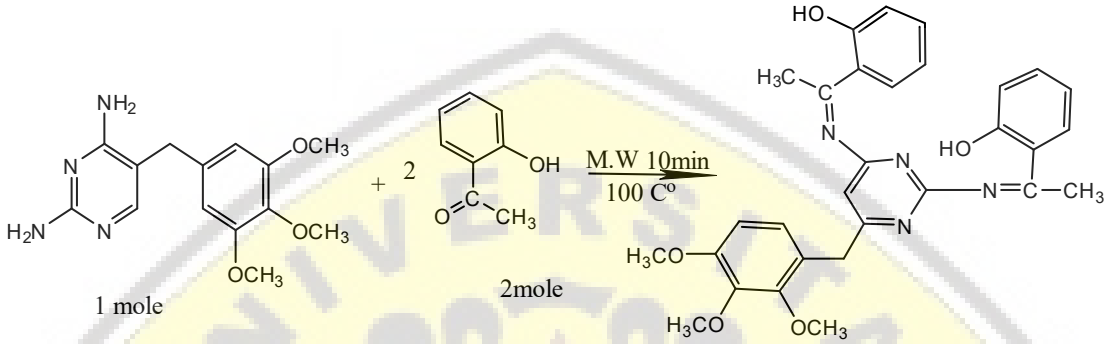
Keywords: *DNA cleavage; Microwave irradiation; Coordination compounds, Trimethoprim, Antioxidant.*

Introduction

Enforcement of sustainable and green chemistry protocols has seen colossal surge in recent times, the development of an effective[1], eco-friendly[2], simple and novel methodologies[3] towards the synthesis of valuable synthetic scaffolds and drug intermediates[4]. Recent advances in technology have now a more efficient means of heating reactions that made microwave energy[5]. Efforts to synthesize novel heterocyclic molecules of biological importanceare in continuation[6]. Microwave irradiation is well known to promote the synthesis of a variety of organic and inorganic compounds[7]. The development of the bioinorganic chemistry field has grew the attention in its complexeswere suggested for antimicrobial[8], anticancer[9], antibacterial[10], anticonvulsant[11], anti-inflammatory[12], anti fungal activities[13]. The essential metallic element and third most abundant is Copper that has antibacterial property and has a biological role in sustaining life[14]. A trace quantity of copper is required by all living organisms to

maintain their proper cellular functions[15]. We conceived a mild base mediated preparation of novel Schiff base of 2-Acetylpheno with trimethoprim drug (H_2TPBD) and its complexes with Cu(II),Co(II),Zn(II),Cd(II)andNi(II).

Synthesis of (H_2TPBD): The ratio (1:2) of ethanolic solution of (0.29g; 0.001mmol) trimethoprim drug and (0.281g; 0.002mmol) 2-Acetylphenol were mixed and irradiated in the microwave-oven insolution (3-4ml), then it was done in (1-2min) with good yield. [H_2TPBD] was isolated by crystallization after volume reduction by evaporation.



Scheme 1: Structure of (H_2TPBD) ligand

Synthesis of Complexes: The ethanolic-solution of the metal salt and ligand and were mixed in ratio of 1:1 and 0.1% ethanolic KOH was added to adjust pH(7-8) and was then irradiated insolution (4-5ml),then it was done in(3-6min). The resulting coloured products were then recrystallized with diethyl ether and ethanol.

MCl_2+H_2TPBD→[M(TPBD)(H_2O)]

Antimicrobial Evaluation: All the investigated (H_2TPBD) and its complexes were tested for their antibacterial activity (MIC) *in vitro* by broth dilution method with B.subtilis, P.aeruginosa, C.albicansand Staphylococcus aureus by disc diffusion technique taking Muller Hinton broth and byusing streptomycin as control and nutrient agar as medium.

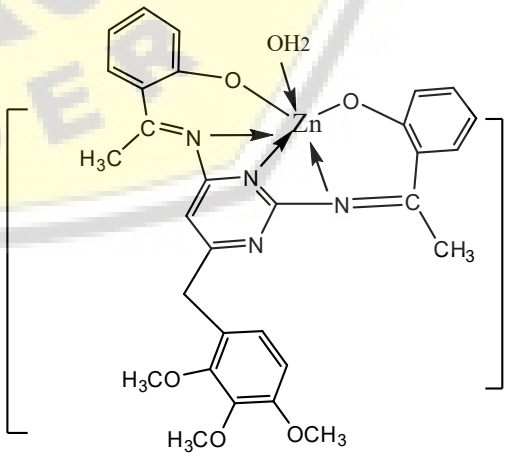
Antioxidant Studies: Antioxidant activities of compounds were investigated by using different free radicals (DPPH) assays.

The % inhibition was determined conforming to the following equation:

$$\%\ of\ radical\ scavenging\ activity = \frac{A_0 - A_1}{A_0} \quad 100$$

Where, A_1 is the absorbance of standard or sample and A_0 is the absorbance of control.

DNA Binding Studies: The experiments of the DNA binding were fulfilled in pH=7.5 (50mM Tris–HCl/1mM NaCl buffer),Tris–HCl/NaCl buffer utilizing (10%)from DMSO solution of the complexes. Experiments of absorption titration were made via employing concentrations of CT-DNA[40, 60 and 80lM]. Saving the concentration of the complexes constant, with suggested rectification for the absorbance of the CT-DNA itself. Specimens were equiponderated before recording each spectrum.



M= Co(II),Ni(II), Cu (II), Zn(II),and Cd(II)

Scheme 2: Suggested structure for complexes

Table (1): Some of physical properties and microanalysis of products

Compound	Empirical Formula	(Formula wt.)	Yield %	Colour	Elemental Analyses Found (Calc.) % (calculated)			
					C	H	N	M
[H_2TPBD]	$C_{30}H_{30}N_4O_5$	526.23	90	Pale Brown	64.24(64.69)	5.26(5.92)	13.07(13.72)	-
[Co(TPBD)(H_2O)]	$C_{30}H_{34}CoN_4O_8$	665.01	81	Olive	59.79 (58.65)	4.59 (4.39)	8.74 (9.24)	6.76 (7.78)

[Cu(TPBD)(H_2O)]	$C_{30}H_{34}CuN_4O_8$	669.62	80	Greenth Brown	57.31(58.29)	3.43(4.36)	9.38(9.19)	8.53(8.34)
[Cd(TPBD)(H_2O)]	$C_{30}H_{34}CdO_5N_8$	671.46	83	Pale Yellow	58.02(58.15)	4.22(4.35)	8.11(9.16)	8.49(8.56)
[Zn(TPBD)(H_2O)]	$C_{30}H_{32}ZnO_7N_4$	718.44	81	Yellow	53.66(54.78)	4.44(4.10)	7.55(8.63)	12.83(13.86)

Characterization of Complexes: The complexes have been prepared by template process by treating [H_2TPBD]and MCl_2in ethanol. The complexes isolated in the current research along with melting point, colour, molar conductance and analytical values have been given in Table (1) [4].They are soluble in highly chelating solvents such as DMSO & DMF. An effort was taken up to crystallize the complexes in different solvent method under various experimental conditions. The melting of complexes with decomposition was in the temperature range(200–240°C).

IR Spectra of Complexes: The band at 3426 and 3365cm^{-1} was assigned to stretching vibration of O-H in [H_2TPBD]. This reside unaltered in the complexes spectra, signalizing that this group in not involved in chelation. The characteristic spectra of compounds possessed azomethine linkage also two (C=N) of trimethoprimdrug groups[9]. [H_2TPBD] hastridentated coordinate with metal ions. The IR spectrum of the ligand exhibited a peak at 1564cm^{-1} corresponded to vibration of (C=N) (trimethoprimdrug). In [H_2TPBD] spectra a new sharp band appeared at 1642 and 624cm^{-1} assigned to the azomethine linkage (C=N).Another frequency observed in the range 1200-1223cm^{-1} corresponded to C-O bond. In complexes, a new band appeared at 520–532cm^{-1} due to M–N indicating the coordination of metal ionswith nitrogen atom[10]. The appearance of a weak band at 463-497cm^{-1} assigned to weak(M–O) and confirmed the chalet ionwith oxygen atom[11].

Mass Spectral Studies: [H_2TPBD]spectrum showed the formation of a molecular ion peak at m/z = 526$[M]^+$ equivalent to its general molecular weight. In addition, to this, $[M]^+$ fragmented observed peak at m/z 333, 200, 168, 137, 134, 109, 93, 77, 76, 67, 56 and 32 equivalent to their molecular weights were due to the cleavage of $[C_{19}H_{17}N_4O_2]^+$, $[C_{11}H_{10}N_3O]^+$, $[C_9H_{12}O_3]^+$, $[C_8H_8NO]^+$, $[C_{10}H_{12}O_3]^+$, $[C_6H_5O]^+$, $[C_6H_6]^+$, $[C_5H_4]^+$, $[CH_4N_3]^+$, $[C_3H_3N_2]^+$, $[C_3H_6N]^+$ and [CH_4O] groups, respectively[12].

UV-Vis Spectra and magnetic susceptibility: UV-VisSpectra of Cu(II), Co(II), Cd(II), Zn(II) and Ni(II) complexes were recorded at ca.10^{-3}M DMSO solution at room temperature. The band places of band maxima functions are listed in Table (2). [H_2TPBD] presented recognizable band at 37,037cm^{-1} would be due to π–π* for C=Ngroup and band at 28,490cm^{-1} is assigned for n–π* transition, respectively[13]. Co(II) complex showed three peaks which fall in the range 13,227-14,556cm^{-1} and23,752cm^{-1} attributed to $^4T_1g_{(F)}\rightarrow{}^4T_2g_{(F)}(\upsilon_1)$ and $^4T_1g_{(F)}\rightarrow{}^4T_1g_{(P)}(\upsilon_3)$ transitions, respectively, [14]. The ligand field parameters (Dq,B, β, β%) have also been calculated for Co(II) complex. The magnetic moment value of Co(II)complexes indicated the presence of three unpaired electrons. The magnetic moment value was found at 4.7BM, that is in the regarded region (4.3–5.2BM) for octahedral arrangement of the Ni(II) complexes[15]. The Ni(II) complex offered three absorption bands in the region 11792$cm^{-1}(\upsilon_3)$, 12345(υ_2),24509(υ_1) attributed to $^3A_2g_{(F)}\rightarrow{}^3T_1g_{(P)}(\upsilon_3)$,$^3A_2g_{(F)}\rightarrow{}^3T_2g_{(F)}(\upsilon_2)$ and $^3A_2g_{(F)}\rightarrow{}^3T_1g_{(F)}(\upsilon_1)$ transitions, respectively. The parameters (Dq,B, β, β%) were called the ligand field parameters that have been studied by using (Dq,B, β, β%). Ligand field parameters have been studied for

Ni(II) complexes.υ_2 was not noticed, but it might be studied by employing the relation $\upsilon_2=\upsilon_1+10Dq$. The data (B) equal(967cm^{-1}) that was further thandata of free ion, signalizing delocalization of d-electron and the orbital overlap on the ligand. The nephelauxetic ratio(β) was>1 that exposes the partial covalent nature of metal ligand bonds. The values 1174.8 and 1221cm^{-1} were (Dq) calculated data of crystal field schism energy. Thesevalues were well within the reignrecited for octahedral complexes[16]. The moment of magnetic data was found at2.86BM of Co(II)complexes.

Cu(II) complex spectrum presented absorption signals at 24271cm^{-1}, 14265cm^{-1} and 11641cm^{-1} which were referred to the transitions$^2B_1g\rightarrow{}^2A_1g$, $^2B_1g\rightarrow{}^2B_2g$ and $^2B_1g\rightarrow{}^2A_1g$ attributed to distorted octahedral structure. In addition substantiation was accomplished by magnetic moment 1.73BM which is compatible with submitted distorted octahedral structure for Cu(II) complex[17].

The electronic transition spectrum of the Zn(II) and Cd(II)complexes showed shoulder band at 421 and 409nm. This band can be attributed to the LMCT-transition. The electronic spectra of the Zn(II) and Cd(II) complexes did not show any (d→d)transition, which may be due to d^{10} electronic configuration. It has been reported that octahedral is the most favoured one.

Biological Effectiveness: In screening antibacterial efficacy of these compounds, we applied more than one screening organism to raise the prospect of exposing antibiotics essentials in examination materials[18; 19]. All of the tested compounds showed the following results: Bacteria: ligand was found to have no biological activity against all tested bacteria[20], but its complexes were found to have sensitivity for inhibition of Gram(+) more than Gram(-)bacteria. It was found in the order Co(II)>Cd(II)>Cu(II)>Zn(II)>Ni(II) for Gram-(+)and Ni(II)≈Zn(II)>Cd(II)>Co(II) for Gram-(-)bacteria, but Cu(II)complex did not show any antibacterial activity[20].

Antioxidants: These are materials or chemicals that give an electron to the free radical and transform it into harmless molecule. They may suppress radical positioning or reformdeterioration or decrease the energy of the free radical or cut-offseriesprevalence and reconstitute vellums.Free radicals ofligand mode is an antioxidant screening constructed on electrontransferthat manufactures a violet solution in ethanol[21;22] at room temperature is decreased in the existence of an antioxidant molecule, granting high to colourless solution of ethanol. The usage of the ligandchecksupplies arapid and easy path to estimate antioxidants by spectrophotometer and it may be beneficial to estimate different produces at a time. The proportion of antioxidant efficacy of each material was estimated by ligand free radical check[23; 24]. The determent of the ligand radical scavenging efficacy was completed depending to methodology recognized by radical scavenging efficacy of Brand-Williams and was evidenced as proportion repression of ligand radical and was determined by the following equation (Table 2).

$$\% \text{ Inhibition} = \frac{(\text{Absorbance of control} - \text{Absorbance of sample})}{\text{Absorbance of control}} \times 100$$

Table 2: DPPH efficacy of compounds

Last Conc. of Complex × 10 M^{-5}	% Inhibition

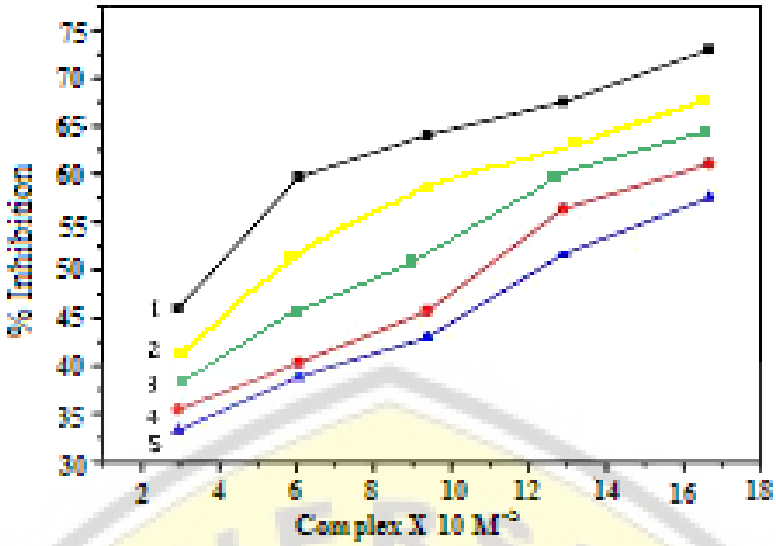

Figure 1: DPPH Activity.

DNA binding studies: UV-Vis spectroscopy avails as the generality prevalent means to research the interactions between DNA-complexes. Bind complex-DNA through intercalation conducts in bathochromism and hypochromism, assign to intercalation method including a powerful accumulating interaction between the DNA, by pairs of base, and an aromatic chromophore[24]**.** The bands of MLCT-transition for complexes displayed bathochromism and hypochromism when concentration of DNA was increased that were related to bind between CT-DNA and the complexes by intercalation. Absorption of complexes in existence of DNA was displayed in Figure (2). The binding strength of the complexes, K_b constant of the intrinsic binding of DNA with the complexes, was calculated from the deterioration of the absorbance observed for complexes**.** K_b for CTDNA with the complexes was estimated from the Equation (1). K_b constants of Intrinsic binding of complexes gained were 1.41×10^{-4}, 1.38×10^{-4}, 1.37×10^{-4}, 1.35×10^{-4} and $1.32\times10^{-4}M^{-1}$. The constants of stability of metal complexes including Schiff base ligand were in the range 10^7–10^6M^1. For example, for Co(II), Cu(II), Ni(II), Cd(II) and Zn (II) were 1.17×10^{-5}, 1.7×10^{-4}, 2.35×10^{-5}, 3.12×10^{-4}, 2.675×10^{-5} and $2.98\times10^{-4}M^{-1}$. These data were lower than (EB) as binding constants were in the range 10^6–10^7 M^1[25].

Viscosity Calculations: For stabilization of the interactions DNA-complexes, viscosity calculations were completed. Physical probes of optical photo supply in dispensable, but not adequate proofs to back up a linking model**.** The calculations of hydrodynamic, which are critical to change of length, were considered like the mostcritical and least ambiguous screen of a linking insolation, in the non-attendance of crystallographic constitutional values. A conventional intercalation pattern demands that the helix of DNA lengthens like base pairs are isolated to harmonize the linking ligand, that due to the increase of DNA viscosity. EB, a recognized DNA intercalator, raises the relative viscosity greatly by lengthening the double helix of DNA through intercalation. Upon increasing the complexes concentrations, the relative viscosity of complexes rises comparable to the conduct of EB. The increased viscosity[28] follows the arrangement EB>1>2>3>4>5 (Figure 2).

Melting of DNA studies: The complexes intercalation into base pairs of DNA brings about stabilization of base accumulating in a way that promotes T for DNA. The DNA melting experience is beneficial in founding the range of intercalation[26]. The complexes were brooded with CT-DNA and their temperature (10-100°C) and the absorbance at 260nm was observed. Conductivity- and pH-determents were then executed previously and next warming the complexes(Figure 3).

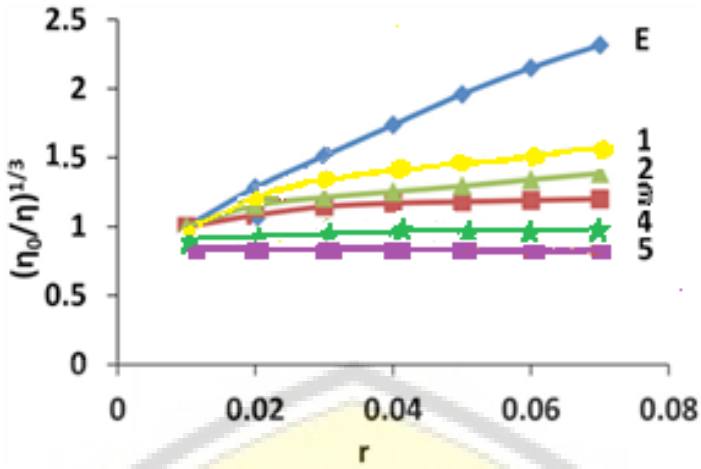

Figure 2: Effects of increasing amount of (EB). Complex(1): Co(II), complex(2): Ni(II), complex(3): Cu(II), complex(4): Zn(II)and complex(5): Cd(II)on ή of CTDNA at 29°C±0.1, [DNA]=15lM.

Abstract

Introduction: Plumbum is a heavy metal that is neurotoxic in children. Plumbum exposure in slum and densely populated environments adversely affects physical growth, nervous system development, memory disorders, and learning disorders, cognitive deficits, psychological disorders and negative temperament of children that persist until adulthood. Zinc is an important trace element in the body. Increased free radical production and oxidative stress can interfere with homeostasis trace elements. Trace element zinc plays an important role in the mechanism of oxidants and antioxidants in microorganisms.

Method: This study is an analytical study with a cross-sectional design with sampling using the random sampling method in grade 3 to 6 grade BK Surabaya elementary school. Measuring plumbum and zinc levels using hair media was measured by the Atomic Absorption Spectrophotometry (AAS) and temperament measurements using the Indonesia's Children's Temperament Questionnaire.

Results and Discussions: Disorders of elemental levels and elemental imbalances will result in oxidative cellular component damage associated with the child's negative temperament which adversely affects communication with parents, siblings with peers and poor academic performance. This disorder can be sustained in adolescence with clinical manifestations of aggressiveness, behavioral disorders, and substance abuse and in adulthood the negative impact of difficulty finding work and poor communication in the family.
Conclusions: Pb, Zinc, the ratio of zinc to Plumbum is significant to the child's temperament

Keywords: *Child temperament, plumbum, zinc, zinc/plumbum ratio.*

Introduction

Plumbum exposure in the environment adversely affects children because plumbum is neurotoxic and and affects the development of the brain area of the prefrontal cortex, basal ganglia, hippocampus, and cerebellum[1,2]. The highest target for plumbum exposure is the central nervous system area. Chronic plumbum exposure adversely affects physical growth, nervous system development, memory disorders, and learning disorders, cognitive deficits, psychological disorders and behaviors and negative temperament of children. Infants and children at high risk of plumbum pollution with levels below 10µg/100ml can cause impaired fetal growth and development and cognitive deficits[3]. Temperament in children is defined as a way of thinking, behaving, or reacting which is an individual characteristic and refers to the ways a person lives[4–8] Children with negative temper the difficult child (difficult children) are usually very active, sensitive stimulate, and have irregular habits. The negative withdrawal response is a characteristic of these children, and requires a more structured environment. Children become slow to adapt to new routines, people or situations. Mood expressions

e-mail: yunias.setiawati@gmail.com

are usually strong and especially negative. They often cry, and frustration often leads to violent tantrums (the slow-to-warm-up) child usually reacts negatively and with mild intensity to new stimuli, and unless pressed, slowly adapts to repeated contact. They only respond with mild rejection but are passive to something new or foreign or changes in routine. Children are quite inactive and moody but only show moderate disorder in terms of function. Children are more susceptible to behavioral problems at the beginning and middle of childhood[7]. Negative temperament is associated with emotional and behavioral disorders that require clinical attention because they can be sustained until adulthood[9]. Given the magnitude of the impact of plumbum exposure on the negative temperament of children as an observer of mental health of children and adolescents, it is considered necessary to conduct research to prevent the risk of children's and adolescent behavioral disorders and personality disorders as adults which burden my family and the surrounding environment

Method

This study was an observational analytic study with cross-sectional design using random sampling method in grade 3 to 6 grade B K Surabaya elementary school with a sample of 44 children. Before the research was conducted, researchers with the help of the principal and class teacher met with parents and students to provide an explanation of the research procedures and provide information for consent and informed consent that must be filled by the respondent. Inclusion criteria for research subjects were children aged 9-12 years no organic disturbances were found, mothers of children with at least junior high school education could communicate Indonesian, patients cooperatively and not experience severe psychosocial stressors. Pb and zinc examination was taken from cutting 10 pieces of children's hair in the occipital area close to the scalp, then the Atomic Absorption Spectrophotometry (AAS) method and temperament measurements were examined using the Children's Temperament Questionnaire. Sampling from hair based on growth is not invasive, provides a child's sense of comfort and the levels of plumbum and zinc in the hair stay longer so they can accurately identify PB and Zink levels[10-12]. Pb value, Zn, Pb/Zink ratio in the form of numerical data and statistical analysis with normality test with results p <0.05, which means that the distribution is not normal so that in the correlation test using the Spearman correlation test. The child's temperament questionnaire which was validated by Rini Harahap in 2013 and has been used for both research and clinical needs (Harapan, 2014) consisted of 15 questions consisting of positive and negative statements. Positive statements consist of 11 statements, namely statements with numbers 1, 2,3, 4, 5, 6, 7, 8, 9, 10, and 11. The choice form of positive statements is always valued (SL), sometimes (KK), and never (TP), with a score of 1-3. Score 1 is never, score 2 is sometimes, score 3 is always. While the negative statement consists of 4 statements on numbers 12, 13, 14 and 15. Negative statement choices are always (SL), sometimes (KK), and never (TP), with a score of 1-3. Score 1 is always, score 2 is sometimes, score 3 is never. The lowest total score is 15 and the highest score is 45. Scoring interpretation is a total score of 15-24 = difficult, a total score of 25-34 = slow and a score of 35-45 = eas.

Results and Discussions

Table 1: Demographic Data of the Childrenin BK Surabaya Elementary 2019

Variable	Category	Frequency	%
Age	≤12 years	41	93,18%
	> 12 years	3	6,82%
Gender	Female	13	29,55%
	Male	31	70,45%
Birth Order	First Child	24	54,55%
	Others	20	45,45%
History of violence in childhood	Never	40	90,91%
	Yes	4	9,09%
Temperament	Difficult	3	6,82%
	Slow	35	79,55%
	Easy	6	13,64%

Table 1 obtains the highest age results of less than 12 years at 93.18% with male sex at 70.54%, the order of the first high-ranking child is 54.55% and the most temperament of the child is the slow temperament of 79.55%. Pb, Zn, Pb/Zink ratios are numerical data and have been tested by normality test with the results of p <0.05, which means that the distribution is abnormal so that the correlation test uses the Spearman correlation test with the following results:

Table 2: Correlation between Pb, Zink, Pb/Zink ratio with the children's temperament in B K Surabaya Elementary 2019

Spearman Correlation	Temperament Score
	r – value
Pb	–0,078
Zn	–0,325*
Pb/Zn	0,208

*. Correlation is significant at the 0.05 level (2-tailed).
**. Correlation is significant at the 0.01 level (2-tailed).

Most child respondents are slow temperament. Temperament in children is defined as a way of thinking, behaving, or reacting which becomes individual characteristics and refers to the ways a person goes through life.

The classification of temperaments in children is divided into three, namely The Easy Child, The Difficult Child, The Slow-to-warm-up child[13,14] The Easy Child (easy child) children are more relaxed and temperamental, have regular and predictable habits, and have a positive approach to new stimuli. Children are more open and can adapt to changes and show the intensity of moods that are mild to moderate which are usually positive [15] The Difficult Child (difficult child) children have a difficult temper usually very active, sensitive, and have irregular habits. The negative withdrawal response is a characteristic of these children, and requires a more structured environment. Children become slow to adapt to new routines, people or situations. Mood expressions are usually strong and especially negative. They often cry, and frustration often leads to violent tantrums [16]The Slow-to-warm-up child usually reacts negatively and with mild intensity to new stimuli, and unless pressed, slowly adapt to repeated contact. They only respond with mild rejection but are passive to something new or foreign or changes in routine. Children are not quite active and moody but only show moderate disorder in terms of function. Children are more susceptible to behavioral problems at the beginning and middle of childhood [13,17]. Parenting is a process of introducing and supporting a child's physical, emotional, social and intellectual development from a baby to an adult.. Another aspect is that parenting is the interaction between children and caregivers during care, including the process of developing appropriate knowledge and skills for children, ways to educate by giving rules and restrictions applied to their children, maintenance, instilling trust, how to get along, attitudes create an emotional atmosphere, protection, and teach general behavior that can be accepted by society. Socio-economic status affects many aspects of parenting. Low income families limit the purchase of goods needed in parenting, such as educational games and books that are beneficial for child development. Poverty and economic insecurity affect the mental health of parents in relation to non-supportive childcare [18,19]. Slow temperament can be caused by a lack of parental stimulation due to family economic limitations and the impact of slum environments with high air pollution.

Stressful conditions in parents can potentially damage parents' attitudes and behavior towards children. Parental stress can come from various forms, such as financial difficulties, lack of social support, and marriage problems. Stressors have a negative impact on the general well-being and health of parents and seize their attention and emotional energy. Parental stress can reduce involvement, attention, patience, and tolerance for children and increase the use of punitive practices.[20] The results of the study stated that the majority of children did not experience childhood trauma while the results of the most temperament were slow temperament. These results can explain the theory of Stella Chest that since childhood children have their own responses. Easy child child, easy to adapt to children environment difficult child difficult to adapt to environment, dissident while child slow to warm up is marked by indifference to the surrounding environment. Children also play a role in their own development. Temperament's interactions and environment are known as good and fit. The results of the study concluded that there was a significant relationship between zinc levels and the child's temperament, but no significant results were found between the plumbum level and the child's temperament. These results are not in accordance with the theory that plumbum is neurotoxic and the risk of brain damage in children with clinical manifestations of learning disorders, memory disorders, and disorders of emotional control, irritability, irritability and chronic and high levels of exposure can cause death. The results of this study still require special attention considering the location of the living and living areas of slums, the pattern of care that does not provide stimulation and limited facilities and infrastructure, because the interaction of these factors negatively affects the child's growth process in the form of mental emotional disorders that can continuing until adolescence and adulthood which results in a

burden on the family and the environment. The ratio of Zinc to Pb in child respondents in the study showed meaningless results. Measurement of Zinc ratio to Pb is a new study that has never been done before[21-24] The rationale of this study is based on the Pb mechanism into the body by binding to calmodulin and blocking the N-methyl-D-aspartate enzyme which will damage brain neuroplasticity and cause encephalopathy and edema in the cerebellum region, this damage is irreversible. Plumbum will inhibit tyrosine synthesis into dopamine, resulting in reduced attention function, visual motor reasoning skills, and reading, numeracy and math skills.[25-26] Plumbum also inhibits the synthesis of tryptophan into serotonin, resulting in symptoms of hyperactivity and impulsivity. [27]Zinc is an important trace element and plays a major role in the synthesis of neurotransmitters in central nervous system. [28-29]Zinc plays a role in the synthesis of dopamine, serotonin and norepinephrine neurotransmitters and increases GABA (amino-amino butyric acid) which functions as inhibitory/relaxation neurotransmitters.[24,25]

Conclusions

The results showed significant results between zinc and child's temperament. Zinc plays a role in the metabolism of melatonin which is the basic ingredient of tyrosine. Melatonin is a hormone secreted by the pineal glandule and is tasked with regulating the rhythm of the circadian cycle which is responsible for regulating the human sleep cycle. Children with emotional disorders often experience sleep disorders that are thought to be caused due to melatonin deficiency[17,29]. Zinc also acts as a precursor in the synthesis of tryptophan. High Pb levels will aggravate children's emotional disturbances characterized by increased symptoms of hyperactivity, impulsivity, motor, cognitive impairment and decreased academic performance.[28,30]

Performance of Fundamental Movement Skills among Elementary School Children with Hearing Impairment by Using an Exergame in an Inclusive Physical Education Sitting: Review of Literature

Abdulrahman N. Alshahrany[1], Halijah Bt Ibrahim[2]

[1]Faculty of Education, Physical Education Department, Bisha University, Saudi Arabia,
[2]Faculty of Social Sciences and Humanities, School of Education, University Technology Malaysia, Johor Bahru, Malaysia

Abstract

The societal perception of the hearing impairment has changed in the past few decades. People show more concern on hearing impairment and have reached a consensus that the case needs to be dealt with care and positivity. Thus, the recent trends towards the integration of children with hearing disabilities in ordinary schools have begun. The integrated physical education program offers opportunities for normal people to learn about the talents and their special skills. The teacher must take care of the child's locomotor and object control skills by paying attention to the development of basic motor skills through which the child can fulfill the necessary needs in life such as walking, running, throwing, etc. In this article, a systematic literature review (SLR) is presented to discuss the possibility of embedding an exergame to improve fundamental motor skills among elementary school children with hearing impairment in an inclusive physical education classroom in Saudi Arabia. The study uses a qualitative method and conducted a content analysis along with the systematic literature review to understand the research done in this field and to set the agenda of future research in this area.

Keywords: *Performance of Fundamental Movement Skills, Elementary schools in Saudi Arabia, Hearing Impairment, Inclusion, Exergame and Physical Education.*

Introduction

Hearing facilitates human communication via languages and forms the basis for social behavioural understanding which ultimately leads to environmental development irrespective of prevailing daily challenges[1]. The quality of being unable to hear or perceive sound is called deafness or hearing impairment. Fundamental Movement Skills (FMS), a combination of movement patterns of two of more body parts to form series of basic movements required for active participations in physical activities, is the foundation for a physically active lifestyle and life-long enjoyment of sporting activities[2]. While school-based interventions via PE classes have been the common media of training in FMS-related studies for children, the number of studies on FMS amongst children with hearing impairment is limited; confirming earlier studies highlighting the inadequacy of research studies on development of FMS in children with hearing impairment [3].Additionally, individuals with hearing impairment need special care and education to adapt to the needs of life and better living in accordance to their abilities and strength. Thus, Inclusion, the model of jointly educating students with disabilities and their normal peers in the same mainstream educational setting is increasingly becoming a norm in the developed nations [4].

Overview of the Problem: The studies indicate the importance of participating in physical activities in upgrading some aspects of psychological evaluation for children, such as the realization of competence, as well as some social aspects such as making friends[5]. One of the most important requirements to achieve the effective participation of students is developing the fundamental movement skills for students with hearing impairment, both in during inclusive class of physical education and non-inclusive class. Furthermore, none of the previous studies dealt with comparing the level of fundamental movement skills of students with hearing impairment during inclusive class and non-inclusive class of physical education. Therefore, there is an urgent need to know the development of students who impaired during both the inclusive and non-inclusive educational environment by using an exergame.

Objectives of the Study:

The specific objectives are as follows:

- To investigate the object control and locomotor skills level among elementary school children with hearing impairment within inclusive and non-inclusive educational settings in Saudi Arabia.
- To investigate impact of exergame-based and traditional interventions on the object control and locomotor skills level among elementary school children with hearing impairment within inclusive and non-inclusive educational settings in Saudi Arabia
- To suggest a teaching model approach for hearing impairment student by using exergames within an inclusive and non-inclusive education setting.

Research Questions:

- Does a statistically significant difference exist in the pre and post – tests assessments of object control and locomotor skills of students with hearing impairment in the inclusive and non-inclusive educational setting groups?
- Does a statistically significant difference exist in the pre and post – tests assessments of object control and locomotor skills of students with hearing impairment in the inclusive and non-inclusive educational setting groups while using exergame-based intervention?
- Does a statistically significant difference exist pre and post – tests assessments of object control and locomotor skills of students with hearing impairment in the inclusive and non-inclusive educational setting groups while using traditional PE intervention?

The Methodology Used and Data Search Criteria: This study was approved by a panel of experts who were considered to be an ethical committee for the school of education at the University Technology Malaysia (UTM). The study uses a qualitative method and conducted a content analysis along with the systematic literature review to understand the research done in this field and to set the agenda of future research. Data collected from articles in Google Scholar databases were performed from January, first 2008 to the end of December 2018. Collected data included study design, study demographics, sample size, study population, outcome measures, and results.

Extraction of Primary Data: The initial search on the database yielded 769 articles were retrieved. Titles and the abstracts of all articles were read and revised for inclusion and exclusion. Meanwhile, most of the articles were excluded because they did not reach to the inclusion criteria. The remaining relevant primary articles were 25 articles. 3 articles were excluded because it did not touch on object control and locomotor skills and the finally forms the choices for the systematic literature review screening. 22 articles were found to be eligible for this research. Of the 22 articles included, three articles analyzed inclusion a, five articles analyzed hearing impairment students, three articles analyzed exergames and eleven articles analyzed fundamental motor skill.

Literature review findings: In this section, the results of the systematic literature review are presented. Table 1 shows the summary of pertinent research on fundamental motor skills development and hearing impairment. Numbers of publication by years for fundamental movement skills from 2008 to 2018. Out of the studies in Table 1, only 3 focused on fundamental movement skills and hearing impairment, 5 on fundament movement skills only. Out of the studies, 5 used test of gross motor development (TGMD-2). As clearly seen from the systematic literature review not too many studies conducted on an inclusion and other research terms.

Table 1: Summary of Pertinent Research on Fundamental Movement Skills Deevelopment

Study	Sample; Age; Location	Design and Intervention Type	Hearing Impairment?	FMS measure
Salmon et al., (2008)	N=311(male= 49%,); 10yr 8 mnths average; Melbourne Australia	Group-randomized controlled trial; School-based	No	Others not clearly stated
Akbari et al., (2009)	N=40 (male= 100%); 7-9 years; Semnan, Iran	quasi- experimental design; School-based	No	Test of Gross Motor Development (TGMD-2)
(Ericsson, 2011)	N=263 (male=49%, girls=51%, intervention=161, control= 102; baseline=7yr, follow-up= 15yrs; Sweden	longitudinal study; school-based	No	MUGI checklists
(Sabah, 2011)	N=40 (girls=100%, intervention=20, control= 20); 9 yrs average; Ahwaz City, Iran	semi–experimental; school-based	No	Test of Gross Motor Development (TGMD-2)
(Araujo et al., 2012)	N=41; intervention=9.6yrs, control= 9.5 yrs. average; Sao Paulo city, Brazil	school-based	No	TGMD-2
(Sirinkan 2014)	N=24; 9-12 yrs.; Turkey	Pre-posttest design; school-based	Yes	Others Not stated
(Gursel 2014)	N=18(7 hearing impaired and 11 normal); 60-70 months.; Turkey	quasi experimental design; school-based	Yes	TGMD-2
(Temple, 2017)	N=260 (male= 52%, female= 48%); 5.9 yrs.; Canada	quasi-experimental; School-based	Yes	Test of Gross Motor Development (TGMD-2)

The Current State Research Terms: Children with hearing impairment have been shown to characteristically have challenges in their individual development as it relates to speech, language, social, cognitive and FMS development, and early detection with prompt intervention is crucial to alleviating most of these difficulties for an improved overall quality of life [6;8]. [1] also pointed out that early developmental problems in students with hearing impairment are a relatively stable risk factor for certain aspects of the lives like poor academic performance, future behavioural problems, and avoidance of communication with hearing peers.

Significant delays have been reported to exist in FMS of hearing-impaired children in comparison to their hearing peers [6]. FMS development is important to a child's (hearing impaired or not) development as it forms the basis for a physically active lifestyle and lifelong enjoyment and participation in sporting activities[7]. Contrarily, lack or inadequate motor skills could predispose people to inactive behaviour and sedentary lifestyle which is one of the factors behind the rising cases of overweight and obesity in recent years[2].

In conformity with the claim that a critical period to instill the object control and locomotor skills is in the early childhood and primary school stages due to their willingness to learn and implement instructions[10], the existing studies on FMS performance and development have largely focused on children using school-based PE classes as a medium of FMS training, however, very few have focused on children with hearing impairment despite their inherent need for it. This fact has also been noted in [11].

This entails teaching hearing-impaired children alongside their hearing peers in the same class within the same mainstream educational setting. It is expected that by so doing, most of the deficiencies as regards their language, social, academic and general societal perception of them will be improved[4]. Representative studies have shown positive feedback from parents and teachers on this initiative[4;12]. However, when it comes to FMS related studies, only a preliminary study by [13] has been carried out in an inclusive setting.

The contribution of Video Games (VGs) amongst other technological advancements to the growing sedentarily in children and teenagers of this generation has attained an epidemic scale[14]. Given its captivating and motivating yet challenging nature, increasing attempts have been made reduce the stationary nature

of traditional VGs by incorporating a physical activity component to tackle some of its drawbacks [15]. Thus, Exergames, VGs which adds a physical activity component to the otherwise stationary VG environment, have been proposed a few decades ago. Representative studies have shown exergames are increasingly been used in PE classes and has been incorporated into the PE curriculum of some public schools in the United States[15].

In addition to its ability to improve physical fitness, motor skills, and being highly motivating for physical exercise, studies have also shown that exergames is capable alleviating characteristic loneliness in challenged children through increased group participation via multiple players mode[16]. Exergames have also been reported amongst other technology-oriented interventional studies related to children with hearing impairment[5;17]. However, the only related study to FMS development in hearing-impaired children is in[18], where the balance ability of adolescents with hearing impairments were tested after an exergame-based balance training. Finding reveal improved balance ability at post-test. An important future direction suggested by the authors is the need to investigate the effectiveness of this mode of balance training in multiple settings and populations.

Discussion

This Systematic Literature Review (SLR) can be seen as the first broad review on fundamental movement skills among hearing impairment in (KSA), discussing the current state of investigating the impact of interventions like FMS under varying populations gives a wider perspective of the study and exposes the possibility of other confounding factors behind certain findings if it exists. Saudi Arabia. Hence, the establishment of initiatives like the Universal newborn hearing screening which ensures that every newborn is screened for hearing problem in the first few weeks of their birth[8]. However, FMS related studies on children with hearing impairment is still lacking on this population. Although, inclusive education exists for the hearing-impaired, it only happens during PE and Art classes and intervals between classes[19]. Given the apparent lack of studies, the Saudi population of hearing-impaired children becomes an ideal one for this research.

Limitations: The study is limited in the sense that some articles might be missed out in the course of selected studies search considered. More emphasis is laid on ministry even though an in-depth study of the SLR cover other educational method; this is to know the extent of the following:

- What has been done in the popular literature in KSA?
- Where the researches in this domain of fundamental movement skills of hearing impairment students during PE class have reached by using exergame?

Conclusion

Child learning of fundamental movement skills and mastery of it may cause the child to participate in programs of physical activities on a regular basis, and this participation in physical activities increases the fitness of the child. This Systematic Literature Review (SLR) pointed out that early developmental problems in students with hearing impairment are a relatively stable risk factor for certain aspects of the lives like poor academic performance, future behavioural problems, and avoidance of communication with hearing peers**.** One of the most important requirements to achieve the effective participation of students is developing the fundamental movement skills for students with hearing impairment, both in during inclusive class of physical education and non-inclusive class. However, this study has presented detail SLR on the current state of fundamental movement skills Table 1 andnone of the previous studies dealt with comparing the level of fundamental movement skills of students with hearing impairment during inclusive class and non-inclusive class of physical education. Therefore, there is an urgent need to know the development of students who impaired during both the inclusive and non-inclusive educational environment by using an exergame.

[2]Department of Environmental Health, Faculty of Public Health, University of Indonesia

Abstract

Mercury is a toxic contaminant, but its existence until now continues to be discarded into the waters, soil, and atmosphere. One of the organs sensitive to the type of heavy metals in the kidneys. One sign of symptoms of chronic kidney disease is the presence of proteinuria. This research aims to do the association between mercury levels in hair and the incidence of proteinuria on the scavenger in Cipayung landfill area. This research uses cross-sectional study design. The research sample is 85 people scavenger. The statistic test used is a chi-square test. A scavenger with a risk of exposure to mercury (≥ 1 ppm) by 10.6%. The maximum rate of mercury in the hair of the respondent is 2,306 µg/g. As many as 67.1% of respondents experienced proteinuria symptoms. There is a significant association between mercury in hair and proteinuria on the scavenger around Cipayung landfill area (P-value 0.002). Living and working near areas of high pollution have the potential to lower quality of life. Therefore, the local policymakers should aim to establish practices and procedures to reduce exposure to heavy metals from landfill area to improve the quality of life.

Keywords: *Mercury, Proteinuria, Cipayung, Scavenger.*

Introduction

The US Government Agency states that mercury is a toxic contaminant, but its existence is still continuously discarded into the waters, soils, and atmospheres, and consumed in food and drinking water [1]. This heavy metal is still widely used in various fields including the manufacture of thermometers, barometer, manometers, cosmetics, and dental analgam[2]. Mercury emissions from waste disposal and municipal waste utilization are estimated at 0.033 to 46.2 kg-1. India became the world's largest mercury emission nation, followed by China, and North America [3].

Increasing populations, economic growth, rapid urbanization, and increased standards of living communities, potentially increasing the city's dense waste in developing countries. The garbage generated by the world population is about 1.3 trillion tonnes per year, and is expected to increase to 22 trillion tonnes by 2025 [4]. Solid waste disposal management is a priority in modern society organizations. Potential health hazards for the environment and the communities that live nearby are claimed to be associated with waste management [5]. This potential danger also threatens workers who work in landfill (scavenger).

In Indonesia, the mercury contamination is recorded in Banda Acehlandfill, mercury is found in water lecheate which exceeds the standard threshold of quality[6]. At Bantar Gebanglandfill, mercury content in water wells and river water around the landfill area shows the

e-mail: ema_her@ui.ac.id

number of quality standards[7]. Cipayung Depok is a landfill with the largest open dumping system in Depok city. Year 2012 results of water quality test with mercury parameter in Cipayung landfill namely < 0.0002 mg/L[8]. Based on preliminary tests that researchers do in September, the mercury content in water is 0.11 mg/L. It shows mercury in water in Cipayung landfill above the threshold of quality standards, and there has been an increase in the last 7 years. The potential for increased mercury levels in water continues to increase with the increase in the amount of garbage per day of Depok, but not accompanied by good waste management.

The effects of mercury can result in disturbances in the cardiovascular, hematological, pulmonary, digestive and renal systems, the imum system, the nervous system, the endocrine system, the reproductive system, and embryo development disorder [1]. One of the organs sensitive to the type of heavy metals is kidneys. One sign of symptoms of chronic kidney disease is the presence of proteins in urine. Chronic kidney disease is becoming increasingly common in the world. In high-income countries, treatment of kidney disease weighs more than 2-3% of the health budget. The cause of kidney disease is very complex, arising from biological, genetic, lifestyle, and environment [9]. In the year 2015 in Depok, kidney disease became the top disease cause of patient death in hospitals, with 1167 cases and 625 of which is a new case [10].

Increased amount of garbage per day that is not accompanied by good garbage management, can cause mercury pollution in the environment especially around Cipayunglandfillarea. This becomes a risk factor for decreasing the function of mercury's target organ, one of which is kidney, characterized by the presence of protein levels in urine. The increasing number of age groups in the people of Depok who suffer from kidney disease, need to be re-examined sources of exposure especially heavy metals in the environment that can lead to decreased renal function. Based on the explanation, researchers are interested to know the association between mercury levels in hair and the incidence of proteinuria in the scavenger around Cipayung landfill area, Depok city, West Java.

Method

This study uses a cross-sectional design and was conducted in September 2019 at Cipayung landfill Depok, West Java, Province Indonesia. This study uses the Chi-Square test and uses the significance limit of α (alpha) = 0.05 and 95% convidence interval. The population of this study were all scavengers working around the Cipayung landfill. This research technique uses total sampling technique. The sample of this study was 85 scavengers who worked during sampling days. Hair used as a biomarker to measure mercury in this study. Hair samples are taken to the laboratory and analyzed using MA-3000 devices. Urine is used to test protein levels. Testing using a dipstick. Then, the results were verified by two clinical laboratory analysts.

Result

In this study there were 85 respondents who had the characteristics presented in table 1.

Table 1. Characteristics of Sample Populations

No	Characteritics (N=85)	n (%)
1.	Sex	
	Male	44 (51.8)
	Female	41 (48.2)
2.	Age, mean ± SD	46.33 ± 13.2
	≤25	7 (8.2)
	26-45	30 (35.3)
	46-64	42 (49.4)
	≥65	6 (7.1)
3.	Weight, mean ± SD	54.02 ± 11.5
	20-40 kg	9 (10.6)
	41-60 kg	58 (68.2)
	>60 kg	18 (21.2)
4.	Education	
	Not Study	24 (28.2)
	Primary School	35 (41.2)
	Secondary School	14 (16.5)
	Higher Secondary School	12 (14.1)
5.	Smooking	
	No	34 (40)
	Yes	51 (60)

Gender of the participants were 44 males (51.8%) and 41 females (48.2%). The average age was 46.33 years old. The average weight of the respondent is 54.02 kg. As many as 35 (41.2%) respondents graduated from primary school. Respondents who smoked were 51 (60%) (Table 1).

The results of measurements of mercury in hair are in table 2. Scavengers with a risk of exposure to mercury (≥1 ppm) of 10.6%. The maximum level of mercury in the respondent's hair is 2,306 µg/g.

Table 2. Results of Mercury in Hair

Mercury in Hair (N=85)	n (%)
Normal (<1 ppm)	76 (89.4)
Risk (≥1 ppm)	9 (10.6)
Mean ± SD	0.56 ± 0.43
Min – max (µg/g)	0.156 – 2.306

The results of proteinuria on scavengers are presented in table 3. As many as 67.1% of respondents experienced symptoms of proteinuria. Only 32.9% of respondents with negative proteinuria.

Table 3. Proteinuria Results

Proteinuria (N=85)	n (%)
Normal (negative)	28 (32.9)
Risk (≥1)	57 (67.1)

In this study, respondents with mercury levels above recommended levels and proteinuria positive, at 7.8%, A strength of our study is that it addresses a significant association between mercury in hair and proteinuria on scavengers around the Cipayung landfill (p-value 0.002). Scavengers with mercury levels in the hair above the quality standard have a 11,278 times chance of experiencing proteinuria (Table 4).

Table 4. Associations between Mercury in Hair and Proteinuria

Mercury in Hair	Proteinuria		Total n (%)	Pvalue	OR
	Normal n (%)	Risk n (%)			
Normal n (%)	58 (76.3)	18 (23.7)	76 (100)	0.002	11.278 (2.149-59.198)
Risk n (%)	2 (22.2)	7 (7.8)	9 (100)		
Total	60 (70.6)	25 (29.4)	85 (100)		

Discussion

Cipayung landfill area (6º25'08ºS 106º47'10ºE), located in Depok, West Java Province, Indonesia. Cipayung Depok landfill is the largest open dumping landfill in Depok City. Cipayung landfill began operating since 1984 with a total land area of morethan 11.2 hectares with a 5.1 hectare landfill area. The volume of garbage entering per dayreaches 1,500 tons per day, but 600 tons have been processed into the composting process at the waste management unit and garbage bank. So that average waste daily entrance to the Cipayung landfill reaches 900 tons of waste a day.

Urban waste management in Indonesia becomes an actual problem along with the increasing rate of population growth which has an impact on the increasing amount of waste generated [2]. The Government of Indonesia still faces many obstacles in the implementation of waste management systems, especially in the context of achieving universal sanitation access targets in 2019, including the low access to waste services, low public awareness, low commitment by local governments in waste management, weak institutional management sanitation (regulator and operator) as well as human resource capabilities. The complexity of the waste problem in Indonesia makes health problems stem from landfills including mercury pollution.

Based on the water quality test results of the mercury parameters at the Cipayung Landfill in 2012, it was found that mercury levels were still below the quality standard of <0,0002 mg/L [8]. In September 2019, researchers conducted a mercury test in water which was 0.11 mg/L. this shows that the mercury in the water around the Cipayung landfill is above the quality standard threshold, and there has been an increase in the last 7 years.

Increasing the amount of waste per day, which is not accompanied by good waste management, can cause mercury pollution from heavy metals in the vicinity

of the landfill. The control of mercury emission is very difficult, because anthropogenic mercury sources decompose for a long time, while the residual waste of mercury products is still piling up at the landfill site and is increasing day by day. As a global pollutant, mercury bioaccumulation can enter the food chain and is very toxic to humans [12].

Hair is the preferred choice for many studies because it provides simple, integrative, and non-invasive samples. Estimated exposure should not take up to 11 years. After accumulating in the hair, mercury does not return to the blood, thus providing a good long-term marker of methyl mercury exposure. The total mercury in the hair is around 250 to 300 times higher than the blood mercury concentration when the hair is formed. CVAAS is one method for measuring mercury levels in hair [13]. The permissible reference dose of mercury in hair is 1.0 µg/g. More than the specified dose, can cause damage to the target organ [14].

Proteinuria is a condition that is often found in humans, which is generally a marker of kidney and urinary tract abnormalities. Acute clinical symptoms of mercury exposure in the renal are oliguria, anuria, hematuria, proteinuria. Chronic clinical symptoms of mercury exposure in the renal are polyuria, polydipsia, and albuminuria. After acute exposure to mercury, acute tubular necrosis appears, usually accompanied by oliguria. In chronic exposure, mercury is stored in the kidneys and induces epithelial injury and necrosis in the rectal pars of the proximal tubules [15]. Mercury concentrates on the kidney tubules and in the glomerulus which produces proteinuria, fibrosis, chronic kidney dysfunction, and renal insufficiency [16].

Mercury and proteinuria are also reported in Hg toxicity. Effects on rectal pars tubules, proximal tubules, inclusion of mercury in glomerular filters, and sensitivity of lysosome tissue are assumed to contribute to proteinuria. Long-term exposure to organic and inorganic mercury is detrimental to health including the kidneys [17]. Various reports have shown that mercury exposure can cause a variety of kidney injuries including subacute-onset nephrotic syndrome, tubular dysfunction, secondary segmental focal glomerulosclerosis, synchronic nephrotic syndrome, nephritic syndrome, nephrotic range proteinuria, glomerular disease, and membranous glomerulosclerosis[1].

Conclusions

Working as a scavenger has the risk of being exposed to hazardous substances and is detrimental to health. The discovery of an association between mercury in the hair with proteinuria shows the presence of heavy metal mercury exposure around the Cipayung landfill area. Living and working near high polluting areas has the potential to reduce quality of life. Therefore, the local policymakers should aim to establish practices and procedures to reduce heavy metal exposurefrom the landfill area to improve the quality of life. Moreover, these findings indicate the importance of intervention and surveillance measures, especially for residents with respiratory symptoms, to reduce the risks of water pollution exposure and lead to better health.

Health Risk Analysis of Exposure to Air Benzene among Student at Junior High School 16 Bandung West Java

Fildzah Aulia H.[1], Febri Hardiyanti[1], Ema Hermawati[2], Bambang Wispriyono[2]

[1]Environmental Health Program Study, [2]Department of Environmental Health, Faculty of Public Health, Universitas Indonesia, West Java, Indonesia

Abstract

Air containing harmful substances can harm human health. One of the harmful chemicals that can pollute the air is benzene. The use of benzene in Indonesia ranging from 20-40%. Bandung is one of the largest cities in Indonesia, which experienced a decline in ambient air quality due to air pollution. With the condition of ambient air pollution on children of the school to be one risk population exposed to benzene substances. This study was conducted to analyze the environmental health risks due to exposure benzene to students of Junior High School 16 Bandung. The research method used a cross-sectional design with environmental health analysis. The samples were 109 respondents who are selected by purposive sampling. The anthropometric characteristic was measured by body weight, and student activity pattern characteristic was measured by direct interview. Benzene concentration used NIOSH 1501 method using a personal sampler pump and charcoal tube which analyzed by Gas Chromatography. Analysis conducted using the Environmental health risk analysis method. Benzene concentration in ambient air had an average of <0,316 mg/m3. The average of intake rate for non-carcinogenic (CDI) real-time duration was 0,000987 mg/kg/day while for the intake rate for carcinogenic (LADD) was 0,00035 mg/kg/day. The non-carcinogenic risk level Risk Quotient (RQ) real-time duration was 0,115 and 3 years duration was 0,191, while for life span exposure was 1,598. The carcinogenic risk level (ECR) minimum was 2,676E-6, and the maximum was 9,426E-6. The RQ value of life span duration had exceeded the risk-safe limits so that the air in the school environment could lead to a non-carcinogenic health effect.

Keywords: *Benzene, Air Pollution, School, Environmental Health Risk Analysis.*

Introduction

Air containing harmful substances can harm human health. According to WHO in 2014, 92% of the human population lives in areas with air quality that does not comply with the provisions of the WHO. One of the harmful chemicals that can pollute the air is benzene. Benzene exposure in the population comes from inhaling contaminated air such as benzene from transport, motor vehicle exhaust emissions, industrial waste gas, oil extraction, and the location is close to the fueling stations[1,2,3]. The International Agency for Research on Cancer (IARC) and the US Environmental Protection Agency (US EPA) classifies benzene as a carcinogenic to humans [4,5]. The use of benzene in Indonesia ranging from 20-40% [6]. The presence of benzene content in gasoline to 12 million kL per year led to a decrease in air quality in major cities[7]. Bandung is one of the largest cities in Indonesia, which experienced a decline in ambient air quality due to air pollution. With the condition of ambient air pollution on children of the school to be one risk population exposed to benzene substances. Children aged less than seventeen years old who are exposed to benzene showed a change in the blood profile, liver enzymes, and somatic symptoms, so

ema.hermawati1@gmail.com

children at higher risk of experiencing blood disorders or liver development [8]. This study was conducted to analyze the environmental health risks due to exposure benzene to students of Junior High School 16 Bandung.

Method

This study uses a cross-sectional study design. The analysis conducted using the method of Environmental Health Risk Analysis. The research looked at the amount of benzene concentration in ambient air as much risk of exposure and health effects estimates of carcinogenic and non-carcinogenic which may occur at-risk populations studied.

The concentration of benzene obtained through measurement using NIOSH method 1501 at 10 points at Junior High School 16 Bandung. A sampling of benzene in the air using a personal sample pump and filter tube benzene SKC 226-01 charcoal. Set the pump flow rate of 0.2 mL/min and the pump is activated first for 5 minutes to obtain an appropriate sampling volume. Activated carbon (charcoal) containing benzene from the air will be broken up and dissolved carbon disulfide (CS2). Analysis of benzene will use tools Gas Chromatography (GC-FID) in the laboratory.

Data processing is performed on the results of studies using the quantitative analysis method by comparing the intake of benzene exposure is inhaled by students Junior High School 16 Bandung with the reference concentration value (RFC) for non-carcinogenic effects while the slope factor (SF) for carcinogenic effects.

Results

Benzene Concentration: Air sampling was conducted at 10 points in the Junior High School 16 Bandung when learning activities taking place was 4 points corridors classes and six points outside the room (2 points in the field, one point in the cafeteria, one point in front of the security office, 1 point in the sidewalk in front of the school, and 1 point opposite the location of the school students of Junior High school 16 Bandung ride down public transit). In the analysis of the measurement results of air samples at Junior High School 16 Bandung, in getting that on the whole point has a value of 0.092 ppm or 0.316 mg/m^3. These values are used for each point mentioned contained levels of benzene in air analysis using Gas Chromatography, but do not exceed the limit so that the tool detection stated that the concentration of benzene in the air 0.092 ppm or 0.316 mg/m^3.

Table 1. Benzene concentration, temperature, humidity, and wind speed at Junior High School 16 Bandung

Average Outdoors		<0.092	0316	30.3	59	0,023
Average Overall		<0.092	0316	30.06	59.4	0,014

Dose-response Analysis: Analysis of dose-response is determining quantitative values the agent for any form of specific chemical in which the toxicity of the effects of non-carcinogenic expressed in the reference dose (RFD) or the concentration of reference (RFC), while the carcinogenic effects expressed in value curve effect-dose or Slope Factor (SF). RFC value of benzene is 3x10-2 mg/m^3 in order to know the value of RQ (Risk Quotient), the unit value of RFC should be converted into mg/kg/day in order to be compared with the value of the intake (Intake) by multiplying the value of concentration reference (RFC) benzene with units of mg/m3 by inhalation rate value per day, then divided by the weight. From these calculations are obtained benzene RFC value is 0.00857 mg/kg/day.

SF value can be derived from the value of water inhalation unit risk of benzene exposure set by the US-EPA IRIS. The value water unit risk of benzene was 2.2 x 10-6 to 7.8 x 10-6 for every 1 g/m^3 of benzene. SF value obtained that have two minimum and maximum values in which the minimum SF is 7.59 x 10-3 (mg/kg/day) -1 and a maximum SF is 2.69 x 10-2 (mg/kg/day) -1. CSF maximum and minimum value will be used to calculate the health risk of cancer due to exposure to benzene in the air at students of Junior High School 16 Bandung.

Characterization Risk: The level of non-cancer health risks stated in the Risk Quotient (RQ) to be able to determine the magnitude of the danger level of exposure to a populace. Non-cancer health risks (RQ) for all student respondents SPMN 16 Bandung on the duration of exposure at this time (real time) did not indicate any risk, so bullae on the duration of exposure for three years. However, if the time duration is calculated throughout life (lifespan), then visible non-carcinogenic health risks. Calculations are also performed when the exposure for 5, 10, 15, 20, and 25, so it can be estimated that exposure to benzene for students of Junior High School 16 Bandung no risk to less than 20 years.

Table 2. Estimated Health Risk Non-Carcinogenic (RQ) Benzene Against Students Junior High School 16 Bandung

Information	Dt (years)						
	1.8 (Real Time)	3	5	10	15	20	25 (Life Span)
CDI (mg/kg/day)	0.000987	0.00165	0.00274	0.00548	0.00823	.0110	.0137
RQ	0,115	0.191	0.319	.639	0,960	1,280	1,598

The level of carcinogenic health risk expressed in the ECR (Excess Cancer Risk) was calculated to determine the level of the carcinogenic hazards of an agent of risk in the population.

The health risks of cancer in real time for all the students of Junior High School 16 Bandung is 2,676 x 10^{-6} to 9,483 x 10^{-6}. The value indicates that the health risks of cancer do not exceed 10-4, so that means there is no risk of carcinogenic cancer. To predict the health risks of cancer in students of Junior High School 16 Bandung then done anyway if exposure calculation for 5, 10, 15, 20, and 25. From Table 6 it can be estimated that the health risks of cancer (ECR) minimum exposure to benzene are not at risk up to 25 years but in the ECR maximum exposure to benzene can occur from year to 20 which is equal to 1.05 x 10^{-4} up to 25 years of exposure which is equal to 1.31 x 10^{-4}.

Table 3. Estimated Carcinogenic Health Risk (ECR) Benzene Against Students Junior High School 16 Bandung

Information	Dt					
	1.8 (Real Time)	5	10	15	20	25 (Life Span)
LADD (mg/kg/day)	0.000352	0.000979	0.00196	0.00294	0.00391	0.00489
ECR min	2.676 x 10-6	7.43 x 10-6	1.49 x 10-5	2.23 x 10-5	2.97 x 10-5	3.71 x 10-5
ECR max	9.483 x 10-6	2.63 x 10-5	5.27 x 10-5	7.90 x 10-5	1.05 x 10-4	1.31 x 10-4

Discussion

Benzene is used as an astringent Catalyser and an anti-knock engine with a concentration of 1-5% of the total volume, resulting in approximately 85% of benzene in ambient air coming from transportation activities, namely motor vehicle exhaust gas [9,10]. In Indonesia, the exhaust emission test results conducted by BTMP-BPPT in 2010 showed that concentrations of benzene emitted motor vehicle engines range from 0.01 to 0.39 mg/m^3[1]. Metabolites result from the metabolism of benzene is a reactive compound that can cause health problems [11].

Overview concentration of benzene in the Junior High School 16 Bandung obtained by the measurement of air samples at 10 points and obtained the value of <0.092 ppm, equivalent to <0.316 mg/m^3 in the overall points measured. This is influenced by the method of sampling carried out, in which the sampling method by NIOSH 1501. The standard is suitable for measuring the concentration of benzene in the air working environment but must make modifications to the old sampling to obtain a larger air volume so that the absorption of benzene can be measured with high scores. The concentration of benzene in the air is influenced by the surrounding air temperature and weather. Benzene vapor in the air intangible and can last for one day to two weeks, which is influenced by climatic conditions and concentrations of other pollutants in the air [3,11].Junior High School 16 Bandung has air quality, but quite humid heat, humidity as a whole had an average of 59.4%.

Calculating the value of real-time risk level of benzene exposure in students of Junior High School 16 Bandung obtained 0,115. Nilai value RQ <1 indicates that the absence of non-carcinogenic health risks for the population in a certain duration of exposure. RQ value obtained in a real-time exposure of 0,115 mean benzene exposure to the students of Junior High School 16 Bandung in the duration of the exposure is currently 1.8 years did not show any non-carcinogenic health risks. RQ value for the duration of exposure for three years also showed no non-carcinogenic health risks. However, different for lifelong exposure, the value of non-carcinogenic health risk level indicates RQ of 1.59 which means it shows that under the same conditions, non-carcinogenic health risks may arise.

At the estimated level of non-cancer health risks indicate the level of risk (RQ) ≥ 1 began in the year to 20 exposures, which is equal to 1.280. Estimates of the level of risk undertaken benzene exposure apply to the condition of anthropometry and a similar pattern of activity. In the event of an increase in the concentration and activity patterns that may occur non-carcinogenic health risks faster than forecasts made, because the concentration of benzene and patterns of human activity is directly proportional to the value of the intake.

Carcinogenic health risk characteristics obtained from the calculation of Excess Cancer Risk (ECR) ECR. Value use of lifelong exposure duration of 70 years because if a person at risk for exposure to a toxic, carcinogenic substance, the risk is valid throughout his life. ECR value is 2.676 x 10^{-6} minimum and maximum values w 9.483 x 10^{-6}. Declared carcinogenic risk level exceeded safe limits for population and risk causes carcinogenic health effects if the value of the ECR> 10-4. In this study, the real-time value of the ECR either a maximum or minimum indicates a smaller result of> 10-4 so that it can be concluded that benzene exposure to real-time risk does not pose carcinogenic health effects for students of Junior High School 16 Bandung.

At the minimum risk level value is not found carcinogenic risk up to 25 years into the future, but for maximum risk level can be seen the emergence of a risk to start in all 20 exposures. Under the same circumstances, the emergence of carcinogenic health risks in the year to 20 exposures can occur in a teacher or other school personel who worked for years at the school. Teachers and school staff are not experienced turnover teach or work location will be at the same school so that the concentration of benzene and similarities of the activity will allow for the emergence of the health risk of carcinogenic and non-carcinogenic.

Risk management is conducted if the value of the risk of non-carcinogenic and carcinogenic both declared unsafe. However, risk management also must still be done considering the value of risk is never zero or is always there. Large non-carcinogenic and carcinogenic risk in this study indicates the number within safe limits for the duration of the exposure to real-time, but showed no safe level of risk in the next few years or even sooner if the value of increased concentration and activity patterns. Therefore, do health recommendations (Health Advisory) to be able to control the risk of exposure to benzene. Recommendation health (Health Advisory) that can be done is by controlling the time of exposure. Non-carcinogenic safe exposure time for students in Junior High School 16 Bandung is ≤ 6 hours. Currently, the average exposure time was 6 hours per day so it

is still within safe limits, but other students activities such as extracurricular activities can increase the time students during the school day. Therefore, it is necessary to monitoring learning time during the school day for students that do not pose a health risk.

Conclusion

The average value of the concentration of benzene in the air Junior High School 16 Bandung in 2017 was 0.092 ppm or 0.316 mg/m^3, were above the Reference Concentration (RFC), which has been established by the US EPA which is equal to 0.03 mg/m^3. The results of anthropometric data obtained an average weight of respondents was 47.10 kg. Values intake rate had an average of 0.56 m^3/h, the value of frequency of exposure which is 219 days per year, the value of exposure time was 6 hours/day, and the duration of exposure in real-time was 1.8 years. The average value of the intake (CDI) real-time is 0.000987 mg/kg/day, the value of the intake (CDI) 3 years is 0.00165 mg/kg/day, and the value of the intake (CDI) throughout life or life span is 0, 1371 mg/kg/day. Values for the intake of carcinogenic exposure (LADD) of 0.00035 mg/kg/day. Large non-carcinogenic risk level (RQ) for the duration of the exposure to real-time amounted to 0,115 and for a duration of 3 years exposure of 0.191, while the life span for the duration of exposure is equal to 1.598. Large carcinogenic risk level (ECR) minimum of 2,676 x 10^{-6} and ECR maximum of 9.482 x 10^{-6}.

Abstract

Healthcare data mainly contains all the patients' information as well as the parties involved in healthcare industries. The rate storage of such type of data is increased very rapidly. Because of the continuous increasing the size of electronic healthcare data becomes very complex. It becomes very difficult to extract the meaningful information from it by using the traditional method. Due to advancement in field of statistics, mathematics and every other discipline, now it is possible to extract the meaningful patterns from it and can be used for medical decision making. Data mining is beneficial in such a situation where large collections of healthcare data are available. This paper includes a comparison between Decision tree, Naïve baseand Random Forest algorithms on diabetes and blood pressure dataset. After data classification, the results show that Random Forest algorithm had the more accurate classification with 98% accuracy.

Keywords: *Data Mining; Decision tree; Naive base; Random forest Classification; blood pressure.*

Introduction

Data Mining mainly extracts actionable, meaningful patterns from the data. These patterns can be then integrated into the knowledge and with the help of this knowledge essential medical decisions can be possible. Data mining provide many benefits in many domains: it plays an important role in the detection of fraud and abuse, very helpful in the medical treatments, it is useful in the disease's early stages detection. Data mining techniques in healthcare domain can provide better medical services to the patients, intelligent in healthcare decision support systems and Beneficial in healthcare organizations in various medical management decisions. It has been used in many domains like image mining, opinion mining, web mining, text mining, graph mining etc.it is also helpful for better effective treatments, fraud insurance claims by patients as well as by providers, readmission of patients, identifies best treatments method for a group of patients, construction of effective drug recommendation systems [1].Diabetes and Blood pressure is a major health issue for a long time, is a chronic disease that indicates the high level of diabetes and blood pressure in the blood vessels. In this paper we used data mining techniques for diabetes and blood pressure disease prediction. In our work we used WEKA tool to classify our diabetes and blood pressure dataset. WEKA is a data mining tool that contains many classification and clustering algorithms. We used WEKA Explore with 10-fold cross validation to compare the accuracy results between Decision tree, Naïve base and Random Forest algorithms. Random forest algorithm provided a better accuracy 98% than Decision Tree and Naïve base algorithm. We set an online dataset from Kaggle website. The flowing figure shows the proposed analysis framework, it includes data collection, data preparation, data modeling and the outcomes evaluation.

Figure [1]: Proposed Analysis Framework

Data collection and preparation: A lot of online datasets are available now for analysis. We used an online dataset from Kaggle website from hospital of Frankfurt am Main, Germany[2], this dataset has 2000 rows and 9 columns. Basically, we have used WEKA filters, unsupervised filters to change data values from numeric to nominal values because Naïve base algorithm, decision three algorithm and Random forest algorithm deal with nominal data. The table below shows the data using openrefine tool. Openrefine is an opensource tools for data analysis and data cleaningtask[9].

Table (1): Diabetes dataset

All	Pregnancies	Glucose	Diabetes Pedigree	Skin Thickness	Insulin	BMI	Blood Pressure	Age	Outcome
1	2	138	0.127	35	0	33.6	62	47	1
2	0	84	0.233	31	125	38.2	82	23	0
3	0	145	0.63	0	0	44.2	0	31	1
4	0	135	0.365	42	250	42.3	68	24	1
5	1	139	0.536	41	480	40.7	62	21	0
6	0	173	1.159	32	265	46.5	78	58	0
7	4	99	0.294	17	0	25.6	72	28	0
8	8	194	0.551	0	0	26.1	80	67	0
9	2	83	0.629	28	66	36.8	65	24	0
10	2	89	0.292	30	0	33.5	90	42	0

Methodologies

Decision Tree: J48 it is a classification algorithm for supervised technique, it is simply a tree with root at the top and leave in the bottoms consist of tests or attribute nodes linked to two or more subtrees and leaves or nodes. The non-leaf node is the decision node. Decision Tree can hold high amount of categorical data. So, based on the entropy calculation and information gained, decision tree picks the best feature as a root to start splitting the tree in to branches, decision nodes specify a choice and based on that choice we can decide which direction we should continue, the choice or the test is done on the value of the feature of the instance, so based on the value of the choice we go to the corresponding brunch and continue this until it comes to the decision node which is the predicted value.[3]

The outcome of the decision tree classifier is showing in the table below, which is the number of the instances that are correctly classified and the number of instances that are incorrectly classified and the accuracy rate for.

Table (2): Decision Tree classification results

	Number of instances correctly classified	Number of instances incorrectly classified	Accuracy
Decision Tree	1356	644	67.8

Naïve Base: Is a machine learning algorithm for classification problems. It is known for its simplicity and effectiveness, naïve base builds models fast and make quick predictions, it is a probabilistic classifier. Naïve base refers to the statistician and philosopher Thomas Bayes and the theorem named after him Bayes' theorem[4]. Bayes' rule It says we can compute the probability of our hypothesis **H** given some evidence **E** by looking at the probability of the evidence given the hypothesis and the unconditional probof the hypothesis and the evidence [5], as shown in the following formula:

$$P(H|E) = \frac{P(E|H) * P(H)}{P(E)} \quad [5]$$

The flowing tables shows the classification results for naïve base algorithm which are the numbers of the instances that are correctly classified from the dataset and the number of instances that are incorrectly classified from the dataset in addition, and the accuracy rate for that classifier.

Table (3): Naïve base classification results

	Number of instances correctly classified	Number of instances incorrectly classified	Accuracy
Naïve Base	1785	215	89.25

Random Forest: It is one of the most powerful supervised machine learning algorithms that is capable for regression and classification tasks. The forest is created by number of trees, the more trees in the forest the more chance of prediction leads to higher accuracy. Random forest simply works like decision tree algorithm, the decision of most of the trees that chosen by random forest, it is the final decision. The prediction in Random forest depends on random directions created that decide the growth of each tree in the staff, it is an example of bagging by Bierman 1996 based on random features selection from the training dataset[7,8]. The table below shows the classification results of Random forest algorithm that displays number of instances that correctly classified, the number of instances that incorrectly classified and the accuracy rate.

Table (4): Random forest classification results

	Number of instances correctly classified	Number of instances incorrectly classified	Accuracy
Random Forest	1974	26	98.7

Examine the Output: The goal behind classification method is to boost the accuracy rate to support decision making. Each algorithm has a clear output about the classifier which includes number of instances were correctly classified, the number of instances were incorrectly classified, accuracy rate, precision, recall and confusion matrix. In The class accuracy section, The True Positive (**TP**) rate is the percentage of instances which were correctly classified, and it is equivalent to Recall. The False Positive (**FP**) rate is the percentage of instances which were incorrectly classified. The True negative (**TN**)rate is the percentage of instances that were not classified from the class. The (**FN**) rate is the percentage of instances that are equivalent but were not classified for that class. The **Precision** is the ratio of True Positive instances of the class among all those which were classified in the class. The **Recall** is the percentage of the equivalent records that were classified in the class. The **F-Measure** is a combined measure for precision and recall[3]. The confusion matrix contains the actual count of correct and incorrectly classified instances. It is easy to read; the rows are the actual class and the columns are the predicted class. Multiple class models have a very similar design [6]. The confusion matrix is shown in the table below:

Table (5): Confusion matrix

	Predicted Classes	
Actual Classes	TP	FN
	FP	TN

The main diagonal of the confusion matrix tells us how the model did, in other word the accuracy rate we can calculate the accuracy rate by using the flowing formula:

$$\text{Accuracy} = \frac{TP + TN}{TP + FP + TN + FN} \quad [3].$$

The flowing table shows the compaction results between Decision Tree, Naïve base and Random forest algorithms.

Table (6): A comparison between classifiers

Algorithm	TP Rate	FP Rate	Precision	Recall	F-measure	Accuracy
Decision Tree	0.926	0.800	0.690	0.926	0.791	67.8
Naïve base	0.905	0.132	0.930	0.905	0.917	89.25
Random forest	0.988	0.015	0.992	0.988	0.990	98.7

Conclusion

Applying data mining techniques for chronic diseases can support decision making, reduce the time and the cost in hence reduce the chronic disease death. In this paper we have analyzed an online diabetes dataset from Kaggle website to predict the early detection of diabetes and blood pressure, we used classification techniques which are Decision tree Naïve base and Random forest to compare the accuracy rate between these classifiers. We used WEKA Explore with 10-fold cross validation to compare the accuracy results, classification outcomes show that Random forest is the highest accuracy 98% among these classifiers, while naïve base accuracy rate is 89% and Decision tree came up with 67% accuracy rate. Each classifier has its own characteristics+ and they are powerful in healthcare domains specially with chronic diseases like diabetes, heart disease, kidney disease etc. many benefits behind data mining in healthcare, the most important one is saving patient's life.

The Impact of Psychological Counseling and its Relationship to Internet Addiction among Preparatory School Students

Mohammed Zuhair Hussein Junjun

Ministry of Education / Babylon General Directorate of Education, Iraq

Abstract

Context: Psychological counseling among preparatory school students. Internet addiction among preparatory school students. The relationship between Psychological counseling and internet addiction among preparatory school students. There is no doubt that students when their religious and customary values and principles are weakened, they become in a state of disintegration and rupture in their psychological structure and feel loneliness and alienation within themselves and others, and move from a vacuum into a vacuum. The preparatory school students have average internet addiction. There is a correlation between the level of religious commitment and Internet addiction. According to the findings of the research, some recommendations and suggestions were presented.

Keywords: *Religious commitment, internet addiction.*

Introduction

In order to achieve the objectives of the research, the researcher has conduct the following: Adopt the measure of religious commitment [1] and the measure of Internet addiction [2], which were concord in their final form after the completion in the conditions of psychometric properties, which was paragraph for the religious commitment scale and paragraphs for the Internet addiction scale. The research was limited to the Babylon General Directorate of Education for the academic year (2018-2019), and the research population consists of (150) students, as well as the research adopted the descriptive approach, and to achieve the objectives of the research, the religious commitment scale and the Internet addiction scale was applied on the research sample[3], and then analyzed the data using (SPSS) statistical program, and the results were as follows: The preparatory school students have an average religious commitment. The preparatory school students have average internet addiction. There is a correlation between the level of religious commitment and Internet addiction. According to the findings of the research, some recommendations and suggestions were presented [4]. Islam has made the proper way to build a human being with sound mind and body so that it becomes a strong and coherent brick and a positive element in its bigger society. It has also made the way to build a virtuous human society to be the right environment for human development through sound and proper education, and which allows people to show their energies stored in them[5].

Methodology

This chapter includes an overview of the research methodology and procedure in identifying the research population and sample, method of selection and identification of measurement tools, as well as identifying the most important statistical methods used in data processing and analysis.

1. **Research Methodology:** The researcher used the descriptive approach as the most appropriate method to study the correlation between variables and their detection in order to describe and analyze the phenomenon studied [6].
2. **Research Population:** The research population included preparatory school students in the Babylon

Corresponding Author:
Mohammed Zuhair Hussein Junjun
Ministry of Education / Babylon General Directorate of Education, Iraq

General Directorate of Education for the academic year (2018-2019).

3. **Research Sample:** The research sample was randomly selected from the middle school students. The number of research sample individuals was (150) students distributed in secondary schools in the Babylon General Directorate of Education as illustrated in Table (1).

Table 1: Research sample distributed in schools

No.	School Name	Male	Female	Sum
1	Sana'a Preparatory School	26	-	26
2	Al Sajad Preparatory School for Boys	30	-	30
3	Qortoba High School for Girls	-	27	27
4	Al Jihad Preparatory School for Boys	22	-	22
5	Al-Badour High School for Girls	-	26	26
6	Haifa High School for Girls	-	19	19
	Sum	78	72	150

4. **Research Tools:** The researcher adopted the measures of religious commitment and internet addiction among preparatory school students, where it was adopted Al-Hamdani (2005) scale for religious commitment and Arnot (2007) scale for Internet addiction for the purpose of achieving research objectives.

Validity of paragraphs: The two scales were presented in a preliminary form to a group of specialized arbitrators who were asked to judge the validity of the paragraphs in measuring the religious commitment and Internet addiction, and to give their opinions and notes regarding the formulation of paragraphs and their affiliation to the scale.

Preparing the scales instructions: The instructions of the scale are the guide to the respondent, so it was considered making the scales instructions to be clear, simple and understandable, and should be marked with a sign (/) under the choice that applies to the respondent. In the religious commitment Scale the choices were (totally applicable, medium applicable, slightly applicable, not applicable), while in the Internet Addiction Scale were (totally applicable, applicable to some extent, not applicable), the confidentiality of the answer has been confirmed, and the respondent has not been asked to state an attribute and explained to him that the answer for scientific research purposes.

Survey Application Sample: In order to identify the clarity of the scale instructions and the approval of its paragraphs and to detect the ambiguous and unclear sentences as well as calculating the average time taken to answer all the scale paragraphs, the scales were applied to a sample of (30) male and female students by (15) female and (15) male students. And it was found that the scales were clear, and the average time to respond to the scales was 25 minutes.

Statistical Analysis of the Religious Commitment Scale and the Internet Addiction Scale: Statistical analysis of the paragraphs is more important than the logical analysis because it checks the content of the paragraph in measuring what was prepared for the measurement [7]. The religious commitment scale and the internet addiction scale were applied to a sample of 150 students randomly chosen from the research population and is a non- research sample.

Contrasted Groups Method: For the purpose of analysis in this manner, the following steps were followed:

1. The application of the religious commitment scale and the Internet addiction scale on the statistical analysis sample of (150) male and female students in the preparatory schools in the Babylon General Directorate of Education.
2. Marking students' answers to find the overall score of each student's response to the scale paragraphs.
3. Arranging the students' grades in descending order to choose (27%) of the forms that obtained the highest grades to be the upper group which it's number was (36), and choose (27%) of the forms that obtained low grades to be the lower group which it's number was (36).
4. To extract the coefficient of discrimination using the t-test of two independent samples to test the difference between the upper and lower groups, and for each item of the scales paragraphs, and compare the calculated T value of each item to the tabulated t-value and it was indicated that all the paragraphs are distinguished at the level of significance (0.05) compared to the tabulated t-value of (1.96) except the paragraphs in the religious commitment scale was (16, 19, 28, 42, 49, 60) is less than (1.96) at the level of significance (0.05)

Method of Internal Consistency of Paragraphs: The calculation of paragraphs consistency is one of the important inputs in the psychological measurements because the validity of the scale depends on the validity of its paragraphs and calculated by correlate the degree of each paragraph to the overall degree of the scale [9]. The two scales were applied on the statistical analysis sample of (150) female and male students from the preparatory stage, and when calculating the coefficient of correlation between the score of each paragraph and the total score and using the Pearson correlation coefficient.

Table 2: The paragraph correlation coefficients to the total score of the religious commitment scale.

Psychometric Characteristics of Religious Commitment Scale and Internet Addiction scale:

1. **Scale Validity:** The researcher applied two types of validity to the current two scales: apparent validity and construct validity.

Recognition of the level of religious commitment in the preparatory school students: In order to achieve this goal, the researcher collected the data and insert it in the statistical analysis program (SPSS), and it was showed that the arithmetical mean of the sample reached (144,007) with a standard deviation of (51.13), and a hypothesis mean of (135). In order to determine the difference between the sample mean and the hypothesis mean, the researcher used a t-test for one sample which found that the calculated t-test value of (34.49) was greater than the tabulated t-test value of (1.96) at statistical significance level of (0,05), and Table (4) shows that:

Table 4: T-value for the significance differences on the religious commitment scale.

Sig. Level at (0.05)	T-Value		STD.	Hypothesis Mean	Arithmetic Mean	Sample Size
	Tabulated	Calculated				
Statistically Sig.	1.96	28.01	56.94	135	130.25	150

Table (4) shows that the research sample has a low level of religious commitment because the arithmetic mean is smaller than the hypothesis mean of the scale. This result is consistent with study.

Conclusion

In the light of the current research results, the researcher concluded the following: The preparatory school students have a low level of religious commitment. The preparatory school students have a high level of Internet addiction.There is a moderate correlation between religious commitment and Internet addiction.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Ministry of Education / Babylon General Directorate of Education, Iraq and all experiments were carried out in accordance with approved guidelines.

Dental Fillers Enhanced By Nanomaterial's: Oral Health-Related Diagnostic and Therapeutic Methods

Dhulfiqar Ali Hameed[1], Nihad Abdul Ameer[1]

[1]University of Babylon, college of sciences, physics Department, Babil, Iraq

Abstract

Context: The main drawback of flowable dental composite resin is low strength and incasing shrinkage in the shrinking contrast to conventional composite resin. there are two main goals increasing strength, reducing shrinking. So that mechanical and physical properties can be influenced by adding nonparasitic to the material. This technology has been used in various fields of dentistry. In dental compositions, the process of transition from dough to solid material is related to the ability of light to enter through the material and the beginning of the shrinking in all parts. Show that the increasing in effect at 0.02% gm at 30 sec with (4.2 mm) and (3.2 mm) respectively. Also It showed that good properties to the depth of cure, of shrinkage, diameter for the samples. These materials are promising and good for use in dental fillings. The mechanical properties of resin composites advance with additional Nano Silica fillers. Low Nano silica and Nano graphene addition established more effective in improving mechanical properties compared to higher additions.

Keywords: *Silicon Dioxide Nanoparticles,GrapheneNanopowder, depth of Cure, shrinkage.*

Introduction

The field of regenerative medicine has made great progress in various disciplines in science from engineering, biology and medicine. Research has focused on improving the health of the patients through restoration of damaged or diseased tissues and organs. regenerative medicine is exquisitely focused on directing cellular behavior to evoke therapeutic clinical outcomes [1]. The success of dental cures depends not only on biological, chemical, physical, and pat ho physiological principles nonetheless also on the sufficient and precise knowledge of the mechanical properties of dental tissues and materials [2]. The valuation of the mechanical properties of dental tissues and materials is vital for increasing biocompatible dental materials to utilize in dentistry [3]. The quality of dental biomaterials has been enhanced by the emergence of nanotechnology. This technology manufactures materials with much better characteristic or by improving the properties of existing materials[4]. The science of nanotechnology has become the most popular area of research, currently covering a broad range of applications in dentistry [(5)]. Nanotechnology deals with the physical, chemical, and biological properties of structures and their components at nanoscaledimensions[(6)]. Nanotechnology is based on the concept of creating functional structures by controlling atoms and molecules on a one-by-one basis. The use of this technology will allow many developments in the health sciences as well as in materials science, biotechnology, electronic and computer technology, aviation, and space exploration. With developments in materials science and biotechnology, nanotechnology is especially anticipated to provide advances in dentistry and innovations in oral health-related diagnostic and therapeutic methods[(7)]. Science is currently undergoing a major evolution, taking humanity to a new era: the era of nanotechnology[(8)]. The application of nanotechnology to dentistry and the time that will be desired to implement the results of research into practice are the first questions that arise concerning nanotechnology in dentistry.The opportunity to witness the beginning of a pioneering advance in technology is

encountered scarcely[9]. According to the definition of the National Nanotechnology Initiative, nanotechnology is the direct doctrinaire of materials at the Nano scale[10]. This term defines a technology that enables almost complete control of the synthesis of matter at nanoscale dimensions. Nanotechnology will hand us the ability to arrange atoms as we desire, subsequently to achieve effective and complete control of the structure of matter[11]. The purposes of nanotechnology are to enable structural analysis in nanoscale, to understand the physical properties of structures in the nanoscale, to manufacture nanoscale structures, to develop nanoscale devices, and to create a link between the nanoscopes and macroscopic universes by inventing adequate ways[8]. Nanotechnology is established on the idea of creating functional structures by guiding atoms and molecules on a one-by-one basis. In general, nanotechnology is to understand as "the science of the small." in addition, in addition to creating small structures, nanotechnology includes innovative materials, devices, chemical, systems with physical, biologic properties that differ from those of large scale structures[12].

Restorative Composites: Nanotechnology has allowed the creation of nanofillerparticles[13]. which are added up individually or as clusters into composite resins. Silicon Dioxide,GrapheneNanoparticles offer composites a smoother surface and strength properties. Composite resins with nanoparticles are easier to handle and have more strength and abrasion resistance. composites with hybrid and microfilmed fillers are utilized in Resin containing nanostructured particles in a wider array [14].In recent studies, it was described how these nanoparticles completely Prevented the advance of Streptococcus Mutants bacteria, with an antibacterial efficacy that lasted for up to 3 months. It has been noting that no relevant alteration in terms of enamel lesions and crashes occurred after debracketing of orthodontic brackets bonded with flowable orthodontic composite as well as these with traditional orthodontic composite[15].

The aim of this study: The effect of adding Nanosilica and Nanographene preparation commercial method to the resin composition the mechanical properties.

Preparation of the Silicon Dioxide Nanoparticles: the nano-silica that preparation commercial method from the company US Research Nanomaterials Inc. measurement by XRD to corresponding the materials with calculating the average crystal size.

Preparation of the GrapheneNano powder: the GrapheneNano powder that preparation commercial method from the company SkySpringNanomaterials, Inc. measurement by XRD to corresponding the materials with calculating the average crystal size.

Methodology

In this study, the special type of stainless steel models was used by researchers (SaadiSharshabDiab and his group) [14]. This type of models is used to prepare samples suitable for the examination to be conducted:The study was carried out on the Composan LCM (Shade A1), which is highly transparent (more whiter than the rest of the varieties), which is subject to the comprehensive quality system (ISO 4049/2000). This substance is non-toxic of the type Overlay material in which the Micro Hybrid Composite and the manufacturer (PROMEDICA Domagkstr 24537 Neumunster / Germany).The model is forming of a cylindrical cavity with a diameter (6mm) and thickness (8mm). This model was used for the preparation of samples for the measurement.Measuring the weight ratio from the two nanomaterial's and Mix it with the Composan LCM (Shade A1) respectively.Fill the model with the mixture.Treatment The mixture by using the light emitting diodes for exposure periods (20 - 25-30) sec and Measuring the length and diameter for each of sample.

Result and Discussion

In this study Show that the increasing in effect at 0.02% gm at 30 sec with (4.15 mm) and (3.15mm) for nano-silica and nanographenerespectively. We verified the nanomaterial's capability in the mechanical properties of growing for the two materials. The structure of samples depends both on the Time of curing and ratios of add for the nanomaterials with resin composite. We note form X-Ray for silicon dioxide SiO2 Nanoparticles, we note that the angle diffraction is equal (2θ=11.5°), which is identical to the US Research Nanomaterial's Inc. The average crystal size is calculated using the equation (Debye - Scherer). The average crystal size (28. 16nm).Fig(1) The effect of the addition of Nano silica to the resin composite on the depth cure of the samples so we note that the depth at the lowest ratio is in the greatest value with the highest time. The effect of the material at a depth of up to the last (4.15 mm). It is obvious from figures(2) that the diameter increases, for the samples with increasing the time of light exposure because increasing time of exposure makes more monomers

convert to polymer, so this increasing in a number of the polymers make the polymerization process enhances and becomes better. We observe from Figure (2) and the figures (4) and (5) that increasing the ratio of the filler low the depth of cure. This result, because the nanoparticles restrain the light to enter inside the material due to conduction and valance bands of nanomaterial, are discrete levels not continuous as a result, for every wavelength from the light incident on the material, their must be at least, in the nanomaterial, a pair of levels, one of them in the conduction band and the other in the valance band such that the energy gap between these two levels corresponds the energy of wavelength falling, thus this energy gap will absorb this wavelength; Consequently, the nanoparticles, in the near region from the surface, absorb most of the wavelengths of incident light on the surface and doesn`t let them penetrate inside material. Fig(3,6).The values of shrinkage were added when adding Silica Nano and nanographene ratios to the resin composite. we note X-Ray for nanographene, we note that the angle diffraction is equal ($2\theta=12.5°$), which is identical to the US Research Nanomaterials Inc. The average crystal size is calculated using the equation (Debye - Scherer). The average crystal size 47.04nm.

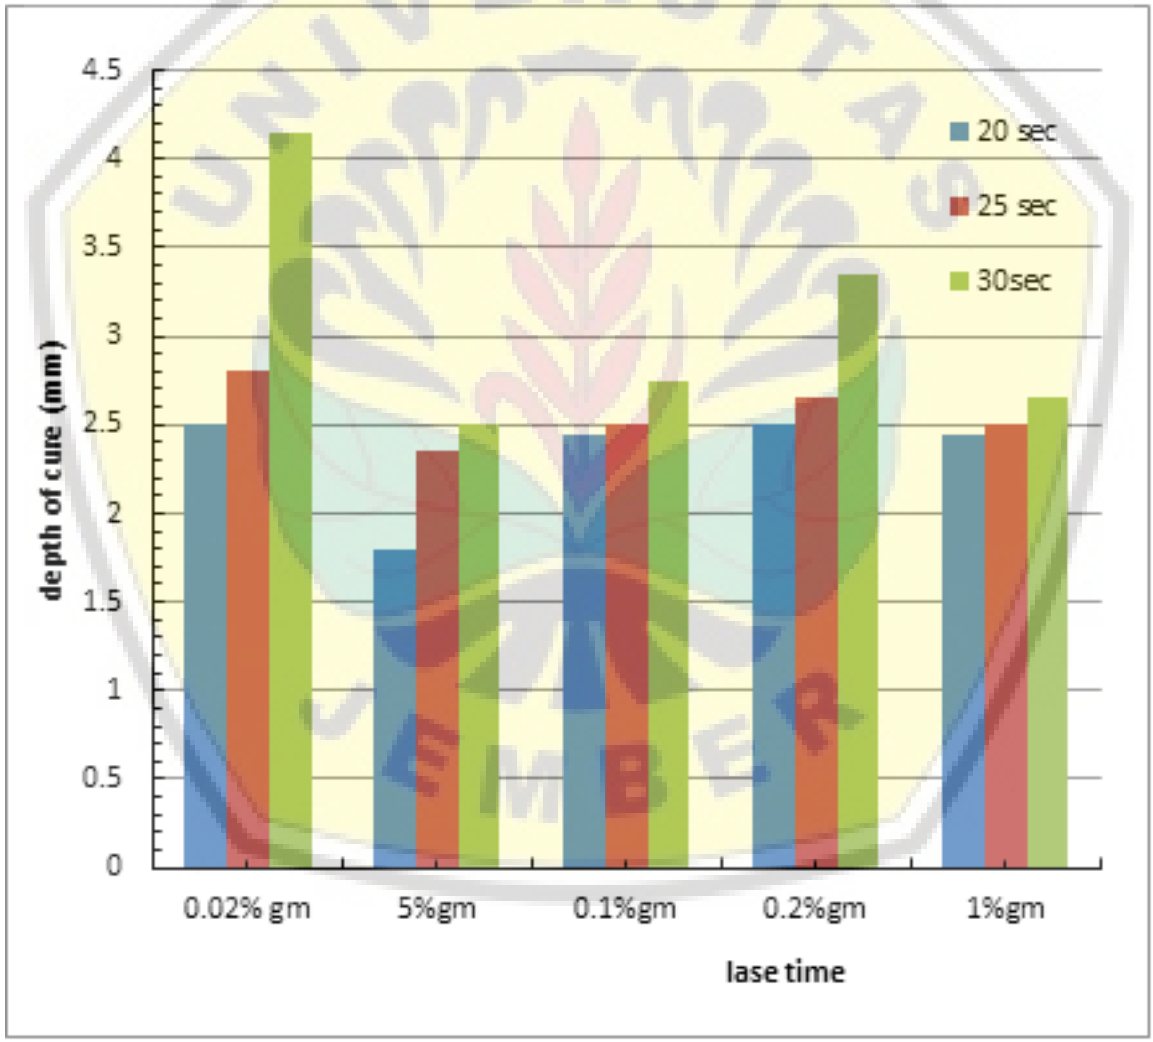

Fig 1:The Effect of Adding Silica Nano to the Resin composite on Depth of cure for the samples

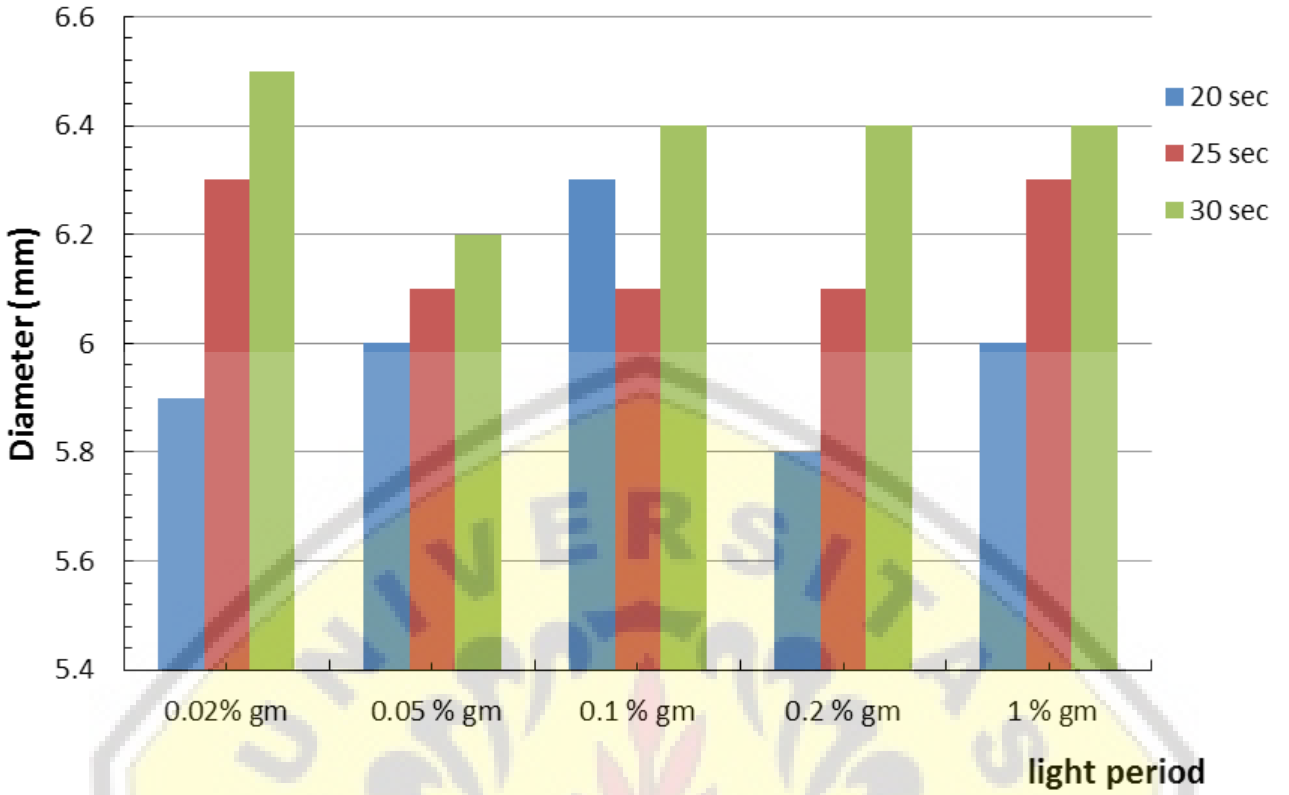

Fig 2: Effect of adding ratios of Silica Nano to the resin composite on the diameter values of the samples.

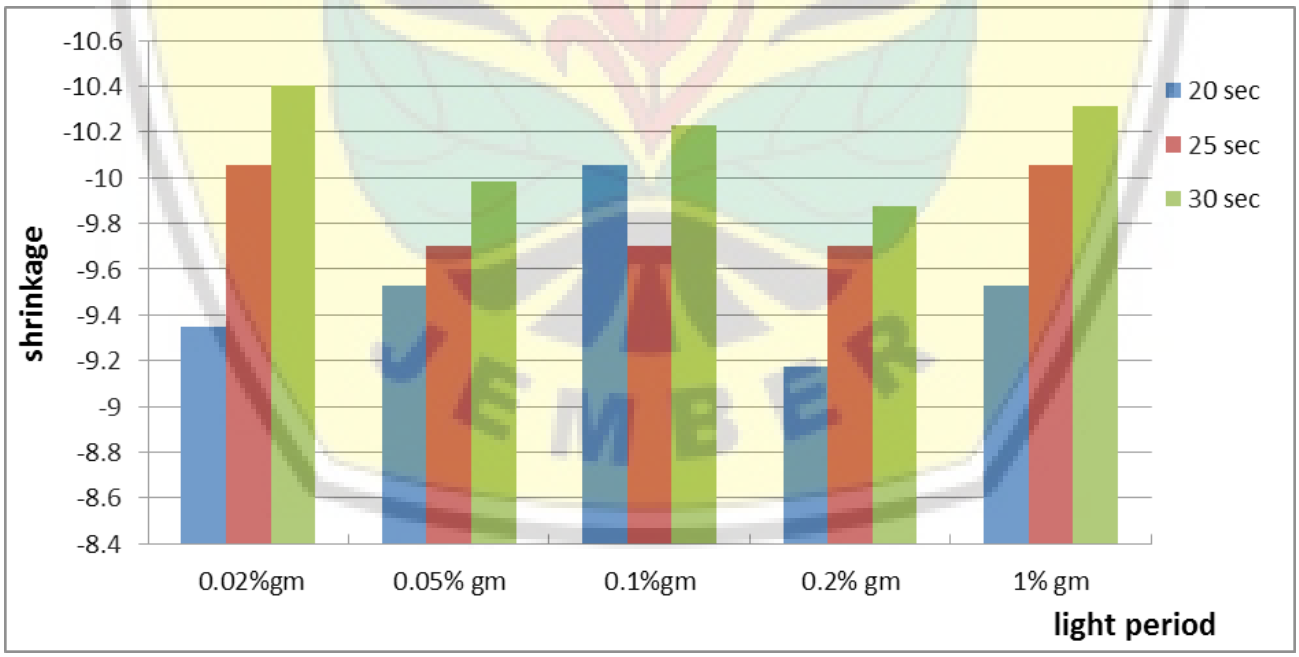

Fig 3: The values of shrinkage were added when adding Silica Nano ratios to the resin composite.

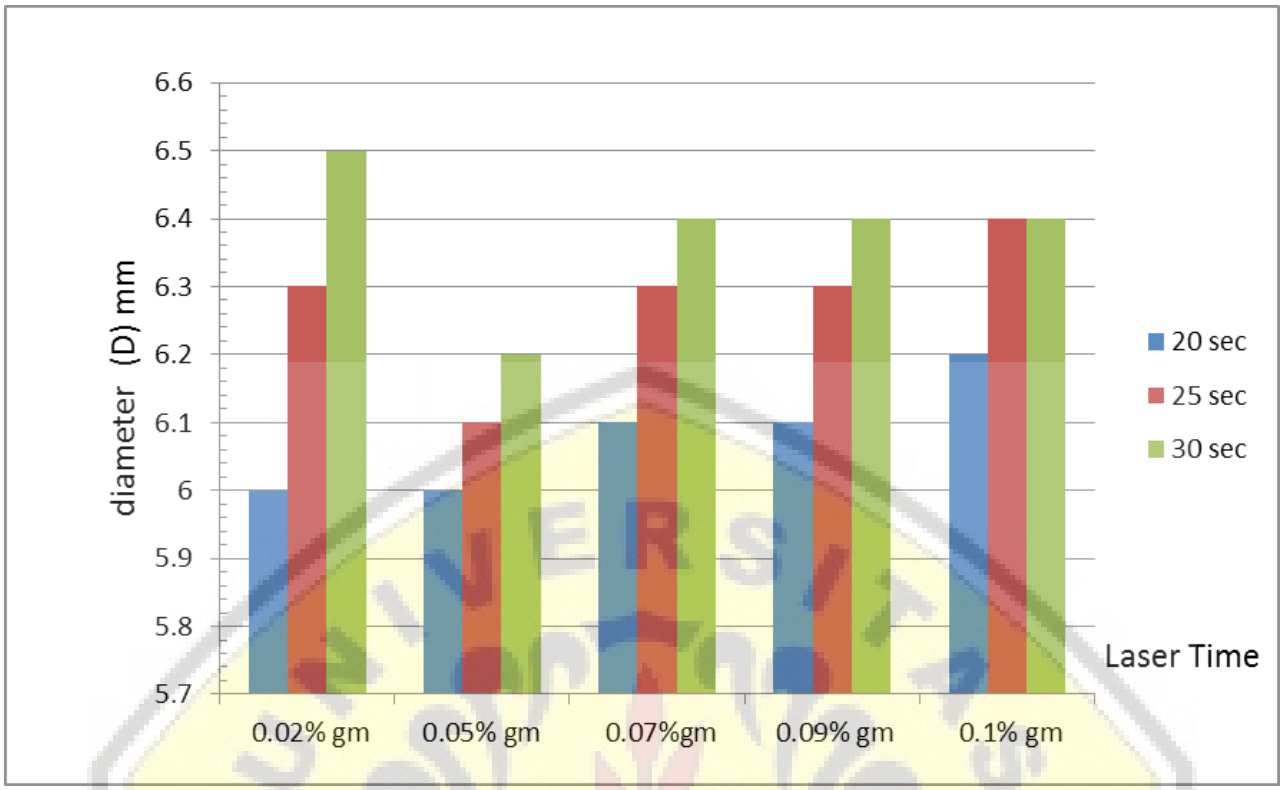

Fig 4: Effect of adding nanographene ratios to the resin composite on Depth of cure for the samples

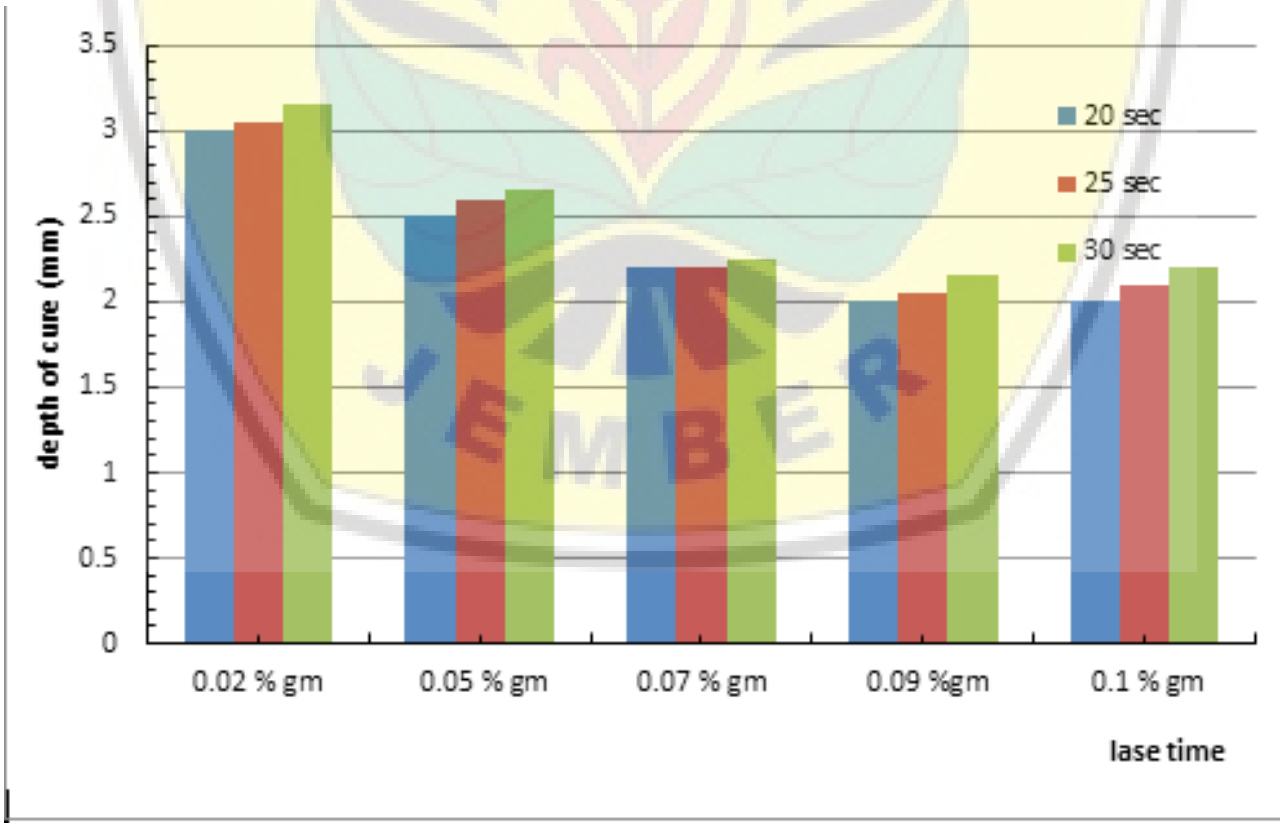

Fig 5: Effect of adding nanographene ratios to the resin composite on on the diameter values of the samples

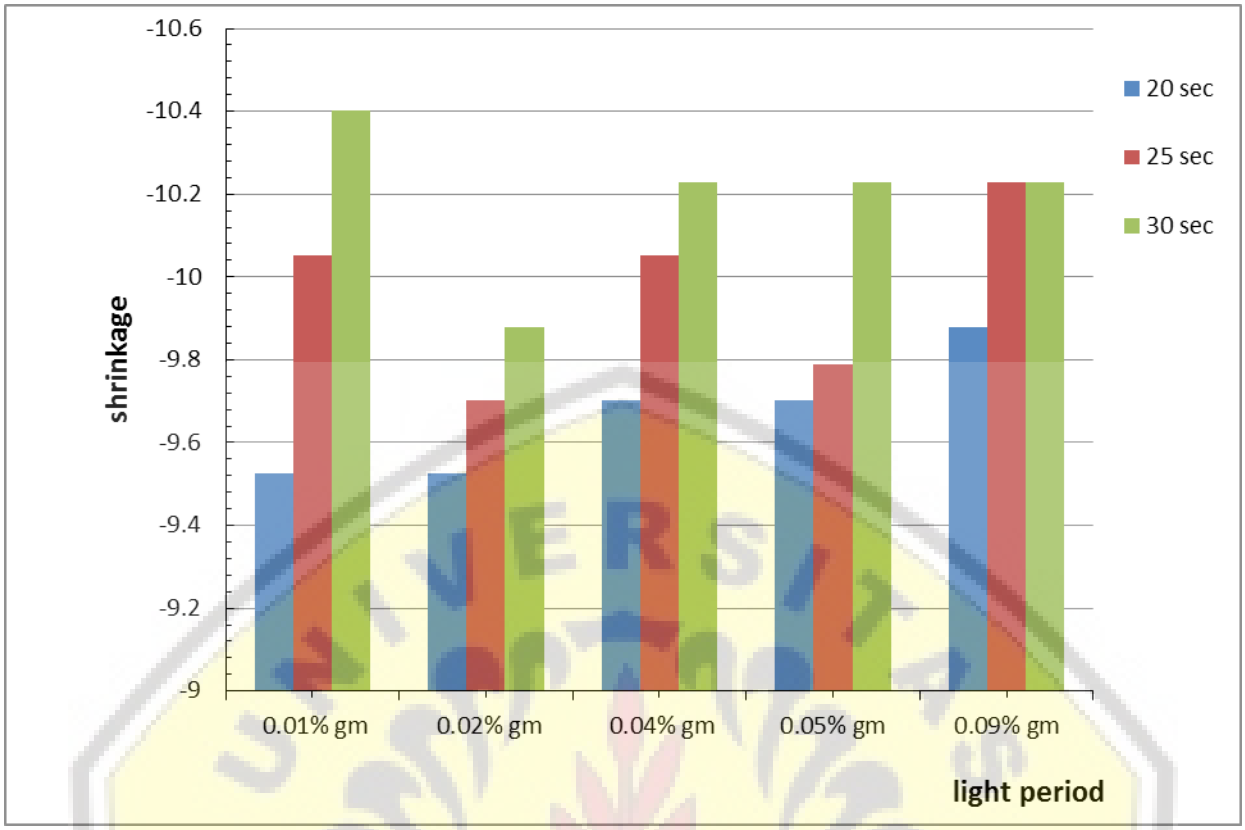

Fig 6: The values of shrinkage were added when adding nanographene ratios to the resin composite

Conclusion

According to the presented results obtained by analysis, the nanomaterial's it could be concluded that low nanomaterial's addition is more effective in increasing mechanical properties of modified composite resin samples, compared to upper nanomaterial's additions. Also, the diameter, shrinkage may be improved at a lower cost than if a higher nanomaterial's addition is considered. More effective reinforcement of the basic material with a lower amount of nanomaterials may be the result of agglomeration, which affects more the samples containing a higher mechanical properties. We conclusion that The depth of cure depends on several factors, including the composition of the composite composition, the type of fillers used in the composition of the overlapping, the size of the particles filler vol. In addition to the proportion of nanoparticles in the overlapping filler ratio. The reason for the difference in the depth of the hardness between the overlays is the non-symmetry distribution of light from the lamp, the nanoparticles are a thick powder (turbid powder) and this density of the particles constitute a barrier to prevent the passage of light or penetrate amount of nanomaterials. Other basic materials and nanoparticle type require careful optimization in term of nanoparticle concentration to achieve optimal

The Effect of Psychological Counseling Healthy Program in Improving the Cognitive Side from (Hardness to Flexibility) and Learning Some Basic Skills of Basketball

Ali Mutair Humedi Alkrizat[1], Mr. Karar Ali Mutair[2], Rasool Raheem Mashaf[1]

[1]Faculty of Physical Education and Sports Sciences, University of Maysan,
[2]College of Physical Education and sports Science, Almustansiriyah University

Abstract

Context: This study aims to build a psychological guidance program in improving the cognitive approach from hardening to flexibility among the students of the first stage in the Faculty of Physical Education and Sports Sciences at the University of Mays an for the academic year 2016-2017. It also investigates **to** identify the results of the scale and elasticity of the control and experimental groups in the tribal test. The study finds out that the differences between the control and experimental groups in the post-test.

Keywords: *Psychological guidance, Physical education, Sports sciences, Flexibility, Hardening.*

Introduction

Since the beginning of the second half of the last century, contemporary psychology has witnessed an increasing interest in cognitive processes in general and in the process of thinking in particular. Psychological counseling, as a science and art, seeks to provide psychological services to those individuals who have problems in their daily lives, whether these problems are on psychological, emotional, Academic level with a view to overcoming them, improving them, limiting their negative effects and consequences, and pursuing the individual's personal goals. The term Cognition refers to all the psychological processes through which the sensory input is transformed, shortened and stored in the person until summoned to be used in different situations. It is a process of reflection of reality and the restructuring and treatment of that reality in order to enable it to control these things. The method of knowledge as hardness and flexibility of the methods that's related to individual differences between individuals in how the performance of mental processes such as thinking, problem solving and decision-making, as individuals are hardened by responses which show the tendency towards definitive solutions that distinguish between right and wrong and these people seek absolute acceptance or absolute rejection that is not ambiguous. Individuals who are flexible have the ability to give a variety of mental responses that are commensurate with the complexity of the situation. Hardness cannot adapt to new situations in the throughout the game, or to changes in those situations. This inability to adapt makes the person in conflict with himself or with others, he is not accepting of those changes that are taking place around him, or very acceptable to them and is not immune to them or far from them. The game of basketball is one of the competitive team games, which occupies an advanced position in the attention and have millions of followers in terms of its spreading around the world and it certainly needs specific physical and technical requirements, so it needs to make great amount of effort and practice for the sake of learning and mastery so cognitive methods can have a big role As well as the recognition of the characteristics of learners who use cognitive methods plays a large role in the treatment of the phenomenon of individual differences between learners and reduce them, and the importance of research in identifying the impact of training exercises the same Which was prepared and organized on the basis of scientific in improving the cognitive side from hardness to flexibility and learning some of the skills of basketball from the scientific concept that indicates that the psychological programs that are prepared and organized is one of the means that determine the causes that lead to solving psychological problems in athletes

and It adopts psychological educational processes that seek to develop the skills of athletes, raise their abilities and address the problems and obstacles facing them

Research Problem: Basketball is a group game and the basis for successful performance depends on mastering its basic skills and the goal of any teacher is for his students to master these skills as many scientists and researchers emphasize the need to use cognitive methods and commensurate with the capabilities of students and their levels, especially those that develop the learners thinking and perception in order to discover The facts associated with learnt skills and the achievement of better learning, the problem of research is that there are many learners who are characterized in their behavior during the units of education in the form of hardness, and therefore the emergence of difficulties in learning the skills of this effectiveness, Since this method is concerned with the degree of consistency that characterizes the person in the use of information in a variety of positions and reflected in the issuance of the extreme and rigid beliefs and resistance to change as well as intolerance to others, so researchers tried to address the phenomena of this method through a program of rational - psychological that was intended to improve the knowledge From hardness to flexibility as well as learning basketball skills.

Research Hypotheses: There were no statistically significant differences between the mean scores of both the experimental and control groups at the level of sclerosis on the test. There were no statistically significant differences between the mean scores of both the experimental and control groups in learning the skills of the basketball in question.

Methodology

Research Methodology: The researchers used the experimental approach to suit the nature of the problem and to achieve the objectives of the research. The experimental approach is the closest approach to problem solving research. It is an attempt to control all the basic factors affecting the variable or the dependent variables in the experiment except one factor that is controlled and modified by researchers with a view to identifying and measuring its impact on the variable or dependent variables"

Experimental Design: Researchers should select appropriate experimental design to test the validity of hypothesized results. The choice of experimental design depends on the nature of the study and the conditions under which it is conducted. Therefore, the researchers adopted the design of the two experimental and pre- the effect of the independent variable on the dependent variable by comparing the results of the two-dimensional tests of the control and experimental groups. The independent variable as psychological-training exercises is applied to the experimental group while the control group is left to take its previous standard approaches without the indicative program.

Steps in the implementation of the experimental design: Apply the scale of the cognitive method as hardness and flexibility to the students of the first stage for the purpose of selecting the sample of the research of students who are characterized by the method of hardness and recording the results of all testers who are characterized by this method.

The research community and its sample: The sample is "a part of the society in which the study is conducted and selected according to special rules to properly represent the society." The research community included students in the first stage of the theoretical sciences for the academic year 2016-2017; 30 students per class. The researchers chose 20 students who are characterized by solidity, i.e. 10 students from each department. They represent 33.33% of the total number of students in this stage and after applying the cognitive standard as hardness and flexibility on the students of this division and before their distribution into two groups that have homogeneity in the variables as length, mass and age, the torsion coefficient of the homogeneity variables was found to be between ± 3.

The researchers then distributed the sample to two groups in the lottery method, as follows: - The experimental group 10 students who were characterized by hardness. The researchers tested the tribal skills in the studied subjects and then applied the psychological guidance exercises for 8 weeks after they were carried out after tests in the cognitive scale as Rigidity - flexibility and in the technical tests. - The control group 10 students who are hardened by the researchers Tribal tests in the skills studied and then applied the curriculum applied by the teacher of the article and for a period of 8weeks after the post-tests were carried out in the scale of knowledge as hardness - flexibility.

The equivalence between the two groups of research: that equivalence is the equality between the

members of the group or groups in the search variables, an attempt to reach a single point of entry before entering the search and investigation and for this researchers performed the process of equivalence of the variables in search using the appropriate statistical means, and there were no differences between The sample in the search variables means that the sample has started from one starting point.

Determining the Search Variables: The research required the use of a method of measuring the methods of as hardness - flexibility to measure the individual differences between students as it's one of the cognitive methods, and the appropriate measure of this study is the measure designed by [1]. As used by many researchers in the field of sports and the scale consists of 56 paragraph, as the researchers presented to a group of experts and specialists put before each paragraph a five-response scale. I strongly agree, agree, between approval and not, I disagree, I totally disagree), and grades were given according to this gradient 5 degrees to high and 165 degrees and below flexibility from 166-184 were characterized by moderation and 185 degrees and above were hardened.

Identification of the basic skills: Since the researchers are a teacher of basketball for all four stages, so he chose the skills that are taught to the students of this first stage: - The accuracy of the chest handling. - The velocity of the plump. - The front shooting towards the basket. According to his long experience in basketball, he was a player, trainer, teacher and referee who chose the appropriate skills tests.

Specification of the technical tests: Test the accuracy of the chest handling: 1The velocity of the plump: 2 Test the front shooting towards the basket: 3

The Main Experiment: Pre-measurement: The test sample was tested for cognitive and skill testing on Sunday, 20/11/2016. The orientation program: The guidance program included the alleviation of the knowledge-based method as rigidity-flexibility. The researchers adopted this program extension sessions with a month and a half in 6 sessions.

Post-Measurement: The test sample was tested for cognitive and skill testing on Wednesday, 25/1/2017.

Statistical Method: The researchers used the statistical file of the spss system.

Table 1: Statistical parameters of the results of the pre and post tests of the variables under study for the experimental group members

S	Statistical Milestones Variables	Unit	س̄		±ع	
			Pre	Post	Pre	Post
1	accuracy of the chest handling	Number	10.4	16.4	1.43	0.70
2	The velocity of the plump	Second	13.49	12.68	0.55	0.88
3	front shooting on the basket	Number	9.2	14	1.40	1.33
4	Scale (Hardness - Flexibility)	Degree	207.6	173.1	7.07	2.08

From the results of Table 1, which shows the results of the members of the experimental group in the skills studied, it was found that in the test of the accuracy of chest handling, the mathematical mean for this test in the pre-measurement was 10.4 and its standard deviation 1.43 while in the post-measurement the mathematical mean was found to be equal to 16.4 with a standard deviation of 0.70.

Table 2: Statistical parameters and the calculated value of (t) between the pre and post measurements of the experimental group members

S	Statistical Milestones Variables	ف س̄	ف ع	The calculated value of (t)	The table value of (t)	Significance level
1	accuracy of the chest handling	2.2	0.92	7.59	2.26	Significant
2	The velocity of the plump	1.12	0.25	14		Significant
3	front shooting on the basket	1.8	0.63	9		Significant
4	Scale (Hardness - Flexibility)	32	8.63	11.72		Significant

The results of Table 2 show the results of the use of T test between the pre and post measurements of the experimental group members in the examined tests.

Results of Control Group:

Table 3: Statistical parameters of the results of the pre and post tests of the variables under study for the control group members

S	Statistical Milestones Variables	Unit	س-		±ع	
			Pre	Post		Pre
1	accuracy of the chest handling	Number	10	12.6	1.15	0.84
2	The velocity of the plump	Second	13.86	13.53	0.41	0.90
3	front shooting on the basket	Number	9.10	12.6	1.73	1.56
4	Scale (Hardness - Flexibility)	Degree	207.3	184.1	4.69	2.56

From the results of Table 3, which shows the results of individuals in the control group in the studied skills, it was found that in the test of the accuracy of chest handling, the mathematical mean of this test in the pre-measurement was equal to 10 and its standard deviation 1.15.

Table 4: Statistical parameters and the calculated value of (t) between the pre and post measurements of the control group members

S	Statistical Milestones Variables	ف -س	ف ع	The calculated value of (t)	The table value of (t)	Significance level
1	accuracy of the chest handling	0.6	0.52	3.75	2.26	Significant
2	The velocity of the plump	0.33	0.32	3.3		Significant
3	front shooting on the basket	0.7	0.48	4.67		Significant
4	Scale (Hardness - Flexibility)	23.2	6.93	10.59		Significant

The results of Table 4 show the results of the use of T test between the pre and post measurements of the control group in the examined tests. As shown in this table, in the test accuracy of chest handling, the calculated value T was 3.75 which is greater than the value of T of the table at the degree of freedom 9 and under the level of significance 0.05, which is equal 2.26.

Table 5: Statistical parameters and the calculated value (T) between the two dimensions of the experimental and control groups

S	Statistical Milestones Variables	Experimental Group		Control Group		The calculated value of (t)	The table value of (t)	Significance level
		س	ع	س	ع			
1	Accuracy of the chest handling	16.4	0.70	12.6	0.84	10.27	2.10	Significant
2	The velocity of the plump	12.68	0.88	13.5	0.90	1.95		Random
3	Front shooting on the basket	14	1.33	12.6	1.56	2.60		Significant
4	Scale (Hardness - Flexibility)	173.1	2.08	185.1	2.56	2.15		Significant

Table 5 shows the values of the calculated T between the two dimensions of the two groups of research, as shown in this table that the value of T calculated between the two dimensions in the test as accuracy of chest handling was equal to 10.27, Which is greater than the value of T of the table that's equal to 2.10 at the degree of freedom 18 and the level of significance 0.05, indicating the existence of significant differences between the results of the two groups and for the benefit of the experimental group. The value of T calculated between the two-dimensional measurements in the test of the velocity of the plumps was 1.95, which is smaller

than the value of T of the table2.10 at the degree of freedom 18 and the level of significance 0.05, indicating the absence of differences.

Discussion

Through the previous results, we find that the results of the experimental group that applied the exercise as psychological guidance were better than the results of the control group that worked according to the teacher's curriculum, as It is clear that all the values of the calculated T between the pre and post measures of the technical tests as well as the scale of hardness - Flexibility are greater than the value of T of the table, indicating that the psychological - guidance exercises have had a significant impact on this development. "This is why the psychological aspect is one of the main and essential pillars in the process of preparing psychological programs for the player's numbers in all aspects Physical, mental, planning and psychological"[2]. Although coaches and psychologists are trying to reach high levels of players and develop their skill and planning ability and to benefit from the potential of the players to get the best results. This applies to flexible dimension specifications in the cognitive method hardness. This is confirmed by [3]view that "individuals with a flexible dimension have the ability to reflect on new situations, changing problems and the ability to change thinking towards a particular solution" [4]. The researchers, based on his long experience in the field of basketball, believe that the skills in question need to be focused, timing and accuracy.

Conclusion

Effectiveness of the guidance program in alleviating the hardness and flexibility of the students of the Faculty of Physical Education and Sports Sciences - Phase I - University of Maysan. The guidance program's vocabulary led to a positive change from hardness to flexibility than it was before application. The program has a clear impact on learning some of the basic skills of basketball, including the various psychological concepts of the research sample. Dissemination of the results of the current study to students of faculties of physical education and sports sciences in Iraqi universities. Conduct training programs similar to the current program on a variety of samples of both genders taking into account the other basic skills of basketball.

Isolation and Identification Some Bacterial Causes of Infections of Wounds and Burns form Patients in Salah al-Din General Hospital and Test Some Vegetable Oils Activity

Omar Ahmed Abdulkadir[1], Mahmood Khalaf Saleh[2]

[1]Department of Biology, College of Education for Pure Sciences, Tikrit University, Salahaddin, Iraq

Abstract

Context: The current study included the collection of 117 samples from wounds and burns from patients lying in the Salah al-Din General Hospital in Tikrit for the period from December 2017 until March 2018, 93 of them showed a positive growth and 24 were negative growth, and the developing colonies were identified with a number of chemical tests. Identification was confirmed using the VITEK2 Compact system. A total of 128 bacterial isolates were distributed among 80 isolates of Gram negative bacteria, including 9 bacterial species (E. col, K. pneumonia, P. mirabilis, Morganellamorganii, Pseudo. Aeruginosa, Entero. Cloacae, Raoultellaornithinolytica, Pseudo. Fluorescence, Stenotrophomonasmaltophilia)and 48 were Gram positive bacteria involving 5 bacterial species(Staph. Aureus, Staph. Epidermidis, Staph. Haemolyticus, Kocuriarhizophila, Staph. Capitis).A susceptibility test has been performed for isolates of some antibiotics where it has been found that antibiotics (Ofloxacin, Tetracycline, Amikacin) the highest efficiency towards the isolates of negative bacteria, and antibiotics (Ciprofloxacin, Penicillin) is more effective towards positive bacteria isolates. We have also tested the activity of some plant oils (Sesame, Fenugreek, Black seed) towards bacteria isolated for four concentrations from each oil (100%, 75%, 50% 25%)The results indicated that the highest activity was for black seed oil, Sesame oil and fenugreek oil respectively.

Keywords: *Patients, Ofloxacin, burns, Tetracycline.*

Introduction

Health-care facilities such as hospitals, nursing homes and outpatient clinics are major causes of infection of many pathogens despite the significant development of sterilization techniques and materials used for one-time.In the statistics of (CDC) the rate of infection associated with health care has increased by 36% over the past 20 years. One of the most important pathogens is the Normal Flora in the human body is opportunistic and poses a risk to patients in hospitals especially individuals whose immunity has been weakened by illness or treatment. Among the bacteria that are commonly isolated in the hospital environment are *streptococcus* bacteria, *Pseudomonas aeruginosa*, *Enterococcus* and *E. coli.* [1, 2].

As a result of the increased and indiscriminate use of drugs to treat microbes, many strains of these microbes have evolved and they have become resistant to these medications and therefore studies have increased in recent years to find more effective and safe alternatives to medicines. For the time being, a lot of new research has been conducted on plants to find natural remedies works to strengthen immunity and overcome microbial resistance to antibiotics. Where it was found that metabolic processes in the parts of plants such as roots, leaves and seedsproduce secondary compounds and these compounds may be medically effective[3].

The aim of this research is to isolation and identification some species of bacteria from wounds and burns in the patients in Salah al-Din General Hospital and test the activity of sesame seed, fenugreek and black seed oils that may contribute to the creation of alternatives to antimicrobial agents such as antibiotics.

Material and Method

Collection of Plant Samples: In this study, seeds were used for three types of commonly used plants which are*Sesamumindicum L., Trigonellafoenum-graecumL.*and*Nigella sativa*which was obtained from the local markets.

Extraction of Essential Oils: Oils were extracted from plant seeds using a saxholet device where they took weight of 50g of each type of seed separately grinding has been crushed by a clean sterile mill, The n□ Hexan used as a solvent by adding 250 ml of it and then turn on the device for 4 hours, Then the oil was separated from the solvent using the device Rotary evaporator the temperature was set at 40°Cto ensure no chemical change in the extract and it lasted for 30 minutes where pure oil was isolated. Four oil concentration were prepared (100%, 75% 50%, 25%)using material Dimethyl Sulphoxide (DMSO). The resulting oil is finally stored in the freezer with sealed plastic containers with each oil information written on it [4].

Sample Collection of Patients: 117 samples of patients were collected from Salah al-Din General hospital in Tikrit using a cotton swab for the period from 13 December 2017 to 21 March 2018 of patients with wounds and burns residing in the hospital where 90 sample of wounds and 27 samples of burns were collected for both genders for ages ranging from 1-65 years.

The samples were then transported directly to the hospital laboratory and cultured on Blood agar and Macon key agar that Pre-prepared and incubated at 37ºC for 24 hours. The growth on the culture media was then observed,the isolates were then purified by taking one colony for each growth and re cultured them on new media and stored in the refrigerator for Identification.

Identification: The initial identification was by using Gram stain after which several biochemical tests were performed on the obtained isolates, these tests were :(Catalase, Oxidase, Urease, Mannitol, Coagulase, Hemolysin, Motility, Methyl Red, Citrate Utilization, Vogasproskaur, Indol test, H2S, Lactose, Glucose, Swarming). Then was used device VITEK 2 compact System as instructed by BioMérieux Company which manufactured the device to confirm the results of the identification obtained from previous tests.

Susceptibility test: Twelve commonly antibiotics were used and described in the table (1) by using the propagation method where bacteria have been cultured on Muller-Hinton Agar antibiotic discs were distributed at 6 discsper petri dish and incubated at 37 ºC for 24 hours and the resistance was determined by measuring the inhibition zone by the ruler as mentioned in[5].

Result and Discussion

The current study included isolation and identification 117 samples from wounds and burns from patients residing in Salah Al-Din General Hospital, bacterial growth was positive in 93 isolates (79.5%), 41 were isolated from females and 52 from males infections included: burns, burns a variety of different degrees, wound while infections included: (Surgery, Explosive injuries, Injury to diabetes feet and other injuries), While 24 isolates (20.5%) of the samples was negative growth on culture media, The total number of bacterial isolates obtained was 128 pure culture, as some of the samples obtained were mixture of growth, 80 (62.5%) isolates was negative to the Gram stain and 48 (37.5%) isolates was positive to Gram stain, as shown in table 2.

Table 1: antibiotics used in the study

Table 2: number and percentage of samples broken down by source

Source samples		Positive isolates of Gram stain		Negative isolates of Gram stain		Total (%)
		Number	%	Number	%	
Wounds	Surgery	45.16%	14	54.83%	17	31 (24.21%)
	Explosion	37.03%	10	62.96%	17	27 (21.09%)
	diabetes feet	16.66%	2	83.33%	10	12 (9.37%)
	Other injuries	46.42%	13	53.57%	15	28 (21.87%)
Burns		30%	9	70%	21	30 (23.43%)
Total (%)		48 (37.5%)		80 (62.5%)		128

Gram positive bacteria were included(5) species (Staph. Aureus, Staph. Epidermidis, Staph. Haemolyticus, Kocuriarhizophila, Staph. capitis),*Staph. aureus* was the highest isolates with 21 isolates (43.75%), the reason is that bacteria are present in 10-30% of the population where they are present naturally under the armpits and in the cavities of the nose and between the thighs so it can therefore easily be transmitted to the skin by sneezing, touching, etc [6]. The isolation ratio of these bacteria was close to that of the researchers[7, 8], where they were recorded that the dominant species on other isolates was *Staph. aureus*.Followedby *Staph. Epidermidis*(17),*Kocuriarhizophila*(2), *Staph. Capitis* (1). Whilegram negative bacteria were (9)species which are*E. coli, K. pneumonia, P. mirabilis, Morganellamorganii, Pseudo. Aeruginosa, Entero. Cloacae, Raoultellaornithinolytica, Pseudo. Fluorescens, Stenotrophomonasmaltophilia*. The most important among them were *E. coli*there were 22 isolates (27.5%) as it is predominantly transmitted from the urethral and anal regions of the patient to the affected areas of the skin they are overwhelmed bymany Virulence factors such as motility, adhesion, fimbriation, k-antigen content, colonization, and others{9}.Followed by bacteria*K. pneumonia* (18), *P. mirabilis*(14), *Morganellamorganii*(10), *Pseudo. aeruginosa*(6), *Entero.cloacae*(5),*Raoultellaornithinolytica*(2),*Pseudo. fluorescens* (2) and *Stenotrophomonasmaltophilia*(1). The rate of isolation of *E.coli*has been agreed with the ratio that appeared in the study [10, 11]with little variation in insulation rates, and differed with the spelling of the researcher[12] where they were *Pseudo. Aeruginosa*are prevailing.Scientific studies indicate that there is a difference in the rates of isolation of bacteria, which may be due to differences in the seasons of collection and number of samples and the cleanliness of the place where the patient and the period of his presence in the hospital and other factors affecting the isolation.

The results of the sensitivity test against the antibiotics used in Table (1) showed different resistance as shown in Tables (3) and (4).

Table 3: the percentage of resistance of Gram positive bacteria to the antibiotics used

60%	55.5%	100%	0	100%	20%	0	85.7%	45.4%	Tetracycline	8
80%	27.2%	100%	50%	100%	90%	100%	100%	86.3%	Cefpodoxime	9
0	88.8%	100%	100%	100%	30%	0	78.5%	100%	Penicillin	10
20%	72.2%	66.6%	100%	0	40%	100%	64.2%	73.7%	Ciprofloxacin	11
40%	16.6%	83.3%	0	100%	100%	0	71.4%	31.8%	Ofloxacin	12

The results showed that the vegetable oils used had positive results in inhibitiongrowth of bacteria isolates studied at different percentage as shown in table (5) above, Black seed oil was the most effective on the bacterial species mentioned previously, of which bacteria *Staph. haemolyticus* were the most affected that showing the highest diameter inhibition of 24mm at the concentration of 50%,and20mm at the concentration of 100%. Followed by*Kocuriarhizophila*with 20mm inhibition at 50% concentration, followed by *Staph. capitis* with a diameter of 16mm inhibition at 25% concentration, while it was not affected with (*Entero. cloacae, R. ornithinolytica, Pseudo. aeruginosa,* and *Steno. maltophilia*) any impact by oil.

Sesame oil ranked second in inhibiting bacterial growth, giving the highest diameter inhibition of 18 mm at concentration 25% followed by *Staph aureus*. And *Pseudo. aeruginosa* 16mm at 25% concentration. A decrease in bacterial growth inhibition was observed with increased oil concentration.

Fenugreek seed oil had the least inhibitory effect compared to other oils,where it was effective against bacteria *E. coli* at 25% concentration was 10 mm inhibition diameter, and effective against bacteria *Staph. Aureus*at the same concentration as 16 mm diameter, and effective with bacteria*Pseudo. aeruginosa* with 12 mm inhibition at 25% concentration as well, and bacteria*Proteus mirabilis* with 4 mm inhibition at 50% concentration. Other bacterial species did not show any impact on oil.

The obtained results showed the active role of oils used to inhibit the growth of isolated bacterial species due to the active compounds such as alkaloids, tannins, flavonoids, steroids, etc., known for their biological efficiency, as the tannins work to prevent the synthesis

of bacterial cell protein by forming complexes with cell wall proteins which is rich in proline, as well as the breakdown of structures on the bacterial cell wall[13, 14]. We also note that flavonoids and phenols have an effective role in stopping the growth of bacteria as they interfere with the proteins leading to the protein mutant and thus inhibiting the enzymes involved in the basic metabolic reactions this inhibits the growth of bacteria. Phenols can inhibit the force of the proton movement (PMF), causing leakage of cellular components, enzyme metabolism, electrons transfer, and cytoplasmic clotting[15,16].

The results obtained from the study can explain that the vegetable oils used have worked like the work of manufactured antibiotics, The study of the inhibitory effect of oils was in conformity with the scientific articles and recommendations of the World Health Organization (WHO) which called for the use of medicinal plants as an alternative to antibiotics manufactured for their high content of active compounds of pharmaceutical importance and not containing harmful side effects of host cells.

Abstract

Context: One form of health promotion for school students is the school health program in every region in Indonesia. The purpose of School Health according to the Ministry of Education and Culture in 2012 is to improve the quality of education and student achievement by improving the quality of clean and healthy life and health status of students and creating a healthy environment. This research was conducted using qualitative descriptive methods with the aim of developing a model of implementing school health programs. Respondents in this study were students from junior high schools managed by the government and junior high schools managed by private parties implementing school health programs. The results of this study are expected to support existing models by improving school health management through a systems approach so that students can improve their performance through improving clean and healthy living behaviors and a healthy environment.

Keywords: *Health promotion, health school, development, junior high schools, systems approach.*

Introduction

School-age children are faced with very complex and diverse health problems. Various kinds of health problems arise in elementary school-age children, but problems that are commonly associated with healthy living behavior (Nugraheni, 2019)[(1)]. While for middle school and high school age children, the problem is related to risky behaviors such as drug abuse (Narcotics, Psychotropic and other addictive substances), unwanted pregnancies, unsafe abortion, sexually transmitted diseases (STDs), including HIV / AIDS, adolescent reproductive health, accidents, and other trauma (MOH, 2004)[(2)].

Efforts to foster school-age children can be done through the School Health program in every region in Indonesia. The School Health is one vehicle for improving student health status (Nugraheni, 2019)[(1)]. The target is students and other school communities with the aim of improving students healthy life skills. School health services that involve all relevant parties such as students, families, and community service providers, school nurses and school doctors play a more complex role to prevent, facilitate and handle health problems to improve the education of all students (Kolbe, 2019) [(3)]. So students can learn, grow and develop optimally and become quality human resources. According to Suliha (2002) the aim of School Health is to improve the ability of healthy living and the health status of students as early as possible and create a healthy school environment so as to enable harmonious and optimal growth and development of children in the context of quality Indonesian human formation[(4)].

Based on the Principles for the Development School Health that have been determined by the government,

School Health has three main programs known as "TRIAS UKS". The three programs include health education, health services and fostering a healthy school environment. School Health activities must be carried out at all levels of education, from the level of kindergarten, elementary school, Junior High School (JHS) to Senior High School (SHS) and vocational education, both under the guidance of the Ministry of National Education and the Ministry of Religion, including Islamic boarding schools and out-of-school education channels (MOH, 2004)[2].

The fundamental problems that occur in the development and development of School Health include: Clean and Healthy Life Behavior has not reached the expected level, the existence of health problems in school-age children, limited human resources, available facilities and infrastructure, lack of optimal coordination between agencies, lack of the optimal role of the School Health Advisory Team, as well as the limited rules and regulations governing the management of School Health (Ministry of Education and Culture, 2012)[5].

The implementation's problem of School Health in Banyuwangi is not much different from the problems raised by the Ministry of Education and Culture. Strong effort and solid cross-sectoral cooperation are needed to implement the School Health program in accordance with established legislation so that the benefits of implementing the School Health program such as the realization of healthy schools and the creation of the next generation that are physically, mentally and spiritually healthy for a prosperous life.

Based on these conditions, it is necessary to take concrete steps to optimize the implementation of the School Health program, especially in service activities. So the need for innovation in the development model of the School Health program in an effort to improve the health of JHS students in Banyuwangi. The development innovation was carried out by optimizing all elements in the School Health program service and integrated with teaching and learning activities in schools. So as to be able to create personal students who have the ability and awareness of the importance of health.

Material and Method

This research use descriptive qualitative approach. This approach is used with the aim of delving deeply into the knowledge, opinions, opinions and views on the current implementation of the School Health program and exploring more information about the partnerships that have been built in optimizing the implementation of the School Health program. Data collection was carried out in four JHS in Banyuwangi which consisted of two public JHSs and two private JHSs for three months, starting April - June 2016. This study used in-depth interviews and FGD methods conducted through several stages, namely situation analysis and primary data collection.

The variables of this study consisted of the characteristics of the informants, the knowledge of the informants, opinions, and views of informants about the implementation of School Health, management of School Health implementation, obstacles experienced, strengths possessed, future expectations regarding the implementation and utilization of School Health specifically implementing "TRIAS UKS".

Findings: There are three main activities of the School Health activity that are commonly known as the "TRIAS UKS". School Health is a form of health promotion and education efforts in the school environment. In modern school health programs include 10 interactive components such as health education, physical education and physical activity, environmental and nutritional services, health services, counseling, psychological and social services, physical environment, social and emotional climate, family involvement, community involvement, and health employee (Kolbe, 2019)[3]. For this reason, the implementation of School Health is based on the awareness of increasing the welfare of the school community in particular. In terms of this, School Health has an important role in health development in schools to prepare a healthy, smart and prosperous generation.

A. Implementation of the School Health Middle School Program in Banyuwangi Regency: To achieve School Health goals, promotive, preventive, curative and rehabilitative efforts are carried out as early as possible in accordance with the "TRIAS UKS", such as:

1. **Health Education in School:** Health education is a dynamic process of behavior change, where the change is not just the process of transferring material or theory from one person to another and not a set of procedures, but these changes occur because of the awareness of the individual, group, or society itself (Wahid IM & Nurul C, 2009: 9-10)[6]. The health education program must also emphasize

behavioral change skills, such as goal setting and self motivation, to positively impact students' physical activity behavior (Dai, 2019)[7]. The results of the study show that in most of the JHS in Banyuwangi have implemented School Health programs in the field of health education such as:

a. Increase knowledge, behavior, attitudes and skills for a clean and healthy life.

b. Planting and habituating clean and healthy life and deterrence of bad influences from outside.

c. Cultivating a healthy lifestyle so that it can be implemented in everyday life.

In addition, health education can be carried out through intracurric and extracurricular activities. The intracurric activity is a part of the school curriculum such as health science subjects, physical education and health subjects or subjects that can be inserted in health sciences. While extracurricular activities are health education that can be included in activities outside of school hours in order to instill student's healthy behavior.

2. School Health Services: School Health service activities are minimum standard service activities in schools. Health services can help health education for students (Giri, 2018)[8]. Not only the provision of material and information to students regarding their health, but also practice through relationships with health workers. School health also services include regular health examinations, open-door clinic, acute medical care for minor symptoms or injuries, some specialist care as well as the promotion of wellbeing and safety at school (Kivimaki, 2018)[9]. The results of interviews with School Health services can be seen that the information stated that there were services provided by School Health in schools. The implementation of School Health services in Banyuwangi includes:

a. Early Growth and Stimulation Detection and Intervention

b. Health screening and periodic health checks

c. Dental and oral examination and treatment.

d. Development of Clean and Healthy Life Behavior

e. First Aid In Accident / First Aid In Disease

f. Provision of immunization

g. Physical Fitness Test

h. Eradication of Mosquito Nest

i. Adding blood tablets

j. Giving worm medicine

k. Use of the school yard as a family medicine park / live pharmacy.

l. Health education and counseling

m. Guidance and supervision of healthy canteens

n. Nutritional information

o. Post-illness recovery

p. Health referrals for public health center/hospitals.

3. Development of a Healthy Environmental Life: The development of the school environment aims to create a healthy environment in the school that allows every citizen of the school to achieve the highest degree of health in order to support the achievement of a maximum learning process for each student (Ministry of Education and Culture, 2012)[5]. Fostering a healthy school environment includes:

a. Implementation of cleanliness, beauty, comfort, order, security, longing and kinship.

b. Development and maintenance of environmental health including smoke free, pornography, psychotropic narcotics and other addictive substances and violence.

c. Fostering cooperation between school communities.

Based on the explanation above, the "TRIAS UKS" activities have run quite well, although not yet as a whole. The School Health implementation team is still focused on the "TRIAS UKS" activities and the fulfillment of School Health facilities and infrastructure, in addition to the rather heavy extracurricular activities in JHS.

B. Model of School Health Program Development in Middle School: The program is a collection of real, systematic and integrated activities, carried out by one government agency or more or in the framework of cooperation with the community or which is the active participation of the community in order to achieve the goals and objectives that have been set (Pramono, 2011: 45)[10].

One example is the substance of special service management engaged in health at the school scope, namely School Health Unit. This school service management is basically made to facilitate learning and can meet the special needs of students at school. The

implementation of School Health activities still refers to the "TRIAS UKS". There has been no development of the middle school health program. The following is the identification of the expectations of the School Health Implementation Team:

1. Obtain School Health guidelines
2. Medication assistance
3. The presence of medical personnel at the School Health
4. Repair of rooms and School Health facilities
5. Training a small doctor
6. Implementation of the School Health Competition as a form of existence and mutual motivation
7. Education about the dangers of free sex, HIV and drugs.
8. The activity of forming the character of independence
9. Involvement of educational institutions

Based on the identification of the above expectations, it can be concluded that the development of School Health at the Implementing Level is strengthening the input components and enriching activities in the process components. While the implementation of School Health activities at the District and District Guidance Team Levels is still focused on organizing and coordinating the Team Builder mechanism. So, the function of fostering and developing School Health has not been implemented optimally.

WHO in Notoatmodjo (2012) launched five (5) health promotion strategies in schools, namely advocacy, cooperation, capacity building, research and partnerships[11]. Thus, the model of developing the JHS School Health in accordance with the conditions of the JHS in Banyuwangi is strengthening the management of School Health with a systems approach. The following is a scheme for strengthening the management of JHS School Health in Banyuwangi Regency.

Caption:

1. **Input:** In the implementation of the School Health program in Banyuwangi Regency, the staff who organized this program were the School Health Implementation Team (headmaster, supervisor of School Health, teacher council, Student Council, School Health administrators), the savings team of the School Health level and the district level supervisors team. For facilities that support the implementation of this program such as the School Health room, administration desk, mattress, pillow, bolster, blanket, registration book, cupboard, medicines and so on. The implementing of the School Health program is using manual method. All of these input factors must work together in order to realize behavior change to achieve optimal health status.

2. **Process:** The management function is starting from planning, organizing, actuating and controlling.

a. **Planning:** Planning is the initial stage in the management process. Planning according to Koontz and O'Donnell (1964) is "involving selecting the objectives and policies, programs and procedures for achieving them-either for the entire enterprise or for any organized part"[12]. Planning includes decision-making activities because it includes the selection of decision alternatives.

Implementation of the School Health program planning in Banyuwangi, planning was carried out by the School School Health Implementation Team but was not integrated with the District and District Head of the School Health Development Team because the organizing of the School Health Development Team in Banyuwangi didn't work. This can occur because there is no planning for public health center specifically for School Health at the District Level.

While the planning of School Health guidance at the District Level is integrated with the Health Office and the majority is joined by the public health center's program. So that the planning of the JHS School Health program in Banyuwangi is only limited to planning by the School Health Implementation Team itself.

b. **Organizing:** Organizing can be formulated as an overall management activity in grouping people and assigning tasks, functions, authorities, and responsibilities of each with the aim of creating useful and effective activities in achieving predetermined goals (Manullang, 2008)[13]. According to Terry (2006) Organizing includes[14]:

1. Divide the components of activities needed to achieve goals into groups
2. Dividing tasks to someone manager to hold the grouping

3. Establish authority between groups or organizational units

The School Health executive team that came from students namely 7th, 8th and 9th grade students fulfilled the requirements after the School Health training. In line with the organization of the School Health program implementation team in schools, it was not balanced with the organization of District and District advisory teams. Because the sub-district advisory did not know about the team implementing this development. Thus, it resulted in the non-implementation of the task of School Health Guidance Teams in conducting the development of School Health in Banyuwangi.

c. Actuating: Activation and Implementation (actuation) is an action to make all group members want to try to achieve organizational goals in accordance with planning (Prayitno, 1997)[15]. In management, other terms will often be encountered for mobilization and implementation functions, namely motivating, directing, influencing, commanding.

The implementation of School Health must be in accordance with the health needs of students. Implementation of these activities can be in the form of "TRIAS UKS". These needs can cover physical, psychological, social and spiritual needs. The implementation of health business activities can be carried out well if all the residents of the school, supporting facilities and infrastructures and various cross-sectoral agencies can contribute to the success of this activity.

d. Controlling: Planning is closely related to the function of supervision or control because it can be said that the plan is a standard or tool of supervision for the work being done. George R Terry (2006) suggested "control is to determine what is accomplished, evaluate it, and apply corrective measures, if need, to insure result in keeping with the plan". Furthermore, Newman said "control is the performance that conforms to plan"[14].

Control of purpose of school health activities includes monitoring and evaluation efforts supported by recording and reporting. Control must be carried out periodically and continuously, one of the methods used by the Government (Regional) in monitoring and evaluating the implementation of health activities in schools. The main objective of control is to make what is planned become a reality (Manullang, 2008)[13].

The supervision of the School Health program in Banyuwangi is carried out by the implementation team and the subdistrict and district development team. At the supervisory level, the evaluation is carried out in each semester. However,0020 supervision of the sub-district and district supervisors team did not work due to barriers to integration with monitoring programs in the puskesmas.

3. **Output:** The output factor of the implementation of this school health business is the change in behavior from unhealthy habits to clean and healthy living habits and a healthy environment.

4. **Outcome:** The outcome factor of the implementation of this school health effort is the increasing quality and achievement of students both academically and non-academically according to the purpose of education at school.

5. **Impact:** The impact of the results of the implementation of health business is expected to increase the level of health of students so that the growth of students continues to increase and free from sources of disease.

Conclusion

Based on the results and finding of research on the development of the School Health program in JHS in Banyuwangi it can be concluded that the planning of the School Health program is still routine which results in less optimal organization. However, the implementation of the School Health program is in accordance with the "TRIAS UKS" and its supervision is already good at the level of the implementation team. It's just that the School Health program development has not been implemented optimally.

Therefore it is necessary to make efforts to optimize the implementation of the School Health program in accordance with the Policy Principles for the Development and Development of School Health and the School Health Development Team. With the model of developing a JHS School Health program in Kabupaten Banyuwangi, "Strengthening School Health Management with a System Approach" is expected to be able to optimize the implementation of the School Health program.

Conflict of Interest: In this article conflict of interest is nil.

Source of Funding: The source of funding research is funds from the Faculty of Public Health Airlangga University.

Ethical Clearance: Ethical approval was obtained from Health Research Ethics Committe, Faculty of Public Health Airlangga University with ethical approval number: 396-KEPK. All the respondents who agreed to participate in the study signed an informed consent statement voluntarily, and the anonymity and confidentiality of each respondent has also been guaranteed and stated in the informed con cent.

Evaluation of Intermediate Schools Female Students Adherence to Healthy Diet at Al-Russafa Sector in Baghdad City: Theory of Self-Efficacy as a Theoretical Framework

Hawraa A. Mukhlif[1], Kareem Gh. Sajem[2]

[1]Academic Nurse, Diyala Health Directorate, Ministry of Health,
[2]Assistant Professor, Community Nursing Department, Middle Technical University

Abstract

Objectives: To Evaluate of intermediate schools female student's adherence to healthy diet and To find out the relationship between students adherence to healthy diet and some of socio-demographic characteristics and Body Mass Index (BMI). A descriptive study, Multi stage "probability" sample of (270) female students were selected. The study sample distribution at selected school: (90) female students from Al-Russafa 1 directorates, (90) female students from Al-Russafa 2 directorates, and (90) female students from Al-Russafa 3 directorates in Baghdad City, Governorate for the period of 6th of January 2019 to 4th of march 2019, and questionnaire for knowledge was constructed for the purpose of the study. Validity and reliability of the instrument were determined through a pilot study. Data were analyzed through the use of Statistical package for Social Sciences (SPSS) version (22.0) descriptive and inferential statistical measures were employed. Findings of the study show that majority of the study sample with age group (14-15) years with percent (61%). Body mass index reported that more than half are normal weight (n=138;51.5%). School's female student's adherence to healthy diet with a moderate level with fifty percentage .

Keywords: *Evaluation, Adherence, Healthy Diet, Self-Efficacy.*

Introduction

A healthy diet is a pillar of well-being throughout the lifespan. It promotes the achievement of healthy pregnancy outcomes, supports normal growth, development and aging helps maintaining healthy body weight, reduces chronic disease risks, and promotes overall health and well-being [(1)]. Most people's diets around the world fail to meet the ideal for healthy diets. It is estimated that "poor diets are responsible for more of the global burden of ill health than sex, drugs, alcohol, and tobacco combined[(2)]. Adolescent girls are a very important section of society. Proper growth of adolescent girls is very important as they constitute a one-tenth population of a country. According to the World Health Organization (WHO) about 1/5th of the world consists of adolescents, during this period good nutrition is very important for their proper physical growth and cognitive development Nutritional status of adolescent girls influences both the growth of the nation as well as the growth of the remaining population. Adolescence is defined as a phase of a rapid growth that needs special nutritional requirements because 20% growth happens in stature and 50% growth happens in adult bone mass [(3)]. Poor diet is a factor of one in five deaths around the world, according to the most comprehensive study ever carried out on the subject. Millions of people are eating the wrong sorts of food for good health. Eating a diet that is low in whole grains, fruit, nuts and seeds and fish oils and high in salt raises the risk of early death, according to the huge and ongoing study Global Burden of Disease [(4)]. Approximately 15-20% of adult height, up to 60% of skeletal mass, and 50% of the weight of the adult body is gained within the adolescent period. Poor nutrition during this time can result in adverse health conditions later in life and poor reproductive health outcomes [(5)]. For girls, low BMI and short stature during childbearing years increase the risk of adverse birth outcomes and obstetric complications[(6)]. Iraq faced quite a long time of unsettlement and conflict during and after the 1991st Gulf War. Except the Northern Region of

Iraq, the nutrition and health situation in the country has continued its deterioration since then, specifically among children and women categories. Data gained from the Iraqi Ministry of Health show that a fast reduction in the population health generally, and of children particularly [7]. The nutritional status of adolescent girls affects their health and condition in later life. The high prevalence of chronic energy and micronutrient deficiencies of today's adolescent girls are directly linked to the quality of the next generation[8].

Methodology

Design of the Study: A descriptive (cross-sectional) study design was used to evaluate intermediate schools females about adherence to healthy diet among intermediate schools female students at Al-Russafa directors in Baghdad City. This study was started from(October 10th, 2018 to April 30th, 2019).

Sample of the study: Multi stage "probability" sample of (270) female students were selected. The study sample distribution at selected school: (90) female students from Al-Russafa 1 directorates, (90) female students from Al-Russafa 2 directorates, and (90) female students from Al-Russafa 3 directorates.

Study Instrument:

Part One: Socio demographic characteristic variables: Socio-demographic characteristic variables of student consist of; Age,Female students' anthropometric measurement, classroom, female student serial between brothers, and socioeconomic statues of the student family and they are accounted through applying of WHO instrument, which consists of several parameters such that, occupation, education levels, crowding index, and particular properties (Especially House Ownership). Three social and economic levels represented by the preceding contents (Low, Moderate, and High).

Part Second: Is related to the information of student health status was included (7) question.

Third Part: self-efficacy scale, the overall number of items including in the questionnaire are (60) items.

Validity: Content validity was determined for study instrument through (16) experts. They were (9) faculty members from the College of Nursing of University of Baghdad, (1) faculty member from college of medicine, (2) Consultant members from Hospital, Ministry of Health, and (3) faculty members from Nutritional Research Institute.

Reliability: Internal consistency reflects reliability of the items. It can be determined by computing Cronbach alpha (α).

A Cronbach's alpha of 0.928 is considered satisfactory.

Data Collection: Data were collected through using of the questionnaire, and the process started at 6th of January 2019 to 4th of march 2019 after obtaining permission from the school for 4th days of week. Each respondents take about (15-25) minute to fill the questionnaire.

Statistical Data Analysis: (SPSS. version22)

Descriptive Data Analysis:

Inferential Data Analysis:

Ethical Considerations: It is necessary to consider moral issues during the evaluation period, among these ethical considerations are the following:

- Informed consent.
- Do no harm.
- Confidentiality.
- Anonymity.

Results

Table (1): Distribution of Students (socio-demographic characteristics) with comparisons significant

SDCv.	Groups	No.	Cum %	C.S. P-value
Age Groups per yrs.	12 _ 13	74	27.4	χ^2= 110.067 P=0.000 (HS)
	14 _ 15	167	61.9	
	16 _ 17	29	10.7	
	Total	270	100	
	Mean ± SD	14.26 ± 1.18		

SDCv.	Groups	No.	Cum %	C.S. P-value
Stage (Class)	First	90	33.3	χ^2= 0.000 P=1.000 (NS)
	Second	90	33.3	
	Third	90	33.3	
	Total	270	100	
Your order among your brothers	First	62	23	χ^2= 129.867 P=0.000 (HS)
	Second	87	32.2	
	Third	74	27.4	
	Fourth	30	11.1	
	Fifth	14	5.2	
	Sixth	3	1.1	
	Total	270	100	

(*) HS: Highly Sig. at P<0.01; S: Sig. at P<0.05; NS: Non Sig. at P>0.05;Testing based on One-Sample Chi-Square test.

Respect to "Student›s Age Groups", majority age group was assigned in group (14-15) yrs., and statistically has highly significant different at P<0.01, as well as recorded mean and standard deviation 14.26 yrs., and 1.18 yrs. respectively. With reference to "Stages or Classes", statistically no significant different at P>0.05 are accounted among the observed frequencies with their an expected outcomes, since studied sample›s students were selected 90 individuals from each stage of an intermediate schools. Respect of "Asking about order among others brothers", majority of ordered were assigned within second, and third, and statistically has highly significant different at P<0.01 accounted among observed frequencies with their an expected outcomes.

Table (2): Distribution of Studied Samples according to Anthropometric Parameter (BMI)

Anthropometric variable	Groups	No.	%	Cum. %	C.S. (*) [P-value]
Body Mass Index BMI	Obese	35	13.0	13.0	χ^2 = 117.067 P=0.000 HS
	Overweight	73	27.0	40.0	
	Normalweight	138	51.1	91.1	
	Underweight	24	8.9	100	
	Total	270	100	-	

(*) HS: Highly Sig. at P<0.01; Statistical hypothesis based on Testing based on One-Sample Chi-Square test

Concerning Body mass index,more than half is normal weight (n=138;51.5%),followed by those who areover weight (n=73;27%), those who are obese (35;13.5%), and those who are underweight (n=24;89%).

Table (3) : Adherence of Schools Female Students to Healthy Diet Domain

Subjective Domain	No.	PGMS	PSD	Min.	Max.	Range	Ev.
The commitment of students to healthy diet	270	44.48	13.80	4.17	93.33	89.16	Mod.

Ev. : Evaluated (0.00 – 33.33) Low (L); (33.34 – 66.66) Moderate (M); (66.67– 100) High (H).

Table (4-2-2) shows summary statistics such that: percentile global mean of score, pooled standard deviation, pooled relative sufficiency, as well as an evaluation of studied responding were assigned using percentile transformation values through three categories (Low, Moderate, and High), and that were

done according to three intervals [(0.00 – 33.33), (33.34–66.66), and (66.67– 100)].

Results show that the observed responses of studied female students are weak evaluated, since percentile global mean of score was assigned under a cutoff point (i.e. Fifty Percent), as well as too wide range are accounted, which indicate that studied female students has large dispersion among the sample respondents.

Table (4): Relationship between redistribution Adherence of students to Healthy Diet and Age Groups with significant level

Age Groups	No. and Percent	Overall Evaluated		Total	C.S. P-value
		Under	Upper		
12 _ 13	No.	53	21	74	CC= 0.172 P=0.016 S
	% Age Groups	71.6%	28.4%	100%	
14 _ 15		129	38	167	
	% Age Groups	77.2%	22.8%	100%	
16 _ 17	No.	15	14	29	
	% Age Groups	51.700%	48.300%	100%	
Total	No.	197	73	270	
	% Age Groups	73.0%	27.0%	100%	

(*) S: Sig. at P<0.05; Testing based on Contingency Coefficient.

Results show that strong relationships are accounted with significant level at P<0.05 between studied factors which, are indicated with the increasing of age students, a positive responding would be obtained by adherence of students to healthy diet.

Table (5): Relationship between Redistribution Adherence of Students to Healthy Diet and Student's BMI with Significant Level

BMI	No. and Percent	Overall Evaluated		Total	C.S. P-value
		Under	Upper		
Under weight	No.	18	6	24	CC= 0.298 P=0.000 HS
	% BMI	75.0%	25.0%	100%	
Normal weight	No.	84	54	138	
	% BMI	60.9%	39.1%	100%	
Over weight	No.	60	13	73	
	% BMI	82.2%	17.8%	100%	
Obese	No.	35	0	35	
	% BMI	100.0%	0.00%	100%	
Total	No.	197	73	270	
	% BMI	73.0%	27.0%	100%	

(*) HS: High Sig. at P<0.01; Testing based on Contingency Coefficient.

Results show that strong relationships are accounted with significant level at P<0.01 between studied factors, which are indicated with escalating of BMI students, a negative responding would be obtained by adherence of students to healthy diet, especially concerning obesity level which shows that among 35(13.0%) of studied subjects no one of student's adherence to healthy diet are passing to upper cutoff point indeed.

Concerning the fathers' level of education, the majority of fathers are intermediate school graduates. This finding agrees with that of Chandrashekarappa, Ramakrishnaiah and Manjunath (2018) who studied stated that the largest proportion of fathers completed 10th grade (4.3%)With respect to mothers' level of education, more than a quarter have completed secondary school. This finding is consistent with that obtained by Chandrashekarappa and others (2018) who reported that less than a third of mothers have completed 10th grade (30.0%). As per fathers' occupation, most of fathers were assigned within lower professionals. This finding is supported by Rani (2016) who stated that most of the fathers' occupation were labour (62.0%)[10].With respect to mothers' occupation, most of mothers were assigned within unskilled workers. This finding is supported by Rani (2016) who reported that most of the mothers' occupation were non-working (Housewives) (75.5%). (Table 1). Concerning to "student's age groups", the majority of the study samples within the age group of was assigned in the group (14-15) years, and statistically has highly significant different at P<0.01, as well as recorded mean and standard deviation 14.26 (± 1.18) years. This finding is consistent with that of Rani (2016) who found that most of the study participants with age group (13-15) years, (n= 139 with percentage) 69.50). Also, Elkhgoly & other (2011) who found that most of the study participants with age group (14-15) years, (n=41) with percentage)58.6([11]. Respect of "Asking about order among others brothers", the majority of ordered were assigned within second, and third, and statistically has highly significant different at P<0.01 accounted among observed frequencies with their an expected outcomes.(n=87, 74) respectively with percentage (32.2, 27.4) respectively. This result is supported with Ibrahim & El-Lassy (2013) who obtain that a highest percent of students were observed to be either first or second child order.(n=360,350 respectively, with percentage 36.0, 35.0 respectively)[12]**.** concerning the result shows that of body mass index readings were evaluated by CDC charts of age (Percentiles) and has recorded highly significant different at P<0.01 among different levels of BMI responding, and however of increasing numbers concerning normal BMI, but leftover cases with reference to overweight level, and who were assigned obesity level cannot be underestimated in contrast of the same studied age groups of normal children, since they are accounted for 35 (35.0%), given that the percentage of an overweight and obese for age groups (2 – 19) is less than half the percentage mentioned in normal cases Table (3)This result is compatible with that of Plotnikoff, Gebel, & Lubans (2014) who reported that anthropometric (BMI) categories (the majority of them were healthy weight with mean SD (n=202 ± 56.60%). On the other hand, underweight was a lower level of BMI with mean SD (n 2 ± 0.60%)[13] . The results show that the observed responses of studied female students are moderate evaluation majority in the whole items, except (low-salt foods, Stick to low-fat when are unable to prepare healthy meal & Avoid junk food that has brought into your home by your family members) have indicated low evaluation of adherence to healthy diet. Since percentile, the global mean of the score was assigned under a cutoff point (i.e. Fifty Percent), as well as too wide range are accounted, which indicate that studied female students have large dispersion among the sample respondents. This study is supported by El Ansari, Suominen, & Samara, (2015) who observed that moderate adherence for most of the 'healthy food' items (> 50%) (Dairy/dairy products, fruit/vegetables servings/ day, fresh fruit, salads/raw vegetables and cereal/cereal products). Fish/seafood, meat/sausage products, and cooked vegetables had levels < 50% for adherence to the guidelines. Women had better adherence for meat/ sausage products, fast food/canned food and for most 'healthy food' items (p≤0.001).[14]Results show that strong relationships are accounted with a significant level at P<0.05 between studied factors which, indicated with increasing of age students, a positive response would be obtained by adherence of students to a healthy diet. This finding agrees with Eraby & Abdollwahid (2016) who found that a significant relationship between dietary habit and age of the female student at p-value=0,05, which means that whenever the age increases, their dietary habit becomes more healthy [15].

Conclusion

For summarizing of preceding results, it could be concluded that school's female students adherence to healthy diet, is not at the level that achieves the goal of self-efficacy for which it was established in the proper health indeed.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Ministry of Health and all experiments were carried out in accordance with approved guidelines.

Impact of the GIST Model in Development of Thinking in Students

Qais Abbas Rabeeh[1], Mohammed Kazem Mentob[1], Ali Jabbar Abdullah [1]

[1]University of Babylon/Faculty of Basic Education, Iraq

Abstract

The objective of the research was to define the effect of the GIST model on the acquisition of geographical concepts. The researcher adopted the empirical research methodology as a methodology for the research regression which includes independent variable (GIST model) and variable dependent (acquisition of concepts)before start applying the experiment The researcher was rewarded between the two research groups for the purpose of obtaining accurate and objective results in the following variables (age of the first month, first grade, parental achievement, Danleys intelligence test). After parity between the two groups, Coordination of plans and objectives, concepts and tests for the two sets of research, and after the completion of the application of the experiment. The researcher applied research tools to the two research groups and after correcting the students' answers, the researcher obtained data for the experimental group and control. The data were processed by spss and T-test of the two groups. The results showed that the experimental group was better than the GIST model. On the officer group that was taught in the normal way independentrariable which teaches the experimental group is the Gest model group.

Keywords: *Gist Model - Acquire Concepts - Fourth Literary Grade*

Introduction

Education is a necessary process for every member of the society together, and the need for the human being to preserve his sex, to direct his instincts, to organize his emotions and develop his tendencies, commensurate with the culture of the society in which he lives, and help him in facing life and its requirements and organizing public behaviors in society to live between The community is a convenient life [1]. The researcher believes that education is a necessary process for man, which can not be dispensed with. It is concerned with helping people to rise to the highest levels of society and increase their cultural achievements[2]. Education can achieve its goals only through education. Education is only a means of transferring individuals to a better future by imparting knowledge, ideas and information to the student, which in turn will receive what the teacher receives from him [3]. The teaching profession requires knowledge based on instinct and teaching, and the most difficult is the confrontation. Facing the teacher to the students in the classroom is not easy, and it must be thought here that the choice of the appropriate teaching method rests with the teacher is the one who determines how and how the material is taught by him And Mohammed, 2002 [4]. The teaching method is a set of interactive procedures used by the teacher to guide and supervise the activities and activities of the learners in order to bring about learning in the different aspects (knowledge - attitudes_ skills) to fit the educational situation and to match the characteristics of the students addressed and the type of educational content concerned. Dynamic interaction between the various elements of teaching of the teacher and student, the content of education and the learning environment, and we must know the good way in a particular educational position may not be the same in another position. Because of the existence of new variables but in general if we have developed the principles of good teaching and established as a standard, the method of teaching will be one of the elements of communication of the teacher and the student and the study material. The importance of teaching social materials at different levels of education is highlighted in order to clarify the humanitarian aspect of human beings and to examine the relationships that

must prevail in societies and their organization, where geography comes in the forefront of social articles which are interested in studying the relationship between man and the natural environment and method of interaction with this environment and the effects of that interaction, where natural geography is concerned with the study of natural phenomena environment surrounding the human distribution And the factors influencing this distribution, while human geography is interested in studying the manifestations of human life and its gatherings and the relations of those gatherings and their negative and positive effects and their impact on natural phenomena and human impact. It also aims to learn geographic concepts from the main objectives of the geography curriculum. It means learning the geographical concept. Any activity that requires the learner to combine two or more phenomena and classify them in order to lead to the growth of the geographical concept and to present new geographic concepts so that it can classify them correctly and distinguish between positive examples and examples Negative [5]. The Gist Template is a model to summarize the content of the readable text in 20 or fewer words, including words or question keys, each of which is a field in which the reader's mind should go to search for what belongs to it or to classify ideas in the text These words are: (who, what, when, where, why, how) expressed by (W 5 and H) because the first five begin with the letter W and the last begins with the letter H, respectively (Who, What, Where, Where and How is a model used to summarize subjects that allows the learner to understand and store learning content in memory in such a way as to provide large volumes of storage space It seeks to occupy the memory of the basic issues contained in the text when summoned can be able to give a picture of it and related ideas and it is by way of molding the meanings of the text read and his ideas in the form or template referred to first and then express them together no more than The effectiveness of this method in the comprehension and comprehension of the reading did not come from a summary, but from the way of intensive reading and analysis of texts and focus on ideas W Aghtha center in the language of the learner and written in the form of notes under each of the areas included in the model Geist then reduced in twenty words or less of them

Methodology

It includes an overview of the research methodology and its procedures in terms of selecting the appropriate experimental design, identifying the research community and its sample, and the equivalence of the research groups (experimental and control), controlling the external variables, preparing the research requirements,

Experimental Design for Research: The experimental design means that the researcher adopts a plan and a work plan for how to implement the experiment belong to research. The experiment is intended to plan the conditions and factors surrounding the phenomenon that you are studying in a certain way and then note what happens.

Search community and eye: The current research community represents fourth grade students, all in secondary and middle schools. Of the Directorate General of the education of Babylon - the Hashemite district. For the academic year (2018 - 2019). In order to identify him, the researcher visited the schools where the number of people is not less than one fourth grade. The researcher (preparatory Hakim) chose in the Hashemite district randomly to conduct his experiment, and after he chose the researcher (preparatory Hakim) to apply the experiment, he found that it contains one division of the fourth grade literary representation of the experimental group, and the number of students (33) students, (The GIST model). In the same way, the researcher chose randomly (middle school) to represent the control group and the number of its students (31) students who will study the students according to the usual method

Equal Search Groups: The researcher's keenness before embarking on actual teaching is to be rewarded between the students of the two research groups statistically. The parity between the experimental and control groups was carried out in some variables that affected in one way or another the results of the experiment, although the researcher chose the two groups in the random drawing method. Although the students of the research sample from the center of social, cultural and economic are very similar to alarge extent and study in two schools are similar in terms of building and garden seats and sitting of one sex, but the researcher was keen to make equivalence of the variables (the age of time calculated months, the achievement of students in the first course in geography, The results of parity between the two research groups showed that the two research groups are equal to the variables mentioned.

Adjusting Extraneous Variables: The control of the external variables is one of the important events in the experimental studies in order to provide an acceptable

degree of internal honesty for the experimental design. The researcher verified the equivalence of the two research groups in some variables that they believe affect the course of the experiment in a different manner, but he tried to control the effect Some experiential variables in the course of the experiment and in what follows some of these variables and how to adjust them to adjust the conditions of the experiment and the accompanying accidents, the experiment did not accompany a circumstance or incident that led to the obstruction of the experiment or affected the results, experimental extinction, Ada The sample was determined by the two groups according to multiple choice. The study material determined the same study material for the two research groups, the selection of the research sample, the two groups were randomized and the two groups were confirmed as the maturity factor. Between the two groups and the age of the students are close, the maturity will return to both groups at the same level, so this factor did not have an impact in the research.

Preparation of research requirements: The research materials is one of the basic factors underlying the research according to which the research is carried out. The scientific material that is taught to the students of the two research groups during the period of the experiment was defined in chapters (4 and 5)of the book of the foundation of geo graph yard its techniaues for the fourlh grade literary Study (2018 - 2019) studied by the researcher in the second course of the same year.

The researcher has set out a set of teaching plans for experimental and control research in the light of the contents of chapters (4 and 5) of the book of the foundations of geography and its techniques for the fourth grade literary year (2018). - 2019)

Search Tools: The test is defined as a structured procedure for measuring a property through a sample of behavior. The purpose of the test is to measure the level of student achievement in the research sample for the basis of the geo-based techniques according to predefined concepts. Determination of test dimensions: The dimensions of the test are determined by the processes of acquiring the geographical concepts (definition - discrimination - application).Formulation of the test paragraphs: After determining the target and dimensions of the selection, the researcher tested the types of questions that measure these objectives and chose (multiple test) the four alternatives, according to three levels (definition - discrimination - application).

Half way Split: In order to avoid some of the method used to measure stability, there was a need to re-test with regard to the failure to ensure the conditions of the first application itself with the second application, and not to give the students experience, if the re-test to gain a little experience. And the ability to determine the internal consistency of the test paragraphs, and determine the time required for statistical processing, and its simplicity in the calculation of the coefficient of stability, and the half-split method was calculated by dividing the paragraphs of the test into two sections, individual paragraphs and pairs of paragraphs. The researcher adopted a random sample of the same students whose grades were subjected to statistical analysis of the application (30) of the students. The Pearson correlation coefficient was used to extract the coefficient of correlation between the individual and marital vertebrates. The coefficient of stability was 0.87 and the coefficient of stability of the extract in this manner was half the test, The overall homogeneity of the test, and to amend the researcher has resorted to a correction equation using Spearman - Brown, then reached (0.93). I tried to apply the experience

During the course of the experiment, the researcher undertook the following steps:

1. The research groups were taught by the researcher himself, in order to avoid the difference.
2. The same amount of scientific material was given through the concepts contained in all subjects.
3. The researcher presented himself as one of the teachers in the school to urge students to be keen and eager to learn the subject.
4. The researcher began to apply the experiment in a single date between the two groups.
5. The duration of the experiment was one between the two groups, if the second course lasted.
6. The researcher applied the test of acquisition of geographical concepts on all sample members, after giving the students time to prepare for the test.

Statistical Method

The researcher used his research and analysis of the results of a number of statistical means, including

1. The second test te - test for two independent samples used this means to know the significance of statistical differences between the grades of the

experimental group and control at the equivalence in the analysis of the results

$$T = \frac{x1 - x2 -}{\sqrt{(n1-1)\sum + (n2-1)\sum \frac{2}{1} \times \left(\frac{1}{n1} + \frac{1}{n2}\right)}}$$

2. **Square Kay X ^ 2:** The researcher used this equation for the purpose of calculating the parity of the two groups of students in the educational achievement of the parents

$$X^2 = \frac{\sum(0-E)^2}{E}$$

Results and Discussion

The results of this study showed that the independent variable (GIST model) in the acquisition of the fourth grade students achieved geographical concepts. This indicates the superiority of the experimental group who studied the GIST model to the control group students who studied the usual method in the achievement test (5468) for the interest of the experimental group studied by relying on multimedia, where the calculated T value (3.568) was greater than the value of Altait and therefore rejected the null hypothesis and accept the alternative hypothesis, and this confirms the superiority of teaching B The GIST model is typical of social studies.

Conclusion

The researcher applied research tools to the two research groups and after correcting the students' answers, the researcher obtained data for the experimental group and control. The data were processed by spss and T-test of the two groups. The results showed that the experimental group was better than the GIST model. On the officer group that was taught in the normal way independentrariable which teaches the experimental group is the Gest model group.

Knowledge and Attitudes of Pregnant Mothers Regarding Risk Factors During Pregnancy at Al-Dewania Maternity and Child Hospital

Hiba Jassim Hafidh[1], Rabea Mohsen Ali[2]

[1]Maternal and Neonate Nursing/Al-Dewania Health Directorate-Iraq,
[2]PhD, Maternal and Neonate Nursing, College of Nursing/Bagdad University-Iraq

Abstract

The preconception period considered an important time for women's health and an opportunity to develop a healthy lifestyle that can be useful both for the health of the mother and the newborn baby. A descriptive cross-sectional study is conducted throughout the period of (18th November 2018 to 10 April 2019) in order to assess the pregnant mothers knowledge and attitudes regarding risk factors during pregnancy; and also, determine socio-demographics of pregnant mothers knowledge and attitude. A non-probability "purposive sample" sample of (100) mothers is selected through the use of non-probability sampling approach. This sample is selected among those who reviews the hospital for receiving health care. Data are analyzed through the application of descriptive statistical data analysis approach that includes, frequencies, percentages, mean of scores, and standard deviation; and inferential statistical data analysis approach that include Chi-squared test and ANOVA. The study results indicate that majority of mothers knowledge were (47%) moderately, and (75%) were neutrally attitudes. As well as, most of demographic characteristics were significantly associated with mothers knowledge and their attitudes at p-value <0.05.

Keywords: *Pregnant, Knowledge, Attitudes, Risks Factors.*

Introduction

One of the important event in the human life is birth. Life starts in the womb of mother, when there is a union of single egg and sperm, it is called as conception and it marks the beginning of pregnancy. Conception occurs not as an isolated event but as a part of sequential process[1]. The sequential process includes gamete formation, ovulation, fertilization and implantation in the uterus. Pregnancy last, approximately for 10 lunar months, nine calendar months, 40 weeks or 280 days. Duration of pregnancy is computed from the first day of the last menstrual period until the day of birth[1]. Pregnancy is an enjoyable experience for pregnant mothers. Evidence shows that adequate nutrition, knowledge and attitude are essential to an individual's health and well-being, especially during pregnancy [2] .Every pregnancy is a unique experience for the women and each pregnancy that the women experience will be new and uniquely different[3]. Reproduction though considered to be an usual process in the life of a women, is stressful and can lead to the risk and threats in reproductive age group women unless, appropriate measures are taken in time, it may reach its peak and endanger the life of mothers[4]. In any community, mothers and children constitute a Priority group. In India, women of the child bearing age (15-44 years) constitute 19% and children under 15 years of age about 40% the total population of about 100 million. By virtue of their numbers, mothers and children are the major consumers of the health services of whatever form[5]. Understanding the common disorders of pregnancy in order to advise the women on strategic that help her to cope with the condition and minimize the effects she experiences. Although such disorders are termed as "minor disorders" they are far from minor for the woman, who is experiencing them [4]. stated that healthy mother brings forth the healthy child. So many of the risks can be controlled and prevented using existing knowledge and affordable tools to the primi-gravid mothers. Before providing the health education to the prim gravid mothers it is essential to

know what they want to know certain aspects of self and child health such as:

(a) Changes and effects of the changes in her own body.

(b) Protection of the baby in the uterus and how to keep him/her healthy.

(c) Adjustment to the expected motherhood and effects of pregnancy on her beauty and comfort is of grater concern in primi gravid.[5] A woman who is pregnant for the first time enters pregnancy with certain beliefs, attitudes & knowledge towards child bearing. Some of which are unscientific and unhealthy like eating papaya will cause abortion, consuming plenty of food and water will make the baby oversize and make deliveries difficult. These misconceptions need to be corrected for the sake of the child as well as the mother, through proper information[6]. Knowledge and attitude intervention in pregnant women it has been showed that as a package comprising the following interlocking system includes interventions, early screening, administration of a preventive prophylactic therapy and curative of the various detected risk conditions effectively on the basis of reduced maternal complications[7].

Methodology

Study Design: A descriptive cross-sectional study is carried in AL-Dewaniya Governorate to explore the risks factors of pregnant mothers and their knowledge and attitudes for the periods of (18th November 2018 to 10 April 2019) .

Study Sample: A non-probability "purposive sample" of (100) pregnant mothers who are attend the Maternity and Child Teaching Hospital in AL-Dewaniya Governorate.

Study Instrument: The study instrument was constructed depending on literature reviews and previous studies related to the anaphylactic shock. It is a questionnaire format for the research purpose and composed of two parts and these parts are:

Part I: Which composed of demographical characteristics.

Part II: This part is related Previous and Current Pregnant Mothers Health History related to Risk Factors.

Part III: Mothers Knowledge related to Risk Factors during Pregnancy.

Part IV: Mother's Attitudes towards Risk Factors of Pregnancy.

Data Collection the Method: The data is collected through the use of a developed questionnaire (Arabic version) and an interview techniques with those who visiting and stay in hospital. Each mothers is interviewed on individual base and each interview takes between (20-30) minutes.

Statistical Analysis: The information of the study are analyzed during the use of the "Statistical Package for the Social Sciences it called (SPSS -version 20)". The information of statistical analysis approaches are used in arrange to analyze and estimate the consequences of the study. A descriptive statistical data analysis approach used to describe the study variables: Frequencies, Percentages, and standard deviation.

Results and Discusion

Table (1): Distribution of Study Sample by their History Diseases Related to Risks Factors of Pregnancy

Risks Factors	Previous			Currently		
	Rating	F.	%	Rating	F.	%
Diabetes/Gestational Diabetes	Yes	6	6.0	Yes	5	5.0
	No	94	94.0	No	95	95.0
	Total	100	100	Total	100	100
Hypertension during pregnancy	Yes	13	13.0	Yes	16	16.0
	No	87	87.0	No	84	84.0
	Total	100	100	Total	100	100

Risks Factors	Previous			Currently		
	Rating	F.	%	Rating	F.	%
Anemia	Yes	23	23.0	Yes	29	29.0
	No	77	77.0	No	71	71.0
	Total	100	100	Total	100	100
Sexually transmitted Diseases (STDs)	Yes	13	13.0	Yes	12	12.0
	No	87	87.0	No	88	88.0
	Total	100	100	Total	100	100
Thyroid Diseases	Yes	0	0.0	Yes	1	1.0
	No	100	100.0	No	99	99.0
	Total	100	100	Total	100	100
Toxoplasmosis	Yes	4	4.0	Yes	2	2.0
	No	96	96.0	No	98	98.0
	Total	100	100	Total	100	100
Polycystic ovaries	Yes	17	17.0	Yes	6	6.0
	No	83	83.0	No	94	94.0
	Total	100	100	Total	100	100
Obesity	Yes	16	16.0	Yes	9	9.0
	No	84	84.0	No	91	91.0
	Total	100	100	Total	100	100
Hyper emesis gravidaram	Yes	3	3.0	Yes	11	11.0
	No	97	97.0	No	89	89.0
	Total	100	100	Total	100	100

This shows mothers history of diseases related to risks factors of pregnancy measured in previous of gestation and currently. Out of (100) mothers who participated in this study, it was found that (6%) (5%) having gestational diabetes previously and currently respectively, (13%) (16%) having hypertension, (23%) (29%) having anemia, (13%)(12%) with STDs, (1%) currently with thyroid disease, (4%)(2%) with toxoplasmosis, (17%)(6%) having polycystic ovaries, (16%)(9%) were obese, and (3%)(11%) having hyper emesis gravidaram respectively. This results reveals that the responses of pregnant mothers were assessed high mean scores and relative sufficiency (RS) at the items (1,5,6) and assessed moderate at the items (3,4,8). As well as, the items number (2,7,9) the responses were low knowledge. The overall knowledge related to risks of pregnancy were assessed moderate mean of score (1.95) and relative sufficiency (65%). The term of pregnancy is the period in which the fetus develops inside the mother's womb, and often of the duration of pregnancy is about forty weeks or nine months, so the duration of pregnancy account starting from the first day of the last menstrual cycle, it should be noted that it can be divided pregnancy into three stages of the period, so that represents the first third of the period between 1-12 weeks of pregnancy, while the second represents a third of the period between 13 and 28 weeks of pregnancy, while the third trimester includes the period between 29 and 40 weeks of pregnancy. When talking about pregnancy in general, it should be noted several aspects, including how it happened, and the mechanism of detection, as well as signs and symptoms associated with it. This chapter presents the discussion of the implications of data gathered and reported in chapter four, their relevance was identified in relations with literature as well as the findings of the study concerning the knowledge and attitudes of pregnancies.

Part I: Distribution of Study Sample by their Demographic Characteristics: The findings of present study found that out of (100) mothers who participated in this study, the highest percentage (30%) their age ranged (21-25) years old, (62%) residences in urban areas, (21%) of husbands were unable to red and writ, while conversely those wife are unlike their husbands, (25%) post graduated. Regarding occupation, the highest percentage (72%) of mothers were housewives and (58%) of their husband are a free work with Enough monthly income within monthly need. It's obvious among results, that the total participants were not smoking, and (55%) of their husband also were not smoke. Regarding consanguinity (52%) of mothers were not relative with their husband as a relationship between spouses (Table 4-1). This study was in a disagreement with a descriptive analytic study carried on (100) pregnant women who attend primary health care centers in Basra city in AL-Seef primary health care Center. Results revealed that (49%) of pregnant women their ages ranged between 15-24 years, (30%) were primary school education, (89%) from house wife[8].

Part II: Distribution of Study Sample by their History Diseases Related to Risks Factors of Pregnancy: The study results shows mothers history of diseases related to risks factors of pregnancy measured in previous gestation and currently. Out of (100) mothers who participated in this study, it was found that (6%) (5%) having gestational diabetes previously and currently respectively, (13%) (16%) having hypertension, (23%) (29%) having anemia, (13%)(12%) with STDs, (1%) currently with thyroid disease, (4%) (2%) with toxoplasmosis, (17%)(6%) having polycystic ovaries, (16%)(9%) were obese, and (3%)(11%) having hyper emesis gravidaram respectively. A cross-sectional study involving 354 pregnant women was conducted in Mbulu District in Tanzania regarding knowledge and attitude of pregnant women in rural areas. Their findings depicts that the risks factors of pregnancy were not during her pregnancy in that study[9].

Part III: The Mother's Knowledge Related to Risks of Pregnancy: The care of the mother during pregnancy is of great importance in maintaining the health and health of her fetus by providing healthy conditions for walking and reduce the proportion of complications that accompany pregnancy, which affect the health of mother and child, the body of women is undergoing major changes in the various organs and these changes are to provide the best conditions For the growth and development of the fetus, and may appear many complications during pregnancy, such as cases of poisoning of pregnancy and vomiting and nausea and changes in smell and taste, etc., which pose a danger to the health of pregnant and fetus. The results of the study are confirmed that the responses of pregnant mothers were assessed high mean scores and relative sufficiency (RS) at the items (1,5,6) and assessed moderate at the items (3,4,8). As well as, the items number (2,7,9) the responses were low knowledge. The overall knowledge related to risks of pregnancy were assessed moderate mean of score (1.95) and relative sufficiency (65%) Today, despite the openness of the world's open knowledge tools, they are often used in a side away from the health aspects. Those results come in the same line with a cross-sectional survey was conducted in 513 pregnant women randomly selected from the gynecological ambulatory services of five hospitals located in Naples, Italy. Their findings indicate that pregnant women lack knowledge regarding the main maternal risk factors[10].Also, the results of our study consisting with study conducted Southwestern Nigeria concerning knowledge and attitude of women and its influence on antenatal care attendance. Their results indicate the mothers with moderately knowledge[11].In addition, a study on knowledge conducted in Tanzania by cross sectional community based descriptive survey study. A pre-tested structured questionnaire was applied. results reveals that pregnant mothers were inadequate regarding risks pregnancy[12].In our society, once declare that a woman pregnant, the surroundings become experts and compete to advise on what to do, and what should not do, these tips are often harmful, but sometimes may find what works for. The results of attitude of mothers on risk factors influencing pregnancy outcomes in Abeokuta South Local Government Area, Ogun State. A descriptive statistic reveals that attitude of the mothers as revealed in this study showed that majority 59(59.6%) do not see anything wrong in being pregnant on yearly basis[14]. Furthermore, study has been investigated the attitude of women of childbearing age towards the legalization of abortion, Ethiopia. Their findings depicts that attitudes were moderately especially those who were adolescents mothers [15].

Conclusions

Most pregnancy risks did not affect pregnant women during pregnancy. A young adults woman's residences in urban areas post graduated and housewife and make a sufficient within the monthly need with early onset

the menstruation regularly and married in ideal age and mostly of them were one gestation. 6.1.6.Mothers have a moderate attitudes towards risks factors during pregnancy.Mothers knowledge has been influenced by their attitudes. Health education program regarding the enhances mothers' knowledge as well as their attitudes about pregnancy and apply in rehabilitation centers in health directorate. Knowledge is an important aspect in deals with risks factors during pregnancy, studies can be conducted to involve a national level and evaluate knowledge in rural areas.

[2]Branch of Microbiology, Collage of Veterinary Medicine, University of Al-Muthana

Abstract

A hundred fesses samples were collected randomly from cattle fields in Babylon province. Using DNA extraction Kit, the DNA of these samples was extracted following the protocol of manufacturer. Nanodrop was used to check the DNA concentration, and then the Nested PCR was performed using specific primers to triosephosphate isomerase A and B of *Giardia lamblia***.** This study detected 16 positive isolate of the genotype *A* of *Giardia lamblia* that recorded 16% of total samples (100). whereas, the genotype *B* was found in 28 samples (36%). The Nested PCR technique was performed to direct and identify the wanted genotypes of *Giardia lamblia*. We recorded that the infection with type B were more common in young age group 1-12 months with percentage of 73% .While highest rate of the genotype A was detected in animal at age of 3-10 years with (62.5%). In addition, the result also revealed that the prevalence rate of overall infection of *Giardia lamblia* (genotype A and B) were significantly recorded in females (68%) more than males (32%).

Keyword: *Giardia lamblia, cattle, Molecular, genotyping, Babylon*

Introduction

Giardia lamblia is a global parasite that can be found in wide range of species and in both wild and domesticated mammals[(1,3)]. It is widely recognized that Giardiasis is a zoonotic diseases that could transfer between animal and human[(4)]. In ruminants, it could cause a significant problem include: weight lost, diarrhea and malabsorption, this might lead to dramatic economic losses in the livestock [(5,6).]

The prevalence rates of *Giardia* infection are variant from country to country and might be ranged between 9-73% in cattle, while its range in sheep between 1.5-38%[(7).]

There are two main stages of the *Giardia* in their life cycle, vegetative and resistant cysts to the environment. The infection occur once the active cysts are swallowed by host either through contaminated food and water within just several hours. In the proximal region of the intestine, the cysts are opening and two trophozoites are formed and released to invade the intestinal cells. Following this steps, the parasite attaches and grows in the small intestinal, particular the luminal lining cells, leads to diarrhea then eventually nutrient malabsorption. The trophozoites travel to the distal region of the intestine then forms a new cysts that then pass through the feces. The released cysts in the feces can survival in the difficult environment, this might allow the parasite to migrate and infect other hosts and new infection developed eventually [(8).] Most of the studies have emphasized the role of trophozoites for causing the infection and on the excystation and encystation. However, very few studies referred to the role of cysts in the infection. The morphological variants between the dormant cyst and motile trophozoite, suggested significant changes in the metabolism and *Giardia* might encysts inside host intestine [(9).]

Infection with *Giardia* diseases leads to decrease the growth rate of the calves, also infected calves shed a significant amount of active cysts or oocysts for several weeks for others[(10, 11)]. It was found that cattle consider as a major source of *Giardia* by contaminating the drinking water[(12,13).]

Light microscopy is mainly used to diagnosis *Giardia*, identify the oocysts and trophozoites in the fecal samples around the developing countries. Low accuracy is one of the disadvantage of using light microscopy in comparison with polymerase chain reaction and antigen identification of *Giardia*[14].

Morphologically, it is difficult to differentiate between trophozoites and cysts stages of Giardiasis infection using light microscopy. Also, it is quite challenging to distinguish between human and animal trophozoites and cysts stages. Therefore, a molecular examination is quite necessary for *Giardia* genotypes identification. The genotype A have been identified in the human as well as farm animals (goats, sheep, cattle and equines). Additionally, it is found in canines, felines and wild animal such as guinea pigs, beavers and loris. While genotype B have been recorded in rats beavers, chinchilla, canines, loris and human beings[15,18].

The current study is designed to detect and identify the *Giardia lamblia* using molecular genotyping of that isolated from cattle feces in Babylon province.

Materials and Method

Samples Collections:

Feces Sample Collection: Hundred fecal samples were randomly collected (28/1-12 months, 38/1-2 years and 34/3-10 years) from cattle in Babylon province. Samples were transferred to the sterile and dried plastic tubes then transported to the laboratory using cold box for examinations

Genomic DNA Extraction: Genomic DNA was extracted from fecal samples using stool DNA extraction Kit, Bioneer (Korea) after determining the target parasites using light microscope. The extraction was achieved according to the protocol that supplied from the company. DNA concentration was measured using Nanodrop spectrophotometer. All the DNA samples were then stored at -20 ˚C until needed.

Nested PCR Amplification: Genotyping of *Giardia lamblia* was detected using Nested PCR assay for DNA, which isolated from human and animal. The PCR techniques was performed according the method of (Minvielle *et al*., 2008).

The primers that used in this study was specific to triosephosphate isomerase gene for genotyping A and B. Sequences from NCBI-GenBank website was used to design primers (GenBank). Primer3 plus website is used to design and validate the required primers online. All the used primers in this study obtained from (Bioneer Company. Korea) as show in table 1.

Table (1): Designed primers of triosephosphate isomerase gene for genotyping A and B.

Nested PCR	Primer	Sequence		Amplicon
First round	TPIA	F	CGAGACAAGTGTTGAGATG	576 bp
		R	GGTCAAGAGCTTACAACACG	
	TPIB	F	GTTGCTCCCTCCTTTGTGC	208 bp
		R	CTCTGCTCATTGGTCTCGC	
Second round	N-TPIA	F	CCAAGAAGGCTAAGCGTGC	476bp
		R	GGTCAAGAGCTTACAACACG	
	N-TPIB	F	GCACAGAACGTGTATCTGG	140bp
		R	CTCTGCTCATTGGTCTCGC	

The master mix of the PCR was performed using (AccuPower® PCR PreMix kit. Bioneer. Korea). The PCR tubes were contained the following: pellet, MgCl2 1.5m M, Taq DNA polymerase, KCl 30m M, stabilizer, Tris-HCl (pH 9.0) 10m M, d NTPs 250µM and tracking dye. The PCR reaction was achieved depending to the provided protocol by company, which was 20µl total volume consist from 5µl of purified DNA plus 1.5µl of 10 pmole of reverse primer and 1.5µl of 10 pmole of forward primer. The volume was complete to the 20µl

with deionizer water. all the previous cocktail was mixed using Exispin vortex centrifuge (Bioneer. Korea).

The cocktail was placed in the thermocycler (Techne TC-3000. USA) and the setting condition was as following: initial denaturation temperature of 95 °C for 5 min; followed by 30 cycles at denaturation 95 °C for 30 s, annealing 52 °C for 30 s, and extension 72 °C for 1 minute and then final extension at 72 °C for 7 min as show in table 2. the PCR products were tested using 1.5% agarose gel that stained with ethidium bromide and then visualized under UV.

Table (2): Nested PCR thermo-cycler setting.

Nested PCR Step	Temperature	Time	Repeat Cycle
Initial Denaturation	95°C	5 minute	1
Denaturation	95°C	30 sec	30
Annealing	52°C	30 Sec	
Extension	72°C	1 min	
Final Extension	72°C	7 min	1
Hold	4°C	10 min	1

Statistical Analysis: Statistics analysis was performed using statistical package for social sciences (SPSS), and all the data were calculated and analyzed with chi square equation and the confidence limit was accepted at 95% ($p>0.05$).[19]

Results and Discussion

The first direct examination of the feces samples (100) from cattle in different ages was performed based on morphological characteristics using light microscope. The results showed that 50 isolates were *Giardia lamblia*. This results were confirmed later via nested PCR assay, which revealed that 63% of the positive samples (44) carry genotype B, while the rest of the positive samples have genotype A (table 3).

Table (3) : percentage genotyping of Giardia lamblia

Genotype	Total positive samples	Percentage (%)
A genotype	16/44	37%
B genotype	28/44	63%

The amplified gene products of genotype A resulted from using Polymerase Chain Reaction technique (PCR) were confirmed by running agarose gel electrophoresis. Direct detection of genotyping **A** of ***Giardia lamblia* isolates** according to ribosomal RNA gene (576 bp) and (476 bp) were shown in figure (1).

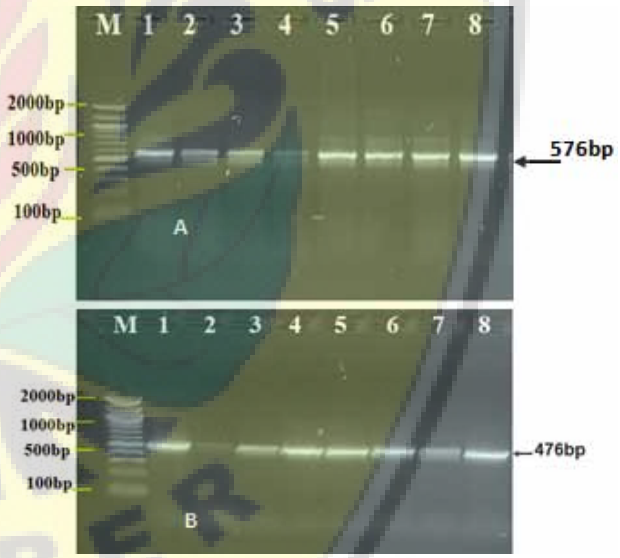

Figure (1): Agarose gel electrophoresis images

A) It shows first round of PCR product amplification of *Giardia lamblia* genotype A based on ribosomal RNA gene (576 bp. **B)** It shows second round Nested PCR product analysis of *Giardia lamblia* genotype A based on ribosomal RNA gene size 476 bp.. (M) DNA marker (100-2000 bp), Lane 1 (A) DAN control size 576 bp.), Lane 1 (B) DAN control size 476 bp. (2-8) DNA products of the positive sample of *Giardia lamblia*

Similarly, the amplified gene products of genotype **B** resulted from using Nested (PCR) were confirmed by agarose gel electrophoresis. Direct detection of genotyping**B**of ***Giardia lamblia*** **isolates** based on ribosomal RNA gene (208 bp) and (140 bp) were shown in figure (2).

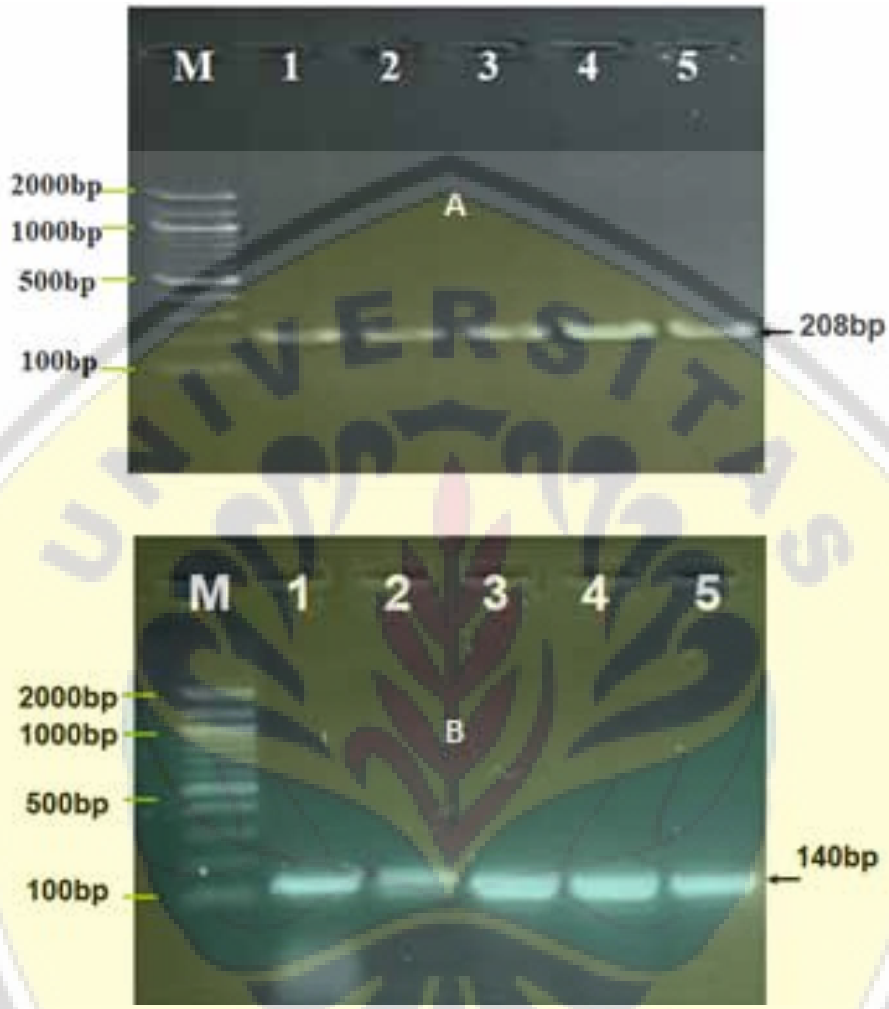

Figure (2): Agarose gel electrophoresis images

A) It shows first round of PCR product amplification of *Giardia lamblia* genotype B based on ribosomal RNA gene (208 bp. **B)** it shows second round Nested PCR product analysis of *Giardia lamblia* genotype B based on ribosomal RNA gene size 140 bp.. (M) DNA marker (100-2000 bp), Lane 1 (A) DAN control size 208 bp.), Lane 1 (B) DAN control size 120 bp. (2-5) DNA products of the positive sample of *Giardia lamblia*

Generally, the results revealed that the infection rate was at a high score (47%) in animals at the age of 1-24 months in comparison with (38%) at age (3-10) years (table 4). Moreover, the results appeared that the females more exposed to infection (66%) than the males with a domination of genotype B (3, 4)

Table (4): Prevalence of *Giardia lamblia* according to sex and age

Age	Sex		Total
	Male	Female	28 (46%)/13
1-12 Month	(4)	(9)	38 (47%)/18
Year1-2	(7)	(11)	34 (38%)/13
3-10 Year	(4)	(9)	

Molecular technology was used to detect the *Giardia lamblia* parasite that was agreed with 20 research, which used the same techniques for identification of *Giardia* in general. This study showed that 44% of study animals were infected with *Giardia lamblia*, in this percentage, 36% belongs to genotype A and 64% were genotype B. high prevalence of genotype B was in agreement with (21).Data analysis showed there were no significant association between gender, age with a variable independency. Previous studies, a low rate of infection of *Giardia* was recorded in comparison with this study (22) and (23), which were 5.45% and 10.27% respectively. This can be explained that these studies were conducted in different regions and countries or there were another factors regulate the infection of Giardiasuch as season of the study, environmental changes, number of collected samples, method that have been used to collect and examine the samples (24). In the present study, young animals between age group 1-2 years was the mostly infected group with percentage 47%, which shared a similar ratio as the group of 1-12 months old (46%). The majority of the infection ratio was scored to genotype B strain especially for the group of 2 year old, while genotype A was recorded in the age group 3-10 years with parentage of 62.5%. It was found that the highest prevalence of *Giardia* was noticed in cattle aged < 6 month In Baghdad region . While in East Azerbaijan-Iran, a high prevalence was recorded in calves less than two months old (25). It is perhaps that calves are more susceptible to the infection, or the infection transfers vertically to these calves from their infected mother. As these infected animal still sheds the *Giardia* cysts due to a low immunity in their bodies (26). Colostrum to the new calves does not offer a protection against *Giardia* and does not prevent the infection special if these calves still in contact with the their infected mother. This study indicated that the prevalence rate of infection with genotype A and B is higher in females 66% than male 34%, this finding agreed with (20). This may be due to the preganncy and milking which is more stressful process to the female that have a big impact on their immun system. However, several studies stated that there are no differancess between females and males in terms of infection.

Conclusion

This study revealed that infection with *Giardia lamblia* are gradually decreasing within the age progression. It may be because to a low development of the immune system in the newborn and calves. As well as, it could possibly that the calves may be exposed to a high number of oocysts come from cows that already infected. It has been suggested that there are several factors may regulate a spread of the infection such as: gender, crowd, size, age, climate.

Prevalence of Hepatitis C among Patients Undergoing Hemodialysis in Dialysis Center in Al-Najaf Al-Ashraf Governorate

Zahraa Abdull Abbass Taher Al- Khafajy[1], Iman Qasim Kteo Al-hussein[1], Haider Mohammed Haloob AL- Abedi[1], Athraa Abbas Al-Zeyadi[2]

[1]M.Sc. Adults Nursing, Faculty of Nursing, University of Kufa, [2]M.Sc. Maternal and Newborn Health Nursing

Abstract

Objective: this study aimed to estimate prevalence of Hepatitis C among Patients Undergoing Hemodialysis (HD) in Dialysis Center at Al- Najaf Al- Ashraf Governorate, To Compare between Prevalence of HCV in AL-Sadder Medical City and AL- Hakeem General Hospital, to find relationship between Prevalence of HCV and related risk factor. A descriptive study design (retrospective design) was carried out through the present study in order to achieve the early stated objectives. From period 15th of February 2017 to 2ed of May 2017, A non-probability (purposive sample) of (103) patients with hemodialysis who were admitted to AL-Sadder Medical City and AL-Hakeem General hospital/Dialysis Centers for treatment were included in the study. Also The result claimed that there is a high significant relationship between the blood transfusion and the incidence of hepatitis C at p-value more than 0.001, as well as the result shows high significant relationship between the duration of hemodialysis and incidence of hepatitis C at p-value more than 0.001 Furthermore the study conclude that the half of patients are infected with HCV, and prevalence of hepatitis C virus associated with several factors, especially the long-term duration of hemodialysis, and history of blood transfusion.

Keywords: *Hepatitis C, Patients, Hemodialysis, Dialysis.*

Introduction

Hepatitis is a disease of the liver that causes inflammation and swelling, which represent a serious worldwide health problem, potentially resulting in permanent damage[1]. Viral hepatitis is a family of viral infections that affect the liver caused by at least five distinct viruses: hepatitis A virus (HAV), hepatitis B virus (HBV), hepatitis C virus (HCV), hepatitis D virus (HDV), and hepatitis E virus (HEV). The most common viral infection is hepatitis C[2]. It is associated with parenteral means so may occur due to sharing contaminated needles, needle sticks or injuries to health care workers, blood transfusions or sexual contact [5]. For this reason HCV most affected on patients who are severally receiving blood or receiving blood more than one time, individuals who are intravenous and inhalant drug users, hemophiliacs, and hemodialysis patients[20] Around 170 million people are suffer from HCV infection approximately 75% of them becoming a chronic infection which may progress and leading to cirrhosis, end-stage liver disease or liver cancer in 15% to 25% of patients also 350,000 deaths occur each year due to all HCV-related causes [12]. HCV frequent in patient receiving long-term dialysis in both developing and developed countries due to a failure to identify carriers of this disease or because of a lack of truly effective biosafety measures implemented in the dialysis units [(21), (6)]. Chronic hemodialysis (HD) most commonly method of dialysis which represent a lifesaving procedure used for patients who are acutely ill and require short-term dialysis (days to weeks) and for patients with ESRD who require long-term or permanent therapy [(5)]. Patients undergoing chronic HD are predominantly likely to contamination by HCV due to they can exposing to dangerous factors such as treatment duration, blood transfusions and the prevalence of virus in the HD unit, such as (HBV) and (HCV) viruses [(22)]. In Iraq, hepatitis is considered as a major health problem in patients

undergoing hemodialysis. The number of patients who are admitted to Iraqi hospitals in 2013 was 29059 and this number decreased in 2014 to 25803 patients [18]. In Al-Najaf City, the numbers of patients who were admitted to Al-Sadder medical city at renal center in 2015 are 330 and this number grated and reached in 2016 to 440 patients [19].

Methodology

A descriptive study (retrospective design) was carried out through the present study in order to achieve the early stated objectives. The Study conducted in Al-Najaf City/Al-Najaf Al-Ashraf Health Directorate/Al-Sadder Medical City and Al-Hakeem General Hospital/ Dialysis Centers from period 15th of February 2017 to 2ed of May 2017. A non-probability (purposive sample) of (103) patients with hemodialysis who were admitted to AL-Sadder Medical City and AL-Hakeem General hospital/Dialysis Centers were included in the study. An assessment tool were used to determinate the prevalence of HCV for patient undergoing hemodialysis. The final copy consists of the following parts:

Part 1: Patient Demographic Data: The first section of the questionnaire included demographic information which includes gender, age and name of hospital.

Part 2: Clinical Data: The second section consists of the questionnaire related to duration of dialysis, time of dialysis per week and number of blood transfusion before and after diagnosis.

Part 3: Laboratory Test: this part include HCV test which may positive or negative

The data were collected through the utilization of the developed questionnaire, and by means of structured interview technique with the subject who individually interviewed, and each subject was interviewed in the same way by using the similar questionnaire for the subjects of the study sample at the dialysis center. The data collection was carried out from April 20th, to 28th may, 2017.

Results and Discussion

Table (1) The Study Sample clinical characteristics

Clinical data	Rating and Intervals	Frequency	Percent
Duration of dialysis	≤ 1	2	1.9
	2 - 11	13	12.6
	12 - 21	24	23.3
	22 – 31	21	20.4
	≥32	43	41.7
	Total	103	100.0
	Mean std. deviation)/30 (23.5)		
Times of dialysis per week	1	1	1
	2	55	53.4
	3	46	44.7
	4	1	1
	Total	103	100.0

The study result according to table (1) shows that (41.7%) of patients have history of renal failure undergoing hemodialysis for ≥ 32 months and dialyzing two time per week.

Table (2) The Study Sample Distribution according to Laboratory Test

Diagnosis of hepatitis	Name of Hospital				
	AL-Sadder Medical City	%	AL-Hakeem General Hospital	%	Total %
Positive	29	28	25	24.4	52. 4
Negative	35	34	14	13.6	47. 6

This table demonstrate that (28%) of patient undergoing hemodialysis in AL-Sadder medical city infected with hepatitis C, and (24.4%) of them from AL- Hakeem General Hospital.

Table (3) Distribution of the Hepatitis Patients According to the Blood Transfusion Frequencies

Frequent of blood trans.	Intervals	Incidence	%
Blood transfusion before diagnosis of HCV	No blood transfusion	8	15.38
	1- 5	33	63.46
	6- 10	9	17.31
	11 and more	2	3.85
	Total	52	100

Concerning with the above table (63.46%) of patient undergoing hemodialysis infected with hepatitis C after receiving blood more than one pint.

Table (4) Relationship between the Blood Transfusion and the Incidence of Hepatitis

Frequent of blood trans.	Intervals	Incidence		Value	Df	P-Value
		Positive	Negative			
Blood transfusion before diagnosis of HCV	No blood transfusion	10	49	69.701[a]	3	0.001 HS
	1- 5	33	0			
	6- 10	9	0			
	11 and more	2	0			

The study results indicate that there a considerable association between blood transfusion and the incidence of hepatitis C.

Table (5) Mean differences between the incidence of Hepatitis according to the duration of hemodialysis

Main variable	Incidence of hepatitis	N	Mean	Std. Deviation	Sig.
Duration of hemodialysis/per month	+VE	54	38.5741	25.94668	t-value (3.87) d.f. (101) p-value (0.001) HS
	-VE	49	21.7143	16.71327	

This table demonstrate that there is a high substantially association between the blood transfusion and the duration of hemodialysis at p-value more than 0.001.

The study shows that the majority of the research sample are females. This result agrees with study result of [11] and Athbi, and Jasim, (2015) in their studies they[1] found that the majority of study subject's sex are females. While these result disagreed with the studies done by[1,5]. They pointed in their studies that the majority of study subjects are male. In regarding to age, the study indicates that most of patients are within age group (45 ≥) years old. [5,6] they pointed in their study that the majority of the study subjects are within (40-60) age group, Also Ghazzawi, *et al*., (2015), emphasized in their study that the majority of the study subjects are within (41-60) age group, also [5] found in their study that the majority of the study subjects are within (60-69) age group, while this result disagree with [11] they emphasized that the majority of the study subjects who infected with HCV are within (31-35) age group. The researcher believe that the reason that make patients with renal disease at risk to acquiring HCV are prolonged vascular access and the potential of exposure to infected patients and contaminated equipment also many risk factors associated with increases the spread of hepatitis C infection are: age of the patient, duration of hemodialysis, family history of hepatitis C, history of blood transfusion, history of kidney transplant and dental procedures and other factors. In addition to number of Cases, the study result indicate the number of cases with HCV who undergoing HD 62.1% from

AL-Sadder Medical City and 37.9% from AL-Hakeem General Hospital this result matched with [10] they found in their study that the large number of patients with renal failure undergoing HD at high risk to seroprevelanc of hepatitis C virus. The researcher believe this is due to the large distance of renal center in Al-Sadder hospital, routine of work in this center is overtime as well as large number of hemodialysis machine in AL-Sadder Medical City some of them are specialized for patients with HCV. In regarding to duration of dialysis the study shows that the mean duration of dialysis in months 30 ± 23.5 that ≥ 32 this result agree with Ghazzawi, *et al*., (2015) they revealed in their study that the duration of dialysis 68 months were associated with increasing risk of acquiring hepatitis C. [7] they revealed the duration of dialysis ≥ 86 months. In addition Kumar, *et al*., (2011) also agree with our study that they show the mean duration of dialysis 36.67 ± 31.68. In regarding to times of dialysis per week, the study shows that the times of dialysis per week is majority of study sample are two times per week, this result disagree with Makhlough, *et al*., (2017) they revealed in their study that the majority patients underwent hemodialysis three times a week . Also this result disagreement with Jamil, *et al*., (2016) they show that the high present of patients underwent once dialysis weekly. In regarding to Diagnosis of hepatitis, the study show that 52. 4% of patients are positively diagnosis by laboratory tests and 47. 6 are negative this result matched with study done by[7] they pointed in their study that 64% infected with HCV and 36% were negative, also this result conducted with result of study done by Makhlough, *et al*., (2017) they found that 63.6% are positive while this result disagree with result Anwar, *et al*., (2016) they show that the majority of patients are negative. In our study the prevalence of HCV increased significantly with increasing the number of blood units transfused this result matched with [1] show in their study that there an association between HCV and the blood transfusion. Study results indicate an association between blood transfusion and the incidence of hepatitis C at p-value more than 0.001 this result in agreement with[1] they pointed in their study that a significant relationship between the blood transfusion and prevalence HCV at $P < 0.3$ as well as Bastiani, *et al*. (2014) An important cause of HCV infection in hemodialysis is the practice of transfusion of blood and/or blood components. Jamil, *et al*., (2016) they found the majority of patients with HCV have a history of blood transfusion. Amen, (2013) he stated in their study that the hemodialysis patients are at high risk for viral hepatitis infections due to the higher number of blood transfusion sessions range about less 5 pints to more 20 pints.

Conclusions

The prevalence of viral hepatitis among women is higher than that of men. The spread of viral hepatitis in patients with renal failure over 3 years who dialysis more than 2 times a week. The spread of viral hepatitis in the Al-Sadder hospital more than the Al-Hakeem hospital. The spread of viral hepatitis is associated with several factors, especially the long-term duration of hemodialysis, and history of blood transfusion.As general that half of hemodialysis patients are infected with HCV.

The Clinicopathological Characteristics of Endometrial Carcinoma in Iraqi Women: Cross Sectional Study

Ameerah Mahdi Raham

Gynecology Specialist/Al-Diwaniyah Child and Maternity Hospital/
Department of Obstetrics and Gynecology/Al-Diwania/Iraq

Abstract

Aim of the Study: The current study included a sample of Iraqi women from various centers in Baghdad and Al-Diwaniyah province with an established diagnosis of endometrial carcinoma aiming at highlighting the main clinicopathological features of this malignant tumor. In this study, the authors retrospectively collected information about women affected by endometrial carcinoma during the last 3 years, form January the 1st 2015 to December the 31st 2018. Information was retrieved from clinical reports registered at Al-Yarmouk Teaching Hospital laboratories and Al-Diwaniyah teaching Hospital laboratory and also from some private laboratories in Baghdad and Al-Diwaniyah province, Mid-Euphrates region of Iraq. At the end of the study we were able to collect information about 27 cases of endometrial carcinoma. The information included age of women, size of tumor, myometrial invasion, involvement of ovaries, cervix, and fallopian tubes, lymphovascular invasion and pelvic lymph node involvement. Majority of cases of endometrial carcinoma were initially diagnosed in women postmenopausally and that most of cases were of endometrioid variety, low grade and early stage.

Keywords: *Endometrial carcinoma, Iraq, clinicopathological characteristics*

Introduction

When malignant tumors affecting the body of the uterus are taken into consideration, endometrial cancer is often considered as it is the most common form seen at this site; however, sarcoma is also seen in the body of uterus, but it represents a rarity[1]. In term of prevalence, endometrial cancer is the sixth most frequent malignant tumor globally[2]. It is also one of the recognized causes of women death; even though it is the 14th leading cause of women mortality[3]. The annual incidence rate is highly variable across the world with highest incidence being recorded in western countries and the lowest incidence being reported in Middle east and some Asian countries[4]. In general, the annual incidence rate is in the range of 1 to 30 per 100000 across the globe [4]. From histological perspective, the most prevalent subtype is the endometrioid one, followed by the less frequent serous and papillary serous tumors and lastly by the rare clear cell variety[5]. Indeed, histological recognition between type 1 endometrioid and type 2 serous is essential for proper management approach [5]. The risk factors for the development of endometrial carcinoma are numerous. Estrogen when act unopposed by progesterone is a well established risk factor as evident by high prevalence rate of disease in association with early menarche, late menopause and the use of postmenopausal hormone replacement therapy [6]. Hypertension and diabetes mellitus are among well known risk factors. Positive family history of endometrial carcinoma is also associated with higher risk of endometrial carcinoma. Obesity also plays a role since high BMI is associated with more than one third of endometrial carcinoma worldwide [6]. The endometrioid subtype usually arise on the top of uninterrupted endometrial proliferation in the sequence of simple then complex endometrial hyperplasia followed by atypical changes and formation of intraepithelial neoplasia and finally by frank stromal invasion[7]. The prognosis of the disease depends primarily on the grading and staging of the tumor[8]. The current study included a sample of Iraqi women from various centers in Baghdad and Al-Diwaniyah province with an established diagnosis of endometrial carcinoma aiming

at highlighting the main clinicopathological features of this malignant tumor.

Patients and Method

In this study, the authors retrospectively collected information about women affected by endometrial carcinoma during the last 3 years, form January the 1st 2015 to December the 31st 2018. Information was retrieved from clinical reports registered at Al-Yarmouk Teaching Hospital laboratories and Al-Diwaniyah teaching Hospital laboratory and also from some private laboratories in Baghdad and Al-Diwaniyah province, Mid-Euphrates region of Iraq. At the end of the study we were able to collect information about 27 cases of endometrial carcinoma. The information included age of women, size of tumor, myometrial invasion, involvement of ovaries, cervix, and fallopian tubes, lymphovascular invasion and pelvic lymph node involvement. The study was approved by the institutional approval committee. Data were then transferred into an Office Excel worksheet (2010) for descriptive and analytic statistical arrangement.

Results and Discusion

The age characteristics of women with endometrial carcinoma are shown in table 1. No case was reported with an age of less than 50 years and the age range was from 51 to 75 years; the mean age was 60.11 ±6.71 years. Majority of the cases have been reported at 50-59 years age interval, followed by 60-69 years age interval and some cases were reported above 70 years of age, 14 (51.9%), 9 (33.3%) and 4 (14.8%), respectively. The clinicopathological characteristics of the study group are shown in table 2. The main histological type was endometrioid and it was observed in 25 cases (92.6%), followed by papillary serous type which was reported in 2 case only (7.4%). In most of the cases the depth of myometrial invasion was less than half; more than half myometrial invasion was reported in minority, 23 (85.2%) versus 4 (14.8%), respectively. Lower uterine segment (LUS) involvement was seen in 21 (77.8%); however, cervix was clear in all cases as well as ovaries and fallopian tubes. All endometrioid cases were of grade II (moderately differentiated adenocarcinoma) whereas serous subtypes are intrinsically grade III tumors and all cases were of FIGO stage I; stage IA was the dominant followed by stage IB, 22 (81.5%) versus 5 (18.5%), respectively. No case had pelvic lymph nodes involvement; however, lymphovascular invasion was recorded in 5 (18.5%).

Table 1: Age characteristics of the study group

Age (Years)	Value
Mean ±SD	60.11 ±6.71
Range	51-75
< 50, *n* (%)	0 (0%)
50-59, *n* (%)	14 (51.9%)
60-69, *n* (%)	9 (33.3%)
≥70, *n* (%)	4 (14.8%)

n: number of cases; SD: standard deviation

Table 2: Clinicopathological characteristics of endometrial cancer of women enrolled in the present study

Characteristic		n	%
Histological type	Endometrioid	25	92.6
	Papillary serous	2	7.4
Myometrial involvement	less than 50%	23	85.2
	More than 50%	4	14.8
LUS involvement	Negative	6	22.2
	Positive	21	77.8
Cervical involvement	Negative	27	100
	Positive	0	0
Fallopian tube involvement	Negative	27	100
	Positive	0	0
Ovarian involvement	Negative	27	100
	Positive	0	0
Grade	I	0	0
	II	25	92.6
	III	2	7.4

	IB	5	18.5
	II	0	0
	III	0	0
	IV	0	0
Pelvic LN involvement	Negative	27	100
	Positive	0	0
Lymphovascular invasion	Negative	22	81.5
	Positive	5	18.5

Indeed endometrial carcinoma is one of major malignant tumors affecting women worldwide; however, in our country it is overwhelmed by the far more common breast cancer. However, it is responsible

for significant mortality in elderly women as it has been observed during daily gynecological practice. In the present study, the mean age of participating women was 60.11 years and all women were older than 50; cases above 70 years of age accounted for minority of cases. In a study which included 985 cases of endometrial cases [9], the reported mean age of normal weight women was 67.1 years which is somewhat higher than that reported in the current study; whereas, the reported mean age of obese women was 56.3 years which is lower than that reported in the present study. In another study [10], the reported age range of women with endometrial cancer was between 50 to 74 years which is very close to the range reported in the current study. In the United states, the disease primarily target postmenopausal women with a median age at time of diagnosis of 62 years [10]; this median age is very close to that reported in the current study. At time of menopause, the equilibrium between serum estrogen and serum progesterone becomes in favor of estrogen, so that even in small amount, the unopposed estrogen hormone predisposes the endometrial mucosa to malignancy by enhancing endometrial proliferation and development of endometrial hyperplasia [11]. In addition, the use of estrogen as a postmenopausal hormone replacement therapy increases the risk of atypical endometrial hyperplasia according to the observation of a number of studies [12-14]. In addition, postmenopausal women may suffer from diabetes, hypertension, obesity and lack of exercise, which are well known risk factors associating endometrial carcinoma [6]. In the current study, the majority of cases were of endometrioid variety. In addition majority of cases were of low grade and were of stage I disease in favor of god prognosis. Indeed, worldwide, the majority of these neoplasms are well differentiated; endometrioid subtype that present with stage I disease and behave with an excellent prognosis [15]. Nonetheless, nonendometrioid histological subtypes are critical because they usually present with advanced stage and are of poor prognosis[16,17]. Fortunately, even cases with serous papillary carcinoma, in the present stage, were of stage I; however, these non endometrioid tumors are considered of high grade carry less favorable prognosis in comparison with endometrioid variety [18].

Conclusion

Majority of cases of endometrial carcinoma were initially diagnosed in women postmenopausally and that most of cases were of endometrioid variety, low grade and early stage.

The Efficacy of Misoprostol in Controlling Postpartum Hemorrhage in a Sample of Iraqi Pregnant Ladies

Haifaa Abdul-Hadi Ali

Maternity and Child Teaching Hospital in Al-Najaf Province, Iraq

Abstract

Aim of the Study: This study was carried out aiming at exploring the efficacy of misoprostol in prevention of postpartum hemorrhage in a sample of Iraqi women. The present cross sectional study was carried out in the Maternity and Child Teaching Hospital in Al-Najaf province during the period from June the 1st 2006 to December the 30th 2006. The study included three groups, the first group included 56 pregnant women who received oral misoprostol, the second group included 144 pregnant ladies who received intramuscular ergometrin and the third group included 140 pregnant ladies who received oxytocin intramuscularly. No woman in the misoprostol developed blood loss fulfilling the definition of postpartum hemorrhage since all women lost less than 500 ml in average. The difference in blood loss among all groups, misoprostol, methergin and oxytocin was statistically insignificant ($P > 0.05$). Women in misoprostol group needed no manual removal of placenta on the contrary to 8 women in methergin group and 8 women in oxytocin group who needed manual removal of placenta; the difference with this respect was highly significant ($P < 0.001$). Misoprostol results in no hemodynamic disturbance and no significant side effects.

Keywords: *Misoprostol, post partum hemorrhage, Iraq.*

Introduction

Loss of minute amount of blood by pregnant ladies at time of delivery is common and uneventful; however, significant blood loss may complicate both vaginal delivery and cesarean section [1]. This condition was defined, earlier as loss of ≥ 500 cc of blood during vaginal delivery or ≥ during cesarean section within first 24 hours of birth [2,3]. This type of bleeding that happens within first 24 hours is referred to by some authors as primary postpartum hemorrhage in contrast to the prolonged bleeding that happens beyond 24 hours of birth [4]. The definition has been further revised and updated by the American College of Obstetrics and Gynecology in 2017 and the new definition has took in addition into consideration the pathophysiological impact rather than the absolute amount of bleeding alone so that postpartum hemorrhage was defined at aggregated blood loss of > than 1000 cc complicated by clinical picture of hypovolemia regardless of the route of delivery [5]. The problem of postpartum hemorrhage has under focus because the high rate of mortality associated with it [6]. Pregnancy related complications are responsible for premature women death that has been estimated to be around 500,000 women annually; 25% of those women die because of massive postpartum hemorrhage [7]. Postpartum hemorrhage is estimated to complicate approximately 5% of pregnancies in developed and underdeveloped regions of the world and is associated with significant mortality and morbidity [8]. Postpartum hemorrhage has been attributed to a number of causes such as uterine atony, cervical or vaginal tear, vaginal hematoma, uterine angle extension,retained placenta and adherent placenta[9]. Death in women with postpartum hemorrhage has been attributed to a variety of complications such as disseminated intravascular coagulopathy, hypovolemic shock, acute renal insufficiency and acute respiratory distress syndrome [10]. Therefore, early recognition and prompt management of postpartum hemorrhage is mandatory in order to reduce the incidence rate of mortality and morbidity associating this catastrophic pregnancy related complication. In addition to maintenance of blood volume by blood transfusion [11], arrest of bleeding is a major therapeutic goal in management of postpartum hemorrhage [12]. It is

better however to prevent postpartum hemorrhage in high risk group [13]. Many agents have been tested with this regards and one of these agents was misoprostol [14]. Misoprostol is a synthetic prostaglandin E_1 analogue which is extensively for a number of indications in the clinical practice of gynecology and obstetrics such as abortion management, medically indicated abortion, ripening of cervix prior to surgical interventions, labor induction and the control of bleeding at delivery[15].In spite of the widely accepted use of misoprostol for the prevention of maternal mortality caused by anticipated postpartum hemorrhage, a number of reports has raised the issue of adverse side effects and even some rare reports of deaths in association with the use of misoprostol during the third stage of labor [16].

Patient and Method

The present cross sectional study was carried out in the Maternity and Child Teaching Hospital in Al-Najaf province during the period from June the 1st 2006 to December the 30th 2006. During this period 340 term pregnant ladies have been enrolled. Those women were all at first stage of labor when admitted to the hospital. Exclusion criteria included: previous or scheduled cesarean section, anemia with Hb < 9 g/dl, history of antepartum hemorrhage, hypertensive women, multiple pregnancy, undetectable fetal heart sounds, presentation other than cephalic, history of bronchial asthma, diabetic women, women with cardiac problems and history of seizure. Women were then randomly allocated into 3 groups according to the drug given to prevent antepartum hemorrhage. The first group of women was given the tested drug misoprostol in a dose of 400 mg given orally, the second group of women was given the standard oxytocin dose of 10 IU intramuscularly and the third group of women received the standard 0.4 mg methergin (methylergometrine maleate) intramuscularly. The main outcome to be evaluated was blood loss during and shortly after labor; other outcomes included changes in blood pressure, hemoglobin concentration, need for additional oxytocic agents and side effects related to drugs. The study was approved by the institutional approval committee and a verbal consent was obtained from all participating women after full illustration of the goals and the procedures related to the current study. Data were analyzed using SPSS version 23 and Microsoft Office Excel 2010. Quantitative variables were expressed as mean, standard error of mean and range whereas categorical data were expressed as number and percentage. One way ANOVA and Chi-square tests were the main statistical tools used in the current study. The level of significance was considered at $P \leq 0.05$.

Results

Demographic characteristic of women enrolled in the current study are outlined in table 1. There was no significant difference in mean age among all groups ($P> 0.05$). In addition there was no significant difference in mean gestational age among all study groups ($P> 0.05$). Frequency distribution of women according to parity revealed insignificant difference among all enrolled groups ($P> 0.05$). Mean systolic and diastolic blood pressure measurements were within normal range for all groups and there was no significant difference among all groups ($P> 0.05$). There was also no significant difference in mean hemoglobin level and packed cell volume (hematocrit) level among all groups ($P> 0.05$). Moreover, there was no significant difference in mean body temperature among study groups ($P> 0.05$), table 1. Variables related to outcome after delivery are shown in table 2. Mean volume of blood loss was less than 500 ml within first2 hours following delivery for all women in all three study groups. No woman has encountered blood loss of 500 ml or more. Regarding umbilical cord management, manual removal of placenta was indicated for 8 (5.6%) in methergin group and 8 (5.7%) in oxytocin group, but no women in misoprostol group needed manual removal of placenta; this difference was highly significant from statistical perspective ($P< 0.001$). In addition, no woman needed blood transfusion in all groups. There was also no significant difference in mean length third stage of labor among all groups ($P> 0.05$). Blood pressure, heart rate, hemoglobin and PCV levels were all comparable among all study groups ($P> 0.05$); however, post labor body temperature of women in misoprostol group was significantly higher than both methergin and oxytocin groups ($P < 0.05$); nevertheless the mean temperature was within normal rage and not within febrile range, table 2.Mean changes in body temperature, blood pressure, hemoglobin and PCV are shown in table 3. The changes in blood pressure, hemoglobin and PCV were not significant ($P > 0.05$). The rise in body temperature in case of misoprostol was significantly higher in comparison with both methergin and oxytocin ($P < 0.05$); however; the rise did not exceed reference ranges of normal body temperature at physiologic states.

Table 1: Comparison of outcome variables among study groups

Characteristic	Misoprostol Group *n* = 56	Methergin Group *n* = 144	Oxytocin Group *n* = 140	P

n: number of cases; BP: blood pressure; Hb: hemoglobin; PCV: packed cell volume (hematocrit); †: Independent samples t-test; NS: not significant at $P \leq 0.05$; S: significant at $P \leq 0.05$

The main findings in the current study can be summarized within the following few statements. No woman in the misoprostol developed blood loss fulfilling the definition of postpartum hemorrhage since all women lost less than 500 ml in average. The difference in blood loss among all groups, misoprostol, methergin and oxytocin was statistically insignificant ($P > 0.05$). Women in misoprostol group needed no manual removal of placenta on the contrary to 8 women in methergin group and 8 women in oxytocin group who needed manual removal of placenta; the difference with this respect was highly significant ($P < 0.001$). Misoprostol results in no hemodynamic disturbance and no significant side effects. The value of misoprostol in the treatment and prevention of postpartum hemorrhage has evolved over time because of its long shelf life and variable ways of administration. Therefore, it is more suitable for under-resourced situations [17,18]. The issue of using misoprostol in treating postpartum hemorrhage is dated back to 2007, when researchers have supported the use of misoprostol as a second line measure in the absence of other first line measure that are routinely used in obstetric practice or when these routine measures fail to control bleeding [19]. In 2005 a systemic review about the use of misoprostol use in treatment of postpartum hemorrhage was published and it included three

randomized control clinical trials[20]. These randomized controlled clinical trials compared the effect of misoprostol, given by various routes, in controlling postpartum hemorrhage with the effect of either placebo or other routinely used medication such as oxytocin and methergin. Indeed, several studies encouraged the use of misoprostol in managing postpartum hemorrhage[21-24]. There is a study that regarded misoprostol inferior to oxytocin in controlling bleeding complicating labor and encouraged its use only in setting when routine drugs are unavailable. Other authors concluded that the use of misoprostol added nothing to placebo in controlling postpartum hemorrhage. In view of conflicting results, obtained from previous studies, the current study was justified and the results of the present study favor the use of misoprostol in prevention of postpartum hemorrhage especially with the advantage of being given orally.

Conclusion

Misoprostol was as effective as both methergin and oxytocin in prevention of postpartum hemorrhage with the advantage of being given by oral rout.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Maternity and Child Teaching Hospital in Al-Najaf province and all experiments were carried out in accordance with approved guidelines.

Verbal language disorders in autistic children

Hadeel Alwanchyad[1], Abdul Salam Jawdat al-zubaidi[1], Jalal Aziz Frman[1]

[1]*University of Babylon/Faculty of Basic Education/Department of Special Education*

Abstract

The research aims to identify the measurement of verbal language disorders in children of autism if the researchers adopted the descriptive approach. The research community consists of three centers for autism. The members of the society reached 120 children. The sample consisted of (45) children. Verbal is composed of two domains: receptive language disorders and expressive language disorders. The first field comprises 34 paragraphs and the second field (200)paragraphs, then extracting the psychometric properties of each one represented by honesty and persistence. The results showed that autistic children suffer verbal language disorders for both male and female sexes.

Keywords: *Verbal language disorders in autistic children.*

Introduction

The care of children is the cornerstone of a strong family. The building has been grounded. In order to create children, it is healthy and successful. It is necessary to pay attention to them and raise them. However, raising children in general and children with special needs requires care and attention[1]. One of the groups with special needs and who need attention and care so we believe that educational and scientific conferences have paid great attention to the children of this category[2]:Autism is one of the most difficult developmental disorders is a form of behavioral disorders, which is surrounded by a lot of mystery that is related to the causes of infection or diagnosis or treatment method is a widespread developmental disorders because it begins in the early years of life is represented in each of the disorders that begin early, The child's various developmental aspects cause negative effects on these aspects. It may affect the child's cognitive, social and emotional development and overall behavior so that autistic children have a special growth growth that differs from the normal pattern. In our country, Iraq has a large share of this disorder, as no one of us is aware of what caused by the aggression and wars of lack of food and medicine in addition to pollution, which was a direct and indirect cause of the increase in the number of disabled, including children of autism. In recent times in the centers of all governorates, especially in the province of Babylon (three centers), and this undoubtedly represents a social problem of concern to the entire community because of the huge problems, at the level of public health and social welfare and education services as well as the nature of the problems of the retarded themselves, Pay attention Special Education and Care Teams.[7] The issue of language disorders is one of the most recent topics in the field of special education. It is very clear that the beginning of the sixties and communication through speech and language is a complex process but the nature of humanity that develops with the non-linguistic communication of the child through crying and smile and gestures and others and includes aspects of knowledge and hearin[8]. Verbal Language is the means by which the individual in general and the child expresses in particular the thoughts and feelings conveyed by his thoughts and feelings. The language of the child is the main way of his mind so that he can know his nature and his thoughts. The child has a sense of language and the way in which he develops his ideas. This is an important step in the path of mental maturity. Children come to the kindergarten with a different degree of proficiency in understanding the language and a different ability to use it. A group of them is very mature In every aspect of Zahir language and another team has not completed their maturity and therefore can not easily express what is going on in his mind ideas as well as that we may find a child on a large degree of progress in terms of areas of growth more than it is in the language of natural growth.[9] Autistic children suffer from verbal language disorders, language

may be absent or may grow without maturity or with weak language composition with repetitive speech. Where children face autism difficulties in the ability to communicate in different levels and levels are the weakness of language expression or delay in speech and sometimes used autistic words strange from the writing and depends on the repetition always or repeat the last word heard from the sentence and also finds some difficulty in the use of pronouns[10]. Problems related to the inappropriate use of language, such as moving from one subject to another, inability to explain the sound tones and physical expressions associated with the language, as well as problems related to loudness or lowness that do not fit the situation, as well as problems related to receiving language. The latest statistics indicate that the prevalence of autism has increased to about 1: 90 children to become one of the most prevalent disorders and development. The prevalence rate has increased in the current millennium from 10% to 17%According to the American Centers for Disease Control and Prevention (CAC, 2012), according to the American Society of Pediatrics in March 2012 (2012), the prevalence of autism disorder is about 1.88 children and is therefore more prevalent than cerebral palsy and Down syndrome. About 23% in the last two years, almost ten times the reported prevalence rate in the past four decades. This result explains the improvement in diagnosis and awareness. Studies show that autism disorder is more prevalent among boys than girls and is estimated at about 4-5 times an estimated 1:54) of the boys, 1: 252 of the girls. The studies emphasize the need for extensive and extensive attention by researchers and research centers in the countries of the world with autistic children, especially with regard to appropriate procedures and method for diagnosis and detection of members of this group. Despite the global interest in the children of this group, most Arab countries, including Iraq, Which are offered to autistic children and through which these children can be treated and rehabilitated. The aim of this study was to develop a language training program to improve the skills of expressive language in children with language disorders at the age of (5-7) years in Jordan on a sample of (30) children were randomly divided into two equal groups each group (15) Each group was subjected to the implementation of the training program for fifteen months at the rate of twelve sessions per month, and after the statistical treatment using T-test and correlation coefficient, the results of the study showed the following: There are differences in the development of the skills of expressive language among the children of the experimental group and the control group and for the benefit of the experimental group in the development of the sequence of events and skills knowledge of the function of tools and skill development vocabulary and development of the skill of training to build sentences and the researcher to several recommendations, including the need for the preparation of other language training programs targeting all types of disorders Language, and involving parents in their numbers.

Methodology

The current research consists of (3) autism care centers affiliated to the Directorate of Social Welfare in the province of Babil and Karbala for the year 2018-2019, with 120 students as shown in Table 1.

Table 1. Autism care centers affiliated to the Directorate of Social Welfare in the province of Babil and Karbala for the year 2018-2019

Sn.	Name of the Center	Male	Females	Total
1.	Raja Center	40	15	55
2	Imam Ali Center	28	7	35
3	Babylon Specialized Center	18	12	30
	Total	**86**	**34**	**120**

Research Samples:

Sample of Statistical Analysis: The sample of the statistical analysis of the scale consisted of verbal language disorders from (105) teachers and teachers from the centers of Babil and Karbala Babel governorate (83%) were chosen by the method of the number of (105) teachers and teachers distributed in (3) center.

The Basic Sample: After the appropriate statistical analysis procedures for the research tool, did not delete or modify any paragraph of the scale verbal language disorders and thus adopted the sample of statistical analysis as a final sample of application and the sample reached (105) students and they make up (83% of the research community). They were deliberately chosen.

Scale of Verbal Language Disorders: The researchers prepared a measure that measures the verbal language disorders in autistic children, which included two areas: the field of expressive language and the language of receptive language. The researchers claimed that the test paragraphs should be clear, understandable

and suitable for the sample members. They have the ability to distinguish between them, On two areas:

(104) and the number of paragraphs (32) and the language of receptivity and the number of paragraphs (20) paragraph have been given alternatives (apply to a large extent, apply to a medium, do not apply) and grades (2, 1, 0) And the mean mean (52) where the minimum grade of the scale (0)

Statistical Analysis of Verbal Language Disorder Measurement Clauses:

To analyze each of the test paragraphs, the researchers followed these steps:

1. Discriminatory Force of Verbal Disorders Scale:

The discriminatory power of the paragraphs has been verified using the method of the two radical groups according to the following steps:

1. Determine the total score obtained by each member of the sample statistical analysis of the size of (105) students.
2. Arrange the total grades obtained by the members of the sample descending order from the highest degree to the lowest degree.
3. The percentage of (27%) of the forms with the highest scores, and the percentage (27%) of the forms with the lowest grades.In the analysis of the standard vocabulary, Kelley recommended that 27% of the individuals in both extreme groups be excluded and the average 46% excluded. In order for the value of the discrimination coefficient to be consistent from one sample to another, (100) in all extreme groups. The discriminant force of each paragraph of the scale was calculated by using the coefficient of discrimination to test the significance of the statistical differences between the average scores of the upper and lower groups. The number of members of the upper group was 27, the lowest was 27 students, Extract the results using the discrimination equation H that all paragraphs were so distinctive not ruled out any paragraph of it.

Results and Discusion

To identify the level of verbal language disorders in students of autism. After the application of the search tool on the basic sample, after collecting the data obtained from the application of the scale of language disorders in children of autism of the sample statistical treatment indicates that the mean of the scores of students reached (88.67) degree, and a standard deviation of (13,685) With the mean mean of 52 for the language disturbance scale. In order to test the significance of the difference between the arithmetic mean and the mean mean, the T test equation was used for one sample, at the significance level (0.05) and the freedom score (51) as shown in Table (2).

Table (2). T value for the significance of the differences between the mean and the mean mean of the verbal disorders.

Statistical significance level	T-Score		Degree of Freedom	Standard deviation	Working mean	Sample	Arithmetic mean
	Tabulated value	Calculated Value					
0.05	1,96	5.757	51	13.678	52	105	88.67

The above table shows that the calculated T value was (5,757), which is greater than the scale value of (1.96), and this difference is statistically significant at (0.05). That is, members of the research sample of autism students suffer from verbal language disorders. The result can be explained by the cognitive theory that, as the child progresses, his or her language becomes more advanced and complex. Due to the lack of linguistic ability of linguists, they become unable to understand the most complex language that requires advanced thinking skills. Linguistic disorders and their apparent appearance, as well as theories that emphasize developmental aspects in certain areas of the child's brain, are among its most famous thinkers, Berg Brich, Kaplan Kaplan, and Warner Werne. The delay in the stages of mental and sensory development leads to slow learning, as this child seems to others unable to understand or recognize the vocabulary of language and its visual and audio codes, Because of the incomplete growth of the functions of parts in the brain to the degree

that qualify them to work at full capacity and efficiency. In the light of the above theoretical propositions, we have problems with the verbal language of students in special education classes.

Conclusion

The members of the society reached 120 children. The sample consisted of (45) children. Verbal is composed of two domains: receptive language disorders and expressive language disorders. The first field comprises 34 paragraphs and the second field (200) paragraphs, then extracting the psychometric properties of each one represented by honesty and persistence. The results showed that autistic children suffer verbal language disorders for both male and female sexes.

Effectiveness of an Educational Program on Nurses' Knowledge and Practices Regarding Nursing Interventions of Chest Tube Drainage System in Ibn Alnafees Teaching Hospital

Omaima L. Hamel[1], Sabah A. Ahmed[2]

[1]Adult Nursing Department, College of Nursing/University of Baghdad,
[2]Prof. Adult Nursing Department, College of Nursing/University of Baghdad

Abstract

This study aims to evaluate the effectiveness of an educational program on nurses' knowledge and practices regarding nursing interventions of chest tube drainage system in Ibn Alnafees teaching hospital. As well also aims to assess nurses' knowledge and practices regarding these interventions, and to find out the relationships between nurses' knowledge and practices. A quasi- experimental design was used in the present study with the application of a pre-test/post-test approach for the study group and control group. Data collection was done at two times: baseline data (before any intervention was provided to the study group) and 21 days after giving the educational program (in the study group). The period of the study was from 15th December, 2018 to 11th February, 2019. A non-probability purposive sample was randomly selected from nurses who were working in surgical units, intensive care unit, thoracic operating room, and open heart operating room. The results of this study shows that there is a highly significant differences related to nurses' knowledge and practices regarding nursing interventions for chest drainage system; between pre & post-test in the study group, while there is a trivial or no differences between pre & post-test in the control group.

Keywords: *Effectiveness, Educational program, Nursing interventions, Chest tube; Drainage system.*

Introduction

Breathing is spontaneous; so we don't think too much about its importance, just when we develop a respiratory problem, deficiency of sufficient ventilation, and respiratory system impairment can rapidly become a life-threatening condition, in addition there are several clinical situations that may require the use of chest tubes [1].Chest tubes aren't placed in the lungs but in the pleural space; a potential rather than actual space between the parietal and visceral pleura, the parietal (outer) pleura covers the chest wall and diaphragm, it's contain a small amount (about 50 ml) of serous fluid that coats the opposing surfaces, allowing the visceral and parietal pleurae to glide over each other without friction while enabling the pleural surfaces to adhere to each other, the ability to adhere creates negative pressure within the pleural space, which becomes more negative as the visceral and parietal pleura are pulled in opposite directions during inspiration, in addition the negative intra-pleural (and thus intrapulmonary) pressure generated causes air to flow from positive (atmospheric) pressure into the lungs [2]. Expiration increases intrapleural and intrapulmonary pressures to the point where they exceed atmospheric pressure, creating an opposite pressure differential and causing air to flow out of the lungs into the surrounding atmosphere, a breach in pleural integrity creates a separation between the parietal and visceral pleurae, allowing air or fluid to fill this potential space, the visceral pleura collapses inward along with the lungs, while the parietal pleura recoils outward along with the chest wall. [3] The nursing interventions for the patient with chest tube drainage systems need to efficient knowledge and skills, nurses are responsible for the safety care giving, so they must be skillful practices about chest tube drainage system nursing interventions. [4]

Materials and Method

A quasi- experimental design was used in the present study with the application of a pre-test/post-test approach for the study group and control group after implementation of educational program. Data collection was done at two times: baseline data (before any intervention was provided to the study group) and 21 days after giving the educational program (in the study group). The period of the study was from 15th December, 2018 to 11th February, 2019.

Setting of the Study: The study was conducted at Ibn Alnafees teaching hospital in Baghdad city, this hospital was the designated site for data collection, because it is specialized hospital for cardiothoracic and vascular surgeries, which facilitated the process of data collection.

The Sample of the Study: A non - probability purposive sample was randomly selected from (60) nurses who were working in surgical units, intensive care unit, thoracic operating room, and open heart operating room. The sample divided into two groups (30) nurses considered as study group, and another (30) nurses considered as control group. The study group was exposed to an educational program, while the control group was not exposed to the program. Random allocation of the sample was done to avoid bias selection and to control for potential confusing.

Instrument of the Study: To evaluate the effectiveness of the educational program on nurse's knowledge and practices, a self-administered questionnaire was developed to assess the knowledge; it was constructed through the review of related literatures and previous studies. The questionnaire was applied before and after implementation of the program, and used as a mean of data collection; mainly it consisted of three parts:

Part 1: The socio- demographic characteristics of the nurses: This part is concerned with the collection of demographic data obtained from the nurses through an interview questionnaire sheet which include (6) items relative to age, gender, marital status, educational level, years of employment, and training courses in thoracic diseases.

Part II: Nurses' Knowledge regarding basics of thoracic anatomy and chest tube: The second part of the questionnaire consists of (48) items (30 true and false questions and 18 items multiple choice questions) divided into five main domains which are:

A. Knowledge of nurses regarding basics of thoracic anatomy which consist of (6) items.

B. Knowledge of nurses regarding chest tube and chest drainage system which consist of (6) items.

C. Knowledge of nurses regarding chest tube indications, contraindications, and complications which consist of (6) items.

D. Knowledge of nurses regarding nursing role in the insertion and removal of chest tube, which consist of (15) items.

E. Knowledge of nurses regarding nursing interventions for chest tube drainage system, which consist of (15) items.

Part III: Nurses' practices regarding chest tube and chest drainage system:

The third part of the questionnaire consists of (28) items divided into two main domains which are:

A. Observational checklist for nursing practices regarding nursing interventions of chest tube drainage system.

B. Observational checklist for practical demonstrations regarding nursing interventions of chest tube drainage system.

These items are rated according to Likert scale; always applying (3), sometimes applying (2), never applying (1), the level of scale which is scored as a total of three practices of event is observed for each respondent, three correct practices out of the three trails are valued as (3) always applied; (2) sometimes applied practices (applied in one or two observation), (1) never applied practices. The time practices checklist of each nurse for each practices took about 30-60 minutes, the same practices test are used for baseline and 1-month follow up test.

Validity Of The Instrument: Constant validity determined for questionnaire through these of (14) panel experts who are faculty members from college of nursing and surgeons. The experts were asked to review the questionnaire for content with clarity. Some changes were employed according to their suggestions and valuable comments.

Reliability Of The Instrument: Pilot study was carried out from (22th of November, 2018) to (12th of December, 2018). Ten nurses were randomly selected from Ibn Alnafees Teaching Hospital; the nurses in the pilot study had the same criteria of the original study sample. The results of the reliability present alpha correlation coefficient were (r= 0.784) which considered statistically acceptable.

Statistical Method

The analysis of the data was used through descriptive statistics (frequencies, percentages, and the arithmetic mean and standard deviation) and statistical inferential (t-Test) in order to find the differences between the study group and the control group.

Results of the Study

Table (1): Distribution of the study samples (study and Control) according to their years of experience and training courses.

Variable	Groups	Study group		Control group	
		Freq.	%	Freq.	%
Years of experience in nursing	1 - 5	11	36.67	9	30
	6 - 10	5	16.67	5	16.67
	11 - 15	4	13.33	6	20
	16 - 20	6	20.0	6	20
	21 - 25	1	3.33	2	6.67
	26 - 30	2	6.67	1	3.33
	31 - 35	1	3.33	1	3.33
	Total	30	100	30	100
	MS ± SD = 2.75 ± 0.67				
Participation in training courses regarding thoracic diseases	Yes	4	13.3	6	20
	No	26	86.7	24	80
	Total	30	100	30	100
	MS ± SD = 1.83 ± 0.37				

Freq. = frequency, % = percentages, SD = standard deviation, MS= Mean of score

Table (1): shows that the general years of experience in the study group ranged from 1-5 years are (n = 11; 36.67%) followed by those who have 6-10 years (n = 5; 16.67%) and who have 11-15 years (n = 4; 13.33%) respectively. While regarding the general years of experience in the control group almost the same proportion that ranging from 1-5 years are (n = 9; 30%), followed by those who have 11-15, and 16-20 years (n= 6; 20) for both of them, and then those who have 6-10 years (n=5; 16.7%). Both of the study and control groups, less than two third of participants (n = 4; 13.3%) (n = 6; 20.0%) reported that they had specific training courses regarding thoracic diseases.

Table (2): Comparing the significance between the two periods (pre and post-test) related to nurses' knowledge in the study and control groups.

Main Domains of Knowledge	Study Group		t test	P value at 0.05	Control Group		t test	P value at 0.05
	Pre Mean	Post Mean			Pre Mean	Post Mean		
Nurses knowledge regarding basics of thoracic anatomy	1.27	1.81	10.27	0.00 (HS)	1.22	1.26	0.86	0.20 (NS)
Nurses knowledge regarding chest drain and chest drainage system	1.33	1.78	6.93	0.00 (HS)	1.28	1.32	0.54	0.29 (NS)
Nurses knowledge regarding chest drain indications, contraindications, and complications	1.29	1.76	6.76	0.00 (HS)	1.24	1.26	0.43	0.33 (NS)
Nurses knowledge regarding nursing role in the insertion and removal of chest drains	1.40	1.80	5.98	0.00 (HS)	1.33	1.38	0.71	0.24 (NS)
Nurses knowledge regarding nursing interventions for chest drainage system	1.47	1.87	5.79	0.00 (HS)	1.40	1.45	0.57	0.28 (NS)
Overall Domains	1.35	1.80	10.93	0.00 (HS)	1.29	1.33	0.81	0.21 (NS)

*At $p < 0.05$; HS= Highly Significant; NS= Not Significant; MS= Mean Score; SD= standard deviation; Sig.= Significance.

Table (2): shows that, there is no significant difference between both groups (study and control) at pre-test. Participants› knowledge in the study group has increased significantly at the post-test score; at $p < 0.01$. On the other hand there is no improvement in participants› knowledge concerning these items at post-test in the control group.

Table (3) Comparing the significance between the two periods (pre and post-test) related to nurses' practices in the study and control groups.

Main Domains of Practice	Study Group		t test	P value at 0.05	Control Group		t test	P value at 0.05
	Pre Mean	Post Mean			Pre Mean	Post Mean		
Nursing practices regarding nursing interventions of chest tube drainage system	1.36	2.45	14.94	0.00 (HS)	1.36	1.37	0.22	0.41 (NS)
Practical demonstrations regarding nursing interventions of chest tube drainage system	1.26	2.65	10.46	0.00 (HS)	1.26	1.28	0.24	0.40 (NS)
Overall Domains	1.31	2.52	11.09	0.00 (HS)	1.31	1.33	0.22	0.42 (NS)

HS= Highly Significant; NS= Not Significant

Table (3): shows that there is a highly significant difference between pre & post-test in the study group, while there is trivial significant difference between pre & post-test in the control group.

Table (4): Association Significance between Nurses' Socio-Demographic Characteristics with their Overall Knowledge and Practices.

Correlation	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
Age	-.440-	.417	-.810-	-1.055-	.303
Gender	.245	.568	.119	.432	.670
Marital status	-.066-	.501	-.030-	-.131-	.897
Educational Level	-.066-	.423	-.042-	-.155-	.878
Years of experience in nursing	.521	.464	.877	1.122	.274
Participation in training courses regarding thoracic diseases	.038	.702	.012	.054	.958

B = unstandardized coefficients; Std. Error = standard errors; Beta = standardized coefficients; t = t-statistics; Sig. = significance

Table (4): shows that; there is no association between nurses' knowledge and practices, and their socio-demographic characteristics (age, gender, level of education; years of experience, training sessions, and marital status).

As shown in Tables (1 and 2): The results demonstrated that the highest percentages of the participants in study group are male (53.3%) while (46.7%) are female. This goes in the same line with the control group where (56.7%) are male and (43.3%) female, it shows no statistical differences association between nurses' knowledge and gender (at p value 0.670). The majority of the participants in the study and control group (56.66%) are in age group of (20-25) and (26-30) years respectively and there are no statistical differences between nurses' knowledge and practices with their age (at p value 0.303). These results supported by (Al-Ganmi, 2014) when showing that about (52%) of the nurses were in the age group of (20-25) and (26-30) years respectively, and that's totally agreed with [18] that stated there were no statistical differences between nurses' knowledge and practices with their age (at p value 0.232), and with [7] (at p value 0.888). another study done by[2] are consistent with these results, which indicated that majority of the sample at age group 20-27 years old and there is no relationship between nurses knowledge and practices with their age (P = 0.501). Some studies results disagree with the recent study when describing that the majority of the study sample (58.3%) who worked in ICUs were old age, there were no statistical differences between nurses' knowledge regarding their age (p value 0.840) [13,16] Most of the participants in the study group are married (66.7%), and almost the same proportions of the married participants are in the control group (70%), no statistical difference between nurses' knowledge and practices with their marital status (p value 0.897). The study results supported by[5] in Baghdad city which show that most of the participants in the study and control groups were married (68%). Another study by [7] are consistent as well with these results when indicating that most of participants in the study group are married (62.5%) and (65%) in control group[19, 20].

Conclusion

Nurses' knowledge and practices regarding nursing interventions of chest tube drainage system has been improved after implementation of the educational program in the study group, which reveal that the effectiveness of the provided program was highly beneficial.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the College of Nursing/University of Baghdad and all experiments were carried out in accordance with approved guidelines.

Abstract

The objective of this work is to build a database that provides a records of blood disease and accurate statistics as an important source of medical information and to provide assistance to the laboratory worker by conducting electronic blood tests, serial and fast steps and printing the results of the analysis electronically to facilitate the work and make communication between the official of the laboratory and the patient easier and faster and more accurate by using electronic blood analysis system. Where this system to conduct basic screening tests for determining certain blood disorders (anemia's, abnormal bleeding and clotting, inflammation, infection and inherited disorders of red blood cells, white blood cells, platelets, hemoglobin (HBC), and cell production (hematopoiesis)). In this work we propose a system which can manage the user for each action performed and justifying the authorizationused to create a secure and easy log in. The Physiology lab Management System is tested through verification and validation (V & V) that was one of testing elements to uncover errors that were made inadvertently as it was designed and constructed.

Keywords: *electronic blood tests, blood analysis experiments, session, SQL, ASP.NET, verification and validation (V & V), alpha test,beta test.*

Introduction

A blood test is a laboratory analysis performed on a blood sample that is usually drawn from capillary skin punctures (finger, toe, heel), dried blood samples, arterial or venous sampling using a subcutaneous needle. Blood samples are obtained from the patient by the biologist lap staff in laboratory to perform tests on blood for the purpose of diagnosing diseases of blood disorders[1]. Blood samples may be tested by automated or manual hematology instrumentation and evaluation for the purpose of building a database that provides a record of blood disease and accurate statistics as an important source of medical information. This site is specialized in blood analysis experiments, which consist of eight experiments:

1. The experience of blood groups (ABO): The benefit of this experiment is to know the type of platoon (A+, A-, B+, B-, O+, O-, AB+, AB-) [2].
2. The experience of the white blood cell count (WBC): The benefit of this experience is the knowledge of the severity of bacterial and viral infections in the infected person, except in cases where the WBC grows a large number of more than 50 thousand [3].
3. Red blood cell count (RBC): The benefit of this experience is the detection of anemia and anemia.
4. The experience of platelet count: The benefit of this experience is to know the lack of the number of platelets causing the lack of manufacture of blood clot in the event of any injury, it can lead to bleeding for a long time.
5. Experience of measuring the time of red blood cell deposition (ESR): The benefit of this test is used to detect rheumatic diseases and arthritis [4].
6. Hemoglobin Hormone Estimation Test (HBC): This test is used to detect anemia or increase blood (Polycythemia).
7. Test of Blood Stimulation (PCV): The Benefit of this Examination The identification of abnormally low levels of blood accumulation may indicate

anemia, as well as unusually high levels may indicate polycythemia.

8. Experience of Blooding Time estimation: The purpose of this experiment is to know the time of normal and abnormal bleeding, hereditary hemorrhage (hemorrhagic diseases)[5].

The language used in this site is (C# with ASP. net) therefore to provide some of the characteristics that distinguish it from the rest of the programming languages:

- It is fast compared to others because it translates, not interpretation.
- Security, where there are mechanisms to reduce the penetration of sites that have been programmed through them.
- A large and large code library is a dot net library.
- Frequent tools.
- Advanced integrated environment is the Visual Studio.

In this work we used SQL with ASP.NET. Where the database is a collection of information or organized data which is easy to retrieve, manage and update, Therefore, databases allow us to create interactive sites contain a lot of information, which consists of a table or more[6].

The need for a system to assist the laboratory officer. The program has the last steps and accurate results and a report of this work, through which the results of these tests and their natural and non-natural conditions, which are used in the case of statistics. This system includes several people for each individual work according to its specific privacy

- The admin has the privacy and absolute management of the site.
- The laboratory officer is able to manage the report.
- The patient is able to see the results of his blood tests.

There are many projects in this Field, but I did not find a project that serves the biological laboratory, so this project was designed and implemented to serve the medical field and improve the biologist lab performance. The main features are:

- Administration.
- Employee Information.
- Patient Information.
- Experience.
- Reports.

This is the first electronic system for the biologist lap, this software was done from scratch and based on the paper style system that the office was using, this software will speed up the work and make it more flexible and accurate with better database and it reduces the employee's effort. The following will discuss the paper system.

For an analysis of the patient is the official of the lab by filling in a report (paper form) with personal information about the patient.

An official of the laboratory takes a sample of the patient and then performs an analysis manually Then writes the test result of the report of the patient and are printed manually.

Requirement and Analysis: In this work we design the UML diagrams like Use case, a use case can be described as a specific way of using the system from a user's (actor's) perspective [7]. Use cases are best discovered by examining the actors and defining what the actor will be able to do with the system [8].

Identification of Use Cases:

- Use case "is a set of scenarios that describe the interaction between the user and the system. The usage case diagram "Use Case Diagram" shows the relationship between "actors" and "use cases". The two main components of the "Use Case Diagram" are "use cases" and "actors".
- The "actor" represents the user or another system that will interact with the system you modeled.

The use of "use case" is an external view of the system to review some of the actions a user can take to complete the task.

1. Account management: Site Manager has the privacy and absolute management of the site can create a new account for the lab or the patient and the deletion of any account.
2. Receiving feedback: The user sends comments and observations about the site and about the services provided in the laboratory. These comments are received by the webmaster and are able to delete the unintentional comments.

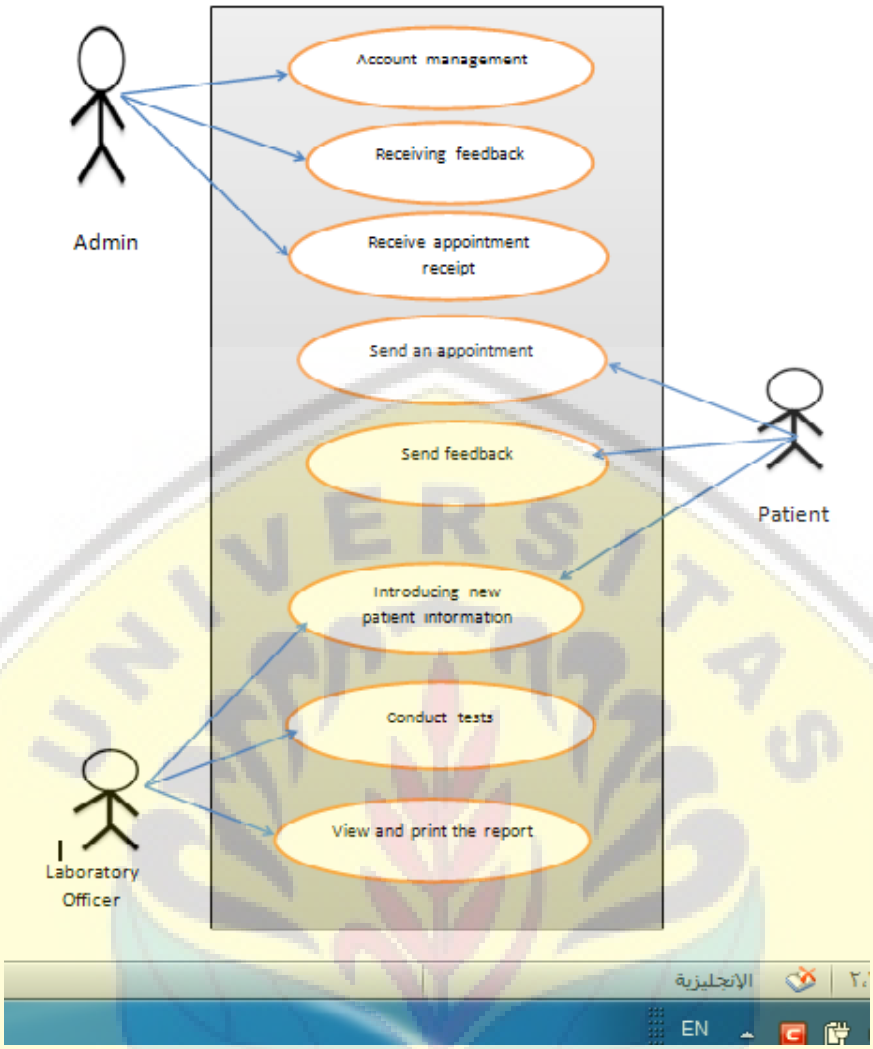

Figure 1: Use Case

3. Receive appointment receipt: Appointment booking shall be within the patient's account until it is more reliable. Send a reservation to the manager of the website. If the date is already booked, the reservation will be deleted.

Patient:

1. Send an appointment: The patient is registered with an account and is booked for a specific date the booking are then sent to the site manager because he has absolute authority over the site if the reservation is canceled, the reservation will be canceled and the patient will be sent to another date.
2. Send feedback: The user may send a comment and comments about the site and the services provided in the laboratory and also reach these comments to the director of the site to see them for the purpose of taking advantage of these views in order to upgrade the level of service and accurate results.
3. View and print the report: After testing the patient and showing the results of the test, he can log in to his account and see the report and can print it.

Laboratory Officer:

1. Introducing new patient information: The laboratory employee dictates a special form called the report with general information about the patient (patient's name, age, address) It identifies the name of the test performed by the patient and saves this information.
2. Conduct tests: After filling the patient's report with information, the laboratory employee begins the experiment and saves the results.

3. View and print the report: The laboratory staff shall inform the patient of the report and search for the patient through his or her triple name or through the address and print the result.

System Design: In order the design and implementation of a physiology lab management system designed to access as we are shown in figure 1 by the Admin/Patient/Laboratory Officer to provide assistance to the laboratory worker. In this work the flowchart used to clarify the processes that take place in this system starting from the start of the program to the end and each person on this site special operations, according to the authority specified to him using the site as shown in figure 2.

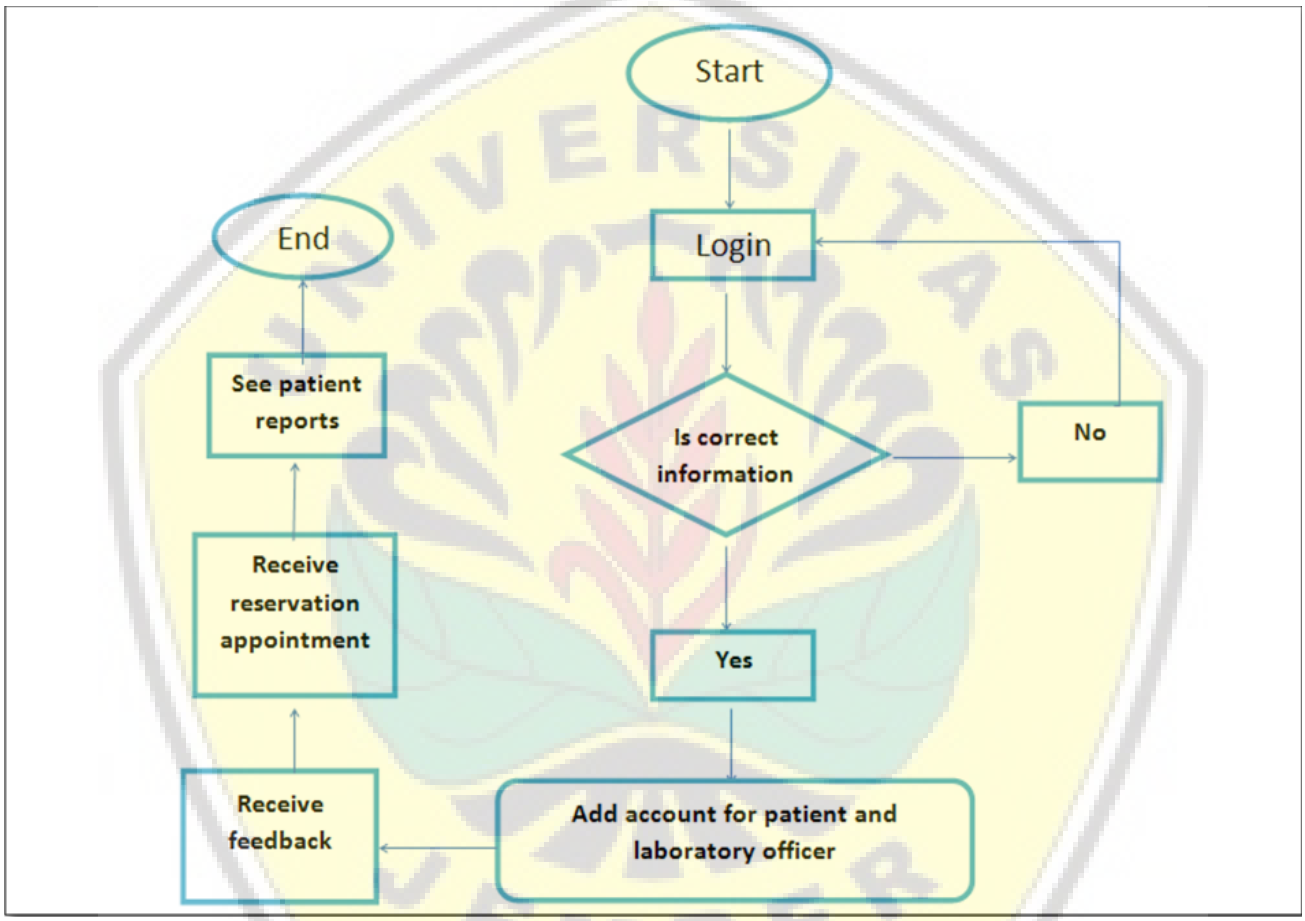

Figure 2: Admin login flowchart

In this project we used SQL with ASP.NET. The report table used to enter new patient information, including the patient's name, patient's age, email, address, name of the experiment to build a database that provides important information on the patient's condition.

The programming interfaces are designed using ASP.NET Language is an open-source server-side web application framework designed for web development to produce dynamic web pages as shown in figure 3.

Figure 3: Homepage

This page contains several choices when clicking on the home page shows the interface of the program where the program starts, and when you click on the tips and guidance goes to the page contains general information about the laboratories and tests, When you click on the test report, the user will receive a full report of all test results and when clicking on the site containing general information about the program designer. The login page records the user's name and password to move to his own account which consists of three accounts (Site manager account, laboratory staff and patient). Each account transfers the user to his page according to the user's specified powers (session)

In ASP.NET Session user can store and retrieve values while the user navigates ASP.NET pages in a Web application. The session can therefore be used to create a secure and easy login by setting a session variable to contain this user account information and allowing the user to browse secure parts of a Web site as long as the session variable is not null. These variables, which are accessed by using the session, are unique to each session instance. A complete security session state of patient information and laboratory information security is provided after a specified period of time. This is because these variables can be adjusted so that they are automatically ended after a specified time and impose the system to log out and return back to main page of inactivity even if the session is not over.

The laboratory employee presents the patient's report by entering his triple name or place of residence in the search and print report.

The patient is able to send an appointment for the test date through this page and send the booking, if the reservation is canceled, the reservation will be canceled and, a new appointment date will be sent to the patient.

Experiment: A questionnaire form was designed and sent to the sample of workers in blood analysis laboratories inside and outside the University of Babylon. The sample consisted of 66 persons divided according to the following age groups (22-30,31-35, Greater than 36) years old.

The questionnaire asked them the following questions :Is the system useful? Are the reports issued by the system in addition to your area of work? Is the system easy to use? Has the system helped save time and effort? Does the system meet the laboratory requirements? Is the program a real guide to be adopted in the Blood Analysis Laboratory?

Results and Discusion

The Physiology lab Management System is tested to uncover errors that were made inadvertently as it was designed and constructed. Verification and validation (V & V) are one of testing elements. Verification refers to set of activities that ensure that system correctly implements a specific function. Validation refers to different set of activities that ensure that system that has been built is traceable to user requirements. In this system we used a process called alpha and beta testing to uncover errors that only the end-user seems able to find.

Alpha test is conducted at developer site by end-users, in this process, we are recording errors and usage problems. The beta test is conducted at end – users sit, end user records all problems and reports these to the developer to find and recover errors and make modification in orderly and effective manner.

The questionnaire form in this work was designed to process the (v & v) testing and alpha & beta testing, the result statistics from questionnaire to the sample consisted of 66 persons was the biologist lap divided according to the following age groups (22-30,31-35 and Greater than 36) years old, we found the following as we are shown in figure (4). From this figure we found that 6% Greater than 36 from workers in biologist lap 9% for (31-35) and 85% for 22-30.

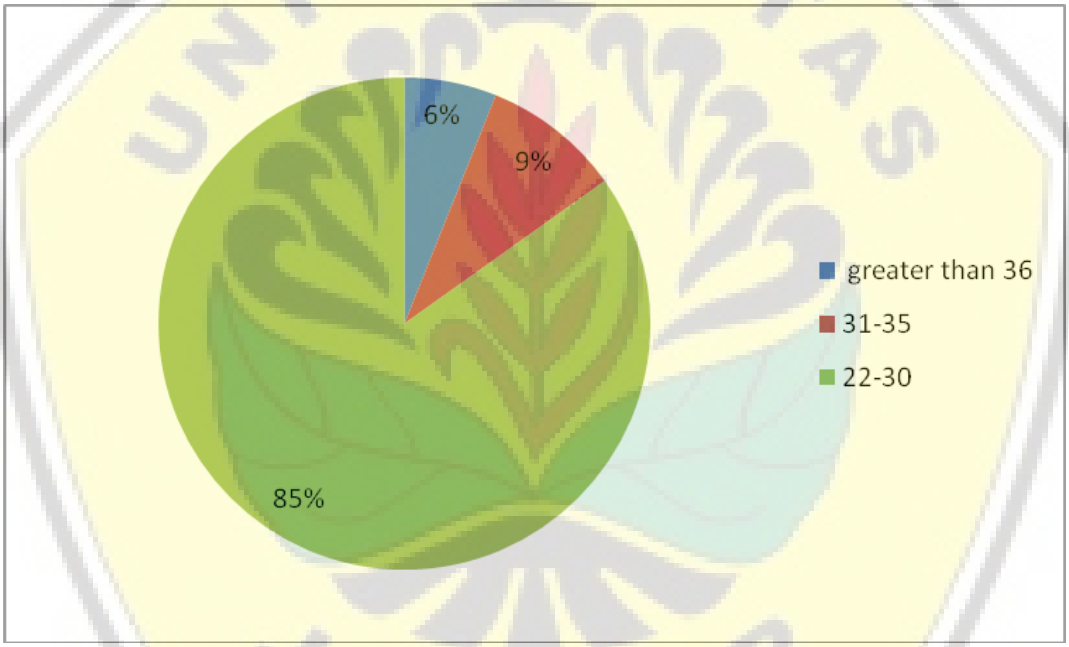

Figure 4: The percentage of responses by questionnaire according to age group

Table 1: A questionnaire 's Questions & responses

	A questionnaire's Question	Yes	Medium	No
1	Is the system useful?	52	13	1
2	Are the reports issued by the system in addition to your area of work?	27	29	10
3	Is the system easy to use?	36	23	7
4	Has the system helped save time and effort?	40	25	1
5	Does the system meet the laboratory requirements?	40	21	5
6	Is the program a real guide to be adopted in the Blood Analysis Laboratory?	34	25	5

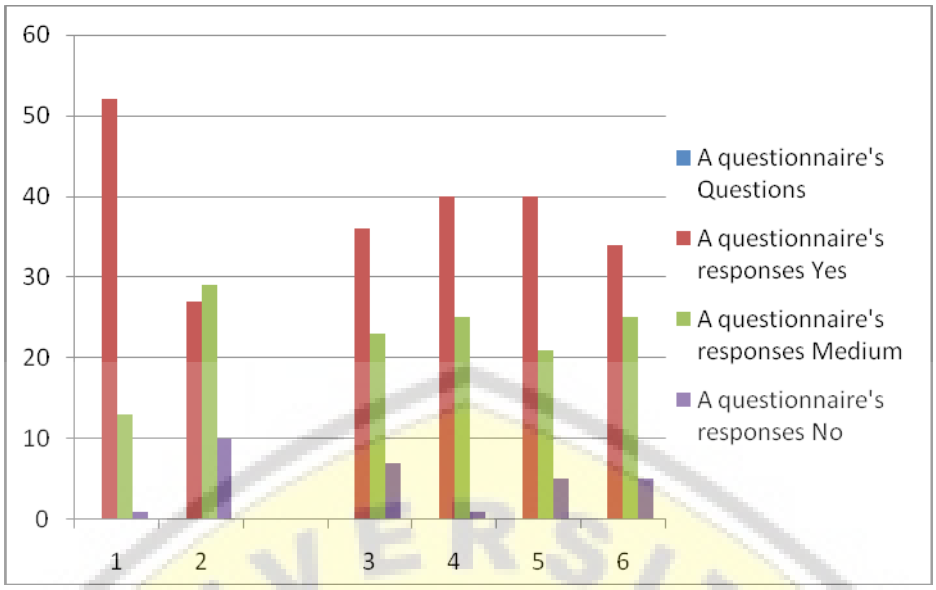

Figure 5: The percentage of A questionnaire's Question & responses

Conclusion

This work was carried out in a laboratory and was worked out by the laboratory employee and found good results in the ease of use and navigation between the pages of the site and the experiments were conducted and the results were withdrawn and the accuracy and high speed, which provided the laboratory staff of the easy to enumerate normal and abnormal diseases. In this work (session) used to create a secure and easy login to provide a complete security session state of patient information and laboratory information security after a specified period of time because the session can be adjusted so that it is automatically destroyed after a specified a specified time and impose the system to log out and return back to main page. The purpose of this system is to provide the registry with satisfactory cases and accurate statistics, which are an important information source for health organizations and the Ministry of Health, through which the database can be built. It provides important information on the patient's condition, which helps to extrapolate the future and identify blood disorders, diseases for the most prevalent based on the current database.

Abstract

A quasi experimental study design (One-group Pretest-Posttest) study has been carried out at Oncology Center at Al-Habbobi Teaching Hospital in Al-Nasiriyah City from the 26th of Des. 2018 to 14th of March 2019 to implement the Effectiveness of an Educational Program on Nurse`s Knowledge about Chemotherapy Hazards, who are working in Oncology Center and to find out the relationship between the nurses' knowledge towards chemotherapy hazards and their demographic characteristics. To achieve the objectives of the present study, non- random (purposive) sample consists of 47 nurses working in Oncology Center have participated in this study. The data are collected through using constructed questionnaire designed for the purpose of the study, which consists of three parts: The first part is related to the demographic characteristics like nurses' age, level of education, marital status, years of experience in oncology ward, and years of employment. The questionnaire is used in pretest before conduction of the program, after the application of the program post test which is done after one month and half from first post-test repeated doing of participants of this study.

Introduction

Cancer is a cause death or cases many complication for patients with it, which can attack adjoining parts of the body and invade to other organs. This process is called to as metastasis. Metastases are the main cause of death from cancer, leading it to of death worldwide[1]. Cancer Chemotherapy refers to the wide range of therapeutic options used in the treatment of malignant diseases, including categories such as cytotoxic drugs, biologics, immunotherapy's, targeted drug therapies, hormonal treatments, and high dose chemotherapy regimens supported with hematopoietic stem cell transplant[2]. Cancer chemotherapy encompasses cytotoxic, cytostatic and biologic agents used to modify the body's response to malignant disorders. These agents can be highly toxic and present specific risks for patients, health care providers and care-givers. As such, the care of patients receiving these drugs requires specific knowledge, skill and judgment within an environment that supports quality practice .Recommendations for the safe handling of hazardous drugs have been available for more than twenty years [3].Evidence for continued risk of occupational exposure is abundant; however, nurses' use of the recommended precautions is not universal. This may be related to a lack of information or to a lack of serious concern for the potential hazards .Over ten and one half million healthcare workers are potentially exposed to hazardous drugs in the workplace. While most drugs defined as hazardous are cytotoxic agents used in the treatment of cancer, many drugs used for other indications and in other patient populations are equally unsafe World Health Organization, 2014. According to the National Institute for Occupational Safety and Health, there is documented evidence of

Corresponding Author:
Hussein Kadhim Abd Ali
Department of Community Nursing College of Nursing-University of Baghdad

contamination of the work environment with hazardous drug HDs, which increases the potential for exposure by nurses, pharmacists and other healthcare workers when these agents are handled inappropriately[4]. A study shows that especially nurses are exposed while preparing and administrating the CDs (chemotherapy drugs) . The level of knowledge of the nurses about antineoplastic drugs is not satisfactory [5]. The awareness of the nurses handling the CDs (chemotherapy drugs) is of concern because it is important in raising standards of safety. In service training is a very effective tool to increase the level of knowledge. This study revealed also the necessity of the improvement of the work environment and the availability of the protective equipment [6]. As the primary prevention measures involve the least possible exposure to CDs (chemotherapy drugs), information regarding the updated guidelines should be disseminated both at the practice and administration levels[7]. For that reason nurses' information about the possible toxicities and the protection measures used while preparing and administering these drugs is gaining more and more importance.

Results and Discusion

There are highly significant differences between two periods (Post 1and post-2 tests) for all items of the Nurse`s Knowledge about Chemotherapy Hazards at Oncology Wards of the Study Sample, which reflects that the nurses' knowledge was affected by educational program when analyzed by (t-test). there are highly significant differences among the three period (pre,post-1and post-2 tests) for of the Nurse`s Knowledge about Chemotherapy Hazards at Oncology Wards of the study sample in all Items and this reflects that the nurses' knowledge was affected by educational program when analyzed by ANOVA. There is no statistically significance at pretest period at p. value 0.05. At posttest-1period statistically significance differences at p. value 0.05 and highly statistically significance differences at posttest-2 period at p.value 0.001. Relative to the table (1) the majority of the study sample at the middle age ranged (25 - 29) years. And they are accounted for (19) nurses with percent (40.4%)with age mean (27) years. This result agree with Wafaa, (2015), that show the majority of study sample with mean age (42.4). This may be because the Department of Oncology wishes to bring middle-aged nurses to be more effective and tolerant to treat and care for patients. In regarding to gender it is noticed that (61.7%) of the study sample are female and the remaining are male. This result is similar to study done by Najma, (2012), they reported that the study population consisted of (35) nurses more than half (80%) of them were female and (20%) male . This may be because of the desire of the Department of Oncology to bring large numbers of graduates of the Faculty of Nursing and medical institutes as they are more knowledgeable and scientific in the treatment of patients, and it is known that most graduates of the collage of Nursing and medical institutes from women, this results is supported by Nezar A., (2014), Who shows that the female rate is higher than the male rate. Table (3) shows that there are highly significant differences between two periods (Post 1and post-2 tests) for all items of the Nurse`s Knowledge about Chemotherapy Hazards at Oncology Wards of the Study Sample, which reflects[11] that the nurses' knowledge was affected by educational program . The health education was effective on study group in present study (Table 3), through the high percent of the nurses responses for knowledge concerning chemotherapy hazards between pre and post health education and majority[12] of nurses responses for the posttest were have been passed compared with pretest.

Conclusion

During the course of the present study data analysis and logical discussion and interpretation of result, the effectiveness of the Education Program was determined. However, the study concluded that: A poor level pretest reflects of knowledge and practice. After posttest 1 the nurses› knowledge level reflects very well and nurses› practice level shows a very good level of practice. Nurses› knowledge and practice become very good after posttest.

In Vitro Assessment of Some Properties of Biocompatable Polymer Dental Implant Consisting from Poly Ether Ketone (Peek) and Silicon Carbide Nanofiller

Mustafa Mahdi Jassim[1], Thekra Ismael Hamad[2]

[1]Lecturer, College of Dentistry, University of Baghdad, Baghdad, Iraq,
[2]Professor, College of Dentistry, University of Baghdad, Baghdad, Iraq

Abstract

Polyetheretherketone (PEEK) is growing in popularity WITH an increased interest in the use of polyether ether ketone (PEEK) for orthopedic and dental implant applications due to its elastic modulus close to that of bone, biocompatibility, and its radiolucent properties PEEK with high chemical resistance, radiolucency, mechanical characteristics compared to those of human bones. Aim of this study this study was done to evaluate the PEEK and PEEK composite dental implant through mechanical and morphological evaluation. PEEK composites (PEEK and SiC with selected weight percentage ratios of (0, 1.5%, 3%, 4.5%, 6%). were fabricated using a compounding by melt blending by (Internal Mixer) at 365ºC, 5min. technique, The study involved Samples preparation (sheets) cutting and machining into desire shapes according to ASTM standards,for mechanical tests which includes tensile strength,elastic modulus and flexural strength,physical tests which include DSC, TGA, FTIR. Morphological test that include SEM, and EDX mapping. The results obtained from the experiments showed that the tensile strength, elastic modulus and flexural strength polymer composite consisting from polyetheretherketone and Silicone Carbide nanofiller implant increased comparing with pure PEEK with better distribution of nano filler particles in PEEK composite (concentration 1.5%, 3%, 4.5%) in the scanning electron microscope examination and EDX mapping

Keywords: *PEEK, PEEK composite, SiC nanofiller.*

Introduction

There is an increased interest in the use of polyether ether ketone (PEEK) for orthopedic and dental implant applications due to its elastic modulus close to that of bone, biocompatibility, and its radiolucent properties PEEK with high chemical resistance, radiolucency, mechanical characteristics compared to those of human bones In addition, it can be repeatedly sterilized and shaped by machining and heat contouring to fit the contour of bones(1) PEEK has been used for load bearing orthopedic applications such as spinal cage, dental implant, and screws . Despite these excellent properties, PEEK is still categorized as bioinert due to its very low reaction with the surrounding tissue, which limits its potential applications(2). Impregnating bioactive materials into PEEK has become an attractive approach for improving its mechanical properties(3). Silicon carbide (SiC) ceramics have a great potential for a number of industrial applications due to their high mechanical strength, low thermal expansion coefficient, low value of relative density, high chemical inertness, oxidation and corrosion resistance(4). Recently, bulk porous silicon carbide ceramics have attracted increasing interest in medical applications as materials with high biocompatibility, for the production of orthopedic and dental implants. Silica-based ceramics are another group of bioactive products, which exhibit better

e-mail: mostafammjmmjmmj@yahoo.com

biodegradability in comparison to HA ceramics, Silicon carbide (SiC) ceramic is one of the members of this group which is light weight and has excellent mechanical properties, It has been used in the manufacture of composite bone scaffolds, for example with a coating of bioactive glass**,** PEEK composites were produced for different applications. The most important application is load bearing implant application[5].

Methodology

Preparation of Polymer: The specimens were prepared in five groups, the preparation method included preparing the polymer composite of PEEK and SiC with selected weight percentage ratios of (0, 1.5%, 3%, 4.5%, 6%).

Mixing Procedure: The polymer composite was made by mixing of PEEK polymer with SiC nano filler with the following proportions (0, 1.5%, 3%, 4.5%, and 6%). The polymer composite was fabricated via a series of processes as follow: Mixing, compounding and compression molding.

1. Mixing between nanoparticles and polymer granule was achieved by sonication instrument firstly, the mixing was carried out manually by adding the selected percentage of SiC with alcohols then sonication for 15 minuts for better distribution of the nano particles the mixing time continued for (15min) followed by put in an oven for drying at (150 °C) for 15 minuts[6].

Figure (1): Specimen Design

2. Mixing and compounding was achieved in an internal mixer (Haake) figure (2-8), the temperature set at 365°C and mixing speed at 70 rpm., the polymer granules added gradually through special opening about 60gm for each mix, The time needed for compounding was about (5) min. after each mix the melted polymer were taken out of the internal mixer and allowed to cool down to room temperature without any further temperature control.

Specimen Preparation:

A. Tensile Test: Tensile test was performed with an Intron 5567 tester(Universal test machine), carried out at room temperature, at a cross head speed of (5 mm/min), and gauge-length, 50 mm. The prepared sheets were cutted with CNC machine to the required shape of tensile test specimen**,**samples were cut according to ASTM D 638- Type3 (ASTM Standard 2011), as shown in Figure (2), the final result represents the average value for the eight tested specimens. Figure (1) shows the standard specimen for tensile test.

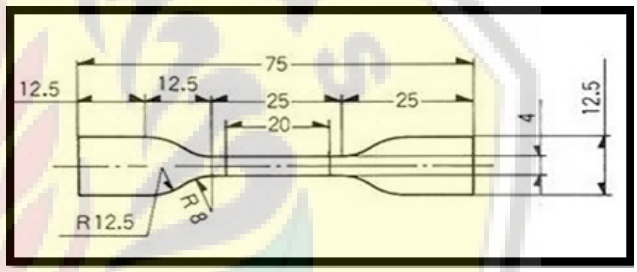

Figure (2): Specimen Design

B. Flexural Tests: Flexural test was performed according to ASTM D790-03 at room temperature by using a three-point test instrument, using the Universal testing machine with velocity (1.28 mm/ min). The sample will be cut at length of at least 65 mm, width was about 10 mm and thickness will be not less than 2.5 mm. Flexural modulus and strength were calculated from the load displacement diagrams. Eight specimens were used for most tests, and the final results represent the average values for Eight specimens, as it was reported.

Physical tests and Structural Characterization:

A. Differential Scanning Calorimeter (DSC): In this test some characteristic were evaluated, such as melting temperature, crystallization temperature, glass transition temperature, and heat of fusion, etc. The procedure of this test was carried out using samples, weigh about (10.96 mg) heated first from room temperature to 400ºC; with 45ºC/min. heating rate in order to erase the thermal history of the sample, thereafter cooled from 400ºC to room

temperature with a rate of 10oC/min, and then heated second in a cycle to 400ºC at 10ºC/min, all in N2 atmosphere. Each sample was subjected to double heating and cooling cycles under a dry nitrogen purge, and data were recorded during the heating and cooling cycle[7].

B. Thermo gravimetric analysis (TGA): In this test, thermal stability has been discussed, including the resistances of thermal degradation and flammability of SiC nanoparticles. by heating from room temperature to 700oC, at heating rate of 20oC/ min in N2 atmosphere [7] . This test was done on a small samples weigh 12.6 mg put in a small crucible of alumina and the weight loss as a function of temperature was measured, the test was performed by using DSC/TGA (STA System) METTLER – TOLLEDO.

C. Scanning Electron Microscopy (SEM): SEM was used to reveal the microstructure of nanoparticles powders samples, neat PEEK, nanocomposites samples. It was used to diagnose the phases and nanoparticles distribution of samples, SEM (LEO, model 1455VP, UK), with an accelerating voltage of 10–20 kV, the uniformity of distribution and the particle size of the nanoparticle in nanocomposites were also inspected. Before observation, in order to avoid charging during electron irradiation, the composite samples were fractured in liquid nitrogen and covered with (Au) using a gold sputter coating.

D. Fourier Transform Infrared (attenuated total reflection) analysis (ATR/FTIR): Thin films (100 microns) shown of the neat PEEK, selected sample from nanocomposite samples These films were used for crystalline structure characterization on a Brucker ATR/FTIR spectrophotometer (model IFS48, Germany) (spectral range 4000–300 cm-1 and resolution 2 cm- 1) .

E. Elemental Analysis with EDX: SEM supported by EDX (energy dispersive X-ray analysis) technique was performed to determine the composition polymer composite the main principle of spectroscopy is that each element has a unique atomic structure allowing a unique set of peaks on its electromagnetic emission spectrum, it depends on the interaction of some source of X-ray excitation and a specimen for the emission is the characteristic X – ray of the elements contained in sample which was detected by the detector. The received signal from the detector was analyzed.

Results

Mechanical Tests:

Tensile Strength: Table (1-1) shows descriptive statistics Mean values, standard deviation, Standard error, maximum and minimum of tensile strength test result of pure PEEK, G1(peek +1.5%Sic), G2 (peek+3%Sic), G3(peek +4.5% SIC), G4 (peek+6%Sic) respectively as a function of nanoparticle weight percentage, it show increase the tensile strength values of the PEEK polymer composite comparing with pure peek with increase the percentage or volume fraction of the SiC nano composite reach to maximum value at G3 group which represent the PEEK with 4.5% SiC nano filler .

Table (1): Descriptive data of tensile strength test (N/mm^2) with F-test by ANOVA of tensile strength test, *P<0.01 High significant

Groups	Descriptive statistics				Comparison	
	Mean	S.D.	Min.	Max.	F-test	p-value
Pure peek	1444.625	93.399	1312	1576	42.660	0.000
G1	1662.625	69.953	1565	1762		
G2	1716.000	16.878	1698	1753		
G3	1927.500	111.024	1819	2086		
G4	1766.250	50.933	1680	1829		

The average data of the tensile test results modulus table 1-2 showed that elastic modulus are increased with increasing the weight percentage of nano powders PEEK polymer composite comparing with pure peek reaching to its maximum value in G3 group, the inclusion of nanoparticles in first group has raised the tensile strength by 15% and for the composite sample, G3(peek +4.5% SIC) group which its tensile strength value raised by 33% comparing with pure PEEK**.**

Table (2) The elastic modulus of PEEK, G1, G2, G3, G4 groups nanocomposites as a function of SiC nanoparticles content in the composite .

0	Pure peek	G1 peek +1.5%Sic	G2 peek+3%Sic	G3peek +4.5%SIC	G4 peek+6%Sic
Elastic modulus	4.1791	5.5904	6.2507	7.4771	6.2373

Flexural strength The highest mean value is recorded by the G3 group, while the lower value was in PEEK control group, it is observed that increased of SiC nanofiller content in polymers (PEEK: X% SiC), lead to increase the values of flexural strength for polymer composite except group G4 which show decrease in the flexural strength value. Statistically F-test show a highly significance difference in the transverse strength among the groups.

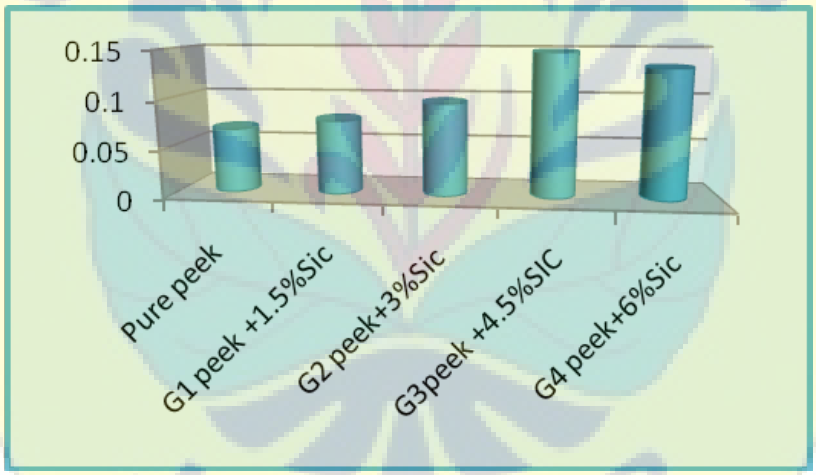

Figure (3): Bar chart showing the flexural strength values for the PEEK, G1, G2, G3, G4 groups

Physical tests and Structural Characterization:

A. Differential Scanning Calorimeter (DSC): (DSC) was used to analyze crystallization and melting temperatures of polymer nanocomposites which can be determined from the curves accordingly. The percentage of crystallinity can be determined by dividing crystallization enthalpy (ΔHc) (integrating the area under exotherm peak) and dividing it with ΔHco, (the theoretical crystallization enthalpy of 100% of PEEK). That shown in equation

$$Xc\% = \frac{\Delta Hc}{\Delta Hc^{o}} Wpolymer \times 100 \ldots\ldots\ldots (3-1)$$

Where, ΔHc refers to heat of crystallization of the specimen, ΔHco fusion heat for pure crystalline PEEK which is 130 Jg-1 [Tg 2011] and *W* for the weight composition of the polymer, DSC the crystallization temperature (Tc) of PEEK has been raised slightly when SiC nano filler was added, this indicate non significant changes in the properties of material

B. Thermo gravimetric Analysis (TGA): TGA characterization has been carried out in nitrogen atmospheres to analyze the thermal stability of the composites and the effect of time and heat on the stability of the nano filler which show that it can withstand the time of processing especially during mixing up to 20 minuts. The degradation curves of pure PEEK, and Sic are illustrated in figure (1-3).

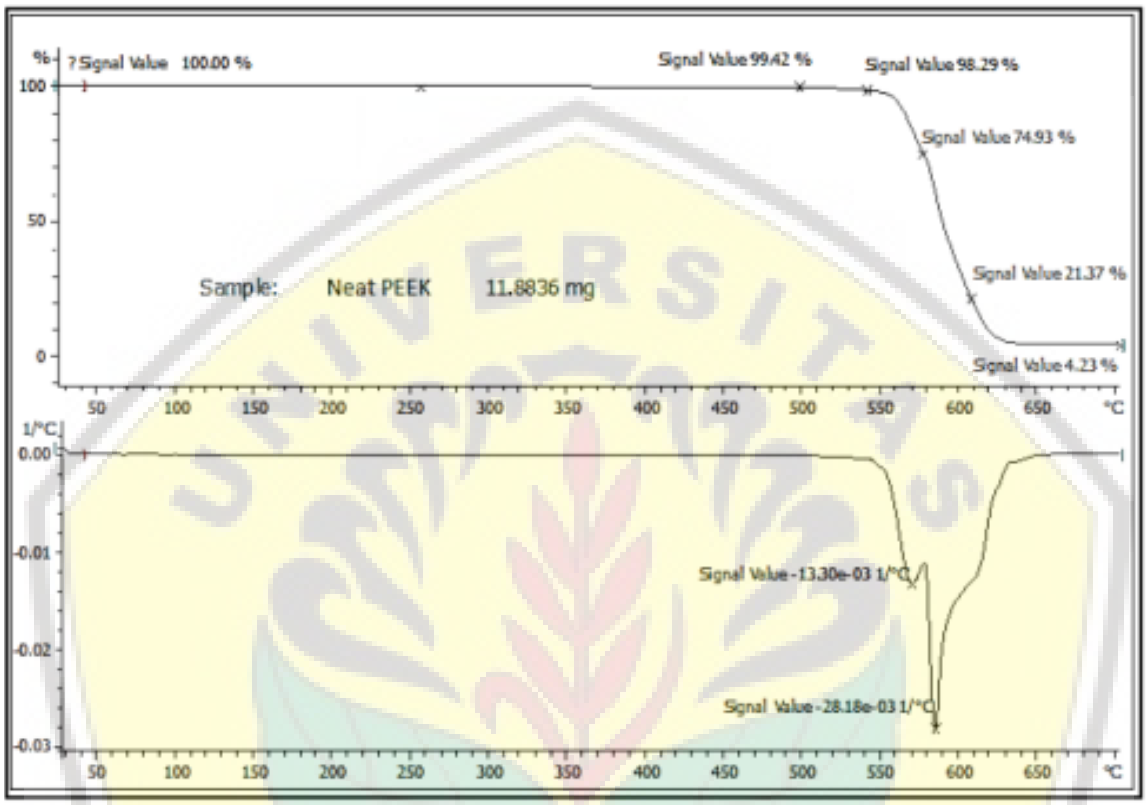

Figure (4): Thermo gravimetric analysis (TGA) for peek

C. Fourier Transformation infrared FTIR analyses. IR mode: The FTIR analysis confirms the structure of Poly ether+ ether ketone with the same absorption bands for the polymer composite in the other groups.

D. Scanning Electron Microscopy SEM: The scanning microscopy image of SiC nano-particles. The nanoparticles form some agglomerates, the particles are irregular in shape and the distribution of the particles is such that they are loosely packed and are approximately at the range between 500 nm to 1-3 μm long, the cryo- fractured surface morphology of neat PEEK was homogenous accompanied by smooth surfaces and no voids or defects, the surface morphology of G1, G2, G3 group with 1.5,3,4.5% of SiC nanoparticle content in composites which exhibited a homogenous morphology with uniform dispersion of the nanoparticle, it can be observed that different sizes of spherical shaped of nanoparticle material were dispersed randomly in PEEK matrix with very few of micro-cavities structure, this indicates a fairly interaction between the components, morphology of G4 group with 6% of SiC nanoparticle content in composites, the dispersion of the SiC nanoparticle in PEEK was much less than the previous groups,with more aggregation behaviors of SiC nanoparticle

figure (4).

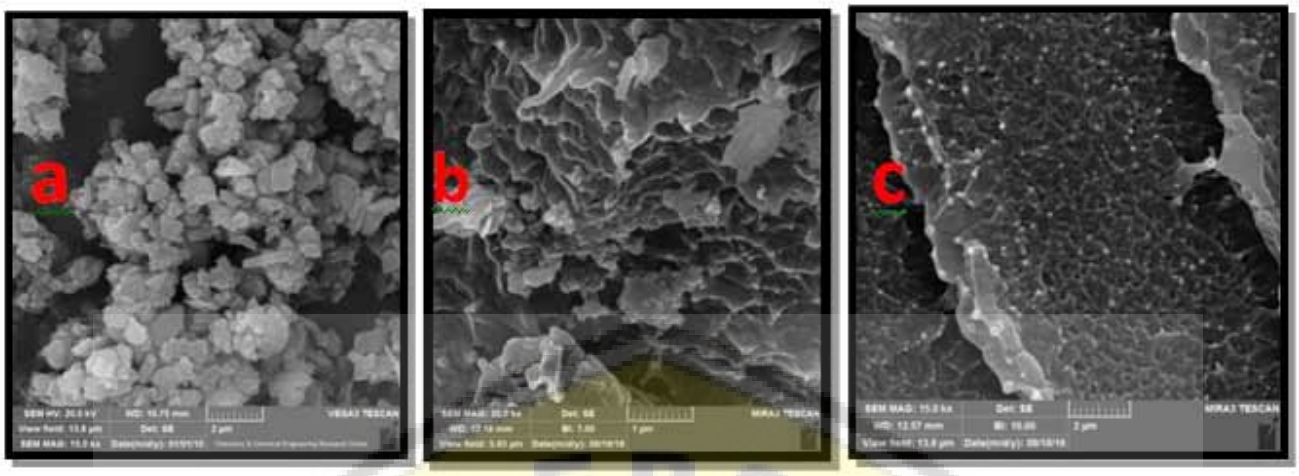

Figure 5: SEM of a. pure PEEK, b. G3 polymer composite, c.G4 polymer composite

E. Scanning Electron Microscopy (SEM) with Energy Dispersive X-Ray Analysis (EDX): EDX mapping for the peek composite group G1 group and G3 group figure (1-5a,b) with magnification of 25000 x show uniform distribution of the nano silicone carbide filler that indicate good mixing procedure while in G4 group PEEK composite figure (1-5c)) show the presence of agglomerates in concentration of 6% SiC

Figure (6): SEM with EDX mapping of PEEK composite a.G1, b.G3, c.G4material 25000 x where the red spots represent the SiC Nano filler

Discussion

There is an increased interest in the use of polyether ether ketone (PEEK) for orthopedic and dental implant applications one of the major reasons to gain interest into PEEK was its closely matched stiffness to bone. This mismatch in stiffness may cause a stress shielding and may lead to bone resorption[8,9]. SiC nanostructures are promising candidates in the field of biomedical device, Moreover, the unusual properties of nanoparticles affect the various interactions take place between nanoparticles and the polymer matrix designing to reinforced the polymers to attain desirable macroscopic material properties by combining materials at a microscopic

level[10]. For the tensile strength mean tensile strength at break show increase in its values of the PEEK polymer composite (G1, G2 G3) with increase the percentage or volume fraction of the SiC nanofiller reach its maximum value at G3 group that represent the PEEK with 4.5% SiC nano filler, the incorporation of the hard nanoparticles powders into the polymer matrix which leads to restricted the movement of polymer chains and, accordingly, increases the tensile strength and elastic modulus for nanocomposite material[11] Group G4 with 6% content of nano SiC show decrease in the value of tensile strength and elastic modulus this may be due to incorporation of nano filler may lead to agglomeration of the filler in some parts of the polymer matrix that proved in the electron[12-17].

Conclusion

polymer composite consisting from polyetheretherketone and Silicone Carbide nanofiller sow improved in its mechanical properties (tensile strength, elastic modulus and flexural strength) comparing with pure PEEK, with the concentration of (1.5,3,4.5%) of nano filler with good distribution the filler confirmed by SEM, EDX examinations.

Cholinesterases Activities in Diabetic and Hyperlipidemic Patient

Ahmed A.J. Mahmood[1], Musab M. Khalaf[2], Adnan A. Zainal[2]

[1]Department of Pharmaceutical Chemistry, College of Pharmacy, University of Mosul, Mosul, Iraq,
[2]Department of Pharmacology and Toxicology, College of Pharmacy, University of Mosul, Mosul, Iraq

Abstract

This this study aims to find whether the elevation or the reduction of ChEs levels can be related to the diabetesmellitus and/or dyslipidemia. This study is considered as case-control comparative study. The human plasma and erythrocyte cholinesterase activity was tested in 5 group. Groups 1 and 2 were type 2 hyper- and normo- lipidemic diabetic patients respectively with good control of diabetes. Groups 3 and 4 were type 2 hyper- and normo- lipidemic diabetic patients respectively with inadequate control of diabetes. Group 5 included patient with hyperlipidemia only. The control group consisted of apparently healthy subjects with no history of diabetes or hyperlipidemia or exposure to anti-ChE insecticides or drugs. Also fasting serum glucose, Hb A1c and the serum lipid profile were estimated in these groups. The results indicate that there is a relation between the BChE and diabetes, but no such relation could be seen with AChE. Also there is similar relation between the dyslipidemia and the both types of the ChE. The combination of inadequately controlled diabetes with dyslipidemia can cause elevation in both types of ChE enzyme but less than that of dyslipidemia alone.

Keywords: *Cholinesterases - Diabetes - Hyperlipidemia -AChE- BChE.*

Introduction

Cholinesterases (ChE) are enzymes that catalyze the hydrolysis of the acetylcholine into choline and acetic acid to allow a cholinergic neuron to return to its resting state after activation[1]. There are two types of cholinesterases enzymes. 1. Acetylcholinesterase (AChE), also known as true or erythrocyte cholinesterase, found primarily in the erythrocytes and some neuralsynapses. Pseudocholinesterase (BChE), also known as plasma cholinesterase, butyrylcholinesterase with a lower specificity for acetylcholine, found primarily in the plasma, liver, glia and many other tissues[2,3]. The physiological functions of plasma ChE are not known, but one idea is that they protect the body from natural anti-ChE agents (e.g. physostigmine, a plant alkaloid) encountered during the evolution of species. Also it has been shown that BChE is involved in lipid/lipoprotein metabolism[4]. Diabetes mellitus (DM) is defined as an elevated blood glucose associated with absent or inadequate pancreatic insulin secretion, with or without concurrent impairment of insulin action[5]. Hyperglycemia is a common end point for all types of diabetes mellitus and is the parameter that is measured to evaluate and manage the efficacy of diabetes therapy[5-7]. There are two major types of lipids in the blood, cholesterol and triglycerides (TG). They are carried on four types of lipoproteins: chylomicrons, low-density lipoprotein (LDL), very low density lipoprotein (VLDL) and high density lipoprotein (HDL). The primary function of lipid particles is fat transport to the liver and adipose storage areas[8]. The lipid abnormalities are prevalent in DM because insulin resistance or deficiency affects the key enzymes and pathways in lipid metabolism[9]. Diabetic dyslipidemia is generally characterized by increased plasma TG and LDL-C, and decreased HDL-C concentration[10]. Much research indicates that the BChE activity is increased in certain metabolic disorders like hypercholesterolemia, hypertension, obesity and type 1 or type 2 diabetes[11-15]. In these studies, BChE activity correlates strongly and positively with serum levels of low density lipoprotein (LDL)-cholesterol and triglycerides (TG) and inversely with serum high density lipoprotein (HDL)-cholesterol.

All these observations suggest a relationship between BChE activity and lipoprotein metabolism, but the rationale for this connection is unclear. On the other hand other researchers indicated the opposite[16,17], as their results indicated that the relationship between serum lipid/lipoprotein metabolism and BChE activity in diabetes lacks any strong supportive evidence[17-19]. So there is a controversy about the level of plasma and erythrocyte ChE that may be increased or decreased or even remain normal in diabetic and in hyperlipidemic patients [17]. However, other studies have suggested BChE may not have a direct pathophysiological role in the development of metabolic syndrome and diabetes[19]. This study's objective is to find whether the elevation or the reduction of ChEs levels can be related to the DM and/or dyslipidemia. Such a relationship could be considered as a diagnostic parameter for such diseases, if proved.

Materials and Method

This study is a case-control comparative study. The study took place in Al-Wafaa Center for Diabetes. The subjects included in this study were male and females, whose age not less than 30 years. The human plasma and erythrocyte cholinesterase activity were tested in 5 groups (30 patients for each group). Groups 1 and 2 were hyper and normo-lipidemic type 2 diabetic patients respectively (duration of diabetes and hyperlipidemia was not less than 3 years) with Hb A1c = 5-8% (indicating a good control of diabetes). Groups 3 and 4 were hyper and normo-lipidemic type 2 diabetic patients respectively (duration of diabetes and hyperlipidemia was not less than 3 years) with Hb A1c >10 (bad control of diabetes). Group 5 were patients with hyperlipidemia only whose duration was not less than 3 years. The control group consisted of apparently healthy subjectswith no history of diabetes or hyperlipidemia or exposure to anti-ChE insecticides or drugs. Patients taking any medications other than oral hypoglycemic and antihyperlipidemic drugs (as these drugs have no effects on the ChEs levels) orexposed to anti-ChE insecticides or drugs were excluded. Also patients were excluded if they had chronic cardiac illness (ischemic heart disease, heart failure, cardiac arrhythmias), chronic liver disease (hepatic failure, active hepatitis, liver cirrhosis), renal complications and any other chronic debilitating illness. Blood samples were collected in 5 ml EDTA-treated test tubes then centrifuged at 3000 rpm for 15 min. The erythrocytes and plasma were separately kept on ice for ChE assay. The rest of the sample was used for the glucose and lipid profile assay. In our work we used the modified electrometric method for the assay of ChE activity, validated in humans[20,21]. The reaction mixture in a 10 ml beaker contained 3 ml distilled water, 0.2 ml plasma or erythrocytes and 3 ml pH 8.1 barbital-phosphate buffer[22]. The pH of the mixture (pH1) was measured with glass electrode using pH meter, then 0.1 ml of aqueous solution of acetylthicholine (7.5%) was added to the reaction mixture which was incubated at 37°C in water bath for 20 min. At the end of the incubation period, the pH of the reaction mixture (pH2) was measured. The enzyme activity was calculated as follows:

ChE activity (ΔpH/20 min.) = (pH1-pH2)-ΔpH of blank: The blank contained no blood aliquot. The barbital-phosphate buffer solution consist of 1.24 g sodium barbital (BDH), 0.163g potassium dihydrogen phosphate, and 35.07g sodium chloride (BDH) dissolved in one liter distilled water [20,21]. The pH of the buffer was adjusted to 8.1 with 1N HCL.

Fasting serum glucose (FSG) was estimated by glucose–oxidase–peroxidase colorimetric method (spectrophotometer (Optima) Japan) [23], by using a kit supplied by Biocon company (Germany). Glycated hemoglobinHb A1c was measured in whole blood sample by ion-exchange resin quantitative colorimetric determination [24], using a kit supplied from Stanbio (USA).Determination of serum TC concentration was done by the enzymatic colorimetric method [25], using total cholesterol BIOLAB kit (France). Determination of serum TGs concentration was done by the enzymatic colorimetric method [26], using triglycerides BIOLABO kit (France).Determination of serum HDL-c concentration was done by the precipitation method [27], using HDL-c BIOLABO kit (France). Low density lipoprotein cholesterol (LDL-c) was calculated by Friedewald formula [28].

LDL-c = TC – (HDL-c + TGs/2.2)

VLDL-c calculated according to the following foemula.

VLDL-c = TGs/2.2 (mmol/l)(29)

Analysis of variance (ANOVA) followed by the least of significant difference test (LSD) *post hoc* test was used as the statistical method. Additionally, simple Student's t-test was used for the comparison between the means of all groups (30). The level of significance was set at $P<0.05$.

Results and Discusion

Table 1 represent the results of the FSG, Hb A1c, TC, TGs, HDL-c, LDL-c VLDL-c, BChE, and AChE of the control and the tested groups. The current study demonstrated that Group 1 shows significant alterations and changes in the lipid profile since the patients were already hyperlipidemic, the Hb A1C also showed elevation as compared with control group, although the FSG was slightly elevated, this could be attributed to the lipid profile derangements which may affect the liver parameters. In this group the BChE was also significantly elevated with no change in AChE.Published data suggest association between BChE activity and lipid metabolism and weight and body mass index (BMI) [31,32]. Moreover, mean BChE activity tends to be higher in obese subjects than in nonobese individuals. Obese humans have high plasma BChE activity, whereas starved humans have low plasma BChE activity [33].Group 2 shows little change in the lipid profile parameters as there is a little elevation of LDL and decrease in HDL, this can be attributed to the eating habits of fats in our locality. Also in this group the BChE shows a significant elevation as compared with the control group.Group 3 like Group 1 shows remarkable changes in the lipid profile as they were initially diagnosed as dyslipidemic patient, also the FSG and Hb A1C were significantly elevated as they were uncontrolled diabetic patients. The ChE shows different picture in this group as the BChE was significantly elevated higher than all other diabetic groups and the control group, also the AChE in this group was elevated significantly. This may explained by the inadequate diabetic control (elevated FSG and Hb A1C)[34] and having dyslipidemia[35,] co-existence of diseases may affect lipid metabolism and its hemostasis causing abnormality and remarkable change in BChE (more than that of the other groups), resulting in changing the hemostasis between the two types of the enzyme (from their site of production) that may cause change in the AChE level. The results by Mushtaq*et al*., indicated altered levels of AChE and BChE both in Alzheimer's disease (AD) as well as in T2DM imply that those two enzymes may be playing a pivotal role in the pathogenesis of the two disorders. AD and T2DM are both characterized by elevated levels of AChE and BuChE in the plasma[36].

Table 1: FSG, Hb A1c, TC, TGs, HDL-c, LDL-c, VLDL-c, BChE, and AChE values of the control and the tested groups.

Parameters	Control	Group 1	Group 2	Group 3	Group 4	Group 5
FSG mmol/L	5.64±0.73	6.36±0.69	6.11±1.24	9.71±1.90*	9.24±0.94*	5.98±0.37

AChE Δ pH/20 min	1.01±0.06	1.10±0.04	1.07±0.13	1.56±0.10*	1.13±0.09	2.61±0.04*

The values are represented as means ±SE
*Significantly different from the respective control (0) group, P<0.05

Conclusion

There is a relation between the BChE and diabetes (as there is an elevation of its level in all diabetic groups), but no such relation could be seen with AChE. There is similar relation between the dyslipidemia and the both types of the ChE. The combination of poor control of diabetes and dyslipidemia can cause elevation in both types of ChE enzyme but less than that of dyslipidemia alone (i.e. the diabetes may reduce the effect of the dyslipidemia on the production of the two types of the ChE, as seen in group 3, or the diabetes and dyslipidemia are both affecting the ChE level in different ways -each

one act alone- as the diabetes is affecting BChE only and the worse dyslipidemia is affecting both ChE types).

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Pharmaceutical Chemistry, College of Pharmacy, University of Mosul, Mosul, Iraq and all experiments were carried out in accordance with approved guidelines.

The Impact of the Formal Strategy of the Theory of Cognitive Burden in Acquiring the Concepts of Middle School Students

Nada Khudair Ali al-Shammari[1], Hamdan Mahdi Abbas al-kraee[1], Abbas Karim Abd al-Khafaji[1]

[1]Babylon University-Faculty of Basic Education

Abstract

The present research aims to identify the effect of the formal strategy based on the cognitive burden theory in acquiring the historical concepts of the fourth literary students. The research was conducted on the fourth grade students. The school was randomly selected (Al-Mahaweel Preparatory School for Girls with 61 students). The researcher used the experimental method as the most suitable method for this research. The experiment was applied to the two research groups with a period of (1) years. 8 weeks), and used the pat The statistical method (t-test, kai square (k2), coefficient of paragraph distinction, coefficient of paragraph difficulty, effectiveness of wrong alternatives, Pearson correlation coefficient, Spearman-Brown correlation coefficient). The researcher found that there was a statistically significant difference between the two groups of research in the post-acquisition experiment in favor of the experimental group.

Keywords: *Formal strategy, cognitive burden, historical concepts, preparatory stage.*

Introduction

Education comes as a mainstay in the building and individualization of the individual as it includes the types of activities that affect the individual and his preparations, behavior, mental orientation, intelligence and skills, and the installation of its effects on his personality in physical, mental and psychological dimensions [1]. The duty of education is the responsibility of building a scientifically educated person who must possess a degree of knowledge and awareness of the general issues related to the various spheres of life so that he can make the right decision regarding the situations and problems he has faced in a society that is constantly changing and evolving [2] Current era And the impact of this development in the field of education and teaching method. It is also reflected in the need to teach the teacher to acquire modern teaching skills, which may facilitate the process of learning and teaching, and promote his role as a guide, facilitator and facilitator of the teaching process through modern and unconventional teaching method [3]. In recent years, several educational theories have emerged, based on a number of method and strategies used in teaching. These theories include the theory of cognitive burden John Sweller. A University of New South Wales University of Psychology, where this theory is based on the concepts of information processing in memory and the development of schematics and the mechanism of procedural knowledge [4]. The cognitive burden is the total mental activity that occupies the capacity of the working memory during a certain time[5]. Based on this theory, the theory emphasized that limited working memory capacity is one of the obstacles to learning, and that these obstacles must be addressed through the change of traditional learning and teaching designs. Therefore, the theory of the cognitive burden of many of the design of learning and education is based on knowledge of cognitive engineering[6]. One of these strategies (formal strategy) aimed at expanding the limited working memory through the use of visual learning or audio learning[7]. Historical concepts form a broad base based on the use of a single type of historical material, where the understanding of the teachers of the events is determined by the depth, breadth and diversity of their achievements of the concepts. As the learner gains from concepts, new attitudes and experiences lose their difficulty and thus the learner is able to interpret and think well[8]. Thus, the acquisition of students of historical concepts is one of the most important fundamentals of the study of history, in turn, constitute the necessary basis for the cognitive behavior of learners

and it constitutes an important educational goal at all levels of study because they contribute significantly to the learning process[9]

Methodology

The researcher followed the experimental approach in the conduct of the research because it is characterized by two reasons: It is the only type that directly try to influence a particular variable and also he can test the validity of hypotheses about the so-called reason relationship and the following table shows this:

Research community and design: The research society included fourth grade students in the preparatory and secondary day schools in Mahaweel district/Babil governorate.

The sample of the study was randomly selected. The Mahaweel Girls' Preparatory School was the site of two groups, one of which was chosen randomly to be experimental group, and the other group was a total of 63 female students with 31 experimental students. The following table shows the following:

Table (1). Distribution of students of the research sample before and after exclusion on the two research groups

Group	Division	Number of female students before exclusion	Number of students excluded	Number of female students after exclusion
Experimental	A	32	1	31
Control	B	33	1	32
Total		**65**	**2**	**63**

The control of extraneous variables: Although the researcher investigated the equivalence of the two sets of research in variables that I think affect the course of the experiment, they tried to avoid the effect of some extraneous variables in the course of the experiment. These variables are: Accidents associated with the experiment: The sample was randomized and the two groups were confirmed. The maturity factor: Because the duration of the experiment was uniform between the two research groups, and the age of the students in both groups was close, this will affect the experimental measures. The researcher worked to limit this factor because it affects the dependent variable during the course of the experiment.

Research tool: Test the acquisition of historical concepts and designed the researcher tested the research and then was presented to a group of experts and specialists and after the amendment and then test students.

Determine the purpose of the test: The purpose of this test is to measure the acquisition of fourth-grade literary female students of historical concepts.

Determination of the objectives of the test: The researcher identified behavioral goals that are (60) behavioral goals after setting the purpose of the test.

Determination of the test paragraphs: The test paragraphs were formulated in their preliminary form and consisted of (20) paragraphs divided into three levels (definition, discrimination, application)

Test instructions: The instructions for the test and how to answer (selecting one correct alternative to the paragraph, answering all paragraphs, the time period for answering, typing the triple name, the class and the division in the assigned space).

Correcting the test answers: After the test paragraphs have been formulated, a standard has been set to correct the answers, with one score for each correct test paragraph, zero for the wrong answer, and the left over paragraph that the student answers. Therefore, The historical concepts are (60) degrees and the minimum is (zero).

The truth of the test: Honesty: It is to measure the test in what is put for it

In this way, the researcher relied on the veracity of the test to verify that the test verbs actually measured the

behavioral objectives. It can be defined as the simplest and most reliable types of honesty and used in the tests because it is the easiest in terms of its procedures and its reliance on the logic guaranteed by the test and its relevance to the measured attribute.

Statistical analysis of the test paragraphs: The test paragraphs were analyzed as follows:

A. Coefficient of difficulty paragraph: It means the proportion of the number of students who answered the paragraph answered correctly to the total number and called the amount of this ratio "difficulty coefficient". If the value of the amount increases, it indicates the ease of the paragraph, and if the value of the value decreases, it indicates that the paragraph is difficult. After calculating the difficulty factor for each test paragraph, it was found to be between 0.39 and 0.7, All the test paragraphs were acceptable, as Sawalma (2009) noted, that the test paragraphs were good if their coefficient of difficulty was between 0.20-0.80. The test paragraphs are therefore acceptable and applicable in terms of difficulty factor.

B. The power of paragraph discrimination: Is the ability of the paragraph to distinguish between the upper group (the students with the high grades in the test) and the minimum (students with low grades in the test) that means the ability to distinguish individual differences between students who know the correct answer and students who do not know the correct answer (Dulaimi and Adnan, (E), (1972: 66). When we calculated the specific force of each paragraph of the test using the parity equation, it was found to be between 0.33 and 0.52. Ebeal (1972) 20-0.80).

C. The effectiveness of wrong alternatives: The wrong alternative is effective when the number of students selected in the lower group is more than the number of students who chose the same alternative in the upper group. All alternatives were found to have attracted more female students in the lower group than the upper group students, and thus were recognized to be retained.

Statistical Means: The researcher used the following statistical means:

1. Frequency and percentage of the calculation (Honesty reaches an 80% virtual honesty ratio).
2. Pearson equation to extract the coefficient of stability, reaching (0.86).
3. The researcher used the Spearman-Brown equation to correct the coefficient of stability (0.92).
4. The researcher used the square Kay (Ka 2) to indicate the differences between the two groups of research at the parity of the academic achievement of parents and the calculated value of parents (0.791), less than the value of (k 2) table of (7.815) and freedom degree (3) 0.05), as in Table (1). The calculated value of mothers (1.461) is less than the value of (ka2) of the table (7,815) and the freedom level (3) at the level of (0.05) as in Table (3).

Table (2) Value of (Ka2) for the academic achievement of parents

Group	The number	Reads, writes and initials	Middle school	Preparatory and Institute	College and above	Values (Ka 2)		The degree of freedom	Level of significance (0,05)
						Calculated	Tabular		
Experimental	31	10	7	8	6	0.791	7.815	3	Not a function Statistic
Control	32	8	6	10	8				

Table (3) Value (k2) for the academic achievement of mothers

Group	The number	Reads, writes and initials	Middle school	Preparatory and Institute	College and above	Values (Ka 2)		The degree of freedom	Level of significance (0,05)
						Calculated	Tabular		
Experimental	31	9	7	6	9	1.461	7.815	3	Not a function
Control	32	11	6	9	6				

I also used (k2) to demonstrate the validity of the concept acquisition test paragraphs.

Table (4) The time life calculated in months

Group	Number of sample	Average	standard deviation	degree of freedom	T value		Statistical significance 0.05 Not a function
					Calculated	Tabular	
Experimental	31	191.03	4.14	61	0.826	2.000	
Control	32	190.13	4.56				

The researcher used the t-test to show the first grade of the history of the Arab Islamic civilization for the fourth quarter, the experimental average of the experimental group (66.32) and the standard deviation (18.17) and the difference (330.15), while the arithmetic average of the control group (67.47) and the standard deviation (17.18) and variation (295.15). When we used the t-test to find out the difference between the grades of the students in the first course, it was found that the difference is not statistically significant at the level of 0.05. The calculated T value is 0.277, (2,000) and a degree of freedom (61) This indicates that the two groups are equal in the grades of the first course The history of the Arab-Islamic civilization and the table (6) illustrate this:

The average results were that the average grades of female students, the experimental group that studied the formal strategy, was 42.97. The difference was 79.74 and the standard deviation was 8.93. The average score of the students in the control group was 35.3, the difference was 111.94 and the standard deviation was 10.58. 3.211. It is smaller than the value of T table (2.000) at the level of significance (0.05) and degree of freedom (61). This is the superiority of students of the experimental group on the control group and thus reject the zero hypothesis developed by the researcher and accept the alternative hypothesis. The students of the experimental group, which studied the history of the Arab Islamic civilization for the fourth grade literary according to the formal strategy on the students of the control group, which studied the same article in the traditional way in the acquisition test. This result can be attributed to:

1. The formal strategy has benefited the students of the experimental group by observing the increasing degrees of testing the acquisition of historical concepts, as they outperformed the students of the control group.
2. This strategy is appropriate to the level of students of this stage because they enjoy mental and intellectual maturity and the ability to analyze and summarize.
3. The formal strategy led to the excitement of students and their interest and suspense for the material history and their desire to know the subject or prepare them, which increased their education of the subject matter.
4. The subjects studied during the experiment may be suitable for the use of formal strategy, which led to increased understanding of students in these subjects.
5. The novelty of the strategy has encouraged students to study history and increased their desire to know the concepts.

Conclusion

The research was conducted on the fourth grade students. The school was randomly selected (Al-Mahaweel Preparatory School for Girls with 61 students). The researcher used the experimental method as the most suitable method for this research. The experiment was applied to the two research groups with a period of (1) years. 8 weeks), and used the pat The statistical method (t-test, kai square (k2), coefficient of paragraph distinction, coefficient of paragraph difficulty, effectiveness of wrong alternatives, Pearson correlation coefficient, Spearman-Brown correlation coefficient). The researcher found that there was a statistically significant difference between the two groups of research in the post-acquisition experiment in favor of the experimental group.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Babylon University - Faculty of Basic Education and all experiments were carried out in accordance with approved guidelines.

Effect of Black Seed Oil on Some Physiological Parameters in Female Rats Treated with Aflatoxin B_1, B_2

Athraa Harjan Mohsen[1], Israa Harjan Mohsen[2]

[1]*College of Sciences/University of Babylon/Iraq,*
[2]*College of Nursing/University of Kufa/Iraq*

Abstract

This study was conducted in order to determine the effect of Black seed oil on the reduction of the negative effects of the Aflatoxin B_1, B_2 produce from *Aspergillusflavus* in white rat females and effect it's on the physiological blood parameters. The results of isolation and initial diagnosis showed *Aspergillusflavus* and *Aspergillusniger* in all samples studied percentage (100%) and isolated from the seeds of rice while the percentage of the emergence of fungi *Penicillium*spp and *Trichothecium* spp and *Rhizopus*spp rates ranged (50, 45, 14)% respectivelyof the samples studied. The results showed that Black seed oil had a significant effect on the physiological parameters of blood. The rate of white blood cells (WBC) increased to (15×10^3 and 21×10^3) cells/mm^3 when treated with Aflatoxin B_1 (AFB_1) and Aflatoxin B_2 (AFB_2) compared to control treatment. The results showed that the Black seed had decreased the rate of white blood cells when used with aflatoxin (AFB_1+ 800) and (AFB_2 + 800)mg/kg oil to (11.5×10^3 and 7.5×10^3 cell/mm^3 respectively .

Keywords: *physiological parameters, Aflatoxin B1, B2.*

Introduction

Aflatoxins are a group of mycotoxins, which are toxic metabolites produced by fungi during their growth in various food and cereal crops [1]. These metabolic compounds have relatively low molecular weights, where contamination of human food and animal feeds from the field to the consumer. The human exposure to Aflatoxins leads to serious diseases according to the dose exposed to it as liver cancer, bone abnormalities, embryonic mutations and fetal deformation as well as its effects on sexual efficiency. In studies conducted a significant correlation between human cancers and the contents of food contaminated with aflatoxins[2]**.** In a study conducted by [3] suggests that aflatoxin has effects on physiological blood parameters, including lowering the number of white blood cells. Mohsen (2006) found that *A.flavus* and *A. niger* had effects on white rat tissue by decrease in body weight weight of ovaries in the rat and a significant increase in the weight of the uterus as well as in the thickness, and cause infertility. *Nigella sativa* is a plant belonging to the family Ranunculaceae. It is used to treat head pain, bladder and kidney stones, chest pain and nausea. It also has a role in reducing the blood sugar level in test animals, also it have a role in reducing blood pressure and the tension of the presence of glycoserin and saponin, which is useful in the treatment of spasticity either directly or in the form of oil [4] *It* is medicinal plants containing antimicrobial agents and germs. and has an effective role in the treatment of chronic asthma, chronic colds, and used against gastrointestinal bacteria and currently as a disinfectant for harmful intestinal flora for young children and adults [5]. Due to the lack of available studies on the effect of oils and plant extracts on some fungi producing toxins within the body of the organism, this study was conducted, which included:

1. Isolates and identification *Aspergillusflavus* of rice seeds .
2. Identification *Ability Aspergillusflavus* on the production of aflatoxin B_1, B_2 .
3. Test the efficiency of different concentrations of the Black seed oil on the growth of isolated fungi in laboratory.

4. Studying the effect of different concentrations of Black oil on some of the physiological parameters of blood. In the Albino rat, it is infused with aflatoxins.

Method

1. Potato extract and dextrose Agar (PDA) The medium was prepared according to the procedure of (Colle et al; 1996)
2. Coconut extract Agar medium. The medium was prepared according to the procedure of (Dianese and Lin, 1976).
3. Isolation and Diagnosis of *A.flavus* from Rice Seeds

The seeds of rice were brought from the local markets of the city of Najaf in the year 2017 and using the sterilized seeds for isolation of *A. flavus* according to procedure of (Fennel and Raper,1965, AL-Ansii1999).

4. Testing ability of *A.flavus* on the production of aflatoxin,steps were followed according (Wyllie and Morehouse 1977;Mohsenand Risan 2009)
5. Preparation of concentrations of the Black seed oil and study the effects in medium

In this experiment, two concentration (200, 800) mg \ L were mixed with the sterile PDA after cooling. all dishes were vaccinated with 0.5 cm disc from the fungus at the center of the dish. Their last rate fungi and calculate the amount of orthogonal inhibition according to equation:

In this experiment used 16 animals divided into 7 groups:

1. Two rats were injected orally with 0.5 ml of aflatoxin B_1 and Black seed oil at a concentration of 200 mg/ kg of 0.5 ml daily for one week.
2. Two rats were injected orally with 0.5 ml of aflatoxin B_1 and Black seed oil at a concentration of 800 mg/ kg of 0.5 ml daily for one week.
3. Two rats were injected orally with 0.5 ml of aflatoxin B_1 daily for one week.
4. Two rats were injected orally with 0.5 ml of aflatoxin B_2 and Black seed oil at a concentration of 200 mg/ kg of 0.5 ml daily for one week.
5. Two rats were injected orally with 0.5 ml of aflatoxin B_2 and Black seed oil at a concentration of 800 mg/ kg of 0.5 ml daily for 1 week.
6. Two rats were injected orally with 0.5 ml of aflatoxin B_2 per day for a week.
7. Included 4 rats without any dosage as control treatment.

Two days after the last dose, the animals were sacrificed, The blood was collected to calculate some physiological blood parameters.

8. **Blood parameters:**
    1. Estimation of leucocytes count: The blood cell count method and the Turks solution were used to calculate the total number of white blood cells (Brown, 1976).
    2. Estimation of Red Blood corpuscles : The blood cell count method and the Hymes fluid solution were used as a dilution solution for total red blood cell count (Hall and Malia, 1984).
    3. Hemoglobin Estimation: Hemoglobin Meter and Drabkinfluid as a dilution solution were used to estimate hemoglobin concentrations in the blood sample (Sood, 1996).
9. Statistical analysis.

All experiments were carried out according to (C.R.D) as single-factor experiments. The averages were compared with the least significant difference of L.S.D and below the level of significance (0.05) (Al-Rawi and Khalaf Allah, 1980).

Results and Discussion

1. **Isolation and diagnosis of fungi associated with rice seeds:** The results of isolation and diagnosis showed an *A. flavus A.niger,* (100%) of the studied samples, followed by *penicilliumspp*, *Trichotheciumspp and Rhizopusspp* (50, 45, 14)% respectivelyfor the studied samples. Figure (1).

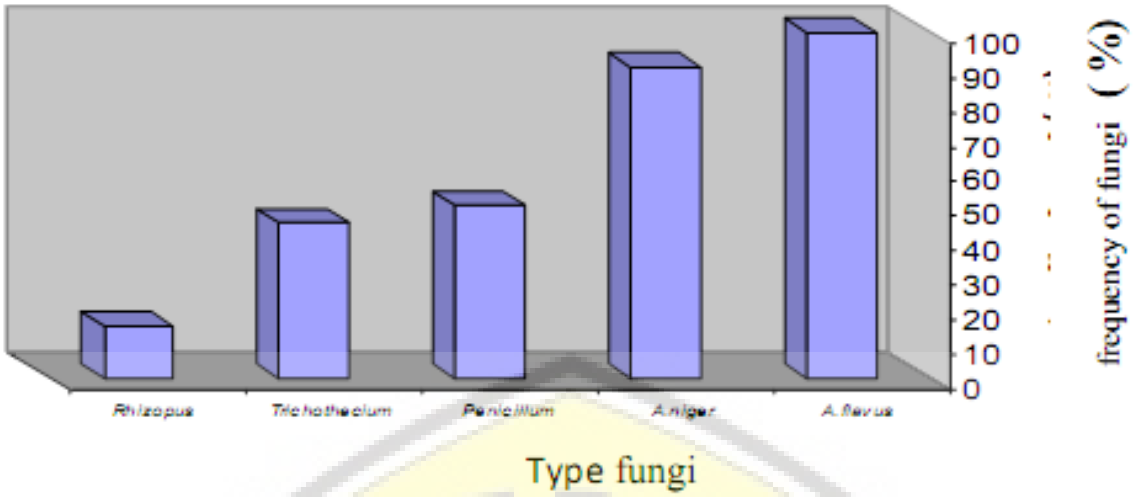

Figure (1): Frequency of fungi isolated from rice seeds

2. *Aspergillusspp* is due to simple dietary requirements as well as its ability to produce a large number of non-homogenous reproduction units..As well as the increase in the proportion of carbohydrates and easy to be represented in rice as the fungus *A.flavus* prefer carbohydrate materials on oily materials in addition to the moisture content if referred to *Aspergillus* with a wide range of temperatures and humidity as well as poor storage and accompanied by the production of toxins at different temperatures[5].

3. Evaluation of the efficacy of Black seed oil in reducing the effects of aflatoxin B_1, B_2 in white rats females. **White Blood Cell Count:** Figure (2) shows that AFB_1, AFB_2 had a negative effect on the white blood cell count its reached (210 × 10^3, 15 × 10^3) cell/mm ^{3} compared to the control treatment of (5.5 × 10^3 (cell/mm^3. The Black seed oil has a positive effect in reducing the rate of white blood cells in which it is used with a (AFB_1+ 800) and (AFB_2 + 800) mg\ kg reaching to (11.5 × 10^3, 7.5× 10^3) cell/ mm^3 respectively compared to control group.

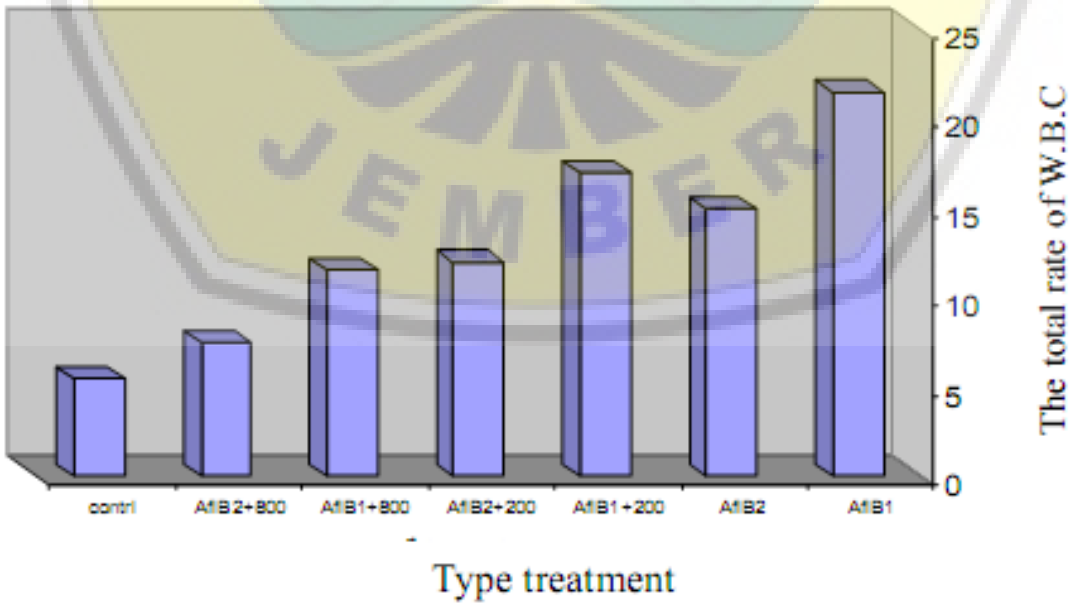

Figure (2): White blood cell count in animals treated with aflatoxin and Black seed oil in different concentrations

The increase in rate of (WBCs) is due to metabolic products by *A.flavus*, causing excessive secretion of immune response factors Tumer necrosis factor,Interleukin-6, cytokines especially that responsible for the occurrence Primary inflammation and immune regulation [6]. The excessive production of these components is important reason to increase the number of (WBCs) in the treated rats or a result of increasing the number of acidic blood cells that work to offset or remove toxic substances from the body, (Pearce and Pearce, 2013), confirming that metabolic products affect the immune system response.

In addition, the dosage of poultry with a different dose of the metabolic products of *A.flavus, A. fumigatus* led to an increase in the number of (WBCs) and anemia thus lead to stimulate the body's immunity and increase the number of acid cells in response to the exotic substances in the body which acted as competitive inhibitors of the enzymes responsible for the synthesis of red blood cells (Croopman et al., 2003)

Red blood cell count (RBC): Figure (3) indicates a reduction in RBC to (1.5.2.5) cells/mm^3, respectively for rats treatment in AFB_1, AFB_2. While RBC was observed to increase to (3.3.4.5) cells/mm^3 when treated with (AFB_1+ 800) and (AFB_2 + 800) mg\ kg respectively, while (8) cells/mm^3, in the control treatment .

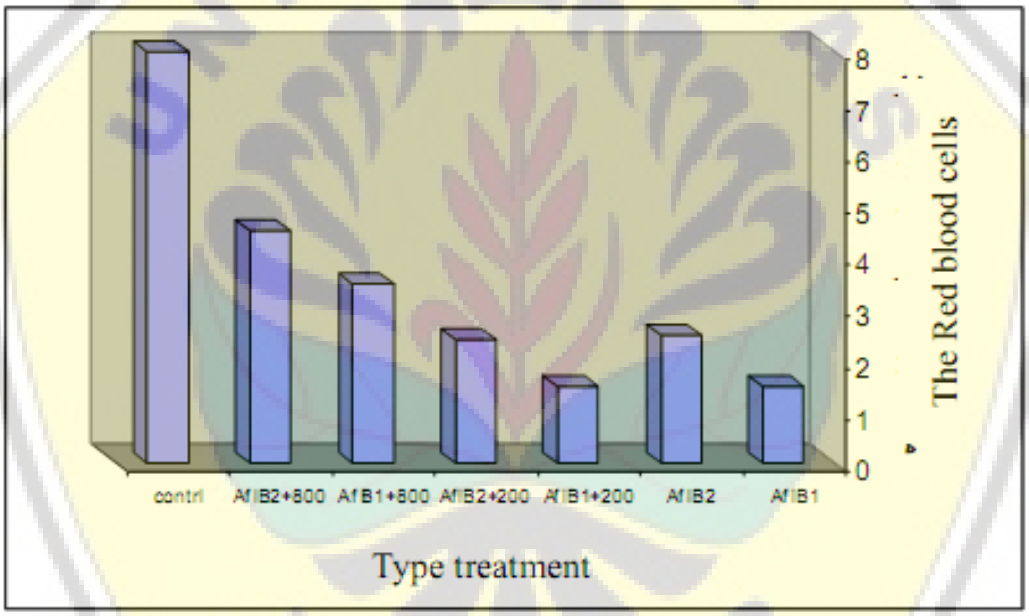

Figure (3): Red blood cells in animals treated with aflatoxin and Black seed oil with different concentrations

The fungal toxins sometimes act as competitive inhibitors of enzymes responsible for the bio-synthesis of (RBC). The ability of the seed oil to play an important role in increasing the rate of hemoglobin and increase the number of (RBC) due to its effect in the activation of bone marrow and spleen responsible for the manufacture of (RBC) [8].

In a study conducted by Mohsen etal (2009), the toxic effects of *Aspergillusparasiticus* and *Bipolarismicropus* in white rats showed a reduction in the weight of animals treated with fungi, where (10.2, 7.2) % respectively The results indicated that the preparation of white blood corpuscles was increased in the blood of animals treated by *A.parasitcus*, which amounted to (6600) cells/ml, while reached (10500) cells/ml in the blood of animals treated with the *B.micropus* and at the same time did not change values ESR in all transactions in addition to the high Hb values was (15-18) % for animals treated with *A.parasiticus* and *B.micropus* compared to the control treatment of (13) %. either the level of P.C.V has risen to (45, 52) % on the respectively.

Hb Concentration Rate: Figure (4) refer that

AFB_1, AFB_2 had a negative effect on the concentration of hemoglobin as the rate was reduced to (3, 5) g/100 ml respectively compared to the control treatment of (15 g/100 ml) on the other hand, a positive effect on a significant increase in the concentration of hemoglobin concentration in animal blood treated with (AFB_1+ 800) and (AFB_2 + 800) mg\ kg respectively to (11.9) g/100 ml compared to control treatment.

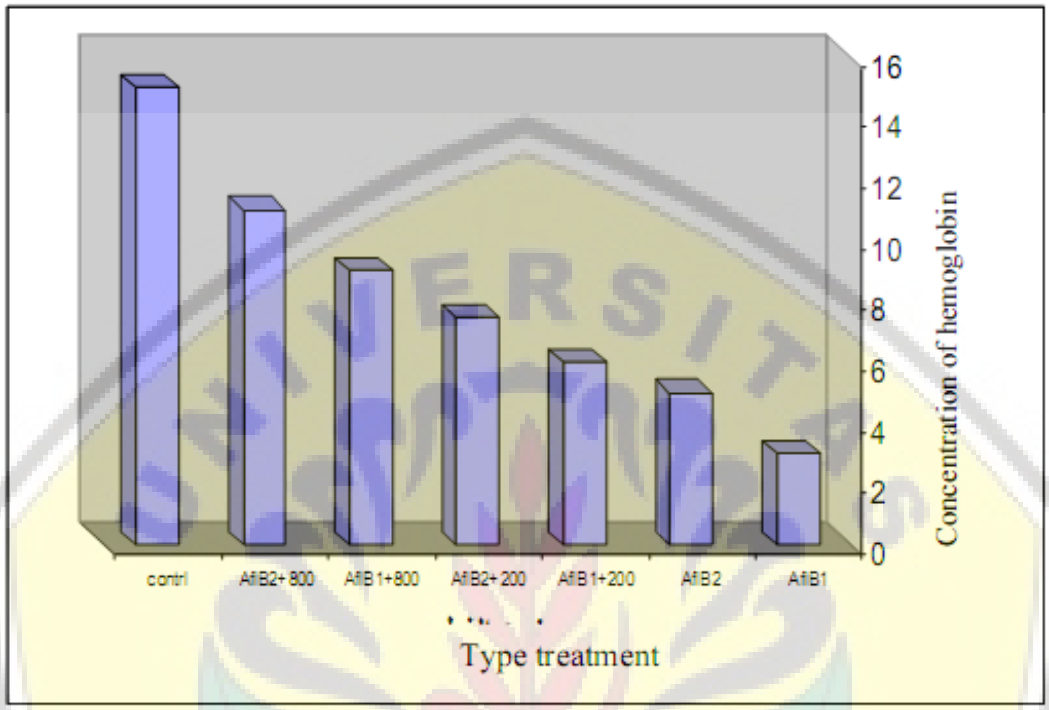

Figure (4) Concentration of hemoglobin in animals treated with aflatoxin and Black seed oil with different concentrations

The high rate of hemoglobin in the use of black seed oil with aflatoxin is due to lowering the level of hemostatin in the blood. In addition, low levels of hemoglobin in animals treated with aflatoxins (B_1, B_2) cause increased production of immune response factors, including cytokines in in animals that gave toxins, which have increased oxidation in the cell, increasing the free radicals that attack red blood cells, Hemoglobin deficiency or aflatoxin has a strong correlation with blood proteins responsible for the synthesis of red blood cells, which results in a small amount of it. It also affects the blood balance [9-13].

On the other hand, in an experiment with the use of the grain of the pond led to an increase in the concentration of hemoglobin in laboratory animals and increase the immunity of the body through lymphocytes and protein and kidneys and globules to contain the grain of the pond on the most important elements of iron, which enters the construction of hemoglobin and copper[14-19]. The reason attributed to raise the proportion of hemoglobin when used The oil has the most effective substances Nigellone, Nigelline, which has the medical effect in addition to the matter of phosphorus and carotene (vitamin A generator) [20-25].

Conclusion

The results showed that Black seed oil had a significant effect on the physiological parameters of blood. The rate of white blood cells (WBC) increased to (15×10^3 and 21×10^3) cells/mm^3 when treated with Aflatoxin B_1 (AFB_1) and Aflatoxin B_2 (AFB_2) compared to control treatment. The results showed that the Black seed had decreased the rate of white blood cells when used with aflatoxin (AFB_1+ 800) and (AFB_2 + 800)mg/ kg oil to (11.5×10^3 and 7.5×10^3 cell/mm^3 respectively

Measuring the Therapeutic Calendar of the Elbow Joint According to the Rate of Change of Rehabilitation Exercises

Imad Kadem Yasser[1], Dhulfiqar Ali Abdul Hussein[1]

[1]Physical Education and Sports Sciences/Dhi Qar University, Iraq

Abstract

The importance of physical fitness by the safety of the affected parts is of great importance, it works to restore the joint function appropriately if the diagnosis is appropriate according to the nature, type and severity of the injury in addition to the level, the goal of the research is the calendar through the exercises articulation elbow attachment, By (10) injured players, and that the type of rehabilitation exercise indirectly helps to restore work as a simple comfort without complicating the work of the muscle part of the injured, and by achieving the goals and obtain the positive results, the researchers have to pay attention to the side application Exercises that match the nature of the level of injury in order to restore the work of the injured part gradually.

Keywords: *Measurement, therapeutic calendar, elbow joint injury.*

Introduction

The great attention given by nations and peoples to the subject of human health and the establishment of special standards for the human body that the health level of society is a measure of the progress of each nation, and the most prominent[1] science examined in this area is the science of therapeutic sport through its various therapeutic means to treat injuries and Rehabilitation of injuries resulting from some excessive use or friction and bruises and others[2], where the strength is one of the most important manifestations of the individual health, and has long been successful scientific research to provide several studies to find the optimal method and the best both to retain or return the body to its natural composition. Physical fitness contributes to the development of the individual in several different aspects, including physical, which is reflected positively on the health side through the direct impact in the functional organs[2], as many studies and research that there is a close link between physical fitness and public health, The health and safety of the body's organs and their adequacy in the performance of their functions to the fullest. The importance of fitness for the public health of the individual is confirmed by many studies conducted in different parts of the world. The rate of infection occurs in those who work in occupations and work requiring movement and activity less than people who work in offices and for long periods without movement and this activity represents our physical aspect is an important element to maintain and maintain the integrity[3] of the devices by maintaining a certain level of fitness, and the other side Physical exertion may have other positive outcomes by utilizing energy to stimulate the organs by moving the organs in order to perform all sports activities, as well as other vital functions such as cellular building process, growth process, and tissue reconstruction in the body[4]. The research problem came through the follow-up of the field researchers and for several years his participation in several courses for sports injuries and field follow-up to the level of injuries that occur during the matches and the acceleration and through his meetings with many of the workers in this field in the sports clubs, noted the lack of scientific research that dealt with this type of injuries[5] As well as lack of interest in the diversification of exercises and method applied after the diagnosis of injury in the annex Tennis, as well as most handball players do not give enough physical exercise in both preparation stages or before the start of the game, which is Which is one of the most important elements to avoid sports injury and also lack of interest by the trainers to give a variety of ways to achieve the dimensions of mobility greater than required by the joint during the deliveries and delivery as well as scoring in various aspects of handball game.

Methodology

Research Methodology: The way in which a human finds a logical scientific method consistent with reality to realize the truth of the scientific facts, which is the way to acquire the real knowledge ... The curriculum is one of these method that regulate the side or the intellectual steps taken by the researchers To solve a certain problem.[1] The research in all scientific fields resort to the selection of a curriculum that is appropriate to the problem The nature of the problem requires a specific approach to reach the truth, it is the primary tool to collect information and impose hypotheses and set goals to solve the problem and access to it. Therefore, the descriptive approach is used in the survey method. This approach is considered an appropriate method for studying social phenomena[5]. It presents data on the reality of these phenomena and the relations between their causes and their results.

The research community and its design: Among the procedures that the researchers are interested in is the selection of the community and the sample that is being tested. The research community is identified as the tennis players in the specialized handball schools in the governorates of Iraq (10) who are injured for the sports season (2017-2018) (100%) of the research community. The researchers conducted a homogeneity of the research sample in order to determine their distribution under the Kaus curve as shown in Tables (1) and (2).

Table (1) shows The homogeneity of the sample according to normal distribution

Variables	Measuring Unit	Statistical		Median	Skewness
		Mean	Standard Deviation		
Titration of the ball between the characters (15) time	Time	13.14	1.56	12.58	0.068
Accuracy correction	Degree	7.20	1.39	7.500	-1.30
Proper handling (30) time	Degree	13.10	4.90	12.50	0.280
Throw the ball to the farthest distance	Degree	10.84	1.76	10.30	0.767

Tests Used:

Test of plutonium ball spherical distance (15) meters[4]:

- Name of test: plump ball zigzag (15) meters.
- The aim of the test: to measure the level of skill Albatba.
- The tools needed: 5 high profile, stopwatch, handball.
- Method of performance: Five characters are shown on the ground in a straight line, the first is from the starting line (3) meters and the distance between the characters is 3 m.
- The player stands behind the starting line when the signal starts to flatten the ball with running in the form of winding between the flags back and forth until the finish line.

Registration: Calculates the recorded time back and forth from the start to the student's graduation

Test (handling from head level to flat wall (30 ths) from distance (3 m).

Purpose of the test: Measuring the handling skill.

- The tools: flat wall, handball number (3), measuring tape, stopwatch, adhesive tape.
- Performance and calendar specifications: The player stands in front of a line drawn on the ground about 3 m away from the wall and with the word (start) the player handles the ball from the level of the head to the wall and received it and the most number of times during (30 seconds). Calculate the correct number of times the ball is handled and delivered to the wall.

Test accuracy of correction on overlapping rectangles.

Test the accuracy of the drawing on overlapping rectangles.

- Purpose of the test: Measurement accuracy.
- Tools: Five tennis balls, wall in front of paved ground. Draws on the wall three overlapping rectangles whose dimensions are the bottom border of the large rectangle rising from the ground by 180 cm, drawing a line on the ground that is about 5 meters from the wall.
- Performance specifications: The student stands behind the line, and then straighten the five balls (consecutive) on the rectangles trying to hit the rectangle small student the right to use any of the hands in the correction.
- Registration Method:

1. If the ball hit the rectangle (inside the rectangle or on the lines specified for him) is calculated for the student (3) degrees.
2. If the ball hit the middle rectangle (inside the rectangle or on the lines specified for him) is calculated for the student (2) degrees.
3. If the ball fit the large rectangle (inside the rectangle or on the lines specified for him) is calculated to the student one degree.
4. If the ball came out of the three rectangles calculated for the student zero.

Test Ball Throwing

Purpose of the test: Measure the explosive force of the arms of the arms and trunk.

- Tools: medical ball weighing (3 kg), measuring tape.
- Performance specifications: The laboratory stands behind the starting line, holding the medical ball trying to throw it to the farthest point
- Registration: The distance is calculated to the farthest point recorded by the laboratory.

Main Experience: The researchers prepared a curriculum for the duration of this curriculum is (6 weeks) by three units per week for the duration of the unit from 10-1,50 minutes depending on the nature of the program which is a physical exercise intended to restore the work of the injured joints gradually according to the intensity used and the program began after the stage The appropriate diagnosis through the resonance of the magnet with the appropriate rest period through the opinion of the specialist doctor and these exercises are performed without the use of any devices or any tools and applied to the first group of (10) injured players. These exercises were used for the purpose of achieving the desired level of physical, where the start of the use of exercises in a streamlined and gradual from easy to difficult as required by the severity of the program and began to work hard (10%), according to the opinion of the doctor as the injury type The second was known as the intermediate injury, and the gradient in the intensity required according to the gradient increase in an orderly manner, taking into account the nature of rest that must be proportional to the nature of intensity used during the rehabilitation program, and the size of the frequencies on the first day (10) This is the first period after the positive rest. These exercises are a sense of the work of the joint after the rest period. These exercises during this day are a group of movements performed by the patient to include movements of the joint and muscles surrounding the work. Joint with the element of the exercises and tandem with the movements of the rotation that occur to us some contractions in the muscles surrounding the injured joint as well as the exercises and tandem that allows the appropriate range of motor during this intensity used and all these exercises result from a set of physical characteristics of the goal Is the sense of the detailed work of the injured facility, and then begin the process of increasing the intensity required with the necessary repetitions and in a proportional fit with sufficient rest appropriate to the intensity used until we reach the injured player at the end of the rehabilitation period to a severity of up to (90%).

Statistical: The researcher used the SPSS ver20 program to process the data. The following treatments were extracted from the program: * - arithmetic mean * - standard deviation * - torsion factor (t) for interrelated samples.

Results and Discusion

Both tables show that the amount of differences in the group of exercises that were applied to the members of the research sample as well as the statistical ratios that clearly show the amounts of the significance of the change due to the application of rehabilitation exercises, which have a positive effect in improving the level

of injury which result from a number of reasons, The rehabilitation programs carried out by the members of the research sample showed a clear percentage of differences between the two tests, which helped to reconstruct and adapt the muscles working in the elbow joint. It can give relative reactions in the development of these muscles of the affected arm, Repeat and strengthen. The training exercises in sports injury are of great scientific importance in terms of the use of any type of injury because the actual practice of exercises mainly stimulate blood circulation and that such activity in the circulatory system significantly helps the flow of lymphatic fluid, which has the most role in the structure of the joint, And the amount of movement produced by these exercises improve the movement of muscles, which leads to an improvement in nutrition within the tissues, which is one of the positive indicators of therapeutic exercises, and this in turn leads to increase the functional efficiency of the affected part through the amount of improvement of nutrition d Remove the tissue as an appropriate reaction to the exercises used.Exercise also plays an important role in acquiring the appropriate motor range for the affected part and depending on the type of exercise. "Any practice of sports activities has benefits, but with the presence of injury because they increase the flow of appropriate amounts of substances, components and elements in the healthy, For any of the infected parts [5].It is noted scientifically that the use of rehabilitation exercises for any infected part that comes after the rest of the time allocated by the therapist or the specialist and the exercise and exercise according to the type of injury and severity that suits the type and severity of the injury is a positive rest for the work of the injured part, and the period of the part of the injured part of the injury until the disappearance Pain and swelling are considered a passive comfort which follows the type and severity of injury because it is a period free of any action and may be limited in motion due to injury and comes the rehabilitation stage that contributes to the return of this part to work gradually without stress. In the injured part which is a positive rest as a result of the practices of exercises may be simple or recreational and then vary according to the intensity of the injured part. All the rehabilitation exercises that have been applied in the field have a high correlation with the muscular ability, which was highlighted during the special rehabilitation program used by the researchers on the sample, and the development in the results of these tests indicated the effect of these exercises in the development of muscle groups working in arm movements[5] The two researchers adopted a range of the kinetic range, the tidal and flexural movements of the joint and the muscles associated with the joint, which have a relationship between the length of the force arm and the strength of the muscle, which represent an important scientific fact determined by Which determines the strength resulting from muscle contraction whether it is positive against gravity or negative with the gravity of the work of the muscles working on this joint if it is a driving force or a resistance force. This is what the researchers adopted in his rehabilitation program, which achieved the purpose of using these exercises[5]. The results were significant for the members of the research sample in this field. Most exercises have different characteristics and have the effect in many fields but most often they are related to motor efficiency. Mechanical, chemical and other order attainment type of development in muscular work.

Table (2) Shows the computational dynamics and standard deviations of the tribal and remote tests and the calculated degree (t) and the significance level

Variables	Measruing Unit	Before Test		After Test		Standard Error	(T)	Level Sig

Df	9				
Sig	0.05				

Conclusion

In the light of the results obtained by the researchers through this applied study we can conclude the following: Therapeutic exercises have an effect in the rehabilitation stage as a result of giving the affected organ the increased kinetic action of the muscles involved in the performance. All the exercises that have been implemented and through the positive results of the level of improvement evidence that the injured member began to receive nerve cells correctly. In the light of the results also achieved the period of time to give such exercises that helped give the joint flexibility that helped achieve the goal of performance during the rehabilitation period.

Effectiveness of an Instructional Program on Promoting Lifestyle of Patients with Diabetes Mellitus Type 2 at Diabetes and Endocrinology Center in Missan City

Sarah Falah Hassan[1], Khalida Alwan Mansur[2]

[1]M.Sc. Student, University of Baghdad, College of Nursing, Iraq,
[2]Professor, Adult Nursing Department, College of Nursing, University of Baghdad, Iraq

Abstract

Diabetes in adults is a global health problem. Diabetes mellitus is a disorder of the endocrine system characterized by abnormal fluctuations in blood glucose levels, usually related to a defect in insulin production and glucose metabolism. Aim: To assess effectiveness of the instructional program on promoting lifestyle of patient with diabetes mellitus type 2. A quasi-experimental design (two-group pretest-posttest) was used to conduct this study. The present study was carried out at Diabetes and Endocrinology Center in Missan Governorate/Iraq for the period 8th of October 2018 to 28th of Abril 2019. A non-probability (purposive) sample of (100) patients was selected. a 28 item self-rated questionnaire was constructed for the purpose of the study. Validity and reliability of the instrument were determined through a pilot study. Data were analyzed through the use of Statistical Package for Social Sciences (SPSS) version. Descriptive and inferential statistical measures were employed. The study indicated that the life style levels of participants were inadequate for both groups in the pre-test, but the study group life style levels scores have increased after introducing them to the instructional program. Thus, there were significant differences between both groups.

Keywords: *Promoting Lifestyle, Patients, diabetes Mellitus type 2, Endocrinology.*

Introduction

The proportion of people with type 2 diabetes is on the rise and is a major cause of death world-wide. Type 2 diabetes is a major risk factor for vascular disease with 65% of all diabetic deaths being due to cardiovascular disease. Lifestyle characteristics, such as physical activity, diet, and stress are important factors that influence development and prognosis of type 2 diabetes. Changes in diet and increase in physical activity (walking, etc.) and exercise (running, cycling, etc.) are key components of the management of type 2 diabetes, and guidelines recommend changes in these lifestyle characteristics for both prevention and management of the disease.(1)The number of people with diabetes has risen from 108 million in 1980 to 422 million in 2014. The global prevalence of diabetes among adults over 18 years of age has risen from 4.7% in 1980 to 8.5% in 2014. Diabetes prevalence has been rising more rapidly in middle- and low-income countries. (2)Diabetes is a major cause of blindness, kidney failure, heart attacks, stroke and lower limb amputation. In 2015, an estimated 1.6 million deaths were directly caused by diabetes. Another 2.2 million deaths were attributable to high blood glucose in 2012. (3)

Methodology

A quasi-experimental design was carried out at Diabetes and Endocrinology Center in Missan Governorate from 8th of October 2018 to 22 of May 2019. The sample involved patients at Diabetes and Endocrinology Center which is divided into two groups, one is study group (50) patients and one is control group (50) patients. A non-probability (purposive) sample of (100) patients was selected. The researcher depends on Type 2 Diabetes and Health Promotion Scale (T2DHPS) which is a 28-item self-rated questionnaire that assesses

six domains related to lifestyle. Reliability was determined through collecting the data from 10 patients and performing test and re-test, the reliability coefficient results are significant for knowledge and validity of questionnaire was determined through the experts.

Results and Discusion

Table (1) Distribution of the Diabetes Mellitus Patients According to their Demographic Characteristics

Variable		Study (n = 50)		Control (n = 50)	
		Freq.	%	Freq.	%
Age	30-39	3	6.0	10	20.0
	40-49	10	20.0	12	24.0

n= number of samples, S.D = Standard Deviation, Ass. = assessment L= Low level of life style (1-2.5), M= moderate level of life style (2.6-3.5), G= high level of life style (3.6-5).

Table (4-5) Demonstrated the items of life style of diabetes mellitus patients related to Health responsibility and healthy Diet that shows all patients life style levels were low at pre and post-test for the control group while low life style at pretest and high at posttest for study group. Analysis of diabetes mellitus patients' demographic characteristics revealed that the half (50%) of the study group and (32%) of the control group were (50-59) years old. This study congruent with(Al-Ebrahimy, 2003; Upadhyay, 2008) [4].Regarding gender, the study finding revealed that more than half (52%) in the study group were males while the control group, female patients were recorded slightly increased than male and they are accounted 29 (58%), and 21(42%) respectively. Viera et al 2006 mention that the male/ female ratio, is now equivalent or minimally favors females and is due in great part to the healthier lifestyle followed by women. One explanation for this difference in sex distribution of the disease may be that females use more health services and pay more attention to their health. [5]Regarding educational status, the study finding displayed that (58%) majority of study and (36%) of control were low educated levels (Primary School). This study was supported by Saffari et al,2015 who reported that the majority of patients low educated levels. [6] Concerning to occupational status of the patients, a high percentage (44%) of study and (58%) of the control, were House wife. This study was supported by Saffari et al, 2015 who reported that House wife present the majority of patients. [6]Regarding Marital status, the study finding most patients were married, and they are accounted 46(92%) and 37(74%) in study and control group. This finding was supported by Awodele,2015. Data analysis of present study have revealed that most participants reported a level of life style were Low at pre and posttest in all items of scale (all domains) for control group, while Low level of life style at pre and high level of life style at post the implementation for the study group. The implementation of instructional program has a positive effect on patients regarding (physical activity, risk reduction, stress management, enjoyment of life, health responsibility and healthy diet) tables (4-3, 4-4, 4-5). The data analysis of six domains of Health promoting lifestyle domains of DM patients shows that the control group had revealed that there are no significant differences between pre and posttests of Health promoting lifestyle domains (physical activity, risk reduction, stress management, enjoyment of life, and health responsibility domains) except (healthy diet domain) (p-value = .019) table (6). Sone et al 2010; Schellenberg 2013 both these studies found a lack of involvement by patientsin activities, and total physical activity after intervention was significantly higher in the study group than in the control group. [9]There is a statistically significant difference in Risk Reduction for participants in the instructional program this study was supported by (Perreault et al,2012). [10]Krishna, (2018); Zhange et al 2009 found that psychological distress is an important concern of many type 2 diabetes patients and coping with that distress is their main priority to improve stress management levels [11,12]This finding indicates the positive influence of the instructional program in improvement patient's health responsibility. this study is supported by Mary (2008): Chang, et al (2015).[1] the statistically significant difference in healthy diet Responsibility for patients (pre – post) periods through implementation of instructional program shows the positive influence of the instructional program in improvement patients healthy diet responsibility. This study is supported by Evert et al, (2014).[11]the difference in Physical Activity for participants in the study group between the pretest and posttest time (p-value = .001). supported by Kirk 2004; Balducci 2017; Johansen2017 where intervention included 5 to 6 weekly aerobic training sessions (duration 30-60 minutes). [12-15]

Conclusion

The instructional program was effective in promoting patient's lifestyle related to T2DM (for all domains).

Outcomes of Laparoscopic Appendicectomyin Al-Diwanyiah Teaching Hospital

Zaman Alrekabi[1], Muayad Alkafaji[1], Shakir Abid Jassim[1]

[1]General Surgery, Al-diwaniyah Teaching Hospital, Department of Surgery, AL-Diwania, Iraq

Abstract

Aim of the Study: To evaluate the clinical results of laparoscopic appendectomy for the treatment of chronic or recurrent appendicitis and interval appendicectomy. A prospective analysis was conductedat Al-Diwanyiah Teaching Hospital on 100 cases of laparoscopic appendicectomy over aperiod between January2013 to January 2016. The diagnosis of appendicitis was established with history, physical examination, laboratory tests and ultrasound examination. The patients were analyzed for age, sex, conversion rate,operation time,postoperative complications,length of hospital stay, time to return to work and cost effectiveness. The postoperative complications including wound infection and ileus were generally low in our study with short hospital stay and early return to work and normal activity. Complication rate is higher after intervallaparoscopic appendicectomy than laparoscopic appendicectomy for chronic appendicitis as well as operative time, conversion rate and hospital stay. Laparoscopic appendicectomy is a safe and effective procedure in the management of chronic or recurrent appendicitis and as interval appendicectomy after non-operative management of appendicular mass. There is an indication that laparoscopy is becoming an excellent method for management of recurrent or chronic appendicitis

Keywords: *Recurrent appendicitis, chronic appendicitis, interval appendicectomy, laparoscopic appendicectomy.*

Introduction

Laparoscopic appendectomyhas become a common procedure worldwide in recent years. Numerous studies tried to define the role of laparoscopic appendectomy in the treatment of chronic appendicitis.[1] Interval appendectomy isdefined as performing an appendectomy following initial successful nonoperative management of appendicularmass. Most patients underwent interval appendectomy 2 to 4 months after their acute presentation.[2,3] The major argument against interval appendectomyis that many patients treated conservatively never develop manifestations of appendicitis, and those who do generally can betreated without additional morbidity.[4,5] The major argument forinterval appendectomy is to prevent future attacks of appendicitis and the need to establish a definite diagnosis and to rule out an underlying malignancy.[3,6]. The precise etiology is unknown. Recurrent appendicitis is thought to occur from transient obstruction of the appendix or secondary to excessive mucus production, while chronic appendicitis is secondary to partial but persistent obstruction of the appendiceal lumen. In both cases, luminal secretions accumulate until they aresubsequently released.[7,8]

Methodology

A prospective clinical analysis on 100 cases of laparoscopic appendicectomy over aperiod between January 2013 to January2016 was conducted at Al-Diwanyiah Teaching Hospital. The diagnosis of appendicitis was established with history, physical examination, laboratory tests and ultrasound examination. Operations were performed by many surgeons who are licensed to practice laparoscopic surgery. The inclusion criteria for our study on laparoscopicappendectomy were:

*chronic recurrent symptoms that could be attributed to appendicitis.

*interval appendicitis after 2-4 months of non operative management of appendicular mass.

*age 15 years or more.

All patients in whomwe performed a laparoscopic appendectomy or an appendectomy after conversion to anopen procedure were included in our analysis (100 pts). The patients were categorized for age, sex, conversion rate, operation time, postoperative complications,length of hospital stay, time to return to work and cost effectiveness.

Surgical team and surgical technique: The surgical operations were performed by a surgical team consisting of an experienced surgeon, a surgical trainee and a scrub nurse. Laparoscopic appendicectomywas performed under general anesthesia and all patients received prophylactic antibiotics (ceftriaxone 1 gram IV) at time of induction of anesthesia followed by 2 subsequent doses at 8 and 16 hours post op.Laparoscopic appendicectomy was performed with 3 ports; a 10-mm umbilical, a 10-mm suprapubic, and a 5-mm port in the left iliac fossa. Intraabdominal pressure of approximately 12 mm-Hg was provided by CO_2 insufflation. The mesoappendix was divided using harmonic ace. The base of the appendix was ligated twice with 2/0 vicrylendo-loop. The appendix was cut out with scissors. The appendix was removed from the abdominal cavity with a plastic bag or a piece of glove through the 10-mm port site. Peritoneal suction-irrigation with normal saline solution was performed in some patients.

Results and Discusion

A total of 100 patients examined. There were 81 (81%) appendicectomies for chronic or recurrent appendicitis (Group I) and 19 (19%) interval appendicectomies Group (II). 58 male and 42 female patients included in the study.

M:F ratio was 1.38 : 1**(table 1)** Mean age for all 100 cases was 20.1 years, range from 15 to 30 **(table 2).** The mean operative time was 44 minutes while it was 41 min for group I and 56 min for group II. The operation times were shown in **(table 3)**. Post op. complications occurred in 9 cases:3 wound infections and 6 cases developed paralytic ileus. Postoperative complications were shown in **(table 4)**.Conversion rate in our study was 5% as shown in **(table 5).** 86 patients (86%) were discharged from the hospital in the first postoperative day, 8 patients (8%) in the second, and 6 patients (6%) in the third day. Mean hospital stay was 29 hours while in group I it was 27 h and in group II was 36 h. **(table 6)** Patients returned to work or full activity within 5-7 day (mean 5.77 days).

Table 1: Sex distribution of patients

Gender	Group I	Group II	Total
Male	44	14	58 (58%)
Female	37	5	42 (42%)
Total	81	19	100(100%)

Table 2: Demographic characteristics of patients

Age	Group I	Group II	Total
15 – 20 years	33	6	39
21 -25 years	24	9	33
26 -30 years	24	4	28
Mean age	19.1 years	24.4 years	20.1 years

Table 3: Operative times

Operative Times	Group I (% from 81 cases)	Group II (% from 19 cases)	Total No. (%)	p-value
<30 min	44 (54%)	6 (42%)	50 (50%)	0.025
30-60 min	25 (31%)	8 (31.5%)	33 (33%)	
60-90 min	12 (15%)	5 (26.5%)	17(17%)	
Mean time	41 min	56 min	44 min	

Table 4: Post operative complications

Parameter	Total No.	Group I (% from 81 cases)	Group II (% from 19 cases)	p-value l
Wound infection	3 (3%)	1(1.23%)	2(10.5%)	0.1
Ileus	6 (6%)	3(3.7%)	3(15.7%)	0.05

Table 5: Conversion rate

	Group I	Group II	Total	P value

Day 1	73	13	86	0.05
Day 2	5	3	8	
Day3	3	3	6	
Mean(hours)	27 h	36 h	29 h	

The first laparoscopic appendectomy was performed by Semm in 1983[9]. Laparoscopic appendicectomy is being done at a time when laparoscopic cholecystectomy has shown definite benefits over open technique. A number of meta-analyses have been performed evaluatingthe cumulative outcomes of multiple prospective studies and randomized controlled trials around laparoscopicappendicectomy. Laparoscopic appendectomy is associated with fewer incision al surgical site infections compared to open appendectomy. There is less pain, shorter length of stay, and quicker return to normal activity and better cosmetic results.[10,11] Laparoscopicappendectomy is associated with increased operative duration and increased operating rooms costs; however, overall costs are likely lower when compared to open appendectomy. Patientstend to have improved satisfaction scores with laparoscopic, appendectomy when compared to open appendicectomy.[12,13] Laparoscopic technique also provides a clear view of the whole abdominal cavity and pelvic organs in female patients for example. A study reported a fewer intra-abdominal adhesions after laparoscopic appendicectomy compared to open appendicectomy by reducing tissue trauma which in turn reduces circulating inflammatory mediators[14]. Relative risk factors of laparoscopic surgery includes:

Bleeding-visceral injury-Incomplete appendicectomy

These are significantly reduced with surgeon`s experience.[15]

There are relative contraindications to laparoscopic appendicectomy given by surgeons which include previous operations on the lower abdomen and situations where a pneumoperitoneum may has deleterious hemodynamic effects [15].

Wound Infection: The average wound infection rate for laparoscopic appendectomy is reported to be 2,8% in a meta-analysis and 2,5% in a big prospective multi-centerstudy[16,17]. While infection rate is reduced by a halfinthe most recent meta-analysis based on the study of more than 6000 cases of laparoscopic appendicectomy[1].

Wound infection rate in our study was measured and was 3 cases (3%) one case from group I and the other 2 from group II although wound infection was higher after interval appendicectomy it was statistically not significant due to small number of cases of wound infection. All three cases of wound infection treated conservatively as out patient. **Post op. paralytic ileus** occurred in 6 cases (6%) and treated conservatively as in-patient.

Paralytic ileus occurred in 3 cases in group I (3.7%) and 3 cases in group II (10.5%).

The percentage of post op. complication is much higher in group IImay be due to the small sample.

Conversion Rate: Conversion rate ranges in meta-analyses between 0% and 23%[10,11] but there are studies which report conversion rates as high as 39%.[1]

In everyday practice conversion rate typically seems to range between 10 and 20%.In our study the conversion rate was 5% and the incidence was higher in group II than in group I. (15.7% vs. 2.5%) .

Causes of conversion were mostly due to excessive adhesions,phlegmonous mass or difficulty to visualize or find the appendix. This is mainly encountered in cases of interval laparoscopic appendicectomy.

Operative Times: In considering operating time the exact identification of the timing of the start of the procedure and its conclusion vary. In general the time should be calculated from the insertion of the first trocar to the end of skin suturing,which is the time calculated in our study.[15] Generally all laparoscopic procedures are more time consuming for the following reasons:

1. Inherent nature of slow maneuver of laparoscopic techniques.
2. time taken by careful slow insufflation.
3. Routine diagnostic laparoscopy before starting procedure.

A meta-analysis of randomized controlled trial has been reported showing the mean operating time was 52 minutes[15].

In our study the mean operating time was 44 minutes with prolongation of mean time in interval appendicectomy cases 56 minutes vs. 41 minutes in chronic or recurrent appendicitis group.

Hospital Stay: In a retrospective study on 176 patients, the mean hospital stay was 37.2 h.[18] All the patients in our study were discharged from hospital between day 1 and day 3 post op. but the majority discharged on the first post op. day (86%).Patients who delayed were those who developed complications mostly ileus or those who live in rural areas. The mean hospital stay after laparoscopic appendicectomy in our study was 29 hours.

The mean hospital stay was longer in group II due to more percentage of ileus than group I (36 h vs. 27 h).

Time to return to work or normal activity: In a randomized prospective study the average time to return to work was 8 days.[19] In our study the patients returned to normal activity and work in 5-8 days. The average time was 5.77 days. Those who delayed were mostly the patients with post operative complications.

Cost Effectiveness of Laparoscopic Appendicectomy: Debate still exists about the cost comparison between laparoscopic and open surgery. Most surgeons believethat laparoscopic appendicectomy is costeffective.[12] It maybe more expensive for the hospital due to the cost of laparoscopic equipment, but it offers diagnostic accuracy, lower complications and among employed patients offer cost savings to society as a result of faster return to work.[13-18]

Conclusion

Laparoscopic appendicectomy is a safe and effective procedure in the management of chronic or recurrent appendicitis and as interval appendicectomy after non-operative management of appendicular mass. It resulted in minimal morbidity in experienced hands and it presents advantages such as short hospitalization and early return to work and cost effectiveness. For this reason disadvantages such as longer duration of surgery,higher hospital costs as well as technical limitations must be overcome. There is an indication that laparoscopy is becoming an excellent choice for management of recurrent or chronic appendicitis.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved and all experiments were carried out in accordance with approved guidelines.

Thyroid Hormone Changes in Early Pregnancy Bleeding Versus Normal Healthy Pregnancy

Samah Radhi Lateef

Maternity and Children Hospital in Al Diwaniyah, Ministry of Health, Iraq

Abstract

This study was done to measure the thyroid hormones levels in patient with unexplained early pregnancy bleeding at their first half of gestation and to compare it with those of normal healthy pregnancy from the period of first of October 2017-first of July 2018. This is a case control study conducted in Basra maternity hospital which includes two groups of patients:

A: Case group: This include 40 pregnant patients with history of un explained early pregnancy bleeding taken as a case group, with gestational age of up to twenty weeks, with parity range of 05, after we took their consent to be included in the study.

B: Control group: Including 58 pregnant healthy women taken as control group they had approximately the same age and parity range those patient was selected from out patient who attend for other cause other than early pregnancy bleeding or those who brought our patient as an attendant. There was a significant decrement in the level of T4, with significant changes in the level of TSH among cases with early pregnancy bleeding compare with normal healthy pregnancy while T3 show no significant changes.

Keywords: *Thyroid Hormone, Pregnancy, Bleeding Versus Normal Healthy.*

Introduction

Thyroid disease is common in general population, and especially in young women. The incidence of thyrotoxicosis, hypothyroidism, and thyroiditis is probably approaches 1 % for each condition.(1) The impact of pregnancy on maternal thyroid physiology is substantial. There are changes in the structure and function of gland that confusing in the diagnosis of thyroid abnormalities, consequently evaluation of thyroid disorders and proper interpretation of thyroid function tests during pregnancy requires an understanding of these changes(2). Thyroid gland is the biggest gland in the neck, the normal adult thyroid gland weight about 15-25g and consists of two lobes connected by an isthmus each thyroid lobe is divided in to lobules consisting 20-40 follicles(3). Thyroid gland volume determined, ultrasonographically, increases during pregnancy, although its echo structure and echogenicity remain unchanged(4,6). Anatomically, there is moderate thyroid gland enlargement as result of glandular hyperplasia and increased vascularity Conversely, pregnancy, usually dose not cause impressive thyromegally and thus any goiter or nodule should be approached as pathological(1). The thyroid gland is responsible for synthesizing and secreting thyroid hormones, L-thyroxine (T4) and L-tri iodothyronine (T3). The concentration of circulating free thyroid hormone is closely regulated by hypothalamic-pituitary-thyroid axis. This free thyroid hormone enters the cell, where T4 is converted to T3. T3 then control the metabolism [5]. The synthesis of thyroid hormone regulated by thyroid releasing hormone (TRH) which is secreted by hypothalamus and stimulates the production of thyroid stimulating hormone (TSH) from the anterior lobe of pituitary which then stimulates the production and release of T4 and T3 from the thyroid gland [7]. The synthesis of these hormones by thyroid gland requires iodine. After releasing of T3 and T4 they exert negative feedback mechanism on TSH production. T4 is the main hormone produced by the thyroid gland while T3 is mainly produced by peripheral conversion

of T4, both T3 and T4 are largely protein bound in the plasma,mainly to thyroxin-binding globulin (TBG), only the un bound or free portion (FT3,FT4) is active [3]. Iodine is a major component of thyroid hormones with dietary requirements increasing in pregnancy due to the enhanced transplacental uptake of iodide and increased maternal renal clearance[8]. Hence pregnancy is a state of relative iodine – deficiency [9].

Spectrum of Thyroid Disease in Pregnancy: Several of thyroid disorders which tend to occur during pregnancy are autoimmune in nature, by this we mean that the body develops antibodies directed against thyroid cells, which then affect the way the thyroid gland functions. Antibodies which damage the thyroid cells may result in lymphocytic thyroiditis (inflammation of the thyroid), also known as Hashemite's disease These damaging antibodies can reduce the function of the thyroid and lead to hypothyroidism. On the other hand, our body can make antibodies against thyroid tissue which can stimulate thyroid cell function, in this case, hyperthyroidism due to over-function of thyroid (graves' disease) may be the result[(16)].Postpartum thyroiditis is recently discovered problem that span the spectrum of both hyper-and hypothyroidism this condition, which tends to occur immediately after pregnancy, may produce antibodies which damage thyroid tissue, thereby releasing thyroid hormone passively into the blood stream and producing either temporary or permanent thyroid failure Since this condition is common, occurring in 8-10% of all women after pregnancy, so postpartum thyroid testing is advisable for all women[(17)].Thyroid nodules, goiter, and other thyroid problems are also sometimes first detected in pregnancy but are less common [14].

Hyperthyroidism and Pregnancy: Hyperthyroidism occurs in two of every 1000 pregnant women. This common disease of pregnancy may go undiagnosed because the clinical presentation of thyrotoxicosis is difficult to distinguish the apparent hyper metabolic state of pregnancy particularly in the second and third trimesters as perhaps expected mild thyrotoxicosis is difficult to diagnosis during pregnancy but some helpful sign include [(18)]:-

1. Tachycardia that exceeds the increase associated with normal pregnancy.
2. An abnormally elevated sleeping pulse rate.
3. Thyromegaly.
4. Exophthalmos.
5. Failure in a non obese woman to gain weight despite normal or increased food intake.

Confirmation has been made easier by assays to determine elevated serum free thyroxine levels along with recent development of assay that reliably measure thyrotropin level less than 0.05 μu/L[(19)]. Rarely hyperthyroidism may be associated with normal serum thyroxin values but, so called T3 - toxicosis.Untreated or inadequately treated hyperthyroid women deliver Babies having higher incidence of minor fetal anomalies[(20)].

Hyperthyroidism can affect the pregnancy [(20,21)]:

1. Preterm labour.
2. Increase Peri-natal mortality.
3. Maternal Heart failure where significantly increased in women who remain thyrotoxic despite treatment and in those, never treated.
4. Preeclampsia.

Etiology of thyrotoxicosis in pregnancy [(22)]:

1. Grave's disease.
2. Toxic multi-nodular goiter.
3. Toxic adenoma.
4. Hyper emesis gravid arum.
5. Gestational trophoblastic neoplasia.
6. Pituitary hyper secretion of TSH.

7- Metastatic follicular cell carcinoma.

8. Exogenous T4 or T3.
9. De Quatrain's thyroiditis. 10-
10. Silent lymphocytic thyroiditis.
11. Struma ovarii.

Graves's disease and pregnancy: The over whelming cause of thyrotoxicosis in pregnancy is graves' disease an organ specific autoimmune process usually associated with thyroid stimulating antibodies. These auto antibodies mimic thyrotrophic in it's ability to stimulate thyroid function, consequently, they appear to be responsible for both thyroid hyper function and growth in graves disease, it has been reported that thyroid - stimulating antibody activity in graves disease usually declines during pregnancy.[13,14]

Hypothyroidism and Pregnancy: Hypothyroidism occur in pregnant women with frequency of about 1 in

1600-2000 deliveries[25], women with hypothyroidism had a higher incidence of:[2]

1. Preeclampsia.
2. Placental abruption.
3. Low birth weight.
4. Still born infants.
5. Gestational hypertension.
6. Postpartum hemorrhage.
7. Anemia.
8. Cardiac dysfunction.

All pregnant women should be carefully asked about any personal or family history of thyroid disease or treatment directed at thyroid gland particularly of external radiation to the head and neck [26]. The best biochemical tests for diagnosis of hypothyroidism are measurement of serum sensitive TSH and free T4 In primary hypothyroidism, the TSH level is elevated and free T4 level is low, If TSH level is elevated and free T4 level is normal, the patient may have sub clinical hypothyroidism. In secondary or pituitary hypothyroidism the TSH level is normal or low in setting of a low free T4, 10% of patients with hypothyroidism have pernicious anemia, but neither vitamin B12 nor foliate deficiencies explain the macrocytic anemia that occurs in approximately one third of patients with hypothyroidism and anemia, Hypothyroidism usually is associated with mild normochromic, no myocytic anemia. Patients with insulin-dependent diabetes mellitus shoud are watched closely for development of hypothyroidism during pregnancy[14].

Differential diagnosis of hypothyroidism[22]:

1. Hashimoto's thyroiditis.
2. Post therapy hypothyroidism.
3. Suppurative and sub acute thyroiditis.
4. Drugs (thionamide therapy, iodides, and lithium, which inhibit the synthesis of thyroid hormones, secretion of thyroid hormone or both).

Carbamazepine, phenytoin, and rifampicin can increase thyroxin clearance.

Ferrous sulfate and sucralfate can interfere with intestinal absorption of thyroxin.

5. Lymphocytic hypophysis.
6. Iodine deficiency.

Iodine Deficiency: Iodine deficiency is a common cause of hypothyroidism in many parts of the world, although it is exceeding rare in the united status. The hypothalamic - pituitary axis responds to iodine deficiency with hyper secretion of TSH. That is probably responsible for the formation of goiters and nodules [22]. The goiter frequently grows during pregnancy, and multiple pregnancies result in much larger goiters than those occurring in nulliparous women. Many women may be clinically euthyroid but show biochemical hypothyroidism upon careful testing. The treatment is iodine supplementation, most practically accomplished when potassium iodide is added to salt[2].

Materials and Method

This is a case control study done in Basra maternity and children hospital aimed to study thyroid hormone change among pregnant women with history of early pregnancy bleeding during the period of first October 2007-first of July 2008, the study includes:-

A: Case Group: This includes 40 pregnant patients with history of of un explained early pregnancy bleeding taken as a case group, with gestational age of up to twenty weeks, with parity range of 0->5, after we took their consent to be included in the study. Detail history was taken from them including their age and parity with detail previous obstetric history and history of past medical illnesses. Those patients with any of following events were excluded from the study:

1. History of trauma.
2. History of fever.
3. History of maternal infection during gestation.
4. History of drug intake like emberyotoxic and other for chronic diseases.
5. History of irradiation during pregnancy.
6. History of repeated abortion.
7. Medical illness like hypertension, sickle cell problem.ect.
8. Molar pregnancy.
9. History of delivery of congenital anomaly babies.

B. Control Group: Including 58 pregnant healthy women taken as control group they had approximately the same age and parity range those patient was selected from out patient who attend for other cause other than early pregnancy The pregnancy of the both groups was confirmed by the following criteria:

1. History of missed period.
2. History of morning sickness.
3. Clinical examination confirms pregnancy with soft and bulky uterus.
4. Laboratory confirmation by pregnancy test and ultrasonography.

Parity of the patient were classified as 0-1 nillpara or primiparous patient, 2-5 multiparous patient and >5 as grand multiparous patients. their age also classified as those <20year, 20-39year.S o clinical and laboratory investigations confirming the presence of pregnancy were carried out for every candidate in each group.

Specimen collection and handling: 5ml of blood samples were collected by venipuncture from each candidate included in the study case and control group. The sample then centrifuged for 5 minutes then the serum was collected for immune enzymatic determination of TSH, T3, T4 using ELFA teqnique (enzyme linked florescent assay). This procedure carried out by VIDAS which is an automated quantities test and used for quantities measurement for TSH, T3, T4.

Principle of the procedure: By using of human serum of lithium heparinate (in amount of 0.Iml for TSH, 0.1 ml for 13 and 0.2ml for T4) the assay principle combines an enzyme immune assay competition method with final fluorescent detection (ELIFA).

Results and Discusion

Table one shows the difference in thyroid hormone level according to parity among the two study group which evidently show no significant differences in TSH, T3, T4 values in both groups, except among grand multiparous women (5 parity) in which T3 value is about 1.76 μiu/l in case group compared to 1.2 µiu/1 among control group with a significant P value of 0.44. Table two shows the thyroid hormone differences between cases and control according to the age as we see there was significant differences in T3 and T4 values in those with age (20-39) years, T3 values was 1.83 $\mu\ mol$/1 (p-value in cases which is higher than in control group 1.43 $\mu\ mol$/1(p-value 0.49 significant) and not significant in those with age more than 40 years. T4 value 96.64 $\mu\ mol$/l in cases which is lower than control group 105.8umol/1 (p -value 0.498 significant) and not significant in those with age 40 years or more. Table three TSH value in those with age 40year or more than was 2.165µiu/ml in cases which was also higher than control group 1.54uiu/ml (p -value o.499 significant) but not significant in those with age (20-39) years.Show thyroid hormone differences between cases mean level and control mean level where TSH value was 1.717µiu/ml in cases which is significantly higher than control group 1.311 (p-value o.49 significant)T3 value was 1.735 umol/lin cases and 1.564umol/1 in control group in which the difference is of no significant. Although thyroid hormone had definite impact on fertility and on the outcome of pregnancy and because of the vitality of thyroid hormone and the pregnant lady, that why we see definite diffuse enlargement of thyroid gland during normal healthy pregnancy this explain the increase demand of the pregnant women to the thyroid hormone,unfortunately no studies found similar to our study and In spite of many studies available regarding the physiological changes In the thyroid during pregnancy, it is uncertain if functional disorder of thyroid play a role in the etiology of spontaneous abortions. Maruo et al. proposed that maternal thyroid hormone level are one of endocrine Factors responsible for the threatened abortion [15].Ross et al. Indicated that Functional disorders of thyroid are not effective in the outcomes of miscarriage, this is in contrast to our study where we found that there is significant decrement in the level of T4 among those with early pregnancy bleeding. Lower TT3, TT4,FT3,FT4 levels and higher TSH values was obtained in the spontaneous abortions group are an indication of the presence of a hypothyroidism situation in this group which goes with our study which evidently showed an increment in the level of TSH among case group as was shown in Table III with a significant decrement in the level of T4 among the same group thus, there are several publications indicating that the ratio of spontaneous abortions rises two -fold in women with hypothyroid as compared to euthyroid women this in turn indicate the importance of thyroxin hormone in the continuation of normal healthy pregnancy.

Table 1. Thyroid hormone differences according to parity in both groups

Parity	Thyroid hormones	Cases mean level	Control mean level	P-Value	Test of significant
0-1 parity	TSH	1.56	0.45	0.136	Not significant
	T4	93.5	101.8	0.37	Not significant
	T3	1.6	1.56	0.19	
	Sample size	9	14		
2-5 parity	TSH	1.78	1.3	0.49	Not significant
	T4	95.2	120.5	< 0.49	Not significant
	T3	1.7	1.47	0.37	Not significant
	Sample size	19	28		
More than 5 Parity	TSH	1.34	2.1	0.36	Not significant
	T4	93.8	103.5	0.37	Not significant
	T3	1.76	1.2	0.44	Significant
	Sample size	13	14		

Table 2. Thyroid hormone changes in the two study groups according to age

Age	Thyroid hormones	Cases mean level	Control mean level	P-Value	Test of significant
> 20 years	TSH	1.031	1.137	0.16	Not significant
	T4	95.34	102.77	0.338	Not significant
	T3	1.73	1.5	0.386	
	Sample size	9	15		
20-39 years	TSH	1.83	1.46	0.32	Not significant
	T4	96.64	105.8	0.498	significant
	T3	1.83	1.42	0.49	significant
	Sample size	22	32		
≥	TSH	2.165	1.54	0.499	significant
	T4	93.73	97.1	0.215	significant
	T3	1.5	1.42	0.114	Significant
	Sample size	9	11		

Table (3) Thyroid hormones differences between cases & control.

Thyroid hormones	Cases mean level	Control mean level	P-Value	Test of significant
TSH	1.717	1.311	0.46	Significant
T4	94.94	102.41	0.49	Significant
T3	1.735	1.564	0.29	Not significant
Sample size	40	58		

Conclusion

There was a significant decrement in the level of T4, with significant changes in the level of TSH among cases with early pregnancy bleeding compare with normal healthy pregnancy while T3 show no significant changes; this is possibly because T4 is the main circulating hormone in the blood.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Knowledge of Nurse-Midwives Concerning Hypertensive Disorders During Pregnancy in Al-Najaf AL-Ashraf City Hospitals

Lina Nidhal Sajjad[1], Muna Abdul-Wahab Khaleel[2]

[1]M.Sc. Student, in Maternal and Neonate Health Nursing/College of Nursing, Babylon University, Babylon Province-Iraq, [2]Professor, Community Nursing/College of Nursing, Babylon University, Babylon Province-Iraq

Abstract

Hypertension is the most common medical disorder of pregnancy;hypertension may exist prior to pregnancy or develop during pregnancy. A descriptive cross-sectional hospital-based study is conducted throughout the period of (31th July 2018 to 29th July 2019.). The population of this study consisted of all nurse-midwives (n=120) who are working at delivery rooms in AL-Najaf AL-Ashraf city Hospitals.Data was collected through the use of the questionnaire and the self-administration report, from those nurse-midwives. Data were analyzed through the application of statistical package of social science (SPSS) program. The study results reveal that nurse-midwives are young with age group of (20 – 29) years old (45%), who were graduated from midwives' secondary school (63.3%), more than half of nurse-midwives are having a period of (1–5) years of experience in working at hospitals (58.3%).Sixtysix. seventy percent(66.7%) of them showing that they get information from health team members the sample under study showed that this have fair level of knowledge about assessment and diagnosis of hypertensive disorders and poor knowledge about the clinical manifestation of severe eclampsia. Also, results indicate that there is significant relationship between knowledge about hypertensive disorders with residence of nurse-midwives as well as, with their educational level

Keywords: *Knowledge, Nurse-Midwives, Hypertensive Disorders During Pregnancy.*

Introduction

Hypertensive disorders complicating pregnancy (HDP) is the most common complication in pregnancy. The incidence varies in different populations and is affected by the definition used. HDP is influenced by null parity, age, and race. In India 2006, the incidence of HDP was 5.38%, while preeclampsia, eclampsia, and HELLP (hemolysis, elevated liver enzymes, and low platelet count) syndrome accounted for 44%, 40%, and 7% of complications, respectively. Maternal and perinatal death have been reported in 5.5% and 37.5% of deliveries, respectively. HDP comprises preeclampsia and eclampsia[(1)]. World Health Organization (WHO) estimates that at least one woman dies every seven minutes from complications of hypertensive disorders of pregnancy, pregnancy induce hypertension is the second most common medical disorder seen during pregnancy They along with contribute hemorrhage & infection, greatly to maternal morbidity & mortality with the advent of antenatal care in large cities, severe degree of toxemia & eclampsia has become mostly preventable. However, in developing countries, it still continues to be a major obstetric problem. Thus, we can reduce the maternal mortality by providing preventive measures & proper management of these complications[(2)]. In developing countries, pre-eclampsia accounts for (20-40%) of the maternal mortality and (15%) of preterm deliveries. According to the reports of the WHO, the pregnancy-induced hypertension in Iraq accounts for (9%) until 2013[(3).]

Methodology

The study aims to assess the knowledge of nurse-midwives regarding hypertensive disorders during

pregnancy and to find out the relationship between knowledge of nurse - midwives and their socio-demographic and personal characteristics such as (age, level of education, years of experience, residency, marital status, income etc...).

Design of the Study: A cross sectional hospital-based study is conducted throughout the period of (31th July 2018 to 29th July 2019).

Sample of the Study: A total of 120 nurse midwives working at delivery rooms in AL-Najaf AL-Ashraf City Hospitals.

Study Instrument: After an intensive review of relevant literatures, the questionnaire is developed and used as a tool of data collection which includes the following:

Part I: Contains socio-demographic and personal characteristics; part II deals with midwife's general knowledge concerning hypertensive disorders during pregnancy.

Data Analysis: Descriptive and inferential statistical study tests used through the use of the (SPSS ver-25).

Results and Discusion

Table (1): Distribution of the Nurse-Midwives According to Their Socio-demographic Characteristics

List	Characteristics		F	%
1	Age	< 20 years	19	15.8
		20 – 29 years	54	45
		30 – 39 years	23	19.2
		40 – 49 years	19	15.8
		50 ≤ years	5	4.2
		Total	120	100
2	Level of Education	Nursing school	15	12.5
		Midwives secondary school	76	63.3
		Nursing secondary school	11	9.2
		Nursing institute	5	4.2
		Nursing college & higher	13	10.8
		Total	120	100
3	Marital status	Single	40	33.3
		Married	63	52.5
		Divorced	9	7.5
		Separated	5	4.2
		Widowed	3	2.5
		Total	120	100
4	Socio-economic status	Sufficient	52	43.4
		Insufficient	55	45.8
		Barely sufficient	13	10.8
		Total	120	100
5	Residency	Urban	89	74.2
		Rural	31	25.8
		Total	120	100

F: Frequency, %: Percentage

This table shows that nurse-midwives are young with age group of (20 – 29) years old (45%), who were graduated from midwives' secondary school (63.3%). Fifty-two. five percent of them are married and (33.3%) are single. Regarding socio-economic status, they are revealing insufficient to sufficient status, in which (45.8%) showing insufficient and (43.4%) showing sufficient socio-economic status. More of the nurse-midwives are resident in an urban area (74.2%) and only (25.8%) are resident in a rural area.

Table (2): Table (4-1): Distribution of Nurse- Midwives According to Their Years of Experience in Nursing Profession

List	Characteristics		F	%
1	Years of experience in hospital	< 1 year	1	0.8
		1 – 5 years	70	58.3
		6 – 10 years	25	20.8
		11 – 15 years	6	5
		16 – 20 years	7	5.8
		21 ≤ years	11	9.2
		Total	120	100
2	Years of experience in delivery room	< 1 year	2	1.7
		1 – 5 years	72	60
		6 – 10 years	26	21.7
		11 – 15 years	9	7.5
		16 – 20 years	6	5
		21 ≤ years	5	4.2
		Total	120	100
3	Years of experience as midwives	< 1 year	2	1.7
		1 – 5 years	73	60.8
		6 – 10 years	25	20.8
		11 – 15 years	11	9.2
		16 – 20 years	4	3.3
		21 ≤ years	5	4.2
		Total	120	100

f: Frequency, %: Percentage

This table reveals that more than half of nurse-midwives are having a period of (1–5) years of experience in working at hospitals (58.3%). Regarding years of experience in delivery room, (60%) of them are working in delivery room for (1 – 5) years, which is the same duration as they working as midwife; they show that they are working as midwife for (1 – 5) years.

Table (3): Significant Differences for Knowledge about Hypertensive Disorders with Respect to Residency of Nurse-Midwives (N=120)

Knowledge Domains / Residency		Independent t-test					
		M	SD	T	df	P ≤ 0.05	Sig.
General Knowledge	Urban	89	8.26	1.797	118	0.075	N.S
	Rural	31	6.87				
Assessment & Diagnosis	Urban	89	4.61	3.075	118	0.003	H.S
	Rural	31	2.87				
Management of Hypertensive disorders	Urban	89	6.08	2.129	118	0.035	S
	Rural	31	4.84				
Overall Knowledge	Urban	89	18.94	2.640	118	0.009	S
	Rural	31	14.58				

This table indicates that there is significant relationship between knowledge about hypertensive disorders with residence of nurse-midwives

Table (4): Analysis of Variance for Knowledge about Hypertensive Disorders with Regard to Nurse-Midwives' Level of Education (N=120)

Education / Knowledge	Source of Variance	Sum of Squares	d.f	Mean Square	F	P-value (Sig.)
General Knowledge	Between Groups	113.688	4	28.422	2.113	.084 (N.S)
	Within Groups	1547.112	115	13.453		
	Total	1660.800	119			
Assessment & Diagnosis	Between Groups	99.152	4	24.788	3.415	.011 (S)
	Within Groups	834.840	115	7.259		
	Total	933.992	119			
Management of hypertensive disorders	Between Groups	50.084	4	12.521	1.589	.182 (N.S)
	Within Groups	905.908	115	7.877		
	Total	955.992	119			
Overall Knowledge	Between Groups	699.728	4	174.932	2.813	.029 (S)
	Within Groups	7150.238	115	62.176		
	Total	7849.967	119			

d.f: Degree of freedom, F: F-statistic, P: Probability value

Sig.: Significance, H.S: High significant, S: Significant, N.S.: Not significant. This table indicates that there is significant relationship between knowledge about hypertensive disorders in pregnancy with educational level among nurse-midwives

Discussion

Part I: The Nurse-Midwives According to Their Socio-demographic Characteristics

1. **Mother's Age:** Results of this study reveal that nurse-midwives are young with age group of (20 – 29) years old (45%) and this result corresponding with a study that carried out by [4] in Ethiopia they found out among the total study participants, 155 (37.3%) were aged between (20-24) years.
2. **Mother's level of education:** Regarding level of education, the total sample of the study graduated from midwives' secondary school (63.3%). The current finding inconsistent with a study that done by [4] in Ethiopia who stated that (36.1%) of their participant's educational level attended primary school only.
3. **Marital Status:** Concerning marital status, (52.5%) of them are married, the finding of this study goes

along with study that conduct by [5], who found that the majority of their study sample were married (91.94).

4. **Socio-economic status:** Regarding socio-economic status, they are revealing insufficient to sufficient status, in which (45.8%) showing insufficient socio-economic status. The result of under hand study supported by A "prospective case – control observational study that conducted by Vats and Paul, 2017, to study risk factors for hypertensive disorders of pregnancy in a tertiary care maternity hospital of Delhi, who stated that majority of cases (63%) belonged to lower and upper lower socioeconomic status[6].

5. **Residency:** In regard to residency, more of the nurse-midwives are resident in an urban area (74.2%). the finding of current study supported by cross-sectional study that conducted by [5] to assess pregnancy induced hypertension and its associated factors among women attending delivery service at Mizan-Tepi University Teaching Hospital, Gebretsadikshawo Hospital and Tepi General Hospital. They were depicted that half of the participants were from rural areas (51.4).

Part II: Distribution of Nurse-Midwives According to Their Years of Experience in Nursing Profession

1. **Years of experience in hospital:** Results reveal that more than half of nurse-midwives are having a period of (1 – 5) years of experience in working at hospitals (58.3%). This finding inconsistent with a quasi-experimental (pre-post) design was used and conducted in Obstetrics and Gynecology Department, Beni-Suef University Hospital, from March to December 2016. A total of 60 nurses working at the out-patient antenatal clinic and inpatient Obstetrics and Gynecology Department took part in Egypt that conducted by [7] who were found that more than half of the nurses had experience less than five years. This is may be due to that the hospital is the second level referral health institution's attending to complicated maternal case's and therefore require more midwives.

2. **Years of experience in delivery room:** Regarding years of experience in delivery room, (60%) of them are working in delivery room for (1 – 5) years, the finding of current study corresponding with study conducted by [8] in Ethiopia who reported that about 52 (66.7%) of total sample served for 1-5 years, while working as midwife; they show that they are working as midwife in delivery rooms for (1 – 5) years.

Part III: Analysis of Variance for Knowledge about Hypertensive Disorders with Regard to Nurse-Midwives' Level of Education.

This table indicates that there is significant relationship between knowledge about hypertensive disorders in pregnancy with educational level among nurse-midwives, at p-value ≤ 0.05. The finding of the present study is incongruent with retrospective study which determine the prevalence of HDP and its associated factors among the pregnant women delivered at tertiary care hospital of Northern Karnataka, that carried out by [9] in India who found that there is no statistically significant association with hypertensive disorders in pregnancy. This difference may be due to pregnancy by the simple reason that the low educational level is associated indirectly to midwives' knowledge such as nurses graduated from nursing school don't had enough knowledge and skills as well as practices to deal with pregnant women who had HDP. Also, was explained by midwives had inadequate training workshop on risk factors, management and caring of pregnant woman with hypertensive disorders in pregnancy.

Part IV: Analysis of Variance for Knowledge about Hypertensive Disorders with Regard to Residency of Nurse-Midwives

The result of the present study indicates that there is significant relationship between knowledge about hypertensive disorders with residency of nurse-midwives at p-value ≤ 0.005, and significant difference is seen between domain of management of disorders with residence of nurse-midwives at p-value ≤ 0.01.

According to cross-sectional study entitled (hypertensive disorders of pregnancy in jimma University specialized hospital) that carried out by [10], who stated that residence area was found to have statistically significant association with the hypertensive disorders in pregnancy at (p- value=0.001). This result is consistent with the result of the current study.

Conclusions

More of the early adult's nurse- midwives' lives at urban areas and graduated from midwives' secondary school, who are marriedand presented with insufficient

to sufficient socio-economic status. Nurse-Midwives' level of education, residency, type of training programs that Nurse-Midwives participate with and sources of information have a great effect on their knowledge regard hypertensive disorders in pregnancy.

Epidemiology of Gestational Diabetes among Pregnant Women at Primary Health Care Centres in Al Nasiriyah City/Iraq

Saja Mahdi Sahib[1], Hala Saadi Abdulwahid[1]

[1]College of Nursing/University of Baghdad, Iraq

Abstract

Objective: To assess the incidence and prevalence of Gestational Diabetes(GD) among pregnant women and find out the factors that contribute to GD occurrence. Retrospective – prospective study is carried out in Al-Nasiriyah city at primary health care centers to find out the incidence rate of GD for two months and prevalence rate of GD for five years ago, and identify the relationship between contributing factors with it.Anon probability sample (convenience sampling) a total of 5183 pregnant (13)out of them new cases with GD for two months and a total of 186056 pregnant(453) out of them existed cases with GD for five years ago. The study was conducted during the period from January 2nd 2019 to February 28th 2019. Findings reveals that there are significant relationships between women's education, occupation and incidence of GD. Highly significant relationship is between women's age and incidence of GDwhile there are highly significant relationships are between women's age, occupation and prevalence of GD only and there is highly Correlation between women's obstetric history, maternal body mass index with incidence and prevalence of gestational diabetes Correlation is significant at the 0.01 level (2-tailed).

Keywords: *Incidence, Prevalence, Gestational Diabetes, primary health care centers.*

Introduction

Pregnancy is a normal physiological state, which a woman experiences at some point of her life. During pregnancy, a woman may develop complications that pose a risk to both maternal and fetal health[(1)]. Gestational diabetes mellitus (GDM) is the second commonest medical complication of pregnancy after hypertension. It is a non-communicable disease that has major effect on pregnancy process and outcomes [(2)(3)]. Worldwide, GDM affects approximately 14% of pregnancies which represent about (18) million births annually [(4)]. Furthermore, the occurrence of GDM is predictable to increase over years. Especially in Asia, this is possibly due to increase in maternal age and obesity [(5)(6)(7)]. The incidence of GDM is rising in the context of the pandemic in obesity and type 2 diabetes in the modern world[(8)(9)]. In Iraq according to statistical report in 2015, non communicable risk factors for female ≥ 18 year include obesity, hypertension, overweight and diabetes which represent 42.6%, 34.5%, 30.6%, and 13.7% respectively. According to the annual statistical report for Iraqi Ministry Of Health/Environment (MOH) in 2017, the second direct cause of maternal mortality is complications of maternal hypertension was 14.5% and third indirect cause of maternal mortality is diabetes was 4.4%[(10)]. The present study aims to find out the incidence and prevalence of GD among pregnant women in Al Nasiriyah City to aid in planning for strategies of control.

Methodology

Design of the Study: Retrospective – prospective study design is conducted at primary health care centers at Al-Nasiriyah city aimed to find out the incidence rate of GD for two months from January 2nd 2019 to February 28th 2019, to find out the prevalence rate of GD during five years ago (2014-2019), and to find out the factors that can contribute to incidence and prevalence of GD among pregnant.

Sample of the Study: Anon probability sample (convenience sampling) a total of 60 pregnant (13) out of them new cases with GD for two months and a total of 1961 pregnant (453) out of them existed cases with GD for five years ago at Al-Nasiriya city/Iraq.

Data collection: Data was collected by reviewing health medical records and using the questionnaire through the researcher interviewed the pregnant to explain purpose of the study in simple way. The data were collected through the period from January 2nd 2019 to February 28th 2019.

Instrument of the Study: The questionnaire consists of two parts: part I: Pregnant's Socio- demographic Data: This part was designed to include items that represent the socio-demographic data of pregnant with GD related to age, education and occupation and part II: Pregnant's risk factors for GD this part was designed to include items that covers the maternal risk factors which associated with GD which consist of (1) Pregnant's medical and family health history: This item include (17) sub items are represent medical history of pregnant which identical with her family history (2) Obstetric history: This item covers obstetric history and reproductive data of pregnant which is involve number of gravida, number of para, number of abortion, history of deliveries, and age at first pregnancy (3) Pregnant's weight status(BMI). The validity and reliability of the instrument was determined by using through the panel of experts, and internal consistency through the computation of Cronbach's Alpha Correlation Coefficient

Statistical Method: Data were analyzed through the application of descriptive statistical(Frequencies and percentages) and inferential analysis (Pearson Correlation Coefficient).

Results

Table (1): Incidence and Prevalence rates for Women's Gestational Diabetes

Variables	Incidence Rate (percent)	Prevalence Rate (percent)
Gestational Diabetes	0.25%	0.24%
Total	5183	186056

Results out of this table depict the incidence rate of gestational diabetes is 0.25% and prevalence rate is 0.24%.

Table (2): Descriptive Statistics of Women's Prevalence during Five Years

Case definition	Year of Prevalence	Frequency	Percent (%)
Gestational Diabetes	2014	90	19.9
	2015	76	16.8
	2016	118	26
	2017	77	17
	2018	92	20.3
	Total	**453**	**100**

Results out of this table indicate major percentage (26%) of the women have gestational diabetes in 2016.

Table (3): The Relationship between Women's Incidence of Gestational Diabetes and Their Demographic Characteristics

Demographic Characteristics	Correlation	Significance
Age	0.720	0.004**
Education	0.534	0.049*
Occupation	627	0.016*

*Correlation is significant at the 0.05 level (2-tailed), **Correlation is significant at the 0.01 level (2-tailed)

Results out of this table presents that there are significant relationships between women's education, occupation and the incidence of gestational diabetes. Highly significant relationship is between women's age and the incidence of gestational diabetes.

Table (4): The Relationship between Women's Prevalence of Gestational Diabetes and Their Demographic Characteristics

Demographic Characteristics	Correlation	Significance
Age	0.292	0.000**
Education	0.133	0.049*
Occupation	0.357	0.000**

** Correlation is significant at the 0.01 level (2-tailed)
* Correlation is significant at the 0.05 level (2-tailed)

Results out of this table indicate that there are highly significant relationships between women's age, occupation and the prevalence of gestational diabetes. Significant relationship is between women's education and the prevalence gestational diabetes.

Table (5): The Relationship between Women's Incidence of Gestational Diabetes and Pregnant's risk factors

Variables	Correlation	Significance
Medical History	0.218	0.455
Family History	0.249	0.391
Obstetric History	0.961	0.000**
Body Mass Index	0.763	0.002**

** Correlation is significant at the 0.01 level (2-tailed)

Results out of this table indicate that there is highly significant relationship between women's obstetric history, maternal body mass index and incidence of gestational diabetes

Table (6): The Relationship between Women's Prevalence of Gestational Diabetes and Pregnant's risk factors

Variables	Correlation	Significance
Medical History	0.032	0.636
Family History	0.026	0.699
Obstetric History	0.546	0.000**
Body Mass Index	0.328	0.000**

** Correlation is significant at the 0.01 level (2-tailed)

Results out of this table reveal that there is highly significant relationship between women's obstetric history, maternal body mass index and prevalence of gestational diabetes.

Discussion

Results of the study depicts, that the incidence rate of GD is (0.25%) and prevalence rate is (0.24%) as shown in table (1). The majority percentage of prevalence of GD is (26%) at year 2016 (table 2). These rates lower towards international statistics. According to the International Diabetes Federation(IDF) the prevalence of GDM may vary from 1% to 14% of all pregnancies this is regarded a good indicator about health of Iraqi women and improvement of health care services thought years.

Part I: Pregnant's Socio-demographic Characteristics: Findings reveals that there are significant relationships between women's education, occupation and incidence of GD. Highly significant relationship is between women's age and incidence of GD table (3) while there are highly significant relationships are between women's age, occupation and prevalence of GD only (table 4), this results consist with Kalyani and others(2014)[11] who are conducted a study in India which included 300 antenatal women to determine the prevalence of GDM and the risk factors associated with it. The findings showed GDM was found to be significantly associated with socioeconomic status and education level.

And agree with Areefa et al(2014)[12] conducted a retrospective case control study in Gaza aimed to identify the prevalence and socio-demographics of GDM revealed there is significant association between level of education, job status and prevalence of GDM. Also consistent with Abu-Heija and others (2017)[13]who are conducted a prospective study at Sultanate Oman designed to study the effects of age on the incidence of GDM in healthy pregnant Omani women. This study reported the incidence of GDM increased with rising maternal age from 2.2% in women aged <25 years to 14.7% in women aged >35 years (P =0.009).

Part II: Pregnant's Risk Factors for Gestational Diabetes: Epidemiological evidences about risk factors of GDM may be different from region to other. The results present highly significant association between women's obstetric history with incidence and prevalence of GD as shown in tables (5) and (6). This results consistent

with Kiani and others (2017)[14]conducted meta-analysis study in Iran based on the national and international journals databases to explore the risk factors of GDM among 1658 pregnant women with average age of 29.15 years old. It was revealed that history of abortion, delivery≥ 5, history of stillbirths, history of delivery < 37 weeks, and history of gestational hypertension were significant risk factors for GDM growing.Supported by Zakir and others(2017)[15] those conducted a study in Pakistan To determine the frequency of GDM and to analyze the relationship and strength of association among common risk factors in the development of GDM which proved that multiparty and obstetrics history were strong predictors of GDM.

This study reveals no association between family history and medical history of pregnant with incidence and prevalence of GD as shown in tables (5) and (6). This results consistent with Lotfi et al(2018)[16]conducted a study to examine the role of clinical factors in the association of GD in Yazd, Iran among women aged 15–49 years showed there is not significant relationship between GDM and underlying diseases.

The findings reveals that there is highly significant relationship between women's body mass index with incidence and prevalence of GD as shown in tables (5) and (6). This results agree with many studies like Pillai (2017)[17] who is conducted a retro- prospective observational study to estimate the prevalence and risk factors of GDM among 222 pregnant diagnosed with GDM for the period of 8 years at Trichy district that showed overall prevalence of GDM was 2.1%. Higher BMI definite influence on GDM . Also agree with Chitme and others (2017)[18] who are conducted a case–control multicentered study to understand the modifiable risk factors in GDM patients of different regions in Oman which involved 291 women diagnosed with GDM and 300 normal pregnant women. This study depicted that body weight significantly (P < 0.001) correlated with incidence of GDM.

Conclusion

According to the present study findings, the investigator concludes the following: The incidence and prevalence rates of GD are less than 1%. This rates were low in compared with international rates of this condition occurrence. Most of the study sample was at age group (25-34) years, unemployed, and low education level. There is statistical significant association between mother's Socio-demographic characteristics, obstetric history, and maternal body mass index with incidence and prevalence of GD.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the College of Nursing/University of Baghdad, Iraq and all experiments were carried out in accordance with approved guidelines.

Assessment of Premenstrual Syndrome (PMS) Symptoms among Female Students in Baghdad City

Kawther Salman Dawood

Ph.D. Psychiatric Mental Health Nursing, Lecturer, Institute of Medical Technology/Baghdad, Middle Technical University, Baghdad, Iraq

Abstract

Premenstrual syndrome (PMS) affects women to extent that their quality of life, interpersonal relationships and work performance can be impaired the current study aims to assess the symptoms of premenstrual syndrome among female students and to determine the severity of premenstrual syndrome symptoms. Adescriptive study was conducted on female students in Baghdad city from august 2nd 2017 to May 30th 2018. A simple random selection of (300) female students was selected to participated in this study; (100) students from Institute of Medical Technology/Baghdad, (100) students from College of Health and Medical Technology and (100) students from Institute of Medical Technology/Al-Mansour. A self-administrative questionnaire was conducted to achieve the study objectives. The participants aged between (18-25) years with mean of age 20.19 years. Most of female students used sleep and rest to relieve the symptoms of PMS. The highest percentage (35.3%) of female students had a mild level of psychological symptoms of PMS. The highest percentage (34.3%) of female students had a moderate level of physical symptoms of PMS. The study concluded that all participants had at least one symptom of premenstrual syndrome and they affected by the physical symptoms more than the psychological symptoms.

Keywords: *Premenstrual syndrome, psychological symptoms, physical symptoms.*

Introduction

Menstruation is a normal physiological phenomenon in a woman's reproductive life. In the gynecological issue the menstrual problems especially among young women are supposed to be the major ones[(1)]. The term premenstrual tension (PMT) was first used by frank in 1931 who described tension, depression, weight gain and headaches in women 7-10 days prior to the onset of menstruation. Green and Delton first used the term PMS in 1953[(2)]. The premenstrual syndrome was defined by the international statistical classification of diseases and related health problem 10th revision (ICD-10) as the existence of one premenstrual symptom within a set of many symptoms which include mild psychological distress, general swelling and weight gain, breast tenderness, swelling of hands and feet, diverse aches and pains, low concentration, disturbed sleep and appetite changes, the luteal phase of menstrual cycle was restricted and terminated with the beginning of menstrual flow[(3)]. The psychological symptoms of PMS may include (Depressed mood, Angry outbursts, Irritability, Anxiety, Confusion and Social withdrawal) and the physical symptoms include (Breast tenderness, Abdominal inflating, Headache and Swelling of extremities). These symptoms start at ovulation and progress during the 5 days before the onset of menses and it will be resolved within 4 days of onset of menses and not persist until after day 12 of the cycle. These symptoms must adversely affect social or work related activities [(4)].It is estimated that PMS affects about 1.5 million women and 80% of women during their reproductive cycle experience some symptoms attributed to premenstrual phase of menstrual cycle. PMS can affect all women and prevalent in women of all ages causing considerable morbidity with evident impairment to interpersonal relationships, social interactions, lifestyle,work performance, emotional well-being, function normally at home and the quality of life [(3)]. This syndrome is mostly common in the young females and seems to become more sever throughout the reproductive years[(5)]. The severity of premenstrual

syndrome symptoms differs extensively from women to women, and can vary from cycle to cycle but the type of symptoms remains constant in each women[6]. The etiology of PMS remains unknown;but many factors contribute to the condition such as change in hormonal levels, fluctuation of neurotransmitters, dietary habits, medications and lifestyle [7]. Low zinc and copper retention, insufficient serotonin amount, deficiency of progesterone, deficiency of vitamin E,B, calcium, linoleic acid, and magnesium manganese are also implicated in the existence of PMS. Management of PMS goals to relief symptoms and restores function and often requires an arrangement of lifestyle adjustments and medication treatment [8].

Methodology

A descriptive correlational study was conducted on female students in Baghdad city from August 2nd 2017 to May 30th 2018. A simple random selection of (300) female students was selected to participated in this study; (100) students from Institute of Medical Technology/ Baghdad, (100) students from College of Health and Medical Technology and (100) students from Institute of Medical Technology/Al-Mansour. A self-administrative questionnaire was conducted to achieve the study objectives. A self-administration questionnaire was constructed by the researchers depending on extensive review of literature and used to achieve the study objectives. Approval consents were obtained before data collection and oral consents also achieved from female students. The questionnaire consists of 3 sections:

1. The demographic characteristics of the female students such as (age, property age, marital status).
2. The data related to the menstrual cycle such as (regulation of menstrual cycle, period of menstruation, duration of menstruation and period of premenstrual pain).
3. The data related to the means used by participants to relieve the symptoms of PMS.
4. The psychological and physical symptoms of premenstrual syndrome assessment include:
   A. Assessment of psychological symptoms contain (12) items.
   B. Assessments of physical symptoms contain (12) items.

The response to these items is (not suffering = 0, having slightly = 1, I suffer moderately = 2, I suffer with sever degree = 3, I suffer with very sever degree = 4).

The reliability of the questionnaire assessed by using split- halve technique of (20) students were (r1)= 0.735. The questionnaire was presented to experts in order to achieve its validity.

The data of the study were analyzed by using the descriptive statistics; frequencies, percentages, mean and standard deviation (SD).

Results and Discussion

Table (1): Distribution of the sample according to socio- demographic characteristics

No.	Variables		f	%
1	Age (Years)	18-19	105	35
		20-21	143	47.7
		22-23	50	16.7
		24-25	2	0.6
		Total	**300**	**100%**
2	Marital Status	Single	274	91.3
		Married	26	8.7
		Total	**300**	**100%**
3	Property age (years)	9-12	105	35
		13-16	195	65
		Total	**300**	**100%**

Table (1) indicated that 300 students who participated in this study aged between (18-25) years old with mean age = 20.19 years and std. deviation = 1.41. The highest percentage (47.7%) of them aged between (20-21) years, as regards to the marital status; majority of the female students (91.3%) were single. And more than half of them (65%) the property age of them were between (13-16) years old. The results of current study was contiguous to (Bakhshani etal, 2009) who reported in there study that the age of 300 university students who participated in the study ranged from 18-27 with mean age 21.64 years. And majority of them (257) were single[9].

Table (2): Distribution of the sample according to data related to menstrual cycle.

No	Data related to menstrual cycle		f	%
1	Regularity of menstrual cycle during the last 12 months	Yes	216	72
		No	84	28
		Total	**300**	**100%**
2	Period of menstruation (days)	3-5 days	149	49.7
		More than 6 days	151	50.3
		Total	**300**	**100%**
3	Duration of menstruation (days)	Less than 26 days	60	20
		26 days	41	13.7
		28 days	117	39
		30 days	42	14
		More than 30 days	40	13.3
		Total	**300**	**100%**
4	Period of premenstrual pain (dysmenorrhea)	Before 2-6 days	268	89.3
		Before 7-14 days	32	10.7
		Total	**300**	**100%**

The results indicated that (72%) of female students have a regular menstrual cycle during the last 12 months. More than half of women (50.3%) reported that the menstruation period more than 6 days. (93%) of female students reported that duration of menstruation was 28 days. The majority of the sample (89.3%) was suffering from PMS symptoms before 2-6 days of menstruation.

Table (3): Distribution of the sample according to the means used to relieve premenstrual pain

No	Means used to relieve premenstrual syndrome symptoms	Yes		No		Total	
		f	%	f	%	f	%
1	Analgesic medications	205	68.3	95	31.7	300	100%
2	Herbs	25	8.3	275	91.7	300	100%
3	Exercise	29	9.7	271	90.3	300	100%
4	Rest and sleep	227	75.7	73	24.3	300	100%
5	Health food	36	12	264	88	300	100%

Table (3) indicated that most of participants (75.7%) used sleep and rest in order to relieve the PMS symptoms and 68.3% of them used an analgesic medication. This result was consistent with the study of Thu et al (2006) who found that 75% of respondents used sleep and 41.4% used Paracetamol when they detected the symptoms of PMS[6].

Table (4): Distribution of the sample according to the physical and psychological symptoms of PMS

PMS symptoms		Yes		No		Total	
		f	%	f	%	f	%
Physical symptoms	Backache	271	90.3	29	9.7	300	100%
	Abdominal spasms	255	85	45	15	300	100%
	Acne	254	84.6	46	15.4	300	100%
	Abdominal bloating	248	82.6	52	17.4	300	100%
	Joints pain	212	70.6	88	29.4	300	100%
	Breast tenderness	210	70	90	30	300	100%
	Frequent urination	172	57.3	128	42.7	300	100%
	Nausea	170	56.6	130	43.4	300	100%
	Swelling of general body	134	44.6	166	55.4	300	100%
	Weight gain	129	43	171	57	300	100%
	Vomiting	125	41.6	175	58.4	300	100%
	Swelling of extremities	120	40	180	60	300	100%
Psychological symptoms	Fatigue	272	90.7	28	9.3	300	100%
	Depressed mood	270	90	30	10	300	100%
	Anger	257	85.7	43	14.3	300	100%
	Appetite changes	245	81.7	55	18.3	300	100%
	Low productivity and performance	242	80.7	58	19.3	300	100%
	Anxiety	242	80.7	58	19.3	300	100%
	Sudden feeling of sadness	238	79.4	62	20.6	300	100%
	Sleep problems	238	79.4	62	20.6	300	100%
	Avoidance of interpersonal relationships	197	75.7	103	34.3	300	100%
	Concentration difficulties	216	72	84	28	300	100%
	Avoid daily routine activities	213	71	87	29	300	100%
	Tearfulness	213	71	87	29	300	100%

Table (4) revealed that the most physical symptom of PMS was the backache (90.3 abdominal spasms (85%), acne (84.6%) and abdominal bloating (82.6%).And the more frequent psychological symptoms were fatigue (90.7%), depressed mood (90%) and anger (85.7). These results were slightly different with (Bakhshani et al, 2009) who found that the most common physical symptoms were backache, abdominal inflating and joints or muscles pain and the most prevalent of psychological symptoms were tiredness and depressed mood. Many studies suggest that the heredity play a role in PMS symptoms[9].

Table (5): Distribution of the sample according to the severity of psychological and physical symptoms of premenstrual syndrome

No.	Severity of symptoms		f	%
1	Psychological symptoms	Mild	106	35.3
		Moderate	99	33
		Sever	95	31.7
		Total	300	100%
2	Physical symptoms	Mild	102	34
		Moderate	103	34.4
		Sever	95	31.7
		Total	300	100%

Table (5) revealed that all female students were suffered from at least one of the psychological and physical symptoms of premenstrual syndrome and reported different levels of severity. The highest percentage (35.3%) of them had a mild level of psychological symptoms of PMS, and (34.3%) of them reported a moderate level of physical symptoms of PMS. This results was consistent with (Thu etal, 2006) who reported that 41% of the sample had symptoms with mild level of PMS symptoms. The results of current study was congruent with (Bakhshani etal, 2009) who reported that all participants had at least one premenstrual symptoms of minimal severity and 88% of them were considered moderate level of severity [(6)(9)].

Conclusions

The study concluded that all participants had at least one symptom of premenstrual syndrome. Most of female students used sleep and rest to relieve the symptoms of PMS. Most frequent psychological symptoms were tiredness, depressed mood and anger, while the main physical symptoms were backache, abdominal spasms and acne. The severity of PMS symptoms varied from mild to severe; the highest percentage (35.3%) of female students had a mild level of psychological symptoms and the highest percentage (34.3%) of had a moderate level of physical symptoms.

Some Important Prognostic Factors in Breast Cancers in Iraqi Women: A Retrospective Study

Basim Mohammed Abdulmajeed[1], Faisal Ali Lattef[2], Ahmed Salahuddin Mohammed[3]

[1]M.Sc. in Histopathology, College of Pathological Analyses Techniques, Al-Bayan University, [2]M.Sc. in Physiology, Pathological Lab, Techniques College, Al-Bayan University, [3]M.Sc. in Histopathology, Ministry of Health, Medical City, Oncology Center

Abstract:

Based on our knowledge about the importance of some prognostic factors in breast cancers, a retrospective study on 101 Iraqi female patients was done, using the following parameters; patient's age, tumor grade, hormones Estrogen receptor (Er.) status, and human epidermal growth factor receptor 2 (Her2/neu) expression. A significant relationship between younger age group (< or = 35 years) and high grade tumors was detected. Significant number of those patients in the study had Er+ve tumors. No significant relationship has been found between Er-ve tumors and high grade histology. Most of postmenopausal women in this study were with Er+ve breast cancers, which is significantly higher than that in premenopausal women. Also a significant increase in Her2/neu expression is seen in tumors with high grade histology. No inverse relationship between Er. concentration and Her2/neu expression was seen. We did comparison between these findings and the results of others over the world to see if behaviors of breast tumors in Iraqi female are the same to that over the world. Unfortunately no similar work on Iraqi females was performed previously for comparison.

Keywords: *Breast cancer, Tumor grade, Er, Pr, Her2/neu, Postmenopausal, premenopausal.*

Introduction

Breast cancer is the most common cancer in females and is the most killing disease in them.(1) According to these facts, it becomes important to study this disease in details and to look for factors that affect therapeutic measures and hence prognosis. Important prognostic factor in breast cancer is the patient age. Those women that are younger than 50 years have the best prognosis.(1) The survival declines after age of 50 years.(2) But women who are at age < or = 35 years (young age group in breast cancer incidence) are at the same risk of older patient(3) and even with higher risk of distant metastasis(4) as they often have higher grade tumors.(5) important prognostic measure, in breast cancer, is looking for the grade of the tumor. Cancer cells are given a grade according to how different they are from normal breast cells and how quickly they are growing. According to Bloom and Richardson grading system (6), the breast cancers were put into 3 grades. High grade tumors (grade 3) look different from normal breast cells and are usually fast growing, while low grade tumors (grade 1) look close to normal breast cells and slowly growing.An important development in treatment of breast cancers is that the detection for the presence or absence of hormone (estrogen and progesterone) receptors in the malignant cells.(7) Normal breast cells and some breast cancer cells have these receptors that attach to the hormones (estrogen and progesterone) and depend on these hormones to grow. These receptors are certain proteins. Cancers are called hormone receptors-positive or hormone receptors-negative based on whether or not they have these receptors. According to these facts the tumor is Estrogen

receptor (Er.) +ve or –ve, and Progesterone receptor (Pr.) +ve or –ve, and even positive for both or negative for both. Knowing this status is important in treatment and even prognosis. [8]About 80% of breast cancers are ER +ve.[1] The ER-ve breast cancers tend to have high grade (grade 3).[9]Generally; estrogen receptors concentration are lower in tumors of premenopausal women than in those who are postmenopausal.[10] Her2/neu (human epidermal growth factor receptor 2) is an oncogen.[11] Its over expression can be measured by immunohistochemistry (IHC) or Fluorescence in situ hybridization (FISH).[12,13] Over expression of Her2/neu is a very good predictor of response to Herceptin (a monoclonal antibody used to treat breast cancer)[1] and a predictor of response to adjuvant chemotherapy.[14] This gen indicates poor prognosis [15] and it is highly related to tumor grade.[16] Her2/neu correlates inversely with estrogen and progesterone expression.[17]According to preceding facts, a study was done on some Iraqi females with breast tumors using same parameters to make some comparison.

Material and Method

A retrospective study was performed on 101 females with breast cancers who visited the Medical City-Oncology Center during the year 2015 for sake of treatment. The data were collected from the previous records of the laboratory section of the center with the agreement of managing director. No patient name or private details were collected. A different parameters were studied (to assess behaviors of these tumors) namely, age of those patients, grades of tumors, hormone receptors status (especially for estrogen), and results of Her2/neu expression. All these records came from previous laboratory works (3 years or more before collection of data). For all these cases, a histological study using traditional paraffin embedding histotechnique and staining by routine Hematoxylin and Eosin (H & E) staining protocol for initial histological diagnosis were adopted. Then immunohistochemistry (IHC) technique was used according to College of American Pathologist (CAP) Breast Biomarkers template, [18] especially for estrogen receptors (ER). Her2/neu study was done by IHC technique initially, while some equivocal cases needed to be confirmed by (fluorescence in situ hybridization) FISH technique (a molecular cytogenetic technique) according to American Society of Clinical Oncology (ASCO) Guideline Update.[19]

Protocols followed in histotechniques (paraffin embedding)

1. Sample receipt & identification
2. Labeling with numbering
3. Fixation
4. Dehydration
5. Clearing
6. Impregnation (infiltration)
7. Section cutting
8. Staining
9. Mounting

Hematoxylin and eosin staining protocol

1. Deparafinization
2. Hydration
3. Nuclear staining (hematoxylin)
4. Cytoplasmic staining
5. Dehydration and clearing
6. Mounting

Immunohistochemistry (IHC) protocol (LSAB method)

1. Tissue preparation
2. Inactivation
3. Antigen retrieval
4. Blocking
5. Primary antibody incubation
6. Secondary antibody incubation
7. Staining

Reporting Results of Estrogen Receptor (ER) and Progesterone Receptor (PgR) Testing (according to CAP):

Results	Criteria	Comments
Positive	Immunoreactive tumor cells present (≥1%)	The percentage of immunoreactive cells may be determined by visual estimation or quantitation. Quantitation can be provided by reporting the percentage of positive cells or by a scoring system, such as the Allred score or H score.
Negative	<1% immunoreactive tumor cells present	

Reporting Results of HER2 Testing by Immunohistochemistry (IHC) according to (CAP):

Results	**Criteria**
Negative (Score 0)	No staining observed or Incomplete, faint/barely perceptible membrane staining in ≤10% of invasive tumor cells
Negative (Score 1+)	Incomplete, faint/barely perceptible membrane staining in >10% of invasive tumor cells
Equivocal (Score 2+)	Incomplete and/or weak to moderate circumferential membrane staining in >10% of invasive tumor cells or Complete, intense, circumferential membrane staining in ≤10% of invasive tumor cells
Positive (Score 3+)	Complete, intense, circumferential membrane staining in >10% of invasive tumor cells

Reporting Results of HER2 Testing by In Situ Hybridization:

Result	**Criteria**
Negative (not amplified)	Average HER2 copy number <4.0 signals/cell
Equivocal	Average HER2 copy number ≥4.0 and <6.0 signals/cell
Positive (amplified)	Average HER2 copy number ≥6.0 signals/cell

Statistical studies for those parameters, mentioned above, were done by using Chi square depending on P-value (p< 0.01 is regarded as significant).

Results

At the end of this study and according to statistical data, we had the following results.

On studying results on those patients, with ages < or = 35 years, we found that; A significant increase (P< 0.01) in high grade (grade 3) of breast tumors in those patients (table no. 1). These findings were found in 44% of them. While in those who were of older (more than 35 years); about 21% of them were with high grade.

Table No. 1: Numbers and percentages of breast tumors with high grade according to age group

No.	**Age group**	**Total no.**	**No. of low grade**	**%**	**No. of high grade**	**%**
1	< or = 35 years	9	5	56%	4	44%
2	> 35 years	92	72	79%	20	21%

We found that about 73 patients (72%) of all patients are Er+ve.

29% of Er-ve tumors were with high grade histology at the same time. The rest (71%) were with low grade histology (table no. 2)

Table No. 2: Relation between Er. status and tumor grade

Er. status	**Total number**	**High grade no. (%)**	**Low grade no. (%)**
Er. -ve cases	24	7 (29%)	17 (71%)

The number of postmenopausal women, in this study, was 34. Twenty nine of them (85%) were with Er.+ve tumors. This finding was significantly higher (P<0.001) than the 47 premenopausal women, in whom 27 cases only (57%) were with Er.+ve tumors (table no. 3).

Table No. 3: Er. status in both postmenopausal and premenopausal women

No.	Group	Total no.	Er. +ve	%	Er. –ve	%
1	Postmenopausal women	34	29	85%	5	15%
2	Premenopausal women	47	27	57%	20	43%

Eighteen of patients, in this study, were with high grade tumors. From them, we found that 15 (83%) were with Her2/neu +ve tumors. While about 71% of patients with low grade tumors, in this study, were Her2/neu +ve (table no.4). This difference was found statistically significant (P<0.01).

Table No. 4: Relation between high grade tumors and Her2\neu expression

No.	Grade	Total no.	Her2\neu +ve	%	Her2\neu -ve	%
1	High	18	15	83%	3	17%
2	Low	83	59	71%	24	29%

There is no significantly inverse relation between Er. percentage and Her2/neu expression in this study.

Discussion

The results of this study were compared to other studies, mentioned in the introduction, as those studies were regarded important international records.

In this study, the studied number of Iraqi patients was a little bit limited (101), so those results can give us information of Iraqi women with breast cancers, but it is not necessarily represent all Iraqi females.

Finding of significant increase in high grade tumors in younger age group (age < or = 35 years), in this study, looks to be similar to what others found [5]. This finding indicates bad prognostic sign in this age group (high grade means bad prognosis).

As we found that 72% of our patients were with Er +ve tumors. This finding is not significantly different from other world result [1], which means that both had same behavior regarding Er. receptors status.

According to our results; the percentage of Er –ve tumors associated with high grade histology (24%) is highly different from other's result (94%)[9] which meant that there is no relation between two parameters (association between Er. negativity and high grade histology) in this study.

The highly significant difference in Er. positivity between postmenopausal and premenopausal women (85% and 57% respectively), in the study, is similar to that in other studies [10]

Like what Tsuda et al found [16] (about correlation between histologic grade of breast tumors and Her2/neu expression), we also found the same significant correlation between these two parameters.

Our results about inverse relation between Er. percentage and Her2/neu expression, is dissimilar to what others found[17] as there was no inverse relation in this study.

Conclusion

In our conclusion; though the number of patients is limited, but most of behaviors of breast tumors in Iraqi

women, in this study, looked like to what we found in other parts of the world.

Conflict of Interest: Authors declare that they have no competing interest.

Abstract

Toxoplasma gondii is an obligate intracellular parasite of the phyla Apicomplexa. This study was measured to detect *T. gondii* infection in diabetic patients using ELISA technique. A total of 98 patients attending the clinics in Baghdad city were detected for *T. gondii* infection. Sera of ninety-eight diabetic mellitus patients were involved in this study. Their serum samples were diagnosed for anti-*T. gondii* IgG and IgM antibodies using ELISA technique in addition to the level of fasting blood sugar. Most of diabetic patients (50 patients) their levels of blood glucose were between 151-200 mg/dl while 45 patients and 3 patients had > 200 mg/dl and 150 mg/dl of blood glucose respectively, among 98 patients there were 10 positive for IgM and 32 for IgG. In conclusion, this study reveals that diabetes could increases susceptibility of *T. gondii* infection.

Keyword: *Toxoplasma gondii, Diabetes mellitus, IgM, IgG, ELISA kits.*

Introduction

Toxoplasma gondii is an obligate intracellular parasite of the phyla Apicomplexa. Felids are the only definitive host for *T. gondii*, but *T. gondii* has a wide intermediate host range and has been documented to naturally infect most warm-blooded animals including birds, rodents, and humans[(1).] Humans can also be secondary hosts for *T. gondii* and it is clearly established that congenital infections,especially early in pregnancy, can produce intracranial calcifications, mental retardation, deafness, seizures, and retinal damage[(2).] Likewise, somecases of acute adult-acquired toxoplasmosis can result in headache, fever, myalgia, lymphadenopathy and occasionally seizures[(3).]

Following ingestion of contaminated food, tachyzoites disseminate throughout the body, infect all nucleated cells, leading to production of necrotic focus surrounded by inflammation. Tachyzoites are transformed into tissue cysts resulting in life-long infection. Cellular immunity mediated by T-cells, macrophages, and activity of Type-1 cytokines (interleukin-12 [IL-12] and interferon [INF] gamma) is necessary for maintaining the quiescence of chronic *T. gondii* infection[(4)]. Anti *T. gondii* IgG antibodies start increasing after 1-2 weeks of infection and reaches peak in 6-8 weeks. They decline gradually over next 1-2 years but they can persist for life time in some cases[(5)]. Demonstration of high titers of anti-*T. gondii* IgG antibodies with high IgG avidity gives serological evidence of infection and also indicates the secondary reactivation of latent or chronic *toxoplasma* infection[(6)]. Diabetes mellitus is a group of metabolic diseases characterized by chronic hyperglycemia resulting from defects in insulin secretion, insulin action, or both. Metabolic abnormalities in carbohydrates, lipids, and proteins result from the importance of insulin as an anabolic hormone. Low levels of insulin to achieve adequate response and/or insulin resistance of target tissues, mainly skeletal muscles, adipose tissue, and to a

lesser extent, liver, at the level of insulin receptors, signal transduction system, and/or effector enzymes or genes are responsible for these metabolic abnormalities[7,8,9]. Several studies have shown that in diabetic patients, leukocyte cytotoxicity to eliminate pathogenic factors is reduced and the opsonic activity of immune system is significantly diminished; therefore, diabetic pregnant women are one of the groups susceptive to such opportunistic infections[10].

Materials and Method

Patients: A total of 98 diabetes mellitus (type 2) patients their age from 20 to >50 attending out private clinics between November 2017 to May 2018 mellitus, were examined for toxoplasmosis infection.

Blood Samples: Five ml of brachial vein blood were drawn from each person using disposable syringes. Then the blood was placed in plain tubes and allowed to clot at room temperature. They centrifuged at 3000 round per minute (rpm) for 10 minutes**.** Serum samples were divided into ependrof tubes and kept at -20 °C until using. The level of glucose (Fasting Blood Sugar) was measured use the enzymatic technique.

Enzyme Linked Immunosorbant Assay (ELISA): This assay was performed by using two kinds of ELISA kits [Bio Check Toxoplasma IgM ELISA (Bc-1087) and [Bio Check Toxoplasma IgG ELISA (Bc-1085), Europe].First for the detection of IgG and the second for the detection of IgM specific antibodies against *T. gondii* antigens in the patient's serum. The test was performed as in the manufacture instruction.

Statistical Analysis: The Statistical Analysis System- SAS (2012) program was used to detect the effect of difference factors in study parameters. T Chi-square test was used to significant compare between percentage (0.05 and 0.01 probability) in this study [11].

Results and Discusion

Sera of ninety-eight diabetic mellitus patients were involved in this study. Their serum samples were diagnosed for anti-*T. gondii* IgG and IgM antibodies using ELISA technique in addition to the level of fasting blood sugar. Table 1 highlights the information in regard to the distributions of toxoplasmosis infection among patients under study, the results revealed that patients between 20-29 years were recording the highest percentage 11(34.78%) of anti-Toxoplasma IgG, while the proportions of those between 30-39 years approaching 4(40%) for anti-Toxoplasma IgM and were the highest among the rest of age groups. Lowest percentages were 5 (15.62%) anti-Toxoplasma IgG and 2 (20%) anti-Toxoplasma IgM for the age groups30-39 and 40-49 years, respectively. There was statistically significant differences between these two antibodies (P<0.01).

Table 1. Distribution of Toxoplasmosis according to different age groups

Age (Year)	Anti-Toxoplasma IgM No of patients (%)	Anti-Toxoplasm IgG No of patients (%)
20-29	1 (10%)	11 (34.78%)
30-39	4 (40%)	5 (15.62%)
40-49	2 (20%)	8 (25.00%)
50>	3 (30%)	8 (25.00%)
Total	10	32
Chi-square	11.764 **	7.041 **

** (P<0.01).

Regarding (Table 2) that provide information in terms of diabetic disease distribution among different age groups, it is found that 15 (33.33%) patients of diabetic category of >200 mg/dl and 18(36%) patients of diabetic category of 150-200 mg/dl which is prevailed to be most abundant than diabetic category 150 mg/dl.

Table 2. Distribution of diabetes according to different age groups

Age (Year)	Number of Patients (Percentage %)		
	Level of Fasting blood sugar		
	~ 150 mg/dl	151-200 mg/dl	>200 mg/dl
20-29	0 (0.00%)	18 (36.00%)	9 (20.00%)
30-39	2 (67.67%)	10 (20.00%)	9 (20.00%)
40-49	1 (33.33%)	13 (26.00%)	15 (33.33%)
50>	0 (0.00%)	9 (18.00%)	12 (26.67%)
Total	3	50	45
Chi-square	11.740 **	7.913 **	6.178 **

** (P<0.01).

Considering (Table 3) that provides information in regard to the toxoplasmosis infection and it's relation with diabetic disease, the results showed that the highest prevalence was 19(59.37%) anti-Toxoplasma IgG and 5 (50%) anti-ToxoplasmaIgM among patients of more than 200mg/dl diabetic category, while the lowest percent was 0 (0.00%) anti-Toxoplasma IgG and 1 (10%) anti-ToxoplasmaIgM among patients of ~150 mg/dl diabetic category. There was statistically significant differences between the groups of glucose level (*P*<0.01).

Table 3. Distribution of diabetes and Toxoplasmosis

Glucose Levels (mg/dl)	IgM No (%)	IgG No (%)
~ 150	1 (10%)	0 (0.00%)
151-200	4 (40%)	13 (40.63%)
>200	5 (50%)	19(59.37%)
Total	10	32
Chi-square	10.966 **	11.927 **

** (P<0.01).

Discussion

In the current study, most diabetic patients (50 patients) their level of blood glucose were between 151-200 mg/dl while 45 patients and 3 patients had > 200 mg/dl and 150 mg/dl of blood glucose respectively. Large proportion of the Iraqi population is at risk of developing type 2 diabetes mellitus within the next years, that may be attributed to the high incidence rates of family history of diabetes, obesity, lifestyle of unhealthy diet and physical inactivity [12,13]. Our study aimed to explore the serum levels of anti-Toxoplasma toxoplasma antibodies in diabetic patients. Our study revealed that among 98 patients there were 10 positive for IgM and 32 for IgG.

Our results are agreed with previous study that accomplished by [14] in Iran which revealed that anti-ToxoplasmaIgM and anti-Toxoplasma IgG proportions in patients with diabetic were 73 and 125 respectively among 205 patients. Another study was done by [15] in Iran also supported our study and the proportions were 3 and 47 among 110 patients for anti-Toxoplasma IgM and anti-Toxoplasma IgG respectively. The highest seroprevalence rate of anti *T. gondii* IgM and IgG antibodies was observed in the >200mg/dl diabetic category, this is in accordance with previous studies had done by [14,16].

Insulin combined with D-glucose plays a significant

role in the regulation of unicellular eukaryotes replication[17], insulin changes the growth kinetics of *T. gondii* and induces a mitogenic influence on *T. gondii* replication[18].

The role of *T. gondii* in the pathogenesis of Type 2 Diabetes mellitus remains a dilemma, that may be attributed to the inflammatory-mediated destruction of pancreatic β cells which indicates to the decrease in β-cell mass that contributes to the failure of the β cell to yield enough insulin, this lead to increase the risk of developing acute and chronic pancreatitis as well as diabetes.[19,20,21,22].

In Iran significantly high rates of anti- *T. gondii* antibodies have been reported in diabetic pregnant women[18]. Moreover, in Turkey, more than double rate of infection among patients with type I diabetes compared with healthy individuals[23]. Those results are consistent with our findings that showed the highest seroprevalence rate of anti *T. gondii* IgM and IgG antibodies was observed in the women of old age.

Conclusion

In conclusion, this study reveals that diabetes could increases susceptibility of *T. gondii* infection. Most diabetic patients (50 patients) their level of blood glucose were between 151-200 mg/dl while 45 patients and 3 patients had > 200 mg/dl and 150 mg/dl of blood glucose respectively. Our study revealed that among 98 patients there were 10 positive for IgM and 32 for IgG.

Analysis of the Psychological Effect of Scamper Education Program and Creative Thinking among Primary Pupils

Sabeeha Hamza Dehham[1], Abd Ali Nayif Hasan[1], Issraa Ibraheem Farj[1]

[1]Asst. Prof., University of Babylon/College of Basic Education, Iraq

Abstract

Gifted students specifically, are in dire need of opportunities to develop their thinking, skills and knowledge acquisition through thinking programs that can suit their abilities, their possession of a wealth of linguistic and a wide range of information and ideas, their love for deep investigation and exploration of new things, as well as activities which are at par with their mental abilities. There were newly formulated ideation approaches, techniques and programs coming forth with cognitive affirming studies, which required directed and intuitive approaches. The aim of this study was to determine the effect of the SCAMPER Program in learning vocabulary for pupils. The participants included a total of 65 fifth grades -year pupils. According to the study results, the primary students can generate, determine, match vocabulary and put it in the appropriate position. Following the application of the SCAMPER program, the pupils generate determine, match vocabulary, that they will recycle all *karikh primary* school.

Keywords: *Psychological effect, Creative Thinking.*

Introduction

Due to the growing body of research in the last decades teaching vocabulary has created a heated debate among researchers [1]. In the center of the discussion is whether words should be taught in context or in isolation or whether incidental vocabulary learning leads to better word power compared to method where learners engage in deliberate word learning activities. SCAMPER is one of the brainstorming strategies developed by Bob Everle (1971), and the program is an extension of ideas and recommendations submitted by Alex Osborn (1953), for the generation of ideas, and making effort[2] or brainstorming during the thinking process, and the different strategies that can be used in promoting the process of thinking, and the principles upon which the generation of ideas is based on; That innovation really stem from ordering and addition of new ideas[3,4]. This program is also one of the programs through which to promote the creative levels between Students' classes, and in this program a number of questions are directed to students in a way that encourages them to get out and think outside the box, and therefore these questions are considered the driving force that allows them to acquire many different thinking skills, which will help them in improving their thinking skills and the wisdom of the program helps teachers to think in an unusual way with more flexibility [5]. The strategy is used effectively in educational settings; teachers need to follow a number of the procedures, and the basic steps that teacher should prepare a lesson plan to be able to identify the preferences through which the information will be transferred to the students,[6] and select the most important topics .It is interesting to keep students' attention as long as possible, and then the teacher sets the time to apply them. the strategy is whether the time is for explaining or whether students are working with each other in a Cooperative way [7].Objectives of the Study the present study aims at: Developing student's ability in acquiring the new vocabulary items in their textbooks and thus increasing student's vocabulary capacity. Determining student's attitudes regarding the utilization of Scamper program.

Methodology

Design of the Study The present study makes use of an experimental design to investigate theefficiency of scamper strategy on the study sample. The experimental design is an approach to research into which situations

are sat up to test a specific hypothesis or idea in which different variables can be determined [8].

Population: The population is the 5th grade students in all the primary schools in Bagdad governorate in the academic year 2018/2019.

The Sample of the Study: The sample of the present study comprises (63) students of TOOLKARAM Primary school in Bagdad Governorate. Such a sample is divided into two groups. The first group (A) is the control group, it consists of (31) students. The second group (B) is the experimental one, it consists of (32) students. After exclusion, the sample decreased to (60) students, (30) students for each group. The experimental group received the treatment based on Scamper strategy activities taught by the researcher during nine weeks in the second term of 2018/2019. The researcher herself taught the experimental and the control group during that period.

Equivalence of the Groups: The researcher is sure of the equivalence between the two groups the (experimental and the control) before getting started with the experiment. There are certain variables that affect the experiment results. These variables are as follows: Students' Age: The students' ages were calculated per months. They were calculated from the day of their birth until the day of the experiment (20 of February 2019). After using the t-test, the mean of the experiment group is (208) and that of the control group is (209), the standard deviation for the experiment group is(12.7) and that for the control group is (8.48) and the calculated t-test value is (1.092) whereas the tabulated one is (2). It was proven that there is no statistically significant difference of (0.05) under (58) degrees of freedom between the ages of the two groups. Students' Scores in the First Course: The researcher obtained the first course scores of English of the year (2018/2019) and after implementing the t-test for the two groups, the mean scores of the experimental and the control groups are (58.6) and (58.6), the standard deviations are (14.2) and (10.6) and the calculated and tabulated test value are (1.95) and (2) respectively. It turned out that there is no statistically significant difference at the level (0.05) under (58) degrees of freedom. Academic Achievement of the Parents: Academic achievement is another variable that is controlled in order to equalize the two groups. These academic achievements are literacy, primary, intermediate, preparatory and bachelor.

Controlling External Variables: 1. The sample was chosen randomly; the researcher has randomly chosen the sample and the equivalence between the two groups. 2. There is no obstacles or accidents that may affect the steps, procedures or circumstances of the experiment. 3. The absence of some students does not cause any experimental extinction because the numbers between the two groups are equal. 4. The growth factor has no effect on the dependent variable because the experiment takes a short period of time (nine weeks) [5]. The researcher uses the same instrument for both groups under the same circumstances [6]. For the sake of preventing the differences between the two groups including teaching method and the way of dealing with students, the researcher taught the two groups (experimental and control) by herself. She also has consolidated the course content which is the last four units of the textbook/English for Iraq for the 5th primary students. 7. The period of the experiment is the same for the two groups (the experiment and control). It started on (20th February, 2019) to (25th of April, 2019) for the two similar classes and under the same physical circumstances [8]. The researcher has given ten lessons a week one lesson for each group every day with close hours as shown in the following table:

Teaching Material: The researcher has taken the last four units (5, 6, 7, and 8) of the textbook/English for Iraq in the second course of (2018/2019) and has chosen the following lessons for such units: 1. Unit Five: Food and drink. (P: 58) from the textbook 2. Unit Six: in the capital city. (p:74) from the textbook 3. Unit Seven. The seasons. (P: 90) from the textbook 4. Unit Eight: The challenge. (p:106) from the textbook. Behavioral Objectives Richards & Schmidt (2010:51) define behavioral objectives as follows: "It's a statement of what a learner is expected to know or be able to do after completing all or part of an educational programmed". A behavioral objective has three characteristics: 1. it describes the goals of learning in terms of observable behavior 2. It describes the conditions under which the behavior will be expected to occur.3. It states an acceptable standard of performance. In the light of the teaching material which is the last four units (5, 6, 7, 8) of the textbook, the researcher prepared (100) behavior objectives depending on bloom's taxonomy in the learning domains including the four levels (knowledge, comprehension, application and analysis). It was shown to a panel of experts to give their opinions and to modify what the researcher had to prepare. There was an 89% approval of all the experts. The behavioral objectives were distributed to the four units of the content.

Table 1: Distribution of behavioral objectives on the units

Level Content	Knowledge	Comprehension	Application	Analysis	Total
Unit 5	11	4	4	4	23
Unit 6	9	9	5	4	27
Unit 7	10	8	5	3	26
Unit 8	5	9	6	4	24
Total	**35**	**30**	**20**	**15**	**100**

Instruction of the Study: The experiment began on the (20th of February, 2019) for nine weeks and lasted to the (25th of April, 2019). The researcher taught the two groups in order to control the teacher variable. SCAMPER strategy was used with the experimental group and the regular teaching with no additional activities for the control group. Each group was exposed to an achievement of pre and post-test.

The Experimental group: in this group the researcher has prepared 30 lesson plans and 100 behavioral objectives according to SCAMPER teaching strategy following 7 Steps such as substitute. Combine, Adapt, Modify, put to other use, Eliminate, Reverse. These steps are as follows: Preparing the students to use Scamper by explaining that they will be taught how to improve their English vocabulary. Attract student 'attention of the most important rules and vocabularies students have previously studied in order to refresh their minds and make them ready for the next activities. Starting by using the first stage "substitute

The Study Instrument: Every experimental study needs a proper instrument through which the researcher collects data: In this study, the following instruments are used: Combee (2007) defines Achievement test as a determiner to what a student has learned about stated course outcomes. It is administered at mid- and end point of the semester or academic year. The content is based on the specific course content or on the course objectives. It is cumulative, covering material drawn from an entire course or semester. The researcher constructed a vocabulary comprehension test for the pre and post-test for both groups. The aim of this procedure is to compare the scores of the pre and post-test to show the impact of using Scamper strategy on the students' achievement.

Pre-Test Description: Richards & Schmidt (2010) define pre-test as the test that is given before learning occurs. The comprehension pre-test for this experiment consists of 5questions; the first question consists of 5 items. The second question consists of 5 items. The third question consists of 5 items.

The Post-test: The researcher post-tested the students of both groups on the 25th of April, 2019. The same procedures of the pre-test were followed as well as the validity, reliability, pilot study, scoring scheme, item facility and item discrimination.

Statistical Tools: The researcher used some statistical tools in this study. They are as follows: 1. T-test 2. Chi-square 3. Item facility and Item discrimination 4. Pearson Correlation Coefficient

Results and Discussion

In order to investigate the aim of this study which is the "The efficiency of Scamper's program on Iraqi EFL 5th primary Pupils' learning vocabulary. improve the students' performance and examine the hypotheses, the data obtained from the pre- and post-test of the experimental and control groups are statistically analyzed. This analysis proves if there is any significant difference between the two groups in the pre- and post-test. Comparison of the Experimental and Control Groups in the post-test scores According to the results obtained from the post-test of both groups it is shown that the mean scores of the EG is (17.0) and that of the CG is (14.5). This means that the scores of the experimental group is higher than that of the control one in listening comprehension performance which is successful. Using the t-test formula, for the two independent samples, is not clear to show the significant difference between the two groups. But it is found that the computed t-value (4.15) is higher than the tabulated one (2) at (0.05) level of significance under (58) degrees of freedom. Analyzing the Hypotheses: Analyzing the Results of the First Hypothesis There is no statistically

significant difference between the mean ages of the students in the experimental and control groups. The two groups are equivalent in the age variable, so the hypothesis is accepted. Analyzing the Results of the Second Hypothesis: The second hypothesis is "There is a statistically significant difference of 0.05 between the mean scores of the students of the experimental and the control groups concerning the first course scores.". The second hypothesis is accepted for there is no significant difference at the 0.05 level in the scores of the groups (experimental and control). Analyzing the Results of the Third Hypothesis The third hypothesis is "There is a statistically significant difference of 0.05 between the mean scores of students of the experimental and control groups in the listening comprehension post-test results in favor of the experimental group" previously which means that this hypothesis is accepted. Discussion Regarding the statistics of data of the present study, the results show that the strategy adopted in this experiment had proved that there is an improvement in the students 'English vocabulary where the students' achievement in the post-test in the experimental group is better than that of the control group. The mean scores are (17.0) for the experimental group, and (14.5) for the control one. The results of using the reciprocal listening activities in the present study are as follows: 1. the researcher used modern ways in teaching such as;(audio, Data-show, laptop and PowerPoint etc.). These techniques help the class make more fun and interesting [2]. The researcher adopted logical steps in introducing the lesson, where he starts with warming up in order to stimulate students to start a new lesson and also for the purpose of reviewing the previous lesson information, then she used scamper strategy step by step such as (substitute, combine . Adapt, Modify, put to other use, eliminate and Reverse) [3]. Scamper strategy is effective and important strategy in learning vocabulary for it helps students understand the study material. With the help of this strategy of teaching, the student can recall any piece of information that they learned in previous lessons.

Conclusion

According to the results, some conclusions have been drawn: The Scamper strategy has proved to be effective in the students' learning vocabulary. Using these 7strategy (substitute, combine. Adapt, Modify, put to other use, eliminate and Reverse) helps students increase their energy and enjoyment in the class. Scamper strategy play an important role in stimulating the basic senses and makes the learning more active and effective. It also increases the students' knowledge of phonology, grammar and vocabulary. The use of modern strategy during class encourages students to develop their English vocabulary. It also enhances their knowledge and understanding as it appears in their performance in the post-test.

The Impact of Think-pair-share Strategy and Psychological Effect for Fifth Preparatory Students

Ula Hisham Abd-alazeez[1], Muna M.A. Al-Khateeb[1], Ma'moon Sami Salah[1]

[1]Asst. Prof., College of Basic Education/University of Babylon, Iraq

Abstract

The observation protocol contains codes related to student behavior in the different phases of the Think-Pair-Share activity. Two trained observers observed samples of students during thirteen Think-Pair-Share activities across ten weeks of the semester, and coded their behavior using the protocol. Analysis of observation data showed that our implementation of Think-Pair-Share results in 83% of the students displaying engaged behaviors for a majority of the time. We analyzed patterns of student behavior in the different phases of TPS and the transition of their behavior from one phase to the next. The sample consisted of (92) students of the Fifth grade in Al-thawra preparatory school for female, they distributed randomly, (46) students in the experimental group and (46) students of the control group. The two groups were equalized in the following variables: age, IQ, and linguistic ability test, parents' education. The experiment lasted over 8 weeks, and at the end of the experiment the post test was applied After the results were analyzed, the results showed that the students of the experimental group who studied by using think-pair-share strategy were superior to the control group who studied the conventional method in the development of the achievement of the students.

Keywords: *Investigating, think-paire-share Strategy, EFL students.*

Introduction

Basically, Think-Pair-share (henceforth TPS) has been utilised as a teaching strategy in the educational world[1]. TPS is found in not only English teaching but also in many other areas of teaching such as mathematics, or social science teaching. TPS challenges the students to be more enthusiastic, proactive and more lively in the learning process. This is because TPS is student-oriented with teachers functioning as a facilitator where their role is directing, facilitating, and guiding students[2]. The foundation of TPS is collaborative learning techniques [3] in which exchanging information, ideas, and opinions is open and stimulating. Also, discussions lie at the heart of collaborative learning. In that way it is clear that discussions are the prototype teaching method to make the students posses eagerness or enthusiasm in learning process and at once they are one of the most valuable tools in teachers' repertoire. TPS was developed by Lyman in 1978 [4] for the first time. It has been observed through varied research on educational teaching from the basic to the university levels. This strategy is a part of cooperative learning. To make a case for collaborative learning seems easy. Research on learning in small groups exists than on any other instructional method, including lecturing. While most of this is credible and positive, it is dominated by research and investigation in higher education [5]. There is a lot of research that involve some structures of cooperative learning: TPS, three-step-interview, round-robin-brainstorming, three-minutes-review, numbered heads, think-pair-solo, circle the sage and partners. TPS consists of some steps. Kagan (2009) states there are five steps in TPS. They are: Organizing students into pairs by dividing the students into pairs randomly. The purpose of choosing randomly is to avoid the gap between high students and low students. Posing the topic or a question is posing a question or a topic to the students. This question should be in general and has many kinds of answers. It makes the students think deeper and deeper, and they can give their opinions in many aspects. Giving time to students to think meanwhile the teacher should give the students several minutes to think an answer of the question given before. They should analyze the question and use their critical thinking to answer the question. [4] Asking students

to discuss with their partner and share their thinking. In this section, each students share his or her own answer to his or her partner in pairs. They share their thinking and discuss each other to find the best answer.[7] Calling on a few students to share their ideas with the rest of the class. This last step is calling some students to share their ideas with the rest of the class. Some students give their answer, and the others can give their opinion or other answers. This improves not only the student's knowledge but also their confidence. In TPS, the teacher poses a challenging or open ended question and gives students a half to one minute to think about question. This is important because it gives a chance to start to formulate answers by retrieving information from their long term memory. Then, the students work in pairs in collaboration or with a neighbor sitting nearby and discuss their ideas about the question for several minutes. The teacher may wish to always have students pair with non collaboration group member expose them to more learning style. TPS gives all students the opportunity to discuss their idea. This is important because students start to construct their knowledge in this discussion and also to find out what they do not know. This active process is not normally available to them during traditional lectures. After several minutes, the teacher solicits students or takes classroom "vote". Students are much more willing to respond after they have a chance to discussing their ideas with a classmate because if the answer is wrong, the embarrassment is shared. Also, the response received are often more intellectually concise since students have a chance to reflect their ideas. TPS also enhances the student's oral communication skills as they discuss their ideas with the one another. This short "intermission" can also provide the teacher with a timely opportunity to mentally go over the next concept to be discussing. One variation of this structure is to skip the whole-class discussion. Another variation is to have students write down their thoughts on note card and collect them. This gives the teacher an opportunity to see whether there are problems in comprehension.

Methodology

The following statistical procedures which followed by the researcher in order to reach the aim of the study and prove its hypothesis. The following procedures are:

1. Selecting the experimental design.
2. Selecting the population and sample and Equalizing the sample
3. Controlling extraneous factors.
4. Applying the experiment.
5. Designing and administering tests. 6. Analyzing the data statistically.

Experimental Design: The experimental design includes one independent variable (think-paire-share strategy) and a dependent variable (the test scores), thus the experimental design was adopted on two equivalent groups one experimental and the other is controlled

Population and Sampling: The population of the presented study is represented by the fifth-grade preparatory school students in the province of Hilla for the educational year (2018-2019). Al -thawra preparatory school for female located at the core of the province was chosen to represent both samples the control and the experimental one, and we randomly selected class (A, 46 students) to represent the experimental set that received think-paire-share strategy based instruction and class (B, 46 students) to represent the control set which received conventional way of teaching.

Samples Equivalence: The researcher conducted a statistical equivalence between the experimental and control sets in some variables that could affect the results of the experiment. The researcher has chosen the two groups randomly, the students of the research sample from similar social and economic status and study in one school. These variables are:the age measured by months, first course scores, and parents academic achievement. The statistical results demonstrated that the two sets were equivalent in all the aforementioned variables.

Extraneous Variables: Despite the fact that the researcher verified the equivalence of the two sets of research in some variables that are believed to affect the course of the experiment, she also tried to avoid the effect of some extraneous variables in the course of the experiment. Some of these variables and how to control them are as follows: Accidents associated with the experiment. There were no accidents during the execution of the experiment. No students left the school or got transported to another one. The sample was chosen intentionally and the two sets were equalized accordingly. The maturity factor: Since the duration of the experiment was unified between the two research groups As well as the age for students in the two groups so all the growth that occurred will be unified between all the students because they are on the same level, so this factor did not have an impact on the research,

the impact of experimental procedures: the researcher worked to reduce the impact of experimental procedures that can affect the dependent variable during the course of the experiment [10].

Preparing the Material

The teaching materials that were used in conducting the experiment were represented by the English for Iraq syllabus and the content that was taught during the second course of the educational year (2018-2019) was set to be from (Unit 6- Unit9). In which the researcher set a number of behavioral objectives to be expected from the test sample, as for the lesson plans the researcher prepared a total of (30)lesson plan for each sample set based on the second intermediate grade book (English for Iraq).

Research Instrument:

- **Pilot study testing:** The researcher chose the students of one school that is located near the main school on which the experiment was conducted. The school was Tulaytula preparatory school for female on (40) student from this school. The test items were statistically analyzed and found that the item difficulty ranged from (0.75-0.30) by which the test items are considered valid in difficulty. The item discrimination ranged from (0.72- 0.31) which is accepted also.
- **Conducting the test**

  * The Pre-test Final Administration

Both students of the experimental and control groups were pre-tested on the 20th of February 2019. This pre-test aims at comparing the scores of the students' achievement in the pre-test with those in the post-test. As a result, the researcher tested and scored the sample of the study.

***The Post-test**

Students of both groups (the experimental and control ones) were post-tested on the 20th of April 2019. The same pre-test procedures were followed in conducting the post-test, namely scoring scheme, validity, pilot study, item difficulty, item discrimination, and reliability. It is worth mentioning that the post- test also was seen by a jury of fifteen specialists in linguistics and TEFL methodology

Results and Discusion

A t-test formula for independent samples was used to compare the mean scores of the EG and CG on the posttest. As shown in Table 1 the mean score of the CG is 36.239; whereas the mean score of the EG is 53.587. The calculated t-value is 4.668 and the tabulated value is 1.98 at 0.05 level of significance and 90 degrees of freedom. This indicates that there is a statistically significant difference between both groups, i.e., the achievement of the EG who were taught by think-paire – share strategy is higher than that of the CG who were taught by the convectional way . This indicates that think-paire – share strategy is more effective than the traditional way. Therefore, the aim of the study is fulfilled and the null hypothesis is rejected. The alternative hypothesis should read: There is a statistically significant difference between the means of the achievement scores of the students who are taught by the traditional method, and those who are taught by using think-paire-strategy in favour of the EG.

Table 1. Comparison between EG and CG on the Posttest

Group	No.	M	SD	df	T-value	
					Calculated	Tabulated
EG	46	53.587	14.387	90	4.668	1.98
CG	46	36.239	20.694			

Conclusion

The use of TPS motivates students in the classroom, but it is used when necessary. Whenthe pair working is used the classroom, learners are motivated to develop their oral skills. The use of TPS does not always enhance the development of classroom interaction and interactional skills. In fact, the lack of use of this technique seems to reduce the progress rate. The use of pair working

in the classroom developed the classroom interaction. This can be helpful for the learners to be active and take opportunities to develop their interactional skills and resources. According to (Runmei Yu,2008)," classroom interaction take the role of collaborative learning, which means that interactional skills development on the different classroom activities".

Psychological Factors Affecting on Performance in Speaking Skill

Yasser Habib Samin[1], Sabeeha Hamza Dehham[1], Nadia Ali Akbar[1]

[1]University of Babylon–College of Basic Education, Department of Higher Studies, Iraq

Abstract

This article is aimed to investigate psychological barriers faced by Indonesian students which affect their speaking performance. Moreover, as this research is a qualitative study, direct observation is done to capture all of phenomenon happened in the speaking class in natural setting. The study adopted a pre-test treatment-post-test design. It is hypothesized that there is no significant difference between the mean score of the students' performance who are taught by the Task-based language teaching and that of the students taught by recommended method from the ministry of education. The test results were analyzed statistically, and it was found out that the achievement of the subjects of the experimental group was better than that of the subjects of the control group. Future studies could very well expand and support the findings of this study or yield different results.

Keywords: *Psychological Factors, Performance, Skill*

Introduction

Most of the foreign language learners prefer learning speaking more than other skills. Many language learners, as Hadley (2003), consider speaking skill as the main goal of learning the language. People who can speak a language are those who are familiar and know that language[1-3]. The development of speaking skill as a classroom goal is highly emphasized in teaching English as a foreign language in Iraqi intermediate and secondary schools. Salih (1998)[14] states that "It is a common experience of the teachers of English in Iraq that students at the secondary stage are very poor and hesitant when it comes to participation in speaking, which can be considered a valid measure for learners of oral proficiency". Hence, it requires the mastery of communicative competence to develop this skill. Richards (2002)[11] state that there are some features and factors which make learning speaking the most difficult skill to be achieved by learners. Such difficulty should be tended to utilize reasonable and suitable method and techniques that would open doors to the improvement and development of the learner's oral skills. Since the development of speaking as a skill is fundamental in language teaching, efforts should be concentrated to find new means and techniques for improving this skill. Starting from this point of view, [2] discusses that students may learn the language if they are thinking about a non-linguistic problem than if they were concentrating on particular language forms. Having the above discussions at hand[5,6] state a new shift seemed to be required to satisfy such requirements. To react to such requests, for example giving ideal conditions to students to improve their speaking ability according to what effective communication or meaningful communication' requires, Task-Based language teaching can be the answer for the absence of exposure to authentic English. Task-Based language teaching gives the students[8] an opportunity to use English by practicing effective and different activities in real-world tasks. The emergence of TBLT as a somewhat supported teaching method recently has won notable increasing popularity in learning a foreign and second language and it has been suggested as a path forward in English learning and teaching[7]. Therefore, the researcher utilizes this approach which depends on the use of tasks as the core unit of planning and instruction in language teaching.

Statement of the Problem: English is considered as the most demanded and important language in the world because it is used for the purpose of technology, education, trade traveling, tourism, and communication

among nations. Nunan (2006) confirms that in the course of recent decades, there is a notable increase in the number of people who speak English as a foreign language or second language around the world. Despite the importance of learning the English language, learning speaking in a2L or a foreign language and, in general, is considered one of the most challenge able and difficult aspects of language learning. Rivers and Temperley (1978) mention that how much students are well trained in using 2L or foreign language structure they face difficulties and sometimes find themselves completely at a loss in speaking the target language. Iraqi students are not out of this rule and always face difficulty with the English language. This can be seen in their results and achievement in the matriculation examination; their grades, unfortunately, are very low in English subject, especially in speaking English. There are many reasons for this failure. One of the most common reasons is that Iraqi students usually are in permanent hesitation to speak English because of their problems using fluent and accurate English language. The other problem lies in using teaching techniques and the method followed in teaching speaking at schools, which neglect giving chance to students for interaction through English. Thus, this study is an attempt to find out and suggest another suitable way of teaching speaking, i.e. the Task-Based Language Teaching.

Methodology

Includes a presentation of the procedures used to achieve the objectives of the study, starting from selecting the population and samples, neutralizing the variables of both samples, designing the instruments and tools of the study, conducting the experiment and analyzing the results.

Experimental Research Design: The researcher used the "Experimental-Control Group Design[9]. The experimental design contains one independent variable (Task-Based Approach) and a dependent variable (the test scores), thus the experimental design was adopted on two equivalent groups one experimental, i.e., the group which the task-based method will be applied to. and the other is controlled, i.e., the group which the traditional method will be applied to.

1.	E.G.	Pre-test	Independent Variable	Post-test
2.	C.G.	Pre-test	----------	Post-test

Population and Sampling: The population of the presented study is represented by the fifth-grade preparatory school students in the province of Kirkuk for the educational year (2018-2019). Al-Shahid Nazhan Al-Juburi preparatory school located at the centre of the province was chosen to represent both samples the control and the experimental one, which the researcher randomly selected class (A, 40 students) to represent the experimental group that received Task-Based instruction and class (B,38 students) to represent the control group which received recommended teaching method by Iraqi ministry of education.

Equivalence of Subjects: The researcher selected the students of the study randomly from one school with similar social and economic status. Both groups (EG and the CG) are equalized by controlling the following variables which possibly affect the experiment results:

The age of both groups is measured by months, parent's academic achievement first-course scores. The statistical results demonstrated that the two groups were equivalent in all the mentioned variables above.

Extraneous Variables Equivalence: Cohen et al. (2000) state that one of the most common factors that may affect the dependent variable in any experiment is 'Extraneous Variables'. The researcher tried to avoid such factors in the course of the experiment. We can mention to some of these variables and the way that can be controlled as follows:

1. Accidents related to experiment. The experiment conducted without any accidents like leaving students the school or transporting to another.
2. Maturation
3. Experimental Mortality
4. History
5. Selection Bias

Preparing the Material

The researcher in conducting the experiment depended on materials taken from book English for Iraq during the second course of the educational year (2018-2019) including (Unit 5-Unit 8). The researcher taught all sections and lessons in spite of speaking sections which was the subject of the study. Hence, the researcher conducted the experiment for the whole course as a teacher.

Instruction Period: The experiment started on the 24th of February 2019 for nine weeks and ended on the 5th of May 2019. The experiment conducted by the researcher himself and taught both EG and CG five lessons per week.

Pilot Study Testing: The pilot administration of the test is carried out so as to help the researcher to: check the clarity of the items of the test; and the average time needed for answering the questions. In addition to this, it is used to check the reliability of the test and the practicality of the test in general. The researcher randomly selected (40) students out of the total number (80) students, The school (Al-Shahid Hashim) was located in the center of the province of Kirkuk.

The Control Group: In this group, the researcher has used the recommended method and techniques by the Iraqi ministry of education and followed the lesson plans, steps, and guidelines mentioned in "English for Iraq" teacher's book for 5th preparatory school students.

The Experimental Group:

Preparation: The researcher prepares in advance the tasks that he is going to use in accordance with the materials to be taught and the learners' cognitive abilities.

Presentation: The following procedures are followed in teaching speaking, according to "TBLT". The lesson is divided into three stages: pre-task, task cycle, and post-task (feedback).

Pre-task stage (3-4 min)

1. The teacher will introduce and define the topic of 'My kind of food'.
2. The teacher will use activities to help students learn new words and phrase about food, such as delicious, fresh, healthy, unhealthy, spicy, tasty, grilled, flavor, olive oil, cereal, energy. This will be done by using different instructional techniques:
   (a) Guiding students to use all types of clues found in the text in order to guess the meanings of new lexemes.
   (b) Teaching pronunciation of new lexical items.
   (c) Using visual aids, realia, and stickers to explain vocabulary items about food and drinks
3. Ensuring that the students write new words and phrases in their notebooks in order to study them at home.
4. The teacher will divide the students into groups and choose a reporter, timekeeper, motivator, and monitor for each group. The timekeeper will ensure that the group is working within the time limit, whereas motivator should encourage group members to move forward and achieve the task. The monitor can help members by gathering information and giving feedback on group interactions. The reporter will represent the group in talking about the task in the task cycle phase.
5. The teacher will ensure that the students understand task instructions.

While-task phase (Task cycle) (2 min): Each group is given pictures of food and drinks. In groups, the students will find the name of given pictures and discuss the benefit and harm of that food and drinks.

Planning (8-10 min):

- The students will prepare a report about the pictures to the class, how they did the task and what they discovered.
- During this phase, the teacher walks around, helps them if they need it and notes down any language points to be highlighted later.
- Then the teacher will help the students to rehearse oral reports.

Report (8-10 min):

- The students present their spoken reports about the pictures to the class.
- The teacher will act as a chairperson, selecting which group's reporter will speak next. He may give brief feedback on content and form.

Post-task phase (language focus) (10-15 min)

Analysis:

- The teacher writes on the board five good phrases used by the students during the task and five incorrect phrases/sentences from the task without the word that caused the problem.
- Students discuss the meaning and negotiate how to correct the wrong expressions.
- The teacher reviews the analysis, possibly writing the language, such as categorizing words according

to relevant concepts, on the board. Students may take notes.

Practice:

- The teacher may use a memory challenge game based on partially erased examples already found on the board, and then ask the students to remember these examples. For example, deleting the name of food and drinks found on the board, and then ask the student to remember them from descriptions.
- Together with the students, the teacher will assign the best group's report, and reward the best group by sticking their report on the wall.

The validity of the Tests: Validity has to do with how well a test actually measures what it is intended to measure.[5]

In this study, the oral test measures the performance of fifth preparatory students in speaking skills, i.e., their ability to speak in real-life situations and to measure the behavioral objectives of the elements of both: communicative competence components and the linguistic competence components.

(a) Content validity: Which is "based on the degree to which a test adequately and sufficiently measures the particular skills or behavior it sets out to measure" (Richards et al 1985:61).It is concerned with the relationship between test or examination content and detailed curriculum aim. In the construction of the speaking test the materials of the test items are based on the materials of the "English for Iraq" (unit 5-8).

(b) Face validity: Which is "the degree to which a test appears to measure the knowledge or abilities it claims to measure, it is based on the subjective judgment of an observer" Richards et al (1985), i.e., how the test items look to the examiners, test administrators, and educators. To check whether the test items are suitable and practical or not, the test has been exposed to a jury of experts for evaluation. The jurors are asked to modify, add, or change anything they do not find appropriate in the oral test. The jurors have agreed that the test items are appropriate to measure the purpose they are designed for, except for some minor recommendations and modifications, which have been taken into consideration.

Results and Discusion

The statistical analysis of the results indicates that the mean value of the experimental group is found to be (37.510), and it is higher than the mean value of the control group, in the post-test, which is found to be (32.110). This means that the achievement of the students of the experimental group is significantly higher than that of the control group on total scores of the post-test. This indicates that "TBLT", which is used to teach speaking skill for the experimental group is more useful and more favorable to learning than the recommended method by the Iraqi ministry of education.

Table 1. T-test results for two independent samples to identify the significance of the statistical differences between the two groups on the post-test

Group	N	Mean	SD	t-value		Level of significance
				Computed	Tabulated	
CG	38	32.110	6.581	3.117	2.000	0.05
EG	40	37.510	8.847			

The following points have been made on the basis of the findings indicated in: TBLT can better improve the students' interaction with the teacher and other students. Hence, there is a notable improvement in students' participation throughout group work. TBLT can increase students' opportunities to speak English during the lesson and provide the potential benefits of student-student interaction. Through the interaction students elicit opinion and information from each other and teacher The given tasks make them work together in groups and feel responsibility for tasks fulfill. TBLT encourages students' practice target language receptivity as a result of given various tasks. The students' reaction to the tasks used during the study was very positive, it showed that they were receptive to the idea of "Task Achievement."

Conclusion

The study adopted a pre-test treatment- post-test design. It is hypothesized that there is no significant difference between the mean score of the students' performance who are taught by the Task-based language teaching and that of the students taught by recommended method from the ministry of education. The test results were analyzed statistically, and it was found out that the achievement of the subjects of the experimental group was better than that of the subjects of the control group. Future studies could very well expand and support the findings of this study or yield different results.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the University of Babylon – College of Basic Education, Department of Higher Studies and all experiments were carried out in accordance with approved guidelines.

The Impact of Psychological Skills and the Strategy of Consensus on Self-Confidence Positive and Negative Affects among Fifth Graders

Hanin Hamid Rashid Al Rajhi[1], Mohammad Kazem Mintoub Al Hamdani[1], Samah Ibrahim Shamki[1]

[1]University of Babylon/Faculty of Basic Education, Iraq

Abstract

The aim of the study is to know the effect of the strategy of consensus on location determination in the achievement and self-confidence of fifth grade students in geography. The experimental approach was adopted as the appropriate method for the research procedures and the research community consisted of secondary and middle schools in Babil governorate, Two of which were (Mahaweel Preparatory School for Girls and Al-Najat Girls' Preparatory School) to be a sample of the research. The experiment was applied in two groups: the first was an experimental group studied. The results showed that the two groups were statistically equivalent, and the researcher used the appropriate statistical means to conduct the research (the independent testing of two independent samples, The coefficient of discrimination, and the effectiveness of the alternatives and the equation Alvakronbach equation size effect)The results showed the superiority of the experimental group's female students in the control group in the achievement test and the self-confidence measure, that is, there is a difference of statistical significance at the level of significance (0,05) and for the benefit of the experimental group.

Keywords: *strategy of consensus on location, achievement, self-confidence.*

Introduction

Today, the world is witnessing a tremendous scientific and technological development in the fields of contemporary life. This scientific development is a standard that is measured by the progress and development of nations and the progress and development of any nation is related to the scientific and technological development achieved by these nations[1]. The process of education has become a social and economic investment tool related to the needs and requirements of society. Therefore, education is multi-faceted for the individual and society and is used as a means to achieve the goals of society[2]. Perhaps the main goal of education is change in behavior, but this change involves a specific goal, namely the individual. Many human societies have given great importance to education because it is the goal they seek to achieve from teaching. Although education is of great importance and has fixed characteristics[3], it is always changing. Education in any country should change to fit the nature and circumstances of these countries[4]. The curriculum is a means of education that includes all the experiences that are given to the student from inside and outside the school. It also constitutes a basis in shaping the life of the individual and society and preparing generations capable of keeping up with the progress of civilization and keeping pace with scientific development. Ability to think properly[5], which includes analysis, criticism, reasoning and evaluation in the stages of the educational process, all of which passes through the student. The social materials have an important place in the curricula of the different stages of study because they have an important and effective effect in preparing the students for their academic and professional future and making them useful individuals in society. The teaching of geography feels that the Arab world is a single country integrated geographically and the current borders between its countries are artificial borders. The study deals with the relations between the institutions and organizations involved in the society and their relations with the environment in which they live, as well as their relations with their cultural heritage and contemporary cultural developments and changes. This

strategy gives each student the opportunity to think and record their ideas as well as to have the opportunity to learn from each other in a small collaborative[6] discussion group that leads to a higher level of learner achievement. The main goal of this strategy is to allow each student to think in a way that makes the learner self-reliant, hears his voice, identifies and discovers. Self-confidence is one of the basic personality traits that begin to form since the birth of the individual and are closely related to the individual's psychological and social adaptation and are entirely dependent on his mental, psychological and social components [7]. And self-confidence and success are two sides of the same coin We cannot mention success. We cannot emphasize that this successful man is characterized by his own confidence. Nor can we say there is a failed and confident person. Self-confidence is the first reason for success in life. The teaching of most of the subjects, including social and especially geography in our schools, depends mainly on the traditional method, which focus on memorizing and memorizing the information.

Methodology

Research Methodology and Procedures: This chapter will include an explanation of the research methodology and procedures. It includes the choice of experimental design and the selection of the research community and its design as well as the procedures of parity between the two research groups (experimental and control)And identify the necessary statistical means as follows:

First: the experimental design of the research: includes an independent variable (the strategy of consensus on the location determination) and (the normal method) and the two variables of achievement and self-confidence. Therefore, the researcher used experimental design with partial control of two equal groups, one experimental and the other control table (1) illustrates this:

Table 1. Experimental design of the research

The Group	Independent Variable	The Dependent Variable	Search Tools
Experimental	The strategy of consensus on location determination	1. Collection 2. Self-confidence	1. Collection test 2. Self-confidence test
Control	-----		

Second: **The research community and its model**: The current research community represents the students of the preparatory stage, all of them in the secondary schools and secondary schools of the General Directorate of Education in the province of Babil (Mahaweel district) for the academic year 2018-2019., The researcher chose the two schools (Mahaweel Preparatory School for girls and junior high school for girls) in the district of Mahaweel and in the random drawing method chose Mahaweel Preparatory School for girls to represent the experimental group and the number of female students (40) students, which will study according to (strategy of consensus on the location) (37) students who will study their students according to the usual method.

Table 2. Distribution of female students before and after exclusion in the experimental and control groups

The Group	Division	Number of female students before exclusion	Number of female students	Number of female students after exclusion
Experimental	B	40	4	36
Control	A	37	2	35
Total	2	77	6	71

Thirdly: The equivalence of the two research groups: Before starting the actual teaching in the experiment, the researcher made sure to achieve equivalence in some variables, which can affect the two dependent variables. In order to guarantee this, the students of the two groups were rewarded in a number of variables. Calculated by Months, Educational Achievement of Parents, Grade of Students in Geography for the First Semester of the Academic Year (2018 - 2019), Danilez Intelligence Test of Previous Information in Geography and Self-Confidence Scale (Table 3).

Table 3. The arithmetic mean, the standard deviation, and the two values of the variables (age of time calculated in months, first grade grades, IQ test and SBI) for the two research groups

Statistical significance level	The value of substrate		The degree of freedom	Standard deviation	Average arithmetic	Sample size	The group	Variable
	Table	The calculated						
Not statistically significant	2.000	0.552	69	6.04	200.42	36	Experimental	Age calculated in months
				5.99	199.63	35	Control	
		0.058		10.05	64.11	36	Experimental	First semester grades
				13.98	63.94	35	Control	
		0.224		4.25	16.19	36	Experimental	Test scores of previous information
				5.17	15.94	35	Control	
		0.345		7.52	26.47	36	Experimental	Test for intelligence (Danlys)
				7.47	27.09	35	Control	
		0.180		23.16	109.03	36	Experimental	Self-confidence scale
				20.71	108.09	35	Control	

Fourthly : Adjusting Exotic Variables: In addition to the above measures of statistical equivalence between experimental and control groups, the researcher attempted to avoid the effect of some internal variables (non-experimental) in the process of the experiment, which increases confidence in the internal credibility of the experiment and then in the results, Sample, associated accidents, experimental extinction, maturation processes, measurement instruments, experimental procedures).

Fifth: Preparing the research requirements: The research requirements are the basic elements on which the research is based and according to which the research procedures are implemented. These requirements are as follows:

1. **The scientific material (content):** The researcher identified the scientific material to be taught to the students of the research groups during the period of the experiment (the second semester) of the academic year (2018-2019). The scientific article included the last three chapters (fourth, fifth and sixth) Of the natural geography book to be taught for the fifth grade literary.
2. **Formulation of Behavioral Goals:** The researcher formulated (120) observable behavioral goals covering the six levels of Bloom's knowledge-based classification (knowledge, understanding, application, analysis, synthesis, and evaluation). She presented a group of experts and specialists in geography, Educational and Psychological, Table (4) illustrates this

Table 4. Behavioral objectives according to the six levels of knowledge of the country and according to their distribution to the chapters

Scientific Article	Knowledge Level Levels (Behavioral Goals)						Total
	Knowledge	Understanding	Implementation	Analysis	Installation	Evaluation	
Chapter 4	18	14	4	3	2	2	43
Chapter 5	11	12	3	4	3	2	35
Chapter 6	20	9	5	3	3	2	42
Total	49	35	12	10	8	6	120

Preparation of teaching plans: The researcher prepared a set of teaching plans for the experimental and control groups in the light of the content of the three chapters (fourth, fifth and sixth) of the scientific material to be taught for the academic year (2018 - 2019). The number of teaching plans (34) (17) for the experimental group and (17) for the control group. Two of these plans were presented to a group of arbitrators, educators and teaching method to benefit from their opinions and observations for the purpose of modifying and improving the formulation of the two plans.

Sixth: The research tools (the achievement test and the self-confidence scale)

The achievement test: is defined as a measuring tool that is organized according to an organized method to determine the level of students' achievement in a given subject matter that was previously learned by answering a sample of the questions that represent the content of the subject [3]. There are several steps in which to prepare the test achievement is as follows:

Determination of the purpose of the achievement test and the number of paragraphs: The purpose of the achievement test is to measure the achievement of students in the fifth grade literary natural geography of the fifth grade literary for the three quarters (fourth, fifth and sixth) according to the objectives of the behavior that was formulated from the scientific article, (50) paragraphs distributed (40) thematic paragraph of the type of multiple choice and (10) paragraph article

Preparation of the specification table: The researcher prepared a table of specifications (the experimental map), which included the subjects studied of the natural geography of the fifth grade in the light of the behavioral objectives of the six levels in the knowledge field of the Bloom classification. Relativity and determination of the number of questions with (50) paragraphs distributed on matrix cells, and Table (5) illustrates this

Table 5. Shows the specifications table (test map)

Seasons	Number of pages	Relative importance	Test paragraphs						Total 100%
			Knowledge 41%	Understanding 29%	Implementation 10%	Analysis 8%	Installation 7%	Evaluation 5%	
P5	46	40%	8	6	2	2	1	1	20
P6	30	26%	5	4	1	1	1	1	13
P7	39	34%	7	5	2	1	1	1	17
Mg	115	100	20	15	4	4	3	3	50

Formulation of the test paragraphs: The test paragraphs that measure the six levels of the Bloom classification, which include (multi-choice, understanding, application), are used for these tests, because they have overall comprehensiveness, objectivity and flexibility, Learning outcomes, shortening time and

effort and covering a large part of the content of the course material [17], The paragraphs that measure the top three levels of knowledge from the Bloom classification (analysis, composition, and calendar) were written in the original paragraphs.

Formulation of instructions to answer the test: The researcher put instructions to answer the paragraphs of the test achievement writing the name of the student in the place allocated to them and answer the fifty paragraphs without leaving any paragraph. The answer is to draw a circle around the correct answer for multiple choice paragraphs.

Results and Discusion

The results of the study variable: The students of the experimental group, who studied according to the strategy of consensus on location, were more than the students of the control group who studied according to the usual method in the achievement test. This indicates that there is a significant difference at (0.05) The average score of students in the experimental group and the average score of the students of the control group in the natural geography collection test. This is in line with the studies that confirmed the superiority of the experimental group on the control group We note that the strategy of consensus on location has had an impact on raising the level of student achievement in geography. The effect of the test in the achievement test is (0.91) which is a large size and this explains the superiority of the experimental group to the control group.Results of the variable self-confidence: The students of the experimental group, who studied according to (strategy of consensus on the location) on the students of the control group, who studied according to the usual method in the self-confidence measure and this indicates a difference of statistical significance at the level of significance (0.05) Between the mean scores of the experimental group and the average score of the control group students in the self-confidence scale we note that the strategy of consensus on the location has had an impact on raising the level of self-confidence of students in geography, and the size of the impact in the scale (1.01) which is large size and this explains the superiority of the experimental group on the control group

Conclusions

The use of the strategy of consensus to identify the location in the teaching of geography has contributed to raising the level of academic achievement among students and revitalize their memory by retrieving the previous information and giving the correct answer. The application of the strategy of consensus to identify the location inspires students enthusiasm and vitality and promotes the spirit of cooperation among them and love to participate in the lesson and the female students self-esteem.

The Impact of Mingle Model on Students' Performance Skill

Ayoub Jamal Jumaah[1], Sura Abbas Obaid[1], Nadia Ali Akbar[1]

[1]Asst. Prof., College of Basic Education/University of Babylon, Iraq

Abstract

This study aims at investigating the effect of Mingle Model on Iraqi EFL Fifth Preparatory Students' Performance in Speaking Skill. The researcher has chosen his participants, and they are the 5th-grade students in preparatory schools for boys in Kirkuk Governorate. The numbers of the participants are (61) students and they are distributed into two groups; the control group (31) students and the experimental one (30) students. The control group was taught by means of the traditional way whereas the experimental group was taught by using Mingle model. The researcher has used a recording tool to measure the learners' performance in speaking skill. The experiment was administered during the second course of the school year 2018- 2019 and continued for nine weeks. During this period, the researcher taught both groups himself. After the administration of the posttest to the main sample and the statistical treatment of data using the t testformula for the two independent samples, the results have indicated that the mean scores of the experimental group are (75.13)whereas the mean scores of the control group are (59.00). This result has shown the effect of MingleModel on Iraqi EFL Fifth Preparatory Students' Performance in Speaking Skill.

Keywords: *Impact, Mingle, Speaking Skill.*

Introduction

Currently, talking a foreign language is considered one of the fundamental demands of today´s society issues and for its great significance it has received a large amount of focus to help the learners to obtain[1] the peaking skill but the language learners have faced many troubles in the present days which they have been considered as barriers to learning: firstly, the linguistic barriers which appear in the students' lack of vocabulary, the grammar mistakes, the pronunciation difficulties and the interference of the mother tongue [2,19]; therefore, students find difficulties to speak since they do not have enough words to express themselves, and they feel unconfident to use incorrect structures or unclear pronunciation. In fact, the requirements of this era require new method, strategies, model, and etc. in education. This information goes above the limits of time and space with its modern features in terms of size, accuracy, speed of movement, ease of storage andretrieval[3]. Moreover, the process of education and learning is developing at an increasing pace[2]and to master any language, it is important to master its components [4]. In addition to that the process of teaching English is an important and difficult task, and the role of teacher is not just for teaching only but also facilitator, involves the sub-roles of a supervisor of student's learning, also he should be as the classroom manager and sometimes as co-communicator with the learners[1]. In order that the researcher aims to apply Mingle model to find out its effect in teaching the English language especially, improving learners' performance. A mingle is an activity where a student slants a classmate, talks for a while, and then exchanges on to speak to another classmate [6]. Mingle is suggested firstly by Pollard and Hess (1997) and it is improved to a new model for teaching speaking skill. It is an activity or technique in which the students stand up and mingle with one another, and chat to people especially at a social event and various topics [16]. The unique one of a Mingle activity is that the students stand up and mingle

Corresponding Author:

e-mail: nadia.alalawi74@gmail.com

at once, in pairs or small groups, and change from one classmate to another whiles peaking, pay attention, and recording notes. Face-to-face interface with at least a few other students is the principal goal. It comes as a set of 20 cards and each card has a unique question designed specifically for the group [10]. The essential skill in learning/teaching language in classroom is speaking skill but most students find difficult to speak fluency. As speaking is not simple to be mastered by the student, the teacher requires developing their strategies in teaching speaking. Since speaking is applied in a school, the students have to learn to comprehend a text and can speak so as to use language fluency. Therefore, the teacher should enable the students to speak by using a new technique or modal to make student better speakers. In addition to that students do not have the ability to speak influency and accuracy as have been noticed that through the period of teaching many levels of learners of English language. English language speaking is a communicating process of constructing sense that includes creating and receiving information[7]. Its method and meaning are reliant on context in which it occurs involving the members themselves, their mutual experiences, the effective physical environment and the speaking objective[11]. Learning English as a Foreign Language (TEFL) has come to bemany popular throughout the last century. Educators face various kinds of complications and problems that make the course slow and relatively weak. These problems headed the teacher in a dilemma in attempting all the hardships in teaching students in order of their future. Iraq is not that far from those problems. Iraq is one of the leading countries that tried to reduce literacy and overcome the difficulties that are related to (TEFL). Consequently, UNESCO has listed Iraq as one of the fastest developing countries in the area of education. Not only has Iraq supplied its society with highly educated people, but it also supported many other neighboring countries with groups of university professors and scientists. In recent, unfortunately, the educational system of Iraq has been lowered to the worst in the region[14]. Therefore, we need a solution to this problem. Accordingly, the researcher aims to apply Mingle model as a new method in teaching the English language and the essential skill of the English language speaking skill as documented by many specialists and teachers of English language. Accordingly, the problem of the current research can be stated in the following question: what is the effect of using mingle model on Iraqi EFL fifth preparatory students' performance in speaking skill?

The Population: The population is the 5th-grade students in preparatory schools for boys in Kirkuk governorate in the academic year 2018- 2019. The sample of the present study includes (68) students of Al-Jehad preparatory school in Kirkuk Governorate. Such a sample is divided into two groups. The first group (A) which is the experimental group; it consists of (33) students while the second group (B) is the control group; which consists of (35) students. After exclusion, the sample is decreased to (61) students, (30) for the experimental group and (31) for the control one. The experimental group received the treatment based on Mingle Model taught by the researcher during eight weeks in the second term of 2018-2019. The researcher himself taught the experimental and the control group during that period of time.

The Experimental Design: The true experimental design is one where the study members are randomly distributed to experimental and control groups. In the experimental investigation the academicdeals with at least one independent variable then,controls further relevant variables, and detect the effect happening on one or extra dependent variables. An experiment typically involves a comparison of two groups [14]. In this study, the experimental group was taught speaking skill by the usage of Mingle Model learning, while the control group has taught by using the traditional method which the teacher normally teaches his classroom (different strategies and techniques).

Controlling Extraneous Factors: The dependent variable may be affected by many unrelated variables in any experiment study adds to the independent variables. These factors are; history, maturation, experimental mortality, and selection bias. So as not to contaminate the obtained results, the researcher attempts to control these extraneous variables.

Instruction: The experiment began on (24th of February, 2019) for nine weeks and ended on the (5 of May, 2019). The researcher has used two groups to determine the control of teaching variables. The researcher has used a Mingle Model to investigate the effect on students' performance in speaking skill with the experimental group and the regular teaching method with the control group, and then administered the pre-test and the posttest on the two groups.

The Control Group: The researcher has followed the steps of the lesson plan and guidelines mentioned

in "English for Iraq"/teacher's book for 5th preparatory school students in teaching this group.

The Experimental group: The researcher has prepared lessons plan and cards to cover the needs of the curriculum and the speaking skill. These cards contain different questions about different subjects as students interact in the classroom. The cards are used in mingle activity to make the situation to be communicated and studied. These cards are shared to students by the researcher to make the Mingle more effective.

Instrument: Every experimental study needs an appropriate instrument that the researcher collects data. The researcher tests speaking skill in this study[3]. For the difficulty of measuring proficiency in speaking accurately, the researcher has used the achievement test and it is an oral test.

Test Validity: Test Validity is the degree to which conclusion drawn from the outcomes of a particular assessment is suitable, expressive, and significant to the assessor's intention[12].

Content Validity: The test is designed according to the general objectives of the content in the "English for Iraq" student's book for fifth preparatory concerning the skill of speaking.

Face Validity: Face validity means the test must appear to assess what it was intended to test. Facial validity can be explained as the extent to which the test is representative of the knowledge and abilities, it presumably stresses to measure[5].

The test is displayed to jury members of teaching staff with well-known and long experience in the field of teaching English language and from different universities in Iraq in order to validate the validity: their advice has been taken into consideration and the tests have become valid within the required standards at the level of the fifth stage preparatory school.

Test Reliability According to classically test theories, every score gained via measuring instrument, the recorded scoreis combined of both a "true" score, which is unidentified and "error" in the measurement practice. The true score is basically the score that the one would have obtained if the measurement were exactly correct.[13]. Reliability is a chief concern as the psychological tests are used to measure certain attributes or behaviors. The researcher uses statistics tools to ensure the test reliability.

Administering the Experiment: The experiment started on Sunday (24th February 2019), extended for nine weeks and ended on Sunday (5th may 2019). The researcher exams the students in the pre-test as well as post-test by himself. The tests were conducted with the approval and assistance of the school administration, a number of teachers and specialists to ensure the safety of the test.

Scoring Scheme: For the test to be objective and reliable, an accurate scoring scheme should be developed for the whole test. The answers of the students in the tests are scored according to Broun's (2001) the oral proficiency scoring categories [8]. The present study is centered on students' performance in speaking skill that depends on oral production. Consequently, it is difficult to test them in a writing style. The researcher tests the students and records their answers with the recorder to be presented to the specialists and compare such scores and determine the final grade for each student.

Results and Discusion

The t test formula is used to indicate pupils score in pre-test and post-test and if there is any significant difference between pre-test and post-test scores or not. To achieve the research aims, a null hypothesis is formulated.

The results showed that the null hypothesis is rejected because there is a statistically significant difference at the level of (0.05) as it clarified in the table below:

The mean results of both groups					
	Group	**N**	**Mean**	**Std. Deviation**	**Std. Error Mean**
Pretest	Control	31	46.71	17.96	3.22
	Experimental	30	46.70	19.24	3.51
Posttest	Control	31	59.00	15.25	2.74
	Experimental	30	75.13	15.25	2.78

Major Findings and Discussion

The researcher concluded in the light of the statistical manipulation of data that Mingle Modelstrategy is a positive effect on Iraqi EFL Fifth Preparatory Students' Performance in Speaking Skill Due to these results, the researcher recommends teachers to use Mingle Model during English classes because they promote learning especially language skills. The Students' Performance in Speaking Skill can be improved; it is supported by the result of the pre-test scores that is lower than the result of the post-test score. The results also indicated that the strategy suggested and adopted by the researcher in his experiment has proved to be effective in improving the pupilspeaking skill.

Conclusion

The results of this study have been reflected a positive effect of using Mingle Model strategies on Iraqi EFL Fifth Preparatory Students' Performance in Speaking Skill. Due to these results, the researcher recommends teachers to use Mingle Model during English classes because they promote learning especially language skills.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the College of Basic Education/ University of Babylon, Iraq and all experiments were carried out in accordance with approved guidelines.

Abstract

The goal of the research is to identify the Pix strategy pecs. In the achievement of students in the fifth grade literary history. The researcher used experimental research as a method of conducting his research, which includes an independent variable (Pix strategy) Method usual, and variable follower(academic achievement), as adopted researcher experimental design The partial adjustment to adjust the variables Alp urged, and before starting the application of the experiment Cava researcher between the two sets of research to get accurate results for the following variables: (chronological age measured in months, collection Students in history material (first course grades), Dan IQ test Liz, academic achievement for parents) and when making parity between the two sets of research, the researcher numbers application plans and requirements targets and tests, and until the completion of the application of the experiment where the researcher applying his research for the two sets of search tools, and when correct answers students got a researcher on the experimental group data And then the data were processed statistically by means of a test t- test)

Introduction

The current era has witnessed a great development in all aspects of life. This development has been reflected in the field of education and teaching method, in light of the need to train the teacher to acquire modern teaching skills to facilitate the process of learning and education[1], in addition to his functions as a guide, facilitator and inspiration during Modern and unconventional method These programs require a distinctive planning of modern strategies that have proven to be effective[2] for the educational environment [3].Until the emergence in recent years of several theories of education based on a number of method and strategies used in teaching, and from these theories The constructivist theory calls for the learner to adopt his own knowledge through his direct interaction of educational attitudes and new knowledge, as he links it to his prior knowledge of the teacher's directions. The constructivist theory is contemporary educational, having received a growing interest in educational thought and teaching. In the contemporary era, the Ba'ath has shifted attention[5] to external factors to the interior, that is, within the mind of the learner, such as : his past knowledge, his motivation, his modes of thinking, and all that makes learning meaningful. [7] education seeks to build the learner to know in the cooperative society, and then benefit the learner from his peers during the work and the signs and assistance provided by the teacher and this corresponds to the goal of learning through scaffolding (Scaffolding) To reach the area of growth potential or neighboring Vijotsky knows it is the distance between the level of possible to reach the solution of the problems posed until the availability of assistance or support during the cooperation between the students themselves[8] . Traditional education views the learner as an empty vessel and the learner as the negative future of knowledge dictated by it until the education changes and becomes a consideration of the learner positively [9]. The modern education meant the learner to make article where you will not only be limited role for the transfer of knowledge, but aims to teach individuals and how they think and learn [10] that education is one of the answer and have a broad role for communities and nations and is

the mainstay of its development and Delighting and its tool The key to survival and sustainability in the wave of environmental challenges and to play a large role in the lives of developed and developing peoples . Its value has grown in the development and development of peoples and increased their ability to meet the challenges of civilization to become a strategy for all peoples[11]. The traditional teaching method used by the teacher to teach his students have obscured the role of the pupil in a significant role to undermine his inactive mentality in the classroom . Because its role is passive recipients of information . This made it difficult to absorb the material by students . This is reflected negatively on the level of scientific students and low level of academic achievement of the scientific material . For this reason, the researcher is thinking about using a modern strategy suitable for maintaining and advancing the age and mental level of students, which is the Pix strategy (pecs) Is one of the strategies of active learning and is based on collaborative groups among students and help them to demonstrate their abilities and potential and develop a spirit of cooperation among members of one group and to highlight the role of each student within his group to reach solutions and information and ideas and this leads to the activity And the role of the student to create the spirit of competition and give it the freedom to rely on themselves in the process of learning and thus lead to raise the level of academic achievement in the subject matter to become a positive and effective student in the educational process .

Methodology

It includes the research procedures to achieve and complete the objectives starting with the methodology chosen by the researcher and experimental design and identifying the research community and the sample and the equivalence of the two research groups and prepare the research requirements and tools and the procedures of applying the experiment and know the statistical means used, which are presented as follows :**Experimental Design :** The selection of the experimental design y a partial adjustment as one of equal groups The Research Society : The research society consists of fifth grade students in the governmental day schools affiliated to the Directorate of Education of Babil province/Musayyib district for the academic year 2018-2019 . The researcher chose the junior high school for boys randomly to implement his current research experience and found that it includes two divisions, Division (A) method of random clouds to represent the experimental group and the number of students (30)students, which will study students according to the strategy of Pix (pecs) And in the same way the researcher chose randomly Division (b) to represent the control group and the number of students (31) students who will study their students according to the usual way. Adjust the extraneous variables: where is the settings extraneous variables and one of the important procedures in experimental research in order to provide internal honesty experimental design, it tried the researcher to control extraneous variables that it deems may affect the integrity of the search and as follows: (associated withincidents of experience: the experience was not exposed to any unforeseen circumstances or the occurrence hinder its progress, disappearing demo: you do not get thecase of interruption, transfer or absence of only some individual cases throughout the duration of the test, the sample test: was selected two groups of research atrandom and checked equal groups with a number of variables and enables the researcher to avoid differences For individual students of the two sets of research which may affect the search results, maturity factor: Ndhara the fact that the duration of a short experience and one of the two sets of research and the convergence of thereconstruction of students in the two groups, so what happens growth will return to the members of the two groups equally so was not this factor after the search .measurement tool: Used the same tool measurement for the two sets of search is (achievement test), following the experimental procedures: the work of the researcher to reduce the impact of the experimental procedures that could affect the dependent variable during the course of the experiment and in comes presentation of these measures that have been identified, secret search: keen researcher On the confidentiality of research in agreement with the school administration and the teacher of the article not to inform students of the nature of the research and application of the experience as they were told that the researcher a new teacher at the school so as not to change their activity or deal with the researcher . Duration of the experiment: The length of time equal to the experience of the two sets of search () weeks as it began on (Tuesday) 19.02.2019 and ended on ()//2019 subject: the two groups studied research article itself and is Chapter V/VI/VII of the Book of contemporary European history (2015 i) to be taught fifth grade literary prepared by the Iraqi Ministry of Education For the academic year 2018-2019 Teacher : The researcher studied the two groups of research himself throughout the duration of the experiment, which gives the results of the experiment accuracy and objectivity because

the difference of teachers may affect the results of the experiment and hides the impact of the independent variable, place : The experiment was applied in the same school, Lessons : The study groups were divided into three classes Each group should have one lesson per group on the same day . The experiment was applied on Tuesday February 19, 2019 from the fifth semester of the second course where the researcher studied the experimental groups and the control himself and prepared teaching plans for the experimental and control groups . He prepared (16) a plan for the experimental group according to the Pixstrategy (pecs) And (16) a plan for the control group according to the usual way, the experiment ended 04/07/2019 day (Sunday) where the researcher applied on the achievement test (Monday) corresponding to 8/4/2019 on the two sets of experimental research and control in one day .

Results and Discusion

The students of the experimental group studied in accordance with the Pix strategy (pecs) With the control group students who have studied according to the usual way in the achievement test, and this is in line with studies that have confirmed the superiority of the experimental group that studied according to Becky ‘s strategy (p, ecs) On the control group studied according to the normal method .Research has shown that neurodegenerative activity, which includes physical activity, sensory activities, learning, thinking and imagination, changes the brain, as well as changing the mind. Cultural activities and ideas are not an exception to this rule, which modifies our brains through our cultural activities, read or study music or learn new languages we all have what can be called the brain susp culturally and while cultures evolve it leads constantly to new changes in the brain as Mears Lynch puts it: vary our brains tremendously in the minute brains Celle details Art .... at every stage of cultural development was a normal human being to learn new skills and capabilities of all include brain change a huge ..... can each one of us to learn actually in his life a very complex set of abilities and skills developed Silvia as happens, re - creativity of the history of this cultural development through plasticity the brain and thus the point of view own culture and brain Al Z based onneural plasticity requires a way bi - directional : the brain and the genetic makeup of one form the culture, but culture is a brain also can these changes be Dramatic sometimes.

Plasticity: The plasticity and the ability to change and modification, and thus refers to neural plasticity ductility neurons in our brains and nerve our devices and the ability to change . Many scientists initially did not dare to use nerve plasticity in their publications. Scientists have shown that the mental abilities in which children are born are not always fixed and that the damaged brain can often distinguish itself so that if one part fails, the other can replace it. Brain cells are dead and can sometimes be replaced .It is possible to re-activate the work of some sensory centers and stimulate them again to make them perform the functions that have already suffered a state of cessation and use this process of stimulation to achieve two purposes : to make the person has special capabilities (bara psychological) concerned with risks and visual and other Of other known psychological capabilities and capabilities .Stop : It means stop responding to external stimuli and be on the first two cases : the cessation of the specific case or the partial or Almnhsr and means the case stopped a particular sensory center or a group of specialized sensory centers (sensory area) responding to one type of external influences and like not A person can smell a certain smell while he can smell the rest of the second types of smell : the spread of the mouth that includes all kinds of responses and this situation occurs when the activities of the system of all five senses when the person suffers from the state of fainting due to a strong external influence and Violent does not strengthen his device To nervous to receive him and the interpretation of the goals and the appropriate response to him and spoke palm of the so - called diffuse or faint to ward off a particular risk may affect a particular sensory or entire region damaged sensory center.

Conclusion

Bex’s strategy is appropriate (pecs) With the topics of history, which studied for the five grade literary in secondary and junior high schools, and that the application of the shortcomings of the strategy refers to the spirit of cooperation in the students in the lesson.

Prevent the Growth of Microorganisms, Reduce the Enzymatic Activity, Storage Traits by Freezing

Abd A. Alwan Al-Tai[1], M.N. Khalaf [2], Zahraa Resan Kareem[2]

[1]Department of Dairy Science and Technology, [2]Department of Food Science and Technology, College of Food Sciences, Al-Qasim green University, Iraq

Abstract

The current study was conducted on some cultivars of Iraqi dates (Khalal Hamrawi, Hamrawi date, Khalal Zahidi, Zahidi Dates, Khalal Barhi, Rutab Barhi, Khastawi dates) in order to know the effect of Storage in Freezing on the chemical, physical and sensory traits for these cultivars after freezing it at -18 °C. Plastic cans with the size of (1 kg), The fruit quality data were collected after 3, 6 and 9 months of storage. The results showed that frozen storage did not significantly affect the physical traits for date fruits,It was noticed that there were no significant differences in the length and width of the fruits as well as the weight of the fruits during the storage period, except for some cultivars such as Khalal Zahidi, Zahidi Dates, and Khalal Barhi, It was found an increase in fruit weight, There was a small increase in the volume of fruits during storage, the results remained constant after six months of storage in freezing, The study showed an increase in the content of TSS and total sugars of fruits during the period of conservation and storage in freezing and decrease in moisture content during storage periods.

Keywords: *Freezing of dates, Hamrawi cultivar, Khastawi cultivar, Storage traits.*

Introduction

Dates palm trees are considered fruit trees in most Arab countries such as Iraq, Egypt, UAE, Saudi Arabia, Kuwait and Tunisia, and it can be said that dates palm trees represent a fruit tree[1] of important economic value if it receives the attention and proper care. It can be transformed into an agricultural commodity that contributes significantly to the list of crops that can be exported, thus add a profitable return from hard currency to national income[2], in addition to the importance of this crop in bridging the food gap because it represents the fruit of rich and poor food, It is characterized as a whole food that contains most of the important nutrient elements needed by the human body, In addition to a large number of manufacturing areas where both main and secondary date palm products are included, Dates are considered an important source of energy and essential nutrients, In addition, it has some medical benefits[5]. At present, as a result of the continuous growth in world production and industrial development of dates, there is an urgent need to store dates in production seasons to other seasons. In addition to the problems experienced by owners of orchards in the storage of dates, Among these problems are the damage of dates and the rotting them as a result of poor and non-objective storage. As we know that the freezing process reduces the water activity, prevents the growth of microorganisms, reduce the enzymatic activity, which leads to the extension of the fruits age[12], especially the rapid freezing maintains the texture and characteristics of the original fruit because it does not cause rupture of cellular tissues when melting ice crystals and it maintains relatively the color of the fruit, In addition, storage in freezing allows dates to be preserved at different stages of maturity compared to dry storage [7] and for the purpose of storage dates in freeze, it is necessary to study and knowing the type, dates cultivars and the amount of moisture[6], knowing The amount of sugars and the quality of packaging, because the filling factor is very important and controls the success of the freezing process, if the dates are packaged, the packaging does not allow the exchange of moisture and thus the relative humidity is not useful, However, if the dates are not packaged, the relative humidity in the atmosphere of the freezing chamber

increases because of the presence of moisture in the incoming fruits and it decreases as soon as evaporation of this surface moisture, and the dates lose their moisture quickly and it often makes fog in the freezing room or whiteness on the surface of dates and cause a shortage of The weight of dates [3]. The fruits of dates are classified into three stages of maturity, which are Khalal, Rutab, and date depending on the color, texture, moisture and sugar content. At the Khalal stage, the fruits of the date begin to mature and the moisture content drops to about 20%, and the sucrose turns to the sugars. In the dates stage, the skin becomes brown and the texture becomes soft. Dates contain the maximum amount for Total Soluble Solids and it is the best case for storing dates[11].

Materials and Method

Preparation of samples: This study was conducted on some cultivars dates in Babylon province for the agricultural season 2018. The samples were taken from the local markets at different stages of maturity which included (Khalal, Rutab, and date). The samples were stored at low temperatures from 0 to -18 ºC. These samples were placed in 1 kg sealed plastic containers until the required laboratory tests were conducted. The weight of the fruit was approximately 500 g in each package.

Conducting chemical, physical and sensory analyzes on stored dates

Estimation of fruit weight: The weight of the fruit was calculated by taking 10 fruits randomly from each replicate using a sensitive balance and the average weight for one fruit per gram was then calculated by dividing the total on the total number of fruits.

Fruit Size: The size of the fruit was measured by the graduated cylinder method and the displaced distilled water at the average of 10 fruits per duplicate, The size of the distilled water was placed in the graduated cylinder and the fruit was immersed in the graduated cylinder. The volume was measured by finding the difference between the water level in both cases and the average of one fruit was then extracted by dividing the size difference on the number of fruits, it was calculated by unit (cm^3).

Fruit length and its diameter: The length and diameter of the fruit were measured using the Vernier (cm) and the length and diameter of the fruit were then extracted by dividing the total on the number of fruits.

Estimating humidity: The percentage of water content and humidity was estimated using the method in [9] by drying 10 fruits per replicate in a vacuum oven at a temperature of 70 °C for 48 hours and at the constant weight, the percentage of the water content for the fruit is calculated.

Estimating Total Soluble Solids: Five gram of chopped fruit was added and 15 ml of distilled water was added and triturated in a ceramic mortar. which then filtered, The percentage of Total Soluble Solids was estimated using the Hand Refractometer by taking a drop of sap and placing it on the prism of device. The results were adjusted based on the optimum temperature of 20 °C.

Estimating pH: The acidity was estimated using the method found in [9]. The study concludes by taking 25 g of available sample (cut into small pieces and ground with blender), followed by adding 100 ml of distilled water and boiling for 1 hour, it was then filtered the resulting mixture and cooling it to 100 ml in a standard glass flask and then transferred to a cup Its capacity is 150 ml and then measure the PH number by using PH METER.

Estimating Total Soluble sugars: It was estimated by the method of [13] which conclude by weighing 200 mg of the sample, adding to it 8 mL of ethyl alcohol at a concentration of 80%, it was placed in a test tube and then placed in a water bath at 60 °C for half an hour.After that, the solution was taken to another flask. An 8 mL ethyl alcohol was added to the remaining precipitant at a concentration of 80% and leave in a water bath for half an hour. this solution was taken and collected with the solution from the previous stage and place in a centrifuge at 4000 rpm for 15 min. The slurry then transferred to the rotary evaporator to remove the alcohol. The remaining solution completed to 100 mL with distilled water and in which the total soluble sugars were estimated using the phenol method by taking 1 ml of the sample and adding 1 ml of phenol at a concentration of 5% and 5 ml of concentrated sulfuric acid, The model was left to cool down and the absorbance was measured at a wavelength of 490 nm and a standard glucose curve was used for this method.

Sensory evaluation for the storage fruits: The sensory evaluation test for dates was conducted by specialized professors in College of Food Sciences, where each professor makes a sensory evaluation of

the samples, taking into consideration the taste, flavor, color, appearance, texture, general acceptance and then filling out the test form. The preference grade in the test model are then classified into figures as follows:

The excellent grade is given 25, a good grade is given 20, the medium grade is given 15, the poor grade is given 10, a Very poor grade is given 5.

Results and Discussion

Effect of Storage Time in freezing on Physical Characteristics for Dates: Figure (1) shows there were no significant differences in the weight of stored fruits during storage periods. Most of the cultivars had very low weight differences, except for a slight increase for the cultivars. This may be due to increasing the maturation during the storage period and low weight loss for the cultivars. These results agree with [17] who found a decrease in the weight of fruits during storage periods in freezing.

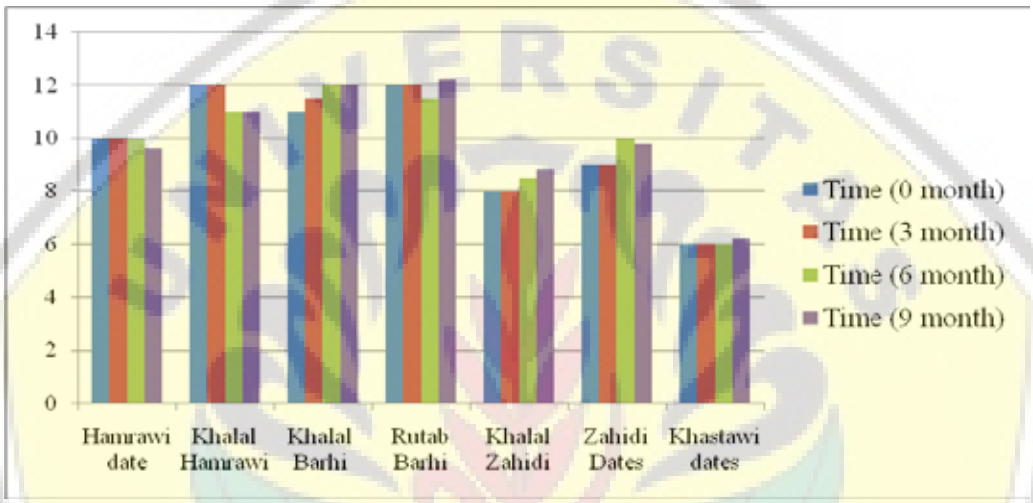

Figure 1: shows the change in the weight of fruits during the conservation period.

As for the size of stored dates, Figure (2) shows the stability of the size for some cultivars such as Rutab Barhi and Khastawi dates, While the rest of the cultivars were a few increases, such as the Khalal Zahidi, Zahidi Dates, Khalal Barhi, and Hamrawi date, while we find a decline in size after 6 months of storage for the cultivar of Khalal Hamrawi. These results agree with [7].

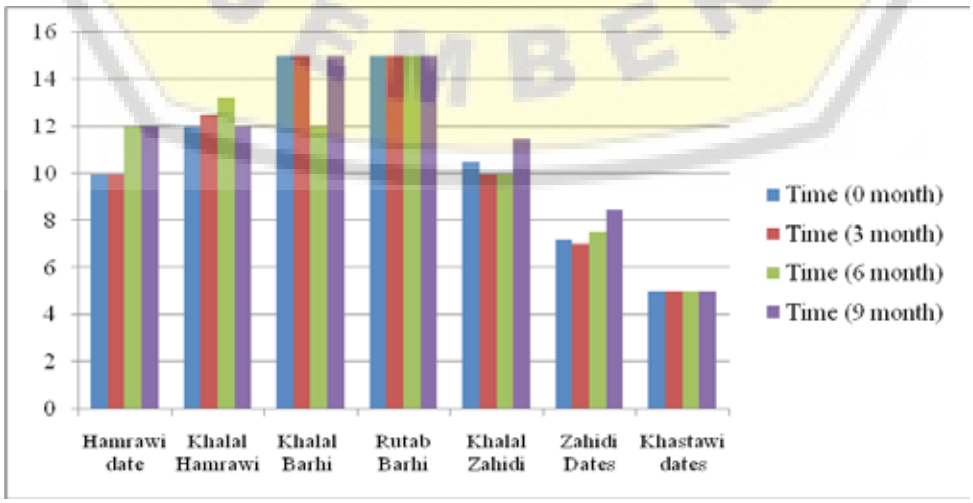

Figure 2: Shows the change in the size of fruits during the conservation period.

Figure (3) shows the change in the width of the stored fruits. The stability of the width for some cultivars, such as Khastawi dates and Rutab Barhi and Khalal Barhi, While there is an increase in width for other cultivars, This result agrees with.[17]

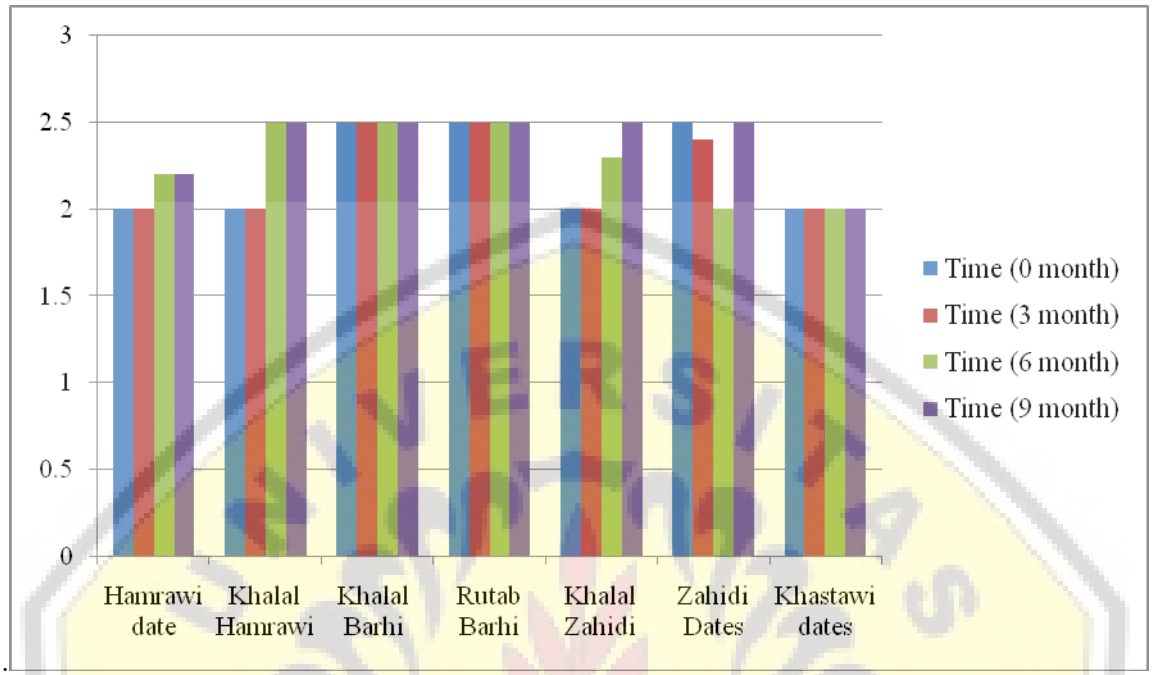

Figure 3: shows the change in the width of fruits during the conservation period.

As for the length of fruits during the storage period, the results were an increase in the length of fruits for most cultivars after 6 months of storage.[17] found clear changes in fruit length and width during the storage period.

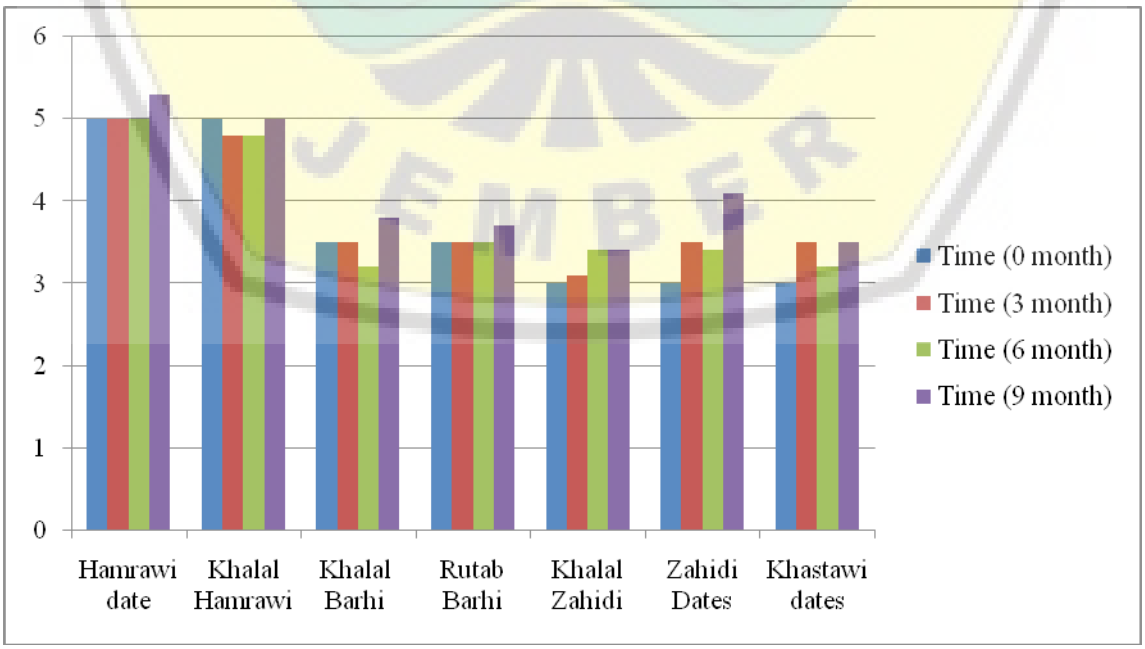

Figure 4: shows the change in the length of fruits during the conservation period.

Effect of storage time in freezing on chemical properties for dates: The pH values were high for Khalal Hamrawi, Hamrawi date, and Khastawi dates during storage periods, As for the cultivars of Khalal Zahidi, Zahidi Dates, Khalal Barhi, and Rutab Barhi, The pH values were slight. This result did not agree with[17], where they found a gradual decrease in pH.

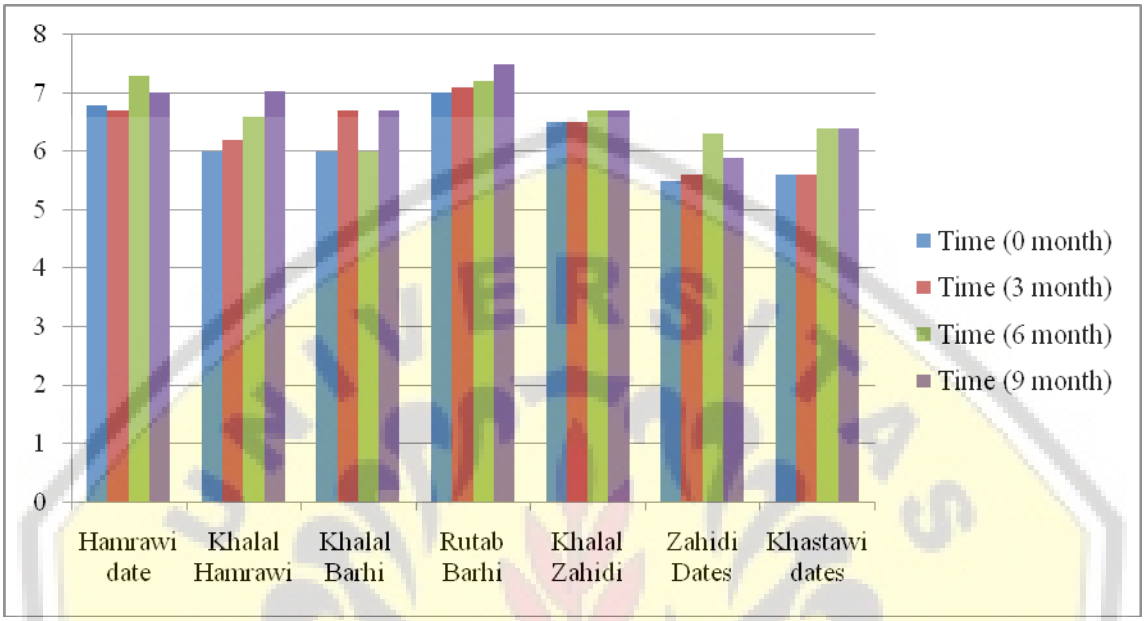

Figure 5: Shows the change in the pH of fruits during the conservation period.

Figure (6) shows the low moisture content in the stored fruits when the storage period is increased because prolonged storage often leads to a decrease in moisture content. This may be due to the high respiratory rate for the stored fruits. These results agree with[2,4,18].

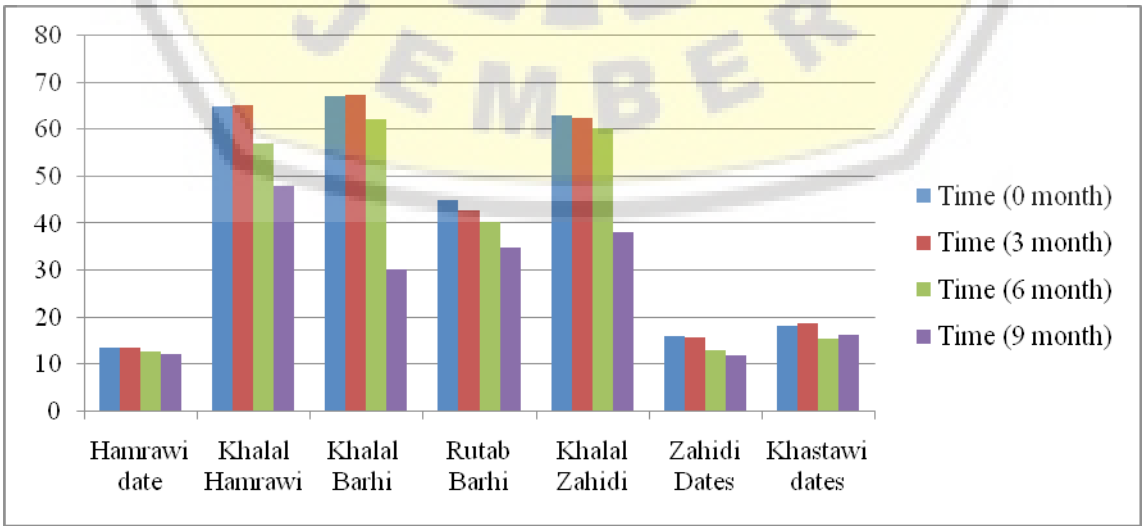

Figure 6: Shows the change in the moisture content of fruits during the conservation period.

An increase in TSS values was observed for most date cultivars during the storage period. This increase may be due to the conversion of some insoluble compounds such as Pectin to soluble compounds, This may indicate the continued degradation of complex sugars to simple. Stability values for some cultivars such as Khastawi dates and Zahidi Dates, These results agree with[14,2,4]. We also note an increase in the percentage of total sugars for the stored dates due to increasing the maturation of dates and increasing enzymes activity that converts tannins and pectin into monosaccharides. These results agree with [15].

Effect of frozen storage on sensory traits: The grades of sensory evaluation are among the most important indicators of the quality for dates in the Rutab and dates stage from the point of view of the consumer. The results indicated in Figure (9) that the best cultivars in terms of taste and flavor is Rutab Barhi with grade of 24.4 followed by Zahidi Dates 24.1 and Khalal Barhi 23.2 where Khalal Barhi became most mature and fresh during the storage period in freezing, The lowest grade was found for Khalal Hamrawi cultivar 15.8, with the disappearance of the clutch taste during the end of the storage period due to the transformation of dissolved tannin compounds into insoluble compounds. The most favorable evaluation was for Zahidi Dates (24.0 and 22.8) for the traits of color and appearance, respectively, with the presence of Sugary spots for Zahidi Dates after 2 months of storage in some storage boxes, followed by Khastawi dates (23.8, 22.1), respectively. As for the fruit texture, the best grades were for the Khalal Zahidi 22.8 followed by Rutab Barhi 22.0.

Conclusion

There was a small increase in the volume of fruits during storage, the results remained constant after six months of storage in freezing, The study showed an increase in the content of TSS and total sugars of fruits during the period of conservation and storage in freezing and decrease in moisture content during storage periods.

Risk Factors Associated with Stroke among Elderly Adults

Dara Abdulla Al-Banna[1], Sadea Ahmed Khuder[2]

[1]Assistant Lecturer, MSc. (PhD Student) in Adult Nursing, College of Nursing, Nursing Department, Hawler Medical University, Erbil, Iraq, [2]Professor, PhD in Adult Nursing, College of Nursing, Nursing Department, Hawler Medical University, Erbil, Iraq

Abstract

Objectives: Some stroke risk factors cannot be controlled. These include Gender, age and family history. However, many stroke risk factors are lifestyle related and can be reduced by making a few simple lifestyle modifications. This study aimed to determine the risk factors associated with stroke among elderly adults. A quantitative case-control study was conducted in the medical wards and physiotherapy units of teaching hospitals in Erbil City of the Kurdistan Region of Iraq from March to August 2017. A randomized cluster sampling technique was used for enrolling 97 cases and 97 controls of elderly adults, and data were collected in direct interviews with a structured questionnaire. Multiple logistic regression analyses revealed a statistically significant association between the risk factors of hypertension (OR = 7.846, P< 0.001), diabetes mellitus (OR = 7.108, P< 0.001), family history of stroke (OR = 5.949, P< 0.001), hypercholesterolemia (OR = 5.700, P= 0.002), smoking (OR = 4.284, P= 0.003), lack of physical activity (OR = 3.351, P= 0.01), obesity (OR = 3.340, P= 0.013), and heart disease (OR = 3.335, P= 0.011) with stroke. Hypertension and diabetes were associated with higher odds of stroke.

Keywords: *Brain; Stroke; Elderly adult; Odds Ratio; Risk factor*

Introduction

Every year, 15 million people worldwide suffer from stroke. About six million die, and five million are remain permanently disabled. Stroke is the second leading cause of disability after dementia [(1)]. Stroke causes sudden difficulty in walking, dizziness, loss of balance, lack of coordination and severe headache with no apparent cause[(2)]. Disabilities due to stroke may include loss of vision and/or speech, paralysis and confusion. Globally, stroke is the second leading cause of death over the age of 60 years [(3)]. Most developed countries were accepted that the chronological age of greater than 60 years as a definition of 'elderly' or older person. There is no United Nations standard numerical criterion, but the United Nation agreed cutoff is 60+ years to refer to the older population[(4)]. Data from the Framingham study showed a lifetime stroke risk of one in five for women and one in six for men among those 55 to 75 years of age. Moreover, the incidence of stroke continuously escalate because of the population expansion of elderly and the apparent epidemic in the general population regarding modifiable cardiovascular risk factors, including diabetes mellitus, obesity, and physical inactivity [(5)]. Many risk factors will contribute to the occurrence of stroke, some of which are modifiable, while others are nonmodifiable. Controlling the modifiable risk factors such as hypertension, hypercholesterolemia, blood glucose, physical inactivity, smoking, stress, obesity, and diet will prevent the occurrence of stroke [(6)]. Because of the importance of controlling the modifiable risk factors by lifestyle changes in preventing stroke, and the importance of screening and early management of stroke to prevent neurologic deficits and disabilities, the researcher intended to determine the risk factors among elderly adults.

Material and Method

Study Design: This research involved a quantitative case-control study design. It was carried out from May to November 2016.

Setting: Medical wards and physiotherapy units of Hawler and Rizgary teaching hospitals in Erbil City of the Kurdistan Region of Iraq.

Participants:

Eligibility: The study population consisted of elderly adults with or without stroke. The study sample included 97 cases and 97 controls of elderly adult patients according to **the following inclusion criteria:** elderly adult (age ≥ 60 years old), both Genders, conscious, agreed to be a subject in this study, good personal communication, hemorrhagic or ischemic types of stroke (for cases) and no other medical problems except stroke (for controls). **Exclusion criteria:** those who had a transient ischemic attack. The controls were matched to cases in age and Gender.

Sampling and sample size: A randomized clustered sampling technique was used to obtain a representative sample of the target population according to the inclusion and exclusion criteria from March 4, to May 22, 2017, once a time without the follow-up of participants. The total sample size was 194 (97 cases and 97 controls). The estimation was based on the following parameters through the GPower software Version 3.1 in two tails: effect size (0.041), alpha I error/level of significance = 0.05 in 95% confidence interval, power (1-beta II error) = 0.8, and number of predictors = 1; these parameters were obtained from a previous study that was conducted in Erbil City [7].

Tool and method of data collection: A questionnaire was designed and consisted of two main parts. Part one included sociodemographic characteristics of the study sample (age, gender, education level, marital status, occupation status, and residency area). Part two included some anthropometric measurements (systolic and diastolic blood pressure, blood glucose level, serum cholesterol level, and body mass index based on the weight and height) and risk factors associated with stroke in elderly adults (hypertension, diabetes mellitus, hypercholesterolemia, obesity, heart disease, smoking-current, lack of physical activity, and family history of stroke). The data were collected through a direct interview (face to face) method of approximately 45 minutes duration with each participant. The data collection duration was approximately 3 months, from June 3, 2016, to August 15, 2016.

Validity and reliability: The validity of the questionnaire was checked initially by experts from different specialties related to neurological nursing/ medicine and physiotherapy. The expert responses were based on agreement or disagreement with items of questionnaire. The results indicated that all experts agreed to the content of the questionnaire with some modifications. The researcher took into consideration their responses and prepared the final version of the questionnaire. A pilot study was carried out in two wards of each hospital on 10 cases and 10 controls to determine the reliability of the questionnaire (internal consistency by the split-half method). The alpha correlation coefficient was 0.811, which is statistically adequate.

Ethical considerations: A formal permission was obtained from both the Ethical and Scientific Committees in the College of Nursing/Hawler Medical University, number 56, on 5th September 2016. Written informed consent was obtained from each participant (attached). The researcher promised to keep the patient's information confidential and use the data for this study only after explaining the purpose of this study to each participant. In addition to the above, the researcher told each participant that participation was voluntary, and he or she could leave at any time even if the process was not completed.

Statistical Method: After data collection, the variables and data were entered into statistical application software (SPSS Version 23). The data were analyzed through descriptive statistical analysis (frequency, percentage, mean, standard deviation, and odds ratio) and inferential statistical analysis (Spearman correlation coefficient, chi-square test, and logistic regression). The confidence interval is 95%. A P-value of each test ≤ 0.05 was considered statistically significant, with a power of 0.80, and a correlation coefficient between -1 and +1. For the odds ratio =1, exposure does not affect the odds of stroke, OR >1 exposure is associated with higher odds of stroke, and OR <1 exposure is associated with lower odds of stroke.

Results and Discusion

In this study, the age and Gender were nearly matching criteria between the case and control groups. Table 1 shows the sociodemographic characteristics of

the 97 case and 97 control groups of the study sample. Regarding the educational level, the highest percentage of the study sample was illiterate in both groups (73.2% of cases, 58.8% of control). For marital status, the highest percentage of the study sample was currently married (59.8% of cases, 79.4% of control). Concerning the occupational states, the highest percentage of the study sample was home maker in both the cases and the control study samples (75.3% and 61.9%, respectively). For residential area, most of the study sample was urban (74.2% cases and 69.1% control).

Table 1: Sociodemographic characteristics of the study sample

Sociodemographic Characteristics	Case (n=97)	Control (n=97)
	F (%)	F (%)
Age group/years		
60-69	32 (33)	35 (36.1)
70-79	56 (57.7)	52 (53.6)
80-89	9 (9.3)	10 (10.3)
Gender		
Male	49 (50.5)	49 (50.5)
Female	48 (49.5)	48 (49.5)
Education level		
Illiterate	71 (73.2)	57 (58.8)
Can read and write	4 (4.1)	2 (2.1)
Primary school graduated	5 (5.2)	9 (9.3)
Intermediate school graduated	5 (5.2)	15 (15.5)
Preparatory school graduated	6 (6.2)	7 (7.2)
Institute or college graduated	6 (6.2)	7 (7.2)
Marital status		
Currently married	58 (59.8)	77 (79.4)
Widowed	39 (40.2)	20 (20.6)
Occupational status		
Paid work	14 (14.4)	17 (17.5)
Self-employed	1 (1)	2 (2.1)
Homemaker	73 (75.3)	60 (61.9)
Retired	9 (9.3)	18 (18.6)
Residential area		
Urban	72 (74.2)	67 (69.1)
Rural	25 (25.8)	30 (30.9)
Total	97 (100)	97 (100)

Table 2 shows the anthropometric measurements and risk factors for stroke among elderly adults in both the case and control groups. Regarding blood pressure, the highest percentage of cases was hypertensive, while the controls were in normal blood pressure (systolic and diastolic blood pressures 63.9% and 62.9% among cases; 80.4% and 66% among controls, respectively). Half of the cases had heart disease (51.5%), while most of the controls did not have any type of heart disease (74.2%). Regarding the blood glucose level, the highest percentage of cases had hyperglycemia- diabetes mellitus (63.9%), but more than half (%53.6) of controls had normal blood glucose levels. Only 43.3% of cases have hypercholesterolemia, and most controls have normal serum cholesterol levels (87.6%). Concerning the body mass index (BMI), the highest percentage of cases were obese (68%) and normal weight among controls (39.1%). Concerning smoking as a risk factor, the highest percentage of cases were smokers (70.1%), and the controls were non-smokers (60.8%). Regarding the lack of physical activity, most of the study sample in the case group was inactive physically (74.2%), and it was nearly similar to the control group, which was 63.9%. This study found that more than half of cases had a family history of stroke (54.6%), while in the control group, most had no family history of stroke (74.2%).

Table 2: Anthropometric measurements and risk factors associated with stroke in the elderly

Anthropometric measurements and risk factors associated with stroke in the elderly	Case (n=97)	Control (n=97)
	F (%)	F (%)
Systolic Blood Pressure (mmHg)		
Normal Blood Pressure	35 (36.1)	78 (80.4)
Hypertension	62 (63.9)	19 (19.6)
Diastolic Blood Pressure (mmHg)		
Hypotension	20 (20.6)	16 (16.5)
Normal Blood Pressure	16 (16.5)	64 (66.0)

Total	**97 (100)**	**97 (100)**

Table 3 shows the odds ratio of risk factor exposure associated with the odds of stroke outcome. All risk factors for exposure to hypertension (OR = 7.846, CI= 3.074 to 20.029, P-value= <0.001 VHS), diabetes mellitus (OR = 7.108, CI= 2.629 to 19.215, P-value= <0.001 VHS), family history of stroke (OR = 5.949, CI= 2.192 to 16.147, P-value= <0.001 VHS), hypercholesterolemia (OR = 5.700, CI= 1.845 to 17.612, P-value= 0.002 HS), currently smoking (OR = 4.284, CI= 1.661 to 11.049, P-value= 0.003 HS), lack of physical activity (OR = 3.351, CI= 1.335 to 8.412, P-value= 0.010 S), obesity (OR = 3.340, CI= 1.289 to 8.653, P-value= 0.013 S), and heart disease (OR = 3.335, CI= 1.314 to 8.466, P-value= 0.011 S) were significant and associated with higher odds of stroke outcome. Therefore, most of the risk factors are modifiable and can be controlled by participants.

Table 3: Odds ratio of risk factor exposure associated with odds of stroke

Risk factors associated with stroke in the elderly	Standard Error	P-value		Odds Ratio	Confidence Interval 95%	
					Lower	Upper
Hypertension	0.478	< 0.001	VHS	7.846	3.074	20.029
Heart disease	0.475	0.011	S	3.335	1.314	8.466
Diabetes Mellitus	0.507	< 0.001	VHS	7.108	2.629	19.215
Hypercholesterolemia	0.576	0.002	HS	5.700	1.845	17.612
Obesity	0.486	0.013	S	3.340	1.289	8.653
Smoking (current)	0.483	0.003	HS	4.284	1.661	11.049
Lack of Physical activity	0.470	0.010	HS	3.351	1.335	8.412
Family history of stroke	0.509	< 0.001	VHS	5.949	2.192	16.147

The present study aimed to determine risk factors associated with stroke among the elderly. Currently, prior stroke is reported in over 5% of individuals aged between 65 and 74 and over 10% of those aged 75 and older[8]. Prevention of stroke occurrence and recurrence in healthy and unhealthy elderly adults is possible by controlling modifiable risk factors through diet and lifestyle changes. Age and Gender were found to be matching criteria between the case and control groups because they are the major confounding factors contributing to stroke occurrence among elderly people. This finding is in good agreement with a large number of previously studies reporting the above mentioned factors as major risk factors for stroke among the elderly [1-3,9].

In the present study, hypertension was found to be one of the most frequent risk factors associated with odds of stroke outcome. This finding is in line with the results of the study conducted in India by Sorganvi et al. (2014), who concluded that a higher risk of stroke among the participants, more than half of whom were over 60 years old, was associated with systolic and diastolic hypertension[9]. The prevalence of increased blood pressure increases with age, with 70% of the elderly suffering from hypertension [10]. According to the present study, diabetes mellitus was a significant risk of stroke, and the patients' blood glucose levels revealed that over half had uncontrolled hyperglycemia [10]. The results of our study also demonstrated that having a family history of stroke on either the paternal or maternal side is a risk factor for stroke occurrence. These authors claimed to be the first to report the association between family history of stroke and development of large-vessel disease (LVD), small-vessel disease (SVD), and cryptogenic stroke [7,11]. Another risk factor for stroke occurrence in the present study was hypercholesterolemia. In line with this finding, Aronow (2006) reported that half of participants aged over 65 had hyperglycemia [12-15].

Conclusion

This is a study that quantifies the contribution of different factors to the overall risk of stroke. Hypertension and diabetes were associated with higher odds of stroke and are the greatest risk factors for all types of stroke. Other risk factors are a family history of stroke, hypercholesterolemia, current smoking, lack of physical activity, obesity, and heart disease, and they were significantly associated with higher odds of stroke. Fortunately, most of the risk factors are modifiable and can be controlled by participants through life style modifications.

Antimicrobial, antioxidants activity and Nutritional Properties of High Protein Breads from Vignaradiata

Riyadh Shamki Ali[1], Laith Fareed Hasan Al-Obaidi[1], Manal Abdalwahed Alssirag[2]

[1]Department of Food Science, Faculty of Agriculture, University of Kufa, Najaf, Iraq,
[2]Department of Animal Science, Faculty of Agriculture, University of Kerbala, Kerbala, Iraq

Abstract

The aim of the current study was to identify the effect of replacing wheat flour with mung bean flour at different levels (0, 5, 10, 15, 20 and 30%) represented as (C, M1, M2, M3, M4 and M5) respectively in some chemical properties of flour, in addition to studying the effect of replacing on some sensory characteristics of the bread. The chemical compositions results of the flour indicated that there was a significant differences between a flour treatments compared to the control flour (100% wheat flour). Also, as the replacing of wheat flour with mung bean flour increased the moisture content decreased while the protein and ash content increased. The sensory evaluation results showed that there was a significant differences between the control bread sample and other bread samples for most of the bread attributes and the best replacing level was using 10% mung bean flour with 90% wheat flour. In addition, the amino analysis results indicated that the wheat flour (control) has the lowest amino acid containing and as the wheat flour replacing increased the amino acids content increased.

Keywords: *Wheat Flour, Mung Bean Flour, Amino Acid Analysis in Flour, Bread Sensory Evaluation.*

Introduction

Legumes are one of the most important sources of protein, mostly when applied with other protein sources such as grains to achieve an integrated protein source of amino acids [13] . The application of legumes in diet formulae has increased to reduce the occurance of certain diseases such as diabetes, heart disease, lowering blood cholesterol levels and the risk of colon cancer[14]. The adding of legume flour to wheat flour is ideal for developing the nutritional value of the bread blends, because of the supplemented with amino acids and fiber[10]. Mung bean (*Vignaradiata*) are type of legume that has oval shaped with greencolor containing 24% protein[11]. The Mung bean contains a high percentage of protein (20 - 27)% and fibers and the type of amino acids found in the mung similar to soybeans, but with less proportion of fat and high activity of antioxidants . The mung beans are also rich in lysine amino acid and the sprouted mung beans contain vitamin C, which is not found in non-sprouted mung bean[1]. The extract of the mung bean was the most effective against the disease of diabetes and cancer and also showed an activity as antimicrobial and antioxidants. In addition, mung bean contains protein, fat, carbohydrates, vitamin B1, B2, carotene, niacin, folic acid and minerals such as calcium, phosphorus, iron, etc.,. Mung bean is combined with cereals which include high concentration of methonine and cysteine to increase its nutrients[2]. Due to the nutritional qualities of mung bean, the current study aimed to evaluate the effect of replacing wheat flour with different levels of mung bean flour on some chemical characteristics of the flour blends, in addition to studying the effect of substitution on some of the sensory characteristics of the bread.

Materials and Method

Materials: Wheat flour and mung bean were purchased from a market in the holy city of Najaf. The wheat flour and mung bean were kept at cool storage untile use.

Method:

Preparation of Mung Bean Flour: The mung bean flour was prepared according to the method described by[11]. The mung beans were cleaned manually by

removing stones and dirt from them. Wash the cleaned mung with distilled water to remove the suspended soil and then dry using an electric oven at a temperature of 60°C and then grinding using the electric grinder. The resulting flour was sieved using sieve size (0.5 mm) to get the flour. The flour was filled in the polyethylene bags and store in the freezer until use.

Location of the experiment: The experiment was held out at the Food Science laboratory, Collage of Agriculture, University of Kufa in May, 2018.

The bread was prepared in a laboratory using the method mentioned by[8]. Wheat flour was replaced by mung bean flour according to the levels represented in Table (1).

Table (1): Replacement levels of Wheat Flour with Mung Bean Flour

Weight of mung bean flour (g)	Weight of wheat flour (g)	Flour type Replacement rate (%)	Sample Code
-	100	0	C
100	-	0	MC
5	95	5	M1
10	90	10	M2
15	85	15	M3
20	80	20	M4
30	70	30	M5

Chemical Composition of Prepared Flour Samples: Determination of Moisture Content The moisture content in the flour samples was estimated in the wheat flour and wheat flour replaced part of it with the mung bean according to the method[3]. Place 2-3 grams of the wheat and mung bean flour sample in a crucible of a known weight in an oven of 105 ° C until the weight is stabilized then cooled and weighted.

Determination of Ash: Ashes were estimated in the flour samples according to the method described[3] by burning the sample in the muffle furnace at 525 ° C until the color changed from gray to white.

Determination of protein: Protein content was determined in the flour samples using the Kjeldahl method described by [15]. The total nitrogen ratio was calculated and multiplied by factor 6.25 to extract the protein percentage.

Determination of fat: The percentage of fat was estimated using the Soxhlet method described by [15]

Amino Acid profile (unit) in Wheat Flour with Different Level of mung bean Flour:

Amino acid exrtraction: The amino acids were taken away according to the method, where the weight of (5 g) of the sample and placed in a bottle of volume (10 ml) and add to it (3 ml) of HCl (6M) with 0.1% of NaOH and 0.1 mg tartric acid and mix well for 15 min, The sample was filtered using a plastic filter (0.45um) and then taken to the apparatus for injection.

Amino acid Derivation: 1 ml of the extracted sample add to 200 µl of dihydroethophthalene (5%). The sample is used for 2 min. Then, 100 microliters of the last mixture were taken and injected into the HPLC, The test was done in the laboratories of the Ministry of Science and Technology/Environment and Water Department using amino acid analysis using the method. The carrier phase consisting of (methanol: acetonitrile: 5% formic acid) (C2-NH2) with a length of (25 cm * 4.6 mm * 10um) to separate the amino acids while the fluorocarbon detector was used to detect amino acids at wavelengths (Ex = 445 nm), Em = 465 nm).

Preparation of Standard Material: (0.01 g) of the standard mixture of high purity amino acids (99.9%) was dissolved in non-ionic water and was transferred to a 100 ml conical flask and completed the size of the mark until it became 100 ppm.

Amino acid analysis conditions:

Mobile phase = acetonitrile : buffer (30 : 70)

Injection: Injection program, including derivatization steps with OPA.

Injected volume = 100 uL

Column = ZORBAX Eclipse-AAA; 3.5µm; L x i.d. = 150 x 4.6 mm

Detector: Florescence (Ex = 360 nm, Em = 450 nm)

Sensory Evaluation of the Bread: The sensory evaluation of the bread samples was carried out by replacing different levels of wheat flour with mung bean flour by faculty and students of Food Science Department at the University of Kufa according to the form described by[9]. The prepared bread were presented

on ten Judges who were interested with breads. The bread samples were analyzed based on (diameter (cm), thicken (Mm), top layer colour, bootom layer colour, pulp coloure,uniformity of pulp texture,pulp softness,odor, chewing and bread leavininig.

Statistical Analysis: All results are given as means of three replicates and the data are transfered as means ± standard deviations. Also, the results were imperiled to one way ANOVA and individual sample T Test using SPSS (version17). The tretments means were detached by comparing the means at $p \leq 0.0001$.

Results and Discusion

Chemical characterization of blends from wheat and mung bean flour: The chemical composition of the flour blends is shown in Table (1). Moisture, protein, fat, ash and carbohydrates for 100% wheat (C); 100% mung bean flour (MC), 95% wheat flour with 5% mung bean flour (M1), 90% wheat flour with 10% mung bean flour (M2), 85%wheat flour with 15% mung bean flour (M3),80% wheat flour with 20% mung bean flour (M4) and 70%wheat flour with 30% mung bean flour (M5) ranged from (9.17% to 6.88%), (11.90% to 18.31%), (1.34% to 1.37%), (1.10% to 1.46%) and (76.67% to 73.39%) respectively for the different flour blends. The moisture content for 100% mung bean flour was significantly the highest (9.17%) compared to other flour samples, while the moisture content was not significant between the flour samples M2 and M3 . This result is in agreement with[5]. The moisture contents for all the flours blends under the study are about the recommendated amounts for dependable keeping of testes by the standards organization of FDA and shows that they will have development kepping value as moisture content in extra of 14% in flours has more danger of bacterial exploit and mould evolution which produce unpleasent changes in the flour[12]. For the fat content, Table (2) showed that there was no significant differences between the flour blends samples. For the protein content, the mung bean flour showed a significant higher protein content (25.10%) compared to all other samples. In addition, the protein results indicated that as the replacement increased the protein content increased significantly except M3 and M4. However, the ash content results of the samples indicated that there was an increased with increasing in the replacement of wheat flour with mung bean flour (1.10% to 1.46%). Increase in the ash ratio represents that the samples with high percentage of ash will be appropriate suppliers of minerals. While the Carbohydrate content reduced significantly with increased substitution of wheat flour with mungbean flour (76.67% to 73.39%). Decrease in carbohydrate content could be because of the low carbohydrate content of mung bean flour as observed in similar works using legumes[7].

Table (2): Chemical Composition of the wheat flour with different level of Mung bean flour

Means ± Stderr					
Carbohydrate (%)	**Ash (%)**	**Protein (%)**	**Fat (%)**	**Moisture (%)**	**Four Treatment**
76.67 ± 0.02	1.10 ± 0.005	11.90 ± 0.05	1.34 ± 0.18	9.17 ± 0.01	Wheat Flour Control
62.53 ± 0.04	3.21 ± 0.003	25.10 ± 0.03	1.64 ± 0.003	7.50 ± 0.005	Mung Bean Flour Control
76.09 ± 0.04	1.18 ± 0.02	12.70 ± 0.05	1.16 ± 0.02	8.85 ± 0.03	M1 (5%)
76.29 ± 0.003	1.26 ± 0.003	13.90 ± 0.01	1.23 ± 0.02	7.31 ± 0.01	M2 (10%)

0.1085	0.0392	1.0147	0.2343	0.0418	l.s.d
0.0001	0.0001	0.0001	0.01	0.0001	P(value)

Determination of Sensory Properties of breads: Table 3 showed the sensory features of combined bread of the different levels of mung bean flour supplementation added to the wheat four. For the diameter of the bread, the results showed that there was a significant differences between all the bread samples and M5 bread sample has significantly the lowest diameter (15.96cm). In addition, the bread thickness results indicated that there was a significant differences between all the bread samples and also M5 bread sample has significantly the lowest thickness (2.12Mm) while the control bread (100% wheat flour) has significantly the highest thickness (6.16Mm). For the top layer color, Table (3) indicated that there was significant differences between the bread samples compared to the control bread while there was no significant differences between (M2, M4 and M5) bread samples. Moreover, the results of the table showed that there was a significant differences between the bread samples compared to the control bread in the bottom layer color but there was no significant differences between M4 and M5 bread samples and between M1 and M2 bread samples. A notable diference is collected by the estimation of the crumb colour between the combined bread treatments and the 100% wheat bread. The results noticeably showed that bread prepared from 10% mung bean flour had significantly the highest score crumb colour (9.87) and the lowest score recorded by bread prepared from 100% of wheat flour (7.90). There is an raise in intensity of crumb colour with higher level of fortification. The results for crumb texture exposed that the bread made with 90 and 80% wheat flour with 10 and 20% of mung bean flour had significantly the highest scoring rate (8.06, 8.03) respectively .

Amino Acid Profile: As the performance of protein is basically affected by its amino acid constitiuation therefore the amino acid profile of samples was measured. The results of Table (4) showed that the all hydrophobic and hydrophilic amino acids content values of the wheat flour replaced with 5, 10, 15,20 and 30% mung bean flour were increased compared to the control flour (100% wheat flour). This increase might be due to their higher contents in mung bean flour than wheat flour[17] reported that amino acids derived from mung bean are an effective complement to those obtained from cereals. Enriching the essential amino acid content of crop plants has both economic and humanitarian impression. Among the essential amino acids, methionine has received the most attention in legumes for 6 protein quality improvement[4].

Table (3): Amino Acid Profile (mg/g) of Wheat Flour with Different Levels of Mung Bean Flour

Treatment / Amino Acid	Control Wheat	Control Mung bean	M 1 (5%)	M 2 (10%)	M 3 (15%)	M 4 (20%)	M 5 (30%)
Aspartic Acid	5.6	3.6	4.2	5.3	7.3	12.1	18.6
Phenylalanine	7.6	5.2	6.3	8.7	11.4	13.5	16.7
Lysine	8.7	8.7	9.9	11.0	16.7	19.7	25.4
Valine	11.6	6.9	7.4	9.3	12.3	16.4	20.6
Glutamic Acid	6.7	5.5	6.1	8.2	10.4	14.9	19.4
Arginine	4.4	12.0	13.5	15.1	18.6	22.4	27.6
Glycine	6.3	18.9	20.1	23.7	29.8	32.2	37.4
Alanine	10.5	7.4	9.4	12.3	17.1	20.4	26.9
Methionine	6.2	7.9	10.2	14.2	15.9	20.3	27.1
Lucien	5.2	6.9	8.7	10.7	13.1	19.7	22.4

Conclusion

The sensory evaluation results showed that there was a significant differences between the control bread sample and other bread samples for most of the bread attributes and the best replacing level was using 10% mung bean flour with 90% wheat flour. In addition, the amino analysis results indicated that the wheat flour (control) has the lowest amino acid containing and as the wheat flour replacing increased the amino acids content increased.

Cytological and Cytogenetic Characterization of the Mouse Hepatocellular Carcinoma (HCAM) Cell Line

Aymen Radhi Habeeb[1], Ahmed Majeed Al-Shammari[2], Baydaa Hussein Mutlak[1]

[1]Biology Department, College of Education, Ibn Alhaithum, Baghdad University,
[2]Iraqi Center for Cancer and Medical Genetic Research, Mustansiriyah University

Abstract

The common type of liver cancer is hepatocellular carcinoma, which often emerges in the setting of major chronic liver disease and has a poor prediction. This study aimed to characterize the cell line of hepatocellular carcinoma established from mice infected with liver cancer. The cell lines characterization was well-defined by morphology, growth curve, and chromosomes analysis. The morphological study was characterized by light microscope and appeared to be extended multipolar epithelial-like cells with a doubling time of 17 h. Cytogenetic test of these cells showed changes in chromosomes with many numerical and structural anomalies. Our results of growth rate, morphological, and cytogenetic properties confirmed that HCAM cell line comprises malignant cells of liver origin.

Keywords: *Cytological, mouse hepatocellular carcinoma (HCAM), cell line.*

Introduction

Liver cancer is one of the most malignant cancers in the world and the third most common reason for cancer-related death[1]. Hepatocellular carcinoma is a type of liver tumor that is considered to be one of the most common causes of death associated with cancer[2] . Cancer cell lines have been widely used in pre-clinical studies and regarded as primary tools for tumor treatment advance and prognosis of the tumor therapy[3]. Early passages of hepatocellular carcinoma provide a better experimental pattern for the study of liver cancer as it resembles the original tumor[4]. Cytogenetic analysis has been used in cancer cell chromosomes from the perspective of morphology and has provided direct evidence for early tumor research[5]. Also, detection of chromosomal breakpoints and chromosomal abnormalities is performed by chromosomal characterization, that can be related to the deregulation of carcinogenic genes[6]. The population doubling time is an essential characteristic of a cell line that can be associated with an important pathophysiological factor[7]. This study aimed to characterize and analyze the characteristics of the HCAM cell line.

Methodology

Cell Culture: The Murine cell line of Hepatocellular Carcinoma Ahmed Majeed (HCAM) was provided from the Iraqi center of cancer and medical genetics research (ICCMGR), Mustansiriyah University. It was grown-up *in vitro* in serum media of RPMI-1640 (10% fetal bovine serum FBS), 100 µg/ml of each streptomycin and ampicillinthen transferred the suspension to a tissue culture flask at 37°C incubation.

Cytogenetic Study: The cells of HCAM were karyotyped at passages (4, 8 and 12). The protocol adjusted by the cytogenetic laboratory at ICCMGR. Before 6 hours of treatment, change media of HCAM cell line and the cells monolayer were processed with colcemid for 25 min and then scattered with trypsin. The obtained cells were suspended treated with 10 ml of

Corresponding Author:
Ahmed Majeed Al-Shammari
Experimental Therapy Department, Iraqi Center for Cancer and Medical Genetic Research, Mustansiriyah University, Baghdad, Iraq
e-mail: ahmed.alshammari@iccmgr.org

solution (KCl) for 45 minutes at 37°C and then fixed in fix solution glacial acetic acid and methanol (1:6, v/v). The cell suspension was dropped onto a glass slide and the chromosomes stained with Giemsa dye, and under the microscope, metaphase of chromosomes numbers were counted[8].

Morphological Observation: At monolayer of HCAM cells, the cells fixed in 4% formalin for 5 min, then washed the fixed cells in three times of tap water for 5 min, and after dehydrated the cells in ethanol (70%, 90%, and 100%) at ascending grades. Moreover, stained with H & E stains for observation by inverted microscope [9].

Cell Growth Curve: The growth rate of HCAM cancer cells was obtained by reaching the cells at the number (10000 cells/well) into ten tissue culture flasks (25 ml). By using a Neubauer hemtocytometer, cells were counted at 24-hour intervals for ten days at passages (5, 9 and 12) and the average value of duplicates was used to estimate the doubling time (DT) and scheme their growth curve. The HCAM cells (DT) were calculated with the aid of Graph Prism 5.0 software by exponential growth equation.

The following formula used to determine (DT):

Doubling time (hours) = 0.693 (t – t0)/ln(Nt/N0).

(t) : the time in hours, (t0): the time at which exponential growth occurs, Nt: the cell number at time t, and (N0): the cell number at t0[10].

Genomic DNA isolation: The genomic DNA was extracted directly from the cultured HCAM cells using manual Animal Genomic DNA Isolation Kit (Applied Biological Materials, Canada) according to the manufacturer's instructions.

PCR: The PCR reaction for the P53 gene amplification is described briefly as following; The primer pair of P53 gene is forward 5'-GCG TAA ACG CTT CGA GAT GTT-3' Reverse: 5'-TTT TTA TGG CGG GAA GTA GAC TG-3', used to amplify a fragment of 400 base pairs (bp). In the PCR test, five µL DNA was denatured and used as a template. The PCR reactions were carried out in (Agilent 8800 gradient PCR) (Agilent Technologies Stratagene, United States). Briefly, the PCR reactions were performed in 25 µL containing RNase -free water 7.5 µL, Herculase II PCR 2× Master Mix 12.5 µL, forward primer one µL and reverse primer one µL, DNA template 3 µL . Reverse transcription was carried out at 45°C for 5 min and one initiate denaturation cycle at 72°C for 1 min PCR reactions were subjected to 40 cycles consisting of denaturation for 20 seconds min at 95 °C, different annealing temperature for 20 seconds at 59.5°C, and 60.5° C, sequentially. Extension for 30 seconds at 72°C and one final extension cycle at 72°C for 5 min. In the end, 50 µL of the reaction mixture with five µL loading dye then loaded on a 1% (w/v) agarose gel, containing three µL ethidium bromide, for electrophoresis and visualized by VISION Gel Documentation System (Scie-Plas, Cambridge, UK).

Sequencing: Sequencing reactions were performed to the purified PCR products in both directions by using 3730XL DNA Analyzer (Applied Biosystems Inc, USA). The complementary sequences were aligned using ApE (A plasmid Editor) software (v2.0.55, May 4, 2018). Sequencing was accomplished at the National Instrumentation Center for Environmental Management (NICEM), College of Agriculture and Life Sciences, Seoul National University (South Korea). [11]. The obtained nucleotide sequences of the P53 gene of HCAM isolate were submitted to GenBank under the submission ID: 2235321.

Statistical Analysis: The statistical analyses were accomplished by Graph Pad Prism version 7 (Graph Pad Software, Inc., La Jolla- CA- USA).

Results and Discusion

Maintenance of HCAM cell line: The hepatocellular carcinoma of murine (HCAM) were applied by (ICCMGR). Hepatic cancer cells were maintained in serum media of RPMI 1640 (10% FBS). The cells were incubated at 37°C (figure-1). Cells were passaged twice a week in tissue culture flask (50 ml size), usually at approximately 80% confluence (Figure 2).

Morphology Observation: Microscopic observation found that hepatic cancer cells had polygonal multipolar epithelial-like cell shape, with polymorphism of nuclear and several nuclei in most of the cells, in addition, most of the cells which expressed the features of cell shape (Figure-2).

Cell growth and doubling time analysis: The growth kinetics of HCAM cells were elaborated at passages (5, 9, and 12). From the 24th hour of incubation, the HCAM cells began to grow, and the difference in

growth speed became after 74 hours figure (1-2). The population doubling time for HCAM was 17 hours. The growth curve was shown in Figure (3-A).

Chromosomal Changes: Chromosomal changes were determined during the characterization of hepatocellular carcinoma by karyotype analysis. The results indicated that HCAM cells showed numerical aberration from 80 to 100 chromosomes Figure (3- B). However, both cells showed abnormal chromosome structure and morphology differences of chromosomes Figure (3 –C).

PCR: Partial P53 gene amplification bands are shown in (Figure-4) The P53 gene product exhibited specific band at 400 bp. Based on P53 gene product partial sequencing NCBI blast result, showed similarity with three partials sequenced P53 gene which is Mus musculus p53 tumor suppressor gene AF190269.1, Rattus norvegicus p53 tumor suppressor (p53) gene, partial cds AH010014.2, and Rattus norvegicus p53 tumor suppressor gene, exon 10 and 11, partial cds; AF190270.1.

This study provides comprehensive information for hepatocellular carcinoma cell line as *in vitro* models of mouse in Iraq.

The cell proliferation rate of HCAM was measured and shown that this line of cells double after 48 h and show a high level of division as a monolayer with 72 hours. It means that this cells number is adequate to communicate with each other and access the average. Several cell lines that show the morphological characteristics that consistent with the differentiation degree of the tumor from which the cell line is derived. An obvious morphological change of HCAM cells was tended to grow in clusters without contact inhibition. These results are inconsistent with[12], it was showed the highest viability and live cells, but the lowest dead cells then passaged at 72 hours. Doubling time (DT) of HCAM is 17 hour, which is more rapid than other HCC. Many of HCC cell lines had doubling time ranged from 24.95 hours to 110.60 hours[13]. Whereas, HSC-Li cell line is more rapid than HCAM with doubling time 8 hours[14]. The differences between other cell lines may be referred to as an external environment or nutrition supplied. Chromosomal aberrations are widely in the malignant tumor, and many of these chromosome changes are potential prognostic[15]. Chromosomes features are characterized by their structure and length abnormalities in contrast with normal chromosomes of mice, which may lead to an increase in the number of cell chromosomes to more than 40. The presence and accumulation of genetic alteration which target genes lead to chromosomal aberration. So, hypo methylation of the repetitive DNA sequences at the centromeric regions in HCC may have led to somatic rearrangements that involve unequal recombination[16]. Methylation of DNA is a critical modification of the epigenetic genome that is involved in many cellular processes regulation including chromatin structure, transcription, inactivation of X chromosome and stability of chromosome, and human diseases are associated with aberrant DNA methylation[17].

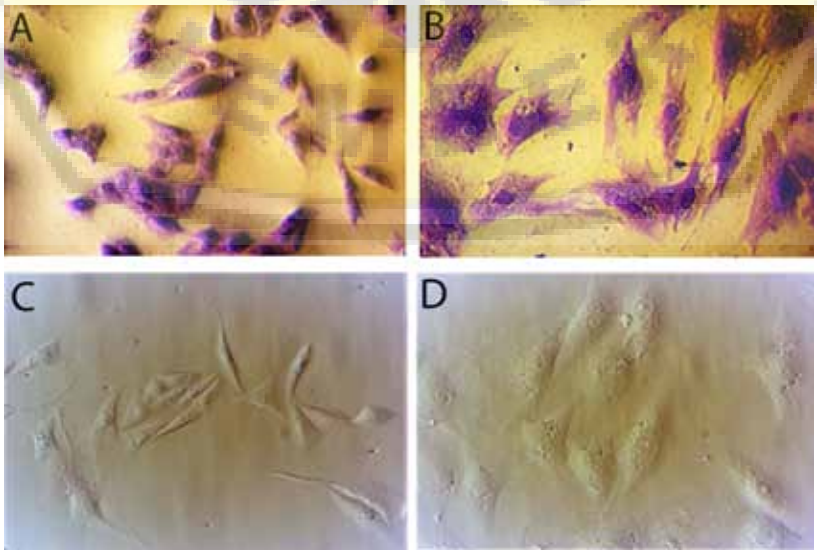

Figure (1): Cell growth and in vitro characteristics of HCAM.

Cells were cultured in a tissue culture flask for 48 hours and then stained with crystal violet, showing epithelial cell with apparent nucleoli A: 24 h 20X, B:24 h 40X (crystal violet dye), C: 24h 20X, D: 48h 40X.

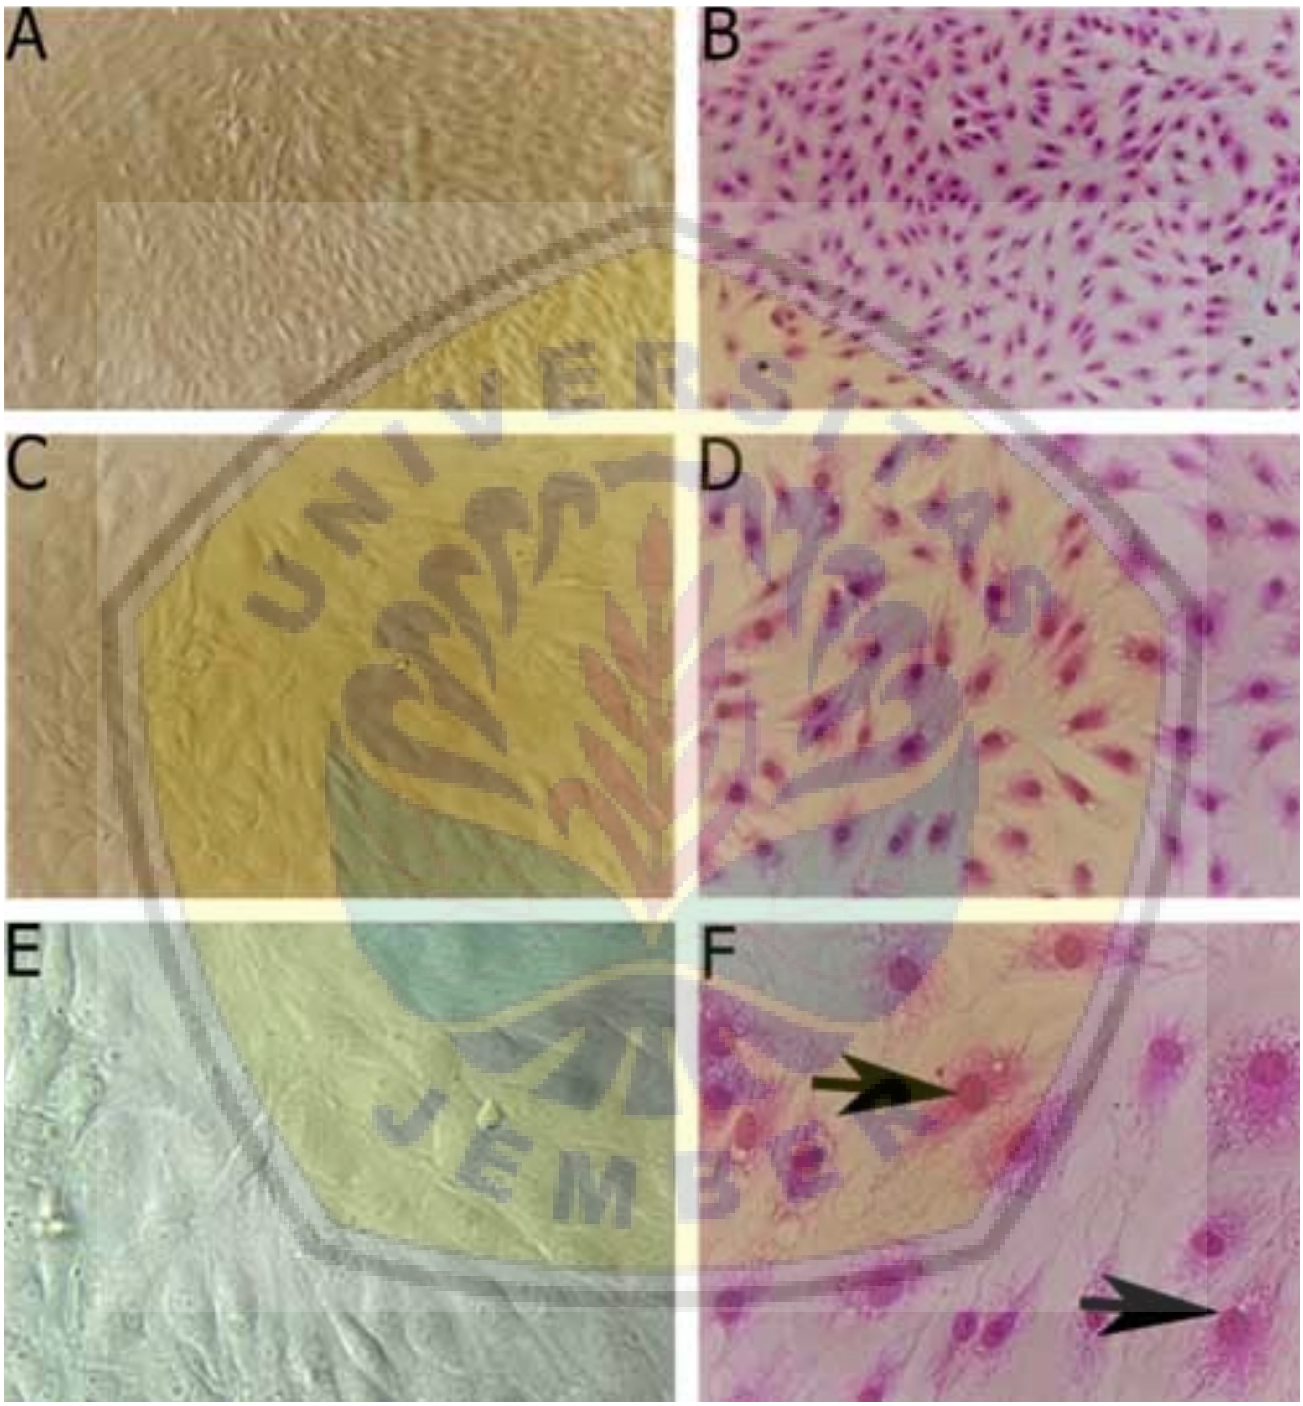

Figure (2): Cell growth and Cell morphology in vitro characteristics of HCAM.

Cultured cells for 72 hours and then stained in H & E stained. (A: X100), (B: X100 H & E stain), (C: X200), (D: X200 H & E stain), (F: X400)(E: X400 H & E stain) showing epithelial cell with nuclear polymorphism and several nucleoli.

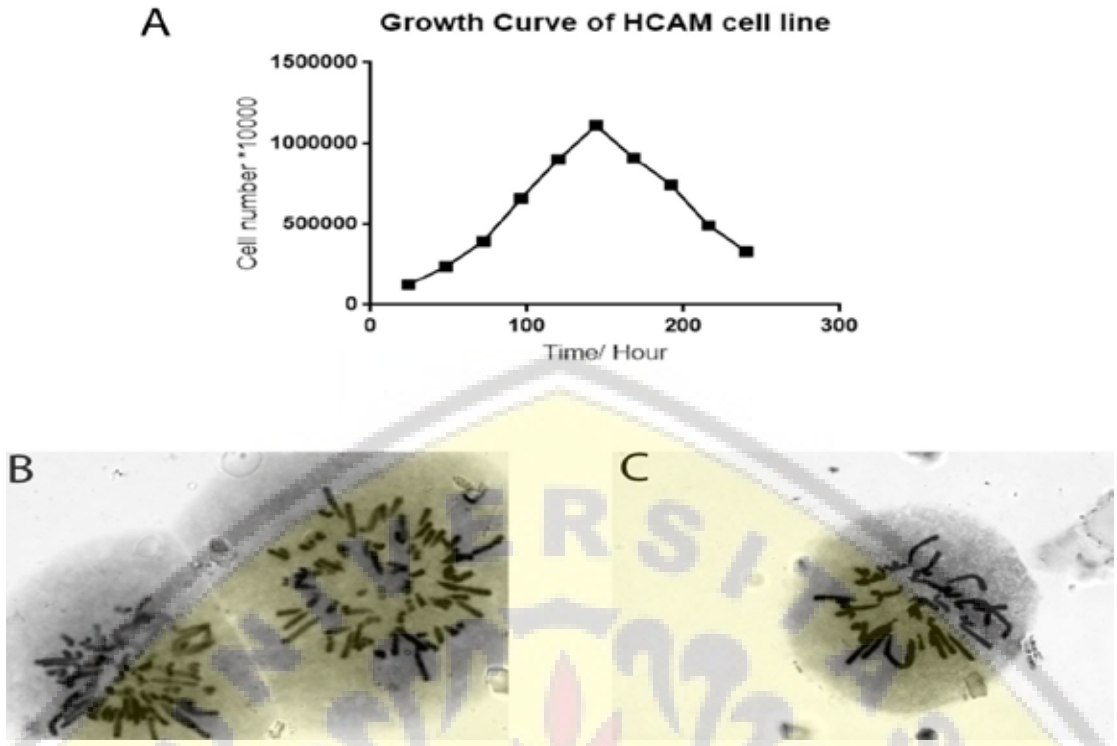

Figure 3: (A) The growth curve for HCAM cell line. (B) Cytogenetic study shows an aberrant number of chromosomes (X1000). (C) Cytogenetic study shows structural changes in chromosomes (X1000).

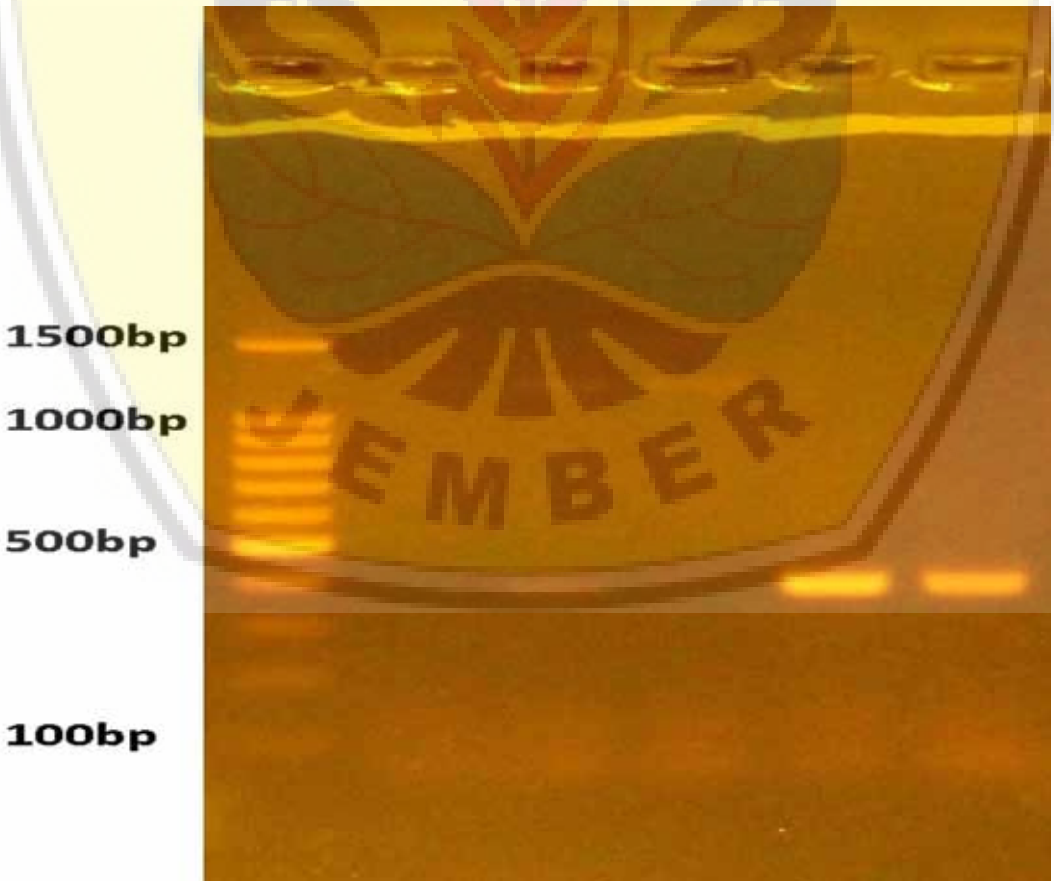

Figure 4: PCR amplification of P53 gene from HCAM cell line, using the forward and the revers primers. The P53 gene product exhibited specific band at 400 bp.

Conclusion

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the college of education, Ibn alhaithum – Baghdad University and all experiments were carried out in accordance with approved guidelines.

Application of Genetic Method in Protection of Potatoes from Pests and Diseases

Omar A. Ahmed Al-tamemi[2], Tatyana Sydorenko[1]

[1]Department of Foreign Languages, Sumy National Agrarian University,
[2]Ministry of Agriculture, Seed Inspection and Certification Department, Crops Field

Abstract

The research was carried out on the experimental ground of chair of biotechnology and phytopharmacology. According to the data received with the aid of chair of arable farming, soil science and agricultural chemistry, the soil of the ground is typical middle- loam heavy dust - like black soil. Humus content - 3.9%.it is clear, that only a small amount (3, 2–12, 6%) did not have external signs of disease according to years and lists. According to the results of performed researches, the beginning of potato vegetation (May month) in 2010 was characterized with humidity deficit (the rate of rain was 19, 5 mm lower, than average for the long period) and high air temperature (average within a month 3, 4°c higher than average long-term).Compared with rogue's mosaic, mosaic torsion of leaves in general was characterized with smaller extension. On its own it had higher extension in 2010 (19, 1% in the first list and 17, 2% in the second). Indicate the high efficiency of growing of selected varieties, which exceeds greatly efficiency of standard sorts Serpanok, Zabava.

Keywords: *Genetic method, pests, diseases.*

Introduction

According to the opinion of Largenumber of researchers, selection and growing or resistant varieties is one of the most efficient ways of getting or stably high potato crops which are justified on ecologic and sanitary and hygiene grounds[1] .As well as manufacture of products free from chemical weed and pest killers in the process of the prurience of e research it was expected to distinguish such varieties, which confirms its timeliness[2].

Connection of research with scientific agenda, plans, topics: The research was carried out in connection with work programs of chair of biotechnology and phytopharmacology.

The purpose of research was to select potato varieties, suggested for growing in Ukraine, which are resistant to the most spread diseases and pests, and which are characterized with other useful economic features.

Research Method: The applied method are generally accepted in the process of performance of the experiments with potato.

Research Novelty: For the first time the varieties were selected in the North-Eastern part of forest steppe of Ukraine, which are resistant to the most spread pests and are characterized with a complex of other useful features, that is Vymir, Latona, Dovira, Roko.[3]

Research Practical Importance: Selected varieties of potato, resistant to the most spread diseases and pests with a complex of other useful features (Vymir, Latona, Dovira Roko)[4], and are recommended for practical use.

Paper Approbation: The paper was presented at meeting of chair of biotechnology anphytopharmacology of Sumy National Agrarian University, conference of students Sumy National Agrarian University (2011).

Publications: The students of Sumy National Agrarian University, December 8-12, 2011 (Attachment A).

Paper Composition and Volume: The diploma paper consists of eight chapters, summary, recommendations for production, bibliography. The paper consists of 91 computer typed pages, contains 14

tables. 6 drawings. 5 attachments. Bibliography consists of 46 items, including 28 items in Latin.

The research was carried out on the experimental ground of chair of biotechnology and phytopharmacology[5]. According to the data received with the aid of chair of arable farming, soil science and agricultural chemistry, the soil of the ground is typical middle- loam heavy dust - like black soil. Humus content - 3.9%.

Weather conditions within the period of performance of experiment were distinct in long-term average annual data. During the majority of ten-day periods of 2011 the air temperature was higher, than before[6]. The higher temperature was also fixed in 2010, when the difference with average long-term temperature in some periods amounted to 11°C. Because of high temperature, the lack of humidity was fixed, especially in 2010 this mach with[7].

Taking into account the presence in Ukraine of areas with invasion of Heteroderarostochiensis Wollenweber, it is important to select the varieties with genetic resistance to eelworms[8]. The data of table No. I confirm that some selective establishments of the country pay attention to selection of such varieties.

Table 1. Classification of varieties, registered in the Registry, according to maturity group and resistance to potato root eelworm (Heteroderarostochiensis) depending on the originator establishment (country) this mach with[8]

Selective establishments of Ukraine, other countries	Varieties, pes.	Including %				
		Resistant to eelworm	Early	Middle-early	Mid-season	Middle-late
Institute for Potato Research of Ukrainian Academy of Agricultural Sciences	38	32	26	26	34	14
Polissia experiment station	25	32	44	40	4	12
Research and Production Association "Chernihivelit-kartoplia" CISC	6	50	33	0	67	0
Institute for Agriculture and Breeding for Western region	4	0	0	25	5	0
Sumy National Agrarian University	8	88	50	38	12	0
Lviv National Agrarian University	3	100	33	0	67	0
Germany	29	76	48	38	7	7
Netherlands	22	73	37	18	27	18

First of all these are Sumy and Lviv National Agrarian Universities, which have higher rate, than the varieties from Germany and Netherlands.

In order to get high crop, it is necessary that varieties have resistance to viral diseases. According to our data (table No. 2) it is clear, that only a small amount (3,2 – 12,6%) did not have external signs of disease according to years and lists according[9].

Besides, the varieties with two or more signs of viral diseases dominated. We selected the varieties with the highest evidence of such resistance that is Vymir[10]. Zaviia Dniprianka, Nezabudka, Vrnisazh, Kuroda and some other, which are considered to bevery essential for growing in areas with great viral diseases shedding. Comparing with fungus diseases under conditions of the North-Eastern forest-steppe of Ukraine, the viral diseases had greater shedding. The data of table No. 2 display difference in showing of resistance to viral of diseases depending on environmental conditions. A number of researches have proved, that adherence to procedure of potato growing, especially application of sufficient amount of balanced mineral and organic feeding, providing of plants with humidity suppress the

signs of viral diseases, that is many viruses are in latent. According to the results of performed researches, the beginning of potato vegetation (May month) in 2010 was characterized with humidity deficit (the rate of rain was 19,5 mm lower, than average for the long period) and high air temperature (average within a month 3,4°c higher than average long-term), which in our opinion was favorable for manifestations of viral diseases. That is why only 6,4% of varieties had no signs of involvement according [11]. We consider that because of lack of genetic control on virus resistance many varieties had signs of two or more diseases.

Table 2. Manifestation of viral diseases among varieties.

Year	List	Estimated pcs.	Including %			
			Symptom-free	Manifestation of		
				One	Two	Three
				Disease (s)		
2010	First	157	6,4	41,3	45,9	6,4
	Second	157	3,2	42,8	50,2	3,8
2011	First	127	5,5	33,5	51,0	10,0
	Second	127	12,6	20,7	50,7	16,0

The last had frequency 6,4% which was equal to the number of varieties without signs of disease: A little less than a half of varieties had signs of two diseases in different combinations.

The data received (table No. 3) attest to the biggest extension of rugose mosaic and mosaic torsion of leaves; Apart from the second list in 2010 the separate manifestation of the firs disease was higher than of the second this mach with[12].

Environmental conditions of 2011 had various influence on manifestation of rugose separately, as well as in combination with other viral diseases. In the first case, the number of plants with signs of disease according to two lists (18,9 and 18,0%) was almost equal matching with[13]. However, while its combination with other diseases, a part of varieties under the first list amounted to a half of varieties under research. The opposite concerned group manifestation of signs of these diseases. Only according to the first list in 2011 the frequency of varieties with rugose mosaic and other diseases was higher. Compared with rugose mosaic[14], mosaic torsion of leaves in general was characterized with smaller extension. On its own it had higher extension in 2010(19, 1%) in the first list and 17, 2% in the second). The opposite was fixed in 2011, when the part of varieties with the signs of disease in the first list was smaller in comparison with the second. Apart from the second list, carried out in 2011, the part of varieties, combining the signs of mosaic torsion of leaves with other diseases, was almost equal (within 34,1-38,0%) However, in the second list in 2011 their number was significantly below (2,3 times smaller in comparison with minimal data rate in 2010 and the first list of 2011). According to some scientists' opinion (44), the variety is a "compromise" between crops. Quality of bulbs and a certain level of resistance to the most spread and harmful diseases. Though on the other hand, differences in genetic control on the stated and other signs allow combining them in one variety, however, it is hard to fulfill it, in witness where of the history of potato selection can be mentioned. Selected varieties with resistance to viral diseases were characterized with manifestation of other economic-essential signs (table No. 4). That is, productivity[15]. Marketability of crop (Dniprianka, Vymir), average mass of bulb (Vymir, Kosen 95), a number of bulbs under the bush. Depending on necessity of presence of the complex of signs, some of them were recommended for growing in the area. Taking into account that higher crops, as well as other economic-essential signs had the varieties of different groups of ripeness, standard varieties in state variety trial were applied as the basic variant.

Table 3. Manifestation of the main economic-essential sings among the varieties, resistant to viral diseases.

Variety	Resistant to viral diseases		Productivity, g/bush	Crop marketability,%	Average mass of bulb (g)	Average number of bulbs, pcs.
	2010 r.	2011 r.				
Vymir	3k8	6/n	709	88	83	9
Zaviya	6/n	6/n	448	84	52	9
Kuroda	Mn18	6/n	539	84	70	8
Dniprianka	3k8	3k8	412	94	52	7
Kosen95	Noj18	6/n	497	85	73	7
Nezabudka	Mn18	Mn18	434	62	42	11
Malynskyibilyi	Mn18	3k8	425	76	43	10
Zernisazh	Ck8	6/n	539	86	61	9

Table 4. Economic efficiency of growing of the varieties, resisters to hazardous organisms.

Variety	Crop, ton/ha	Standard excess, ton/ha	Profit, UAH/ha	Standard excess, ton/ha	Efficiency, %
Standard variety serpanok, basic	20,1	-	16810	-	146
Variety under research vymir	28,9	8,8	28821	12011	243
Variety under research latona	30,4	10,3	27635	10825	226
Standard variety zabava, basic	19,7	-	11174	-	96
Variety under research dovira	40,4	20,7	33972	22798	268
Standard variety yavir, basic	29,3	-	24202	-	203
Variety	38,2	8,9	37835	13633	301

Conclusion

It was determined that the majority of varieties resistant to eelworm (Globoderarostochiensis), suitable for growing in Ukraine, were selected in Lviv (100%) and Sumy (88%) National Agrarian Universities . Manifestation of sign is controlled by gene Ro-l.In the Register of varieties, suitable for growing in Ukraine, there varieties resistant to aggressive pathotypes of potato cancer. The best of them according to complex of economic-essential signs are Vodograi, Svaliavskyi. Gorlytsia. A small number of varieties (within 3,2-12,6% of all accountable) was detected, which have no signs of viral diseases. The majority had the signs of involvement of two viral diseases (45,9-51.0%). According to two lists the most wide-spread (separately or together with other diseases) had rugose mosaic, in 2010-13,2-26,1% and 29,1-33,8% accordingly, and in 2011-18,0-18,9% and 14,2-48,1% . Mosaic torsion of leaves had lower manifestation. The possibility of combination of resistance to Globoderarostochiensis with manifestation of other economic-essential signs was found, which is equalto resistance to viral diseases.

Pattern of Smoking behavior in a Sample of Kurdistan Region People: A Household Survey

Attallah O. Qasem

[1]B.Sc., M.Sc., Department of Community health, Sulaimania Technical Institutes, Sulaimania Polytechnic University

Abstract

Background and Objectives: Worldwide cigarette smoking harms nearly every organ of the body, causes many diseases, and decreases the health of smokers generally. This study will identify the Pattern of smoking behavior in a sample of Erbilan people and find the relationships between smoking behaviors and their socio-demographics characteristics among Erbilan people through household survey in Erbil city, Kurdistan Region-Iraq. A cross-sectional, self-administered, anonymous household survey was conducted in June 2018 among Erbilan people in Erbil city. Analyses are based on 400 participants. A special questionnaire was used. Data on age and gender, smoking behavior of them, number of cigarette smoked per day, and age of starting smoking were obtained. A total of 400 participants of adult's current smoker among Erbilan people in Erbil city revealed that the percentage of current smokers was significantly higher in men than women (91.5%, 8.5% respectively). The highest rate of smokers was among the age group 38-48 year in both sexes. 68.0% of Erbilan people started smoking at the age of 18-21 years.

Keywords: *Smoking behavior, Erbil, household, Kurdistan region, Iraq.*

Introduction

Globally cigarette smoking harms nearly every organ of the body, causes many diseases, and reduces the health of smokers in general[1,2]. Tobacco smoke contains many chemicals harmful that are harmful to both smokers and nonsmokers[3]. It is comprise more than 7,000 chemical in tobacco smoke, at least 400 of which are known and proven to be harmful and carcinogenic, comprising of hydrogen cyanide, carbon monoxide, and ammonia, in addition among the 400 known harmful chemicals in tobacco smoke, at least 69 can cause cancer[4,5]. Worldwide, tobacco use causes nearly 6 million deaths per year, and current trends show that tobacco use will cause more than 8 million deaths annually by 2030[6]. Cigarette smoking is responsible for more than 480,000 deaths per year in the United States, including nearly 42,000 deaths resulting from secondhand smoke exposure, by other mean one in five deaths annually[8], or 1,300 deaths daily. More than 16 million Americans are living with a disease caused by smoking, for every person who dies because of smoking; at least 30 people live with a serious smoking-related illness[9]. The risk of death in the smokers measured by the number of cigarettes smoked daily, the duration of smoking, the degree of inhalation and the age of commencement[1], also smokers die 10 years earlier than nonsmokers whereas their direct relationship between smoker age with risk of death by cigarettes[10]. It is predicted that 20% of women worldwide will be smokers by 2025 when compared with 12%[11]. Furthermore, smoking causes more deaths each year than the following causes combined as Human immunodeficiency virus (HIV), Illegal drug use, Alcohol use, Motor vehicle injuries, Firearm-related incidents[12]. Moreover, smoking causes about 90% of all lung cancer deaths in men and women,

Corresponding Author:
Attallah O. Qasem
B.Sc., M.Sc., Department of Community health, Sulaimania technical Institutes, Sulaimania Polytechnic University
e-mail: atta.kasem@spu.edu.iq
Tel: 00964(770)1571226

also women developing lung cancer by 25.7 times[1], about 80% of all deaths from chronic obstructive pulmonary disease (COPD) are caused by smoking and besides that 12 to 13 times more likely to die from COPD than nonsmokers, also more women die from lung cancer each year than from breast cancer, cigarette smoking increases risk for death from all causes in men and women[2]. Cigarette harder for a woman to become pregnant and can affect her baby's health before and after birth and also increase risks for birth defects and miscarriage, likewise affect men's sperm, which can reduce fertility [4]. Additionally, smoking is causes type 2 diabetes mellitus and can make it harder to control; the risk of developing diabetes is 30–40% higher for active smokers than nonsmokers, whereas smoking causes general adverse effects on the body[13]. Nonetheless percentage of U.S. adults aged 18 years or older who were current cigarette smokers [4]: 16.8% of all adults (40 million people): 18.8% of males, 14.8% of females, more than 29 of every 100 non-Hispanic American Indians/Alaska Natives (29.2%), nearly 28 of every 100 non-Hispanic multiple race individuals (27.9%), More than 18 of every 100 non-Hispanic whites (18.2%), more than 17 of every 100 non-Hispanic Blacks (17.5%), about 11 of every 100 Hispanics (11.2%), More than 9 of every 100 non-Hispanic Asians 9.5% [4]. Thousands of young people start smoking cigarettes every day, daily more than 3,200 people younger than 18 years of age smoke their first cigarette, an estimated 2,100 youth and young adults who have been occasional smokers become daily cigarette smokers [14]. In 2011 nearly 7 in 10 (68.9%) adult cigarette smokers wanted to stop smoking. Approximately 100,000 U.S. smokers are expected to stay quit for good as a result of the 2012 (*Tips from former smokers)* campaign [15]. Likewise, the tobacco industry spends billions of dollars each year on cigarette advertising and promotions, in 2012, $9.17 billion was spent on advertising and promotion of cigarettes more than $25 million every day, or more than $1 million every hour[16]. Smoking behavior may not be nearly as fixed or stable among young adults as is generally assumed. In recent survey data, as many as one fifth of smokers reported starting smoking after the age of 18 a substantial increase over historical norms. Even among smokers who first try smoking in their youth, ''regular'' or daily smoking may not develop until much later, typically between the ages of 20–21. The variable patterns of tobacco use among young adults may partly be explained by the significant life transitions experienced by young adults[17]. In the United States the risk of dying from cigarette smoking has increased over the last 50 years in men and women. Smokers are more likely than nonsmokers to develop heart disease, tuberculosis, certain eye diseases, asthma, blood disease, strokeandlung cancer and estimated to increase the risk for coronary heart disease by 2 to 4 times [14], which causes diminished overall health and increased absenteeism from work and increased health care utilization and cost.

Materials and Method

A cross-sectional survey was conducted in June 2018. Criteria for inclusion in the study were Erbilan people in Erbil city. Erbil city is a capital of Kurdistan Region-Iraq, which has a population of approximately (1.487.266) million people depending on the statistical data retrieved from Kurdistan region statistic office of Ministry of Planning in the Government of Kurdistan region- Iraq in 2015. A multiple cluster sampling method was usedto select 400 adult current smokers from Erbilan people in Erbil city. A closed-end questionnaire was conducted with individual participants of current adult smoking of Erbilan peoplerandomly by distributed 400 questionnaires to partakers through household survey. Data was collected through direct face-to-face interviews technique (self-administration). The sample comprised from both genders (male and female) of the eligible participants and excluded all other not Erbilan people. The data collected included socio-demographic information such as age, gender, education leveland socioeconomic status. Frequency distributions were used to describe the data. Regarding statistical analysis, (SPSS version 18) used for data entry and analysis of the result, Chi-square test has been used in the present study for determining the significance of the result, P value equal to or less than 0.05 ($P \leq 0.05$) was considered as statistically significant. The modified questionnaire used items from an instrument developed by the WHO and Centers for Disease Control and Prevention (CDC). Also a pilot study done by choosing twenty persons, who are not included in the study, have been asked to fill the questionnaire to identify and correcting the weakness of the questionnaire before using it with real respondents. Also, during the present study, the questionnaire has been distributed and explained to all participants in order to make it more reliable and valid. Sample size was determined using a confidence level of 95% with 5% degree of precision of the expected proportion and estimated prevalence of 12%.

Results and Discussion

Of the 400 participants of Erbilan people agree to participate to survey between the ages of 18 to 59+ years, the percentage of current smokers was significantly higher in men than women (91.5%. 8.5% respectively). Moreover, the current adult smokers were higher in age group (39-48) years old about 68.0% of Erbilan people, and also the level of education of Erblian smokers were higher in level of (no education) by 77.8%.

Likewise, the percentage of level income of current smoker was higher of (bad) socioeconomic status approximately 61.8% in most Erbilian family as revealed in Table 1.

As shows in table 1 the age (39-48) group of the age first start smoked among Erbilan people was higher in age group (18-21) old years old group about 60.0% which (X^2 = 208.493[a], p value=.0001). While in same table, the number cigarette smoke per day was higher among group how smoke (31 or more) about 86.8%. Furthermore, among whom craving of cigarette was higher among (often) group about 72.5% as revealed in table 2. Nonetheless, the percentage of number of packs was higher in among respondent who smoke (more than 1000 cigarette) group about 88.2%. Finally, the ratio of participants how soon after wake up usually smoke first cigarette was between groups (31-60 minutes) about 61.2%.

Another results described during the present survey about reason for regular smoker in gender was differ among men and women of adult current smoker, which in men were 309 participants (84.4%) higher in (Smoking made me feel less stressed and helped me focus and concentrate better) group. while in women were 33 participants (97.1%) higher in (Smoking helped me control my weight) group which (X^2 = 208.493[a], P = .0001).Furthermore, the reason of regular smoker of age group (39-48) years old was higher by percentage 71.7% in (Smoking made me feel less stressed and helped me focus and concentrate better) groups which (X^2=51.093[a], P = .0001). However, the reason of regular smoker in income level was identified in (bad) socioeconomic status by percentage 85.4% in (Smoking made me feel less stressed and helped me focus and concentrate better) group which (X^2=82.858[a], P = .0001).

Table 1: Demographic characteristic of the 400 participants among Erbilian current adult smoker

Variable	Frequency	%
Gender		
Male	366	91.5
Female	34	8.5
Age		
18-28	20	5.0
29-38	17	4.3
39-48	272	68.0
49-58	81	20.2
59+	10	2.5
Level of Education		
No education	311	77.8
Basic (Primary/intermediate)	75	18.8
Secondary	12	3.0
Higher education	2	0.4
Income Level		
Bad	247	61.8
Middle	141	35.2
Good	12	3.0

This study described the pattern of smoking behavior among Erbilain people and the relationship between smoking style and demographic factors in a population-based on sample of over 400 current adult smokers in Erbil city. Whereas, smoking behavior is one of the most studied of human behaviors and thousands of studies have documented its health consequences. The present survey discovered that the percentage of adult current smokers were higher in males than females. Furthermore, in a recent nationally representative study across 187 countries, large reductions in the estimated prevalence of daily smoking were observed between 1980 and 2012; for men, the prevalence decreased from 41% to 31%, and for women it decreased from 11% to 6% or 1.7% per year[31]. These data also illustrate that the global percentage of current smoking is nearly five times as high in men as in women; however, substantial differences between countries exist[32]. In the UK, 20% of men and 19% of women are current smokers[30]. Cigarette smoking became prevalent among men before women, and smoking prevalence in the United States has always been lower among women than men [9]. Likewise, a survey on 4361 adolescents living in Tehran (Iran) indicated that 30.7% of boys and 20.6% of girls had smoked hookah[20].

Table 2. Shows the number of cigarette do smoke per day

			How many cigarette do smoke per day				Total
			10 cigarettes or less	11-20	21-30	31 or more	
Gender	Male	Count	0	3	26	337	366
		% within gender	.0%	.8%	7.1%	92.1%	100.0%
	Female	Count	1	0	23	10	34
		% within gender	2.9%	.0%	67.6%	29.4%	100.0%
Total		Count	1	3	49	347	400
		% within gender	.3%	.8%	12.3%	86.8%	100.0%
Age	18-28	Count	0	0	13	7	20
		% within age	.0%	.0%	65.0%	35.0%	100.0%
	29-38	Count	0	0	3	14	17
		% within age	.0%	.0%	17.6%	82.4%	100.0%
	39-48	Count	1	3	33	235	272
		% within age	.4%	1.1%	12.1%	86.4%	100.0%
	49-58	Count	0	0	0	81	81
		% within age	.0%	.0%	.0%	100.0%	100.0%
	59+	Count	0	0	0	10	10
		% within age	.0%	.0%	.0%	100.0%	100.0%
			0	0	13	7	20
Total		Count	1	3	49	347	400
		% within age	.3%	.8%	12.3%	86.8%	100.0%

Conclusion

Cigarette smoking is prevalent among Erbilian adults in Erbil city, particularly males higher than females, most of who begin to smoke rather early in life and continue for many years. Health and an awareness of risks of smoking should be the cornerstone for any organized tobacco control activities, which are urgently needed to combat the expected future epidemic of smoking-related health problems. In conclusion, this study reports and comments on the ongoing high percentage of current male smokers among Erbilan people. It raises awareness that unless public health efforts are taken broadly and comprehensively, tobacco will remain a big issue in public health problem. Public health policies and action need to focus on high risk sub-populations identified through this survey, principally adult males from a lower income group, and with less formal education.

Effect of Rehabilitation Program Using Electric Massage in the Treatment of Muscle Spasm with Racine Femoral of 400 Meters Barriers

Ali Bukheet Hassan

Lecturer, Physical Education and Sports Sciences, University of Kufa

Abstract

The aim of the research was to use the electrical stimulation EMS type body relax in the treatment of muscle spasms of the muscle with the femoral thighs of the contestants 400 m contraindications. The researcher assumed the electrical massage used positive influence in the treatment of muscle spasms. As for the research methodology, the researcher used the experimental method of one group. The research community determined that 400 meters of contraindications for the muscles of the thighs of the 400 meters of the contenders in Najaf. The sample of the research was (6), And used the form of measuring the degree of pain according to the test and the physical tests Schober and the rehabilitation program and the use of the technique of electrical stimulation EMS of muscle relaxant and the researcher used statistical program spss and from using the following statistical means (median, spring deviation, The electrical massage of the muscle relaxation a major role in the lower the level of muscle spasms and improve the flexibility of 400 meters contenders.

Keywords: *Rehabilitation program, treatment of muscle spasm.*

Introduction

What has happened in terms of training and treatment in the world has been the result of scientific studies programmed according to the correct directions and the effective use of the results of research and studies that have the key role in reaching scientific facts [1] that contribute to the development of the level of treatment and rehabilitation of injured players and the speed of the return of the player to field. And athletics events from the events that specialists have developed through the use of all means that increase the player's physical and functional potential [2], especially through the appropriate ways and means for the players and through the equipment and devices used by athletes in the training modules, but the high intensity used in training and frequent repetitions lead to Increased pressure on the muscles causing the mother and spasms in the working muscles and this requires the use of modern techniques to overcome such cases as the technology of the newly used in the training and therapeutic this technique can be used to eliminate muscle tension injuries, especially in the muscles of the two men and in a special current for this purpose known as body relax [3]. This type of current acts on the relaxation of the muscles. Hence the importance of research in the use of electrocardiogram technique for the treatment of muscular tension in the lumbar region For the players of 400 meters barriers in clubs Najaf province. Physical strength is an activity that needs to mobilize maximum muscle strength to overcome weight of gravity[4]. These weights cause pressure on the spine, especially the lumbar spine, causing pain in the lower back area As a large proportion suffer from this injury[5] and most rehabilitation programs for this injury need a relatively long period of time from the moment of pain relief until the arrival of the player to the normal situation that was before the injury and this period may reduce the motivation of the player to implement the rehabilitation programs correctly than It leads to chronic pain in the lower back area. Therefore, the researcher saw the use of electrical stimulation EMS and body relax to eliminate muscle tension and thus eliminate the pain [6] of the lower back of the players of physical strength.

Search Goals: The use of electric massage technique to get rid of muscle strain in the muscle with

thoracic thigh. Identification of the effect of electric massage in the relief of convulsions in the muscle with thoracic thigh.

Methodology

The researcher used the one-group experimental approach as the most appropriate method to solve the research problem.

Community and Research Sample: The research community was identified as 400 meter players in Najaf Governorate who suffer from chronic muscle cramps and muscle spasms in the lower back. The sample consisted of (10) players and a sample of them was chosen by (6) players who were selected by the intentional manner, ie 60% of research community .

Means of collecting information, instruments and tools used: The researcher used more than one means that can help him to reach the facts. Many research tools have been used to ensure that accurate and accurate data are obtained to fulfill the research requirements, including:

Information gathering method:

Arab and foreign sources

- Observation and experimentation.
- Testing and measurement.
- Questionnaire.

Devices and tools used:

- A stimulus electric muscular chinese – made .
- Fitness room
- Tape measure
- Electronic timing clock type (Dimond) number (1).

Field Research Procedures:

Identification of research tests:

First: Measure the level of pain according to the range of motor (1).

The level of pain was measured through a pre-prepared form where the motor ranges can be measured according to the Shopper test to determine the extent to which the injured player suffers.

- **Shopper test:**

Purpose of the Test: Measure the elasticity or amount of the extension that occurs in the biceps brachial muscle.

Description of the Test: From lying position the therapist raises the injured leg up and determine the angle of the thigh at the limits of the level of pain.

Recording Method: Measure the distance between the feet player and earth and record the degree of pain as feel the player and record reading (the amount of flexibility).

Scientific foundations of tests

First: Validate the test: In order to verify the validity of the tests, the researcher relied on honesty through presenting the tests to experts and specialists to determine the most reliable. All of them (100%) agreed on the validity of these tests and applied them to the members of the research sample.

Second: the stability of the test: In order to calculate the coefficient of stability of the test, the researcher used the method of (midterm fragmentation), where the test was applied on Saturday (19/1/2019) at four o'clock in the afternoon and the test was divided into two groups of individual and husband The researcher worked to extract the correlation coefficient between the two parts as in Table (1).

Third: Objectivity: For the purpose of extracting the objectivity of the test in this study, two arbitrators were used to present the results of the tests applied to the sample items and then were statistically processed by extracting the coefficient of correlation (Pearson) to express the coefficient of objectivity.

Pre-Tests: The researcher conducted the pre tests for the research sample on Monday (21/1/2019) at 2:00 pm in the Youth Forum of Kufa/Najaf.

Main Experience: The researcher used electric massage technique EMS and body relax type, which accompanies simple exercises of muscles to relieve cramping and muscle contraction and reduce the level of pain and rehabilitation of muscles with Racine femoral . The implementation of the main experiment prepared for members of the research sample on Sunday (23/1/2019) and for (6) week by two sessions per day, noting that the

time of the session does not exceed 20 minutes and thus the number of sessions of qualifying implemented (14) session The objectives of these sessions to the following:

1. Increased relaxation of the femoral muscle.
2. Reduce the frequent muscle contractions that produce abnormal muscle spasms of the thighs.

These sessions were performed by wearing shorts that contain the electrodes attached to the muscle with the femoral thigh and through the body relax icon of the muscular relaxation is increasing the current of the pole on the muscle and after completing the exercises simple conditioning accompanying the electric massage.

Post-tests: The researcher conducted post tests for the members of the research sample on Thursday (31/1/2019) at 4 pm at the Youth Forum of Kufa/Najaf and the same method of pre testing.

Statistical method used in research: The researcher used the statistical program spss. The following laws were used:

- Mediator.
- Spring deviation.
- Wolukoxin test.
- Arithmetic mean.
- Standard deviation.
- Pearson's simple correlation coefficient.

Presentation, analysis and discussion of results.

Present the results of the differences in the values of the variables investigated.

Table (1): Showing the values of the median, the spring deviation, the calculated value of wolukoxin, the level of significance for the level of pain, and the elasticity of the lower back muscles for pre-and post-test

T T	Variables investigated	Pre - Test		Post-test		Calculated value	Level of significance	The result
		Mediator	Spring Deviation	Mediator Mediator	Spring Deviation			
1	The degree of pain	4.75	0.65	3.5	0.53	3.064	0.02	Moral
2	Lift the leg up from lying position	45.5	0.53	52.57	0.74	0.061	0.02	Moral

Level of significance (0.05): Table (2) shows that the nature of the individuals in the study sample showed significant differences between the pre and post tests in the degree of pain and elasticity of the posterior thigh muscles to the front and upper. The values of the variables were used by the wolukoxin test for the interrelated samples to extract the differences, which was the pain level that reached the calculated value (3.64) And the level of significance (0.02), which is below the level of significance (0.05)

Which indicates that there is a significant difference between the pre-test and the post-test and for the post-test in this variable. The researcher believes that the reason for this development was the result of the use of body massage, which in turn helped to alleviate the pain in the biceps femoral members of the sample, The value of the leg forward and higher was calculated at (3.61) and the level of significance (0.02), which is less than the level of significance, indicating a significant difference between the two tests.

The results of the research showed that the results of the study showed significant differences, ie, there is a difference between the tests of the pre-test and the post-test and for the benefit of the post-test and notes through the effect of electrical massage of the body relax in the reduction of pain levels clearly, ie reduce muscle spasm resulting from stress and the repeated pressure on the lower back muscles due to the high load of training or weights raised in the exercises and thus increase the possibility of the player to perform movements in this area without feeling pain or discomfort during physical performance as the pain factor causes It impedes the

work of the functional muscles and affects the movement and causes inflammation that hinders the work of the muscles as well as affect the ability of joints to move and there is a common relationship between pain and dynamic determination in the region so it is normal to improve the ranges of motor and maximum strength and handling Strength as a result of reduced pain.

Conclusion

The researcher concluded through his experience that: The electric massage for muscular relaxation have a clear effect on the pain level of the sample. Increasing the long - motor range of infected leg to racer 400 meters barrier.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Physical Education and Sports Sciences - University of Kufa and all experiments were carried out in accordance with approved guidelines.

Assessment of Nurses Knowledge Regarding Prevention and Precautions for Patients with Hepatitis in Diwaniya Teaching Hospital

Duaa Ali Hassan[1], Fakhria Jaber Muhbes[2]

[1]MSc Student in Nursing Science from Collegeof Nursing-University of Babylon. Babylon Province, Iraq,
[2]Ph.D. Nursing Science from College of Nursing-University of Babylon, Babylon Province, Iraq

Abstract

Objectives: To assess nurse's knowledge regarding prevention and precautions of hepatitis, and find out the relationship between nurses knowledge regarding hepatitis prevention and precautions with selective socio-demographic variables. A descriptive study was conducted at medical or surgical ward and hemodialysis center unit in Diwaniya teaching hospital. The study was carried out from (1st September 2018) to (12th May 2019), A purposive (non-probability) sample was selected (100) from nurses that working medical or surgical ward and hemodialysis center unit in Diwaniya teaching hospital. The instrument was presented to (17) experts from several universities to be valid, the reliability of the instrument was determined through the implicated the Cronbach's Alpha, the reliability of this instrument was (r = 0.81). The result of study was showed that The represented (69%) nurses had a moderate knowledge towards Prevention and Precautions of Patients with Hepatitis in AL-Diwaniya teaching hospital. In addition, the present study pointed out there was no significant relationship between among nurses knowledge regarding prevention and precautions of patients with hepatitis in Al-Diwaniya Teaching Hospital and their demographic characteristics at p-value >0.05. Excepting with their education has been associated significantly at p-value ≤ 0.05.

Keywords: *Assessment; Nurse; Knowledge;Prevention;Precautions; Patients; Hepatitis.*

Introduction

Viral hepatitis virus are a transitional illness which affected liver of the human body and is transmitted from one person to another can be caused by viruses, which consists of five types and three of viral hepatitis are essential in public health care which included hepatitis A, B, and C virus. Both virus of hepatitis B and hepatitis C infection reasons around 80% of hepatocarcinoma (HCC) that considered the fifth widespread cancer in men and the seventh most common in women [1].In addition to, hepatitis is an essential contagious disease which challenges to health worldwide and infectious disease that caused equally of the morbidity which divided between settings in high-income and low-income. Also, HAV and HEV is similar in transmutation and incubation period, while HBV, HCV, and HDV are chronic diseases of the liver caused by the fibrous thickening of tissue and scarring of connective tissue and hepatocarcinoma[2] viral hepatitis in many countries that have various strategies and by application of these strategies will help in prevention and controlling this disease. Proper effective strategies and policy-making are tools to achieve these goals. In 2013, the World Health Organization a report published about prevention and control of hepatitis that described countries status around a world concerning systems, plans, and strategies that use for hepatitis program. Despite many barriers, there are such as still a lack of accurate data on the infection, efforts adequate policies for fighting hepatitis, knowledge in the community and service providers, sufficient funding, and the use of the guidelines and standardized procedures. Other challenges include the lack of up-to-date diagnostics and the adoption of treatments that are not evidence-based[3]. In US of hepatitis C virus is a widespread virus that infected Americans approximately more than 4 million and about (2.7 to 3.9) million did not recover and had a chronic infection at some time in the past[4]. Nurses are a danger face which

life threaten during contact with blood and body fluids or accident exposure which contagion through blood-borne pathogen especially HBV and HCV[5]. Therefore, nurses role are very important about standard precautions, also every nurse should be educated around the basic rules of standard precautions and protocols of infection control to prevent all nurse from getting an infection. Training needs to be implemented starting in the wards through the unit manager to improve the entire nurse's knowledge and practice [6].According to the Centre for Disease Control guidelines universal precaution is a group of activity which is required to prevent infections from blood borne or body fluid-borne infection or protect health workers and patients from infection. As well as, four essential practices in universal precaution are hand washing, prevent direct contact by using protective barriers, safe handling, and disposal of sharps. Most important pathogens related to universal precautions are HBV and HCV [7]. In addition to, vaccine which prevent spread infection and also, it is available in the US ago 1995 and 1981 and uses to prevent infection with HAV and HBV. however, hepatitis C virus with infected persons have no active immunization and acute infections of hepatitis C virus without antiviral treatment can be a chronic disease and cause damage of liver tissue which lead to death [8].

Method

A descriptive study was conducted at medical or surgical ward and hemodialysis center unit in Diwaniya teaching hospital. The study was carried out to assess of nurses' knowledge regarding prevention and precautions of hepatitisfrom (1st September 2018) to (12th May 2019), A purposive (non-probability) sample was selected (100) from nurses that working medical or surgical ward and hemodialysis center unit in Diwaniya teaching hospital at Diwaniya governorate, the instrument was presented to (17) experts from several universities to be valid, the reliability of the instrument was determined through the implicated the Cronbach's Alpha, the reliability of this instrument was (r = 0.81), The data analyzed was conducted through the application of "descriptive statistics (frequencies", "percentages", "mean of scores", "Standard deviation") and "inferential statistics (Chi-squared test)", the data was collected by utilizing the questionnaire which included two parts:

Part I: Demographic data and professional information of the sample include (Age, Gender, Educational level, socio-economic status of the nurses, level educational, total years of experience in the nursing field, and training courses).

Part II: This part consists of (5) elements which include measurement of knowledge related to nature of the hepatitis which contain(20) items, measurement of knowledge related to transmission of hepatitis contain(18) items, measurement of knowledge related to prevention and precaution of hepatitis contain (16) items, measurement of knowledge related to precautions in giving injection to patients with hepatitis contain(6) items, while measurement of knowledge related to management and treatment of patients with hepatitis which contain(13) items. It consisted of (86) questions as multiple choices, each question has (3) choices and was scored through giving I known answer (3), uncertain (2), and I don't known (1).

Results

This figure (1) concerned with assessment all domains about the knowledge of nurses regarding nature transmission of hepatitis, (74%) and (70%) had moderate knowledge. As well as, the knowledge regarding prevention, giving an injection, and treatment hepatitis (59%), (61%), or (41%) them respectively had a high level of knowledge. The overall represented (69%) nurses had a moderate knowledge towards Prevention and Precautions of Patients with Hepatitis in AL-Diwaniya Teaching Hospital. There was no significant relationship between nurse knowledge and their demographic characteristics, p-value (> 0.05) except the number of education level related to hepatitis there was a significant relationship at p-value (< 0.05).

The study was conducted in three areas at AL-Diwaniya teaching hospital which include (35%) of nurses were working in the surgical department, also (35%) in the medical ward department, and only (30%) were working in a hemodialysis center, these findings were agree with (13). The findings pointed out that the majority of the nurses (38%) their ages between (20-24) years old, these findings were agree with [14,15].Regarding gender results which the percentage of females was high at about (58%) and (42%) of males because females are more numerous than males where they chose the sample and some males also refused participating in the study. The result was compatible with [16]. Highest proportion findings were made sufficient income, it constituted (60%). Only a small percent (3%) were insufficient economic status, this result agreed with[19].

The study result showed that the most of those were married and constituted (60%) out the total number and (30%) were nurses single in the study group, this means the number of nurses married is higher than the number of nurses single, this result agreed with[13]. In view of a large number of medical institutes were found in the hospital most of the nurses were instituted graduated, is composed (35%). On the other hand, where their years of experience was (1-4) years they were trained in our country, This result agreed with[21]. Also, the results of years of experience agree with the result of [22] that explain years of experience job was(1–5) years and composed (47%) was higher among primary health care workers in Saudi Arabia. The majority (69%) of nurses were moderately knowledge towards Prevention and Precautions of Patients with Hepatitis in Diwaniya Teaching Hospital. It could be mentioned that the knowledge score pattern was comparable but the values were different. It might be due to the fact that the number of items set for the questionnaire by the authors was different for different studies. The majority of overall knowledge of the nurses towards prevention and precautions of patients with hepatitis in Al-Diwaniya teaching hospital(69%) were moderately knowledge. Also, this result agreed with the finding study in South Africa 2015 and the overall mean knowledge score for health care professionals was adequate knowledge regarding viral hepatitis notification. The results depict there was a no significant association between nurses their knowledge related to nature of habitats and their demographic characteristics at p-value >0.05.except their education, there were significantly associated at p-value ≤ 0.05. In addition to, the resultsdepicts there was a no significant association between nurses their knowledge related to the transmission of habitats and their demographic characteristics at p-value >0.05 except with their training course there were significantly associated at p-value ≤ 0.05. Moreover, there results was no significantly association between nurses their knowledge related to prevention of habitats and their demographic characteristics at p-value >0.05. However, the finding revealed there was a no significant association between nurses their knowledge related to precautions in giving an injection to patients with hepatitis and their demographic characteristics at p-value >0.05. The study result agreed with (26, 27). Additionally, results depicts there was a no significant association between nurses their knowledge related to management and treatment of patients with hepatitis and their demographic characteristics at p-value >0.05, the finding disagreed with [21]that showed and explained the relationship among knowledge of the nurses regarding hepatitis C infection and demographic data, there was significant relation among knowledge nurses about treatment and their demographic characteristics.

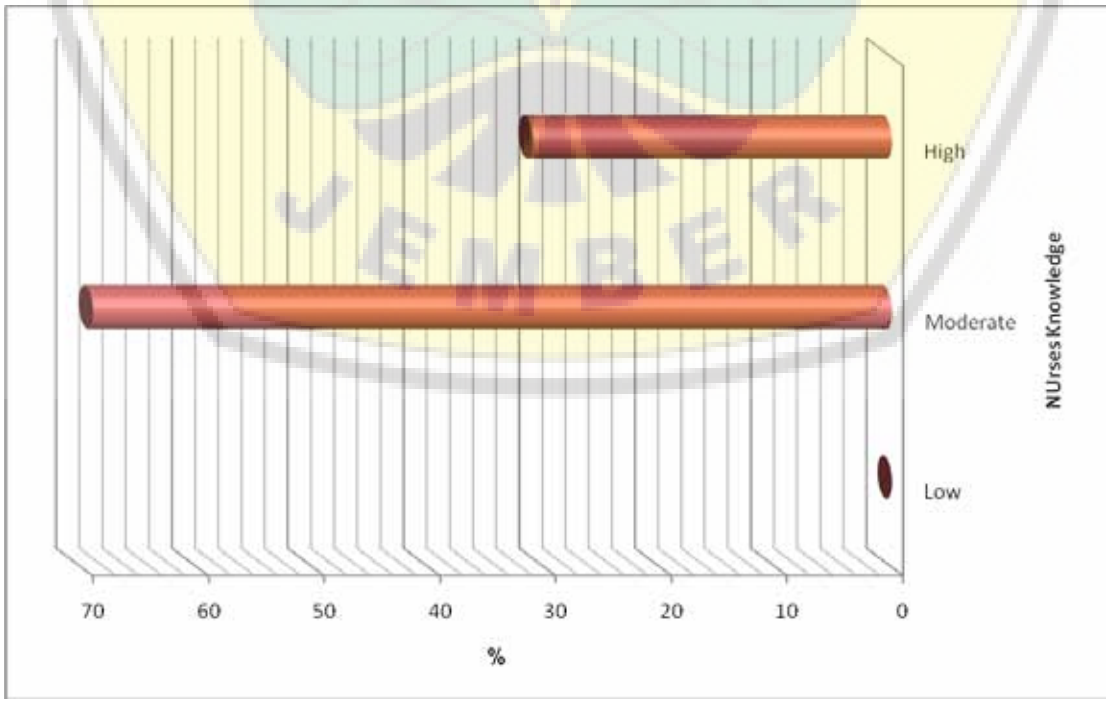

Figure 1. Assessment of Nurses Knowledge about hepatitis by their Domains

Conclusion

From the results of the present study, we can conclude thatis good knowledge of nurses toward prevention and precautions of hepatitis and this showed by the result of the assessment, however, showing all nurses knowledge towards prevention and precaution with hepatitis patients were moderately knowledge. Also, explain no relationship between nurses knowledge and their demographic characteristics.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the College of Nursing-University of Babylonand all experiments were carried out in accordance with approved guidelines.

Evaluation of Nurses Practices toward Care of Children Undergoing Cardiac Correction "Ventricle Septal Defect" in Baghdad Teaching Hospital at Baghdad City

Anfal Abd-Alkareem Taha[1], Suad Hassoon Khudhair[2]

1Academic Nurse, Ministry of Health, Iraq, [2]PhD, Pediatric Health Nursing Department, College of Nursing, University of Baghdad, Iraq

Abstract

The study aimed to assess and evaluated nursing practices of the nurses and their demographic characteristics. A descriptive study which initiated from 20th November 2017 to 25th of April 2019, carried out in 3 teaching hospitals (Ibn Al - Nafees Teaching Hospital for cardiovascular and thoracic surgery, Ibn AL-Betar Center for Heart Diseases, and Iraqi Center for Heart Diseases) in Baghdad City**.** The study sample was 50 nurses who were working in the cardiac units of these hospitals. The data was collected through using questionnaire format and the questionnaire consisted of 2 parts. The first one is demographic characteristics and the second part includes observational section of nurses' practices and this consisted from 4 items pre and post operation. The data were analyzed through the application of descriptive statistic frequency, percentage, and the application of inferential statistical procedures, which include Pearson correlation coefficient and chi-square. The socio-demographic characteristics of 50 nurses included 24 (48%) who were in age group of 19-28 years, 31 (62%) were married, 20 (40%) were graduates of Nursing institute graduate, 28 (56%) had 1-5 years of hospital work and 37 (74%) had 1-5 years of work in the cardiac units. 80% had previous related training courses.

Keywords: *Nurses' Practices, ventricular septal defect, cardiac correction, Evaluation.*

Introduction

A congenital heart defect is a problem with the structure of the heart which may present at birth. These defects can involve the walls of the heart, the valves of the heart and the arteries and veins near the heart which disrupts the normal flow of blood through the heart[1]. The most common form of congenital heart disease in childhood is the VSD, occurring in 50% of all children with congenital heart disease and in 20% as an isolated lesion (Minette & Sahn, 2006). A ventricular Septal defect is a hole in the part of the septum that separates the ventricles . The hole allows oxygen-rich blood to flow from the left ventricle into the right ventricle instead of flowing into the aorta and out to the body as it should and it is occur in many locations and sizes which will determine in part the consequences of the ventricular Septal defect [2]. The incidence of VSD in all live births is approximately 1.5 to 3.5 per 1000 term infants and 4.5 to 7 per 1000 premature infants[3].

The symptoms and physical findings associated with ventricular septal defects (VSDs) depend on the size of the defect and the magnitude of the left-to-right shunt[3]. Small Ventricular Septal defect don't cause problems and often may close on their own, because it is allow only a small amount of blood to flow between the ventricles; Medium are less likely to close on their own and may require surgery to close and may cause symptoms during infancy and childhood, They're sometimes called nonrestrictive Ventricular Septal

Corresponding Author:
Anfal Abd-Alkareem Taha
Ministry of Health, Iraq
e-mail: anfalak@yahoo.com

defect and less likely to close completely on it is own, but it may get smaller over time and cause symptoms in infants and children, and surgery usually is needed to close them: in large opening, the child may breathe faster and harder than normal. Symptoms may not occur until several weeks after birth [4].

Ventricular Septal defect are described by the anatomic location of the defect as seen from the right ventricle. The most common types are per membranous, outlet, inlet, and muscular. The etiology of ventricular septal defect is not known, but a combination of genetic and other factors has suggested a multifactorial cause [5]. If opening is small, it won't cause symptoms because the heart and lungs don't have to work harder. The only abnormal finding is a loud murmur [6]. Small defects are expected to close spontaneously in the first year of life; however, larger defects can result in severe complications [7] Nurses play a critical role in the lives of children with congenital heart disease (CHD) and their families, and identifying subtle changes in the assessment of the complex cardiac patient [8]

Methodology

A descriptive study was conducted on nurses who work in cardiac units from the October 16th, 2018 through April 25th, 2019. The study was conducted at 3 teaching hospitals (Ibn Al - Nafees Teaching Hospital, Ibn AL-Betar Center for Heart Diseases, and Iraqi Center for Heart Diseases) in Baghdad City. The study sample 50 nurses who were working in the cardiac units. The educational level of nurses included school of nursing, secondary nursing school graduate and nursing institute graduate and graduate of Nursing College. The data were collected through using observations chick list, which comprises two parts. The first one was demographic characteristics and the second part was nurses' practices. The questionnaire used three level of evaluation in different period of data collection

Part I: Demographic Characteristics: The demographic Characteristics for the nurses include nurses' age, gender, level of education, the nurses` marital status, number of years of employment at hospital, number of years of experience in the cardiac unit, sharing in training sessions, number of training courses, and Type of the training session.

Part II: Nurses' Practice: This part is concerned with data related to the nurses' practices and comprises 4 major item, have been rated and scored according to the three point Likert scale for nurses' practices and score as (first, second, third observation). The validity of the questionnaire was determined through a panel of 16 experts. The reliability of the questionnaire was determined through a pilot study. The data were analyzed through the application of descriptive statistic frequency, percentage, and the application of inferential statistical procedures, which include Pearson correlation coefficient and chi-square.

Results and Discusion

In part 1, The socio-demographic characteristics of 50 nurses included 24 (48%) who were in age group of 19-28 years, 31 (62%) were married, 20 (40%) were graduates of Nursing institute graduate, 28 (56%) had 1-5 years of hospital work and 37 (74%) had 1-5 years of work in the cardiac units. 80% had previous related training courses Table (1).

In Part II, table 4 shows the distribution of nurse's practice items toward care of child undergoing cardiac correction with three levels score.

Table (1): Causes correlation ship of the contingency coefficient and significant level responding under and upper cut off point in compact form of nurses' practices among gender

Gender \ Nurses' practices		Under cut off point	Upper cut off point	Total	*C.C. test	**P-value	CS
Male	F	1	14	15	0.089	0.529	N.S
	%	2.0%	28.0%	30.0%			
Female	F	1	34	35			
	%	2.0%	68.0%	70.0%			
Total	**F**	**2**	**48**	**50**			
	%	**4.0%**	**98.0%**	**100.0%**			
Confidence level = 0.471							

The result indicated that the nurses have a high level of practices in most of intervention items in pre operation and have moderate level in some of nursing intervention after operation.

There is no significant relationship between nurses' practices and level of education and a significant relationship between years of experience in Units. So, the null hypothesis is rejected because the p-value is equal to 0.000; in this case it is statistically significant.

Table (2): Causes correlation ship of the contingency coefficient and significant level responding under and upper cut off point in compact form of nurses' practices among level of education

	%	0.0%	12.0%	12.0%			
Total	F	2	48	50			
	%	4.0%	96.0%	100.0			
Confidence level = 0.988							

Throughout the course of the present study, it has been noticed that approximately (70.0%) of the study sample were females and the highest proportion (48.0%) of them was 19-28 years old. Atsha in 2016 conducted a study on nurse›s knowledge at pediatric teaching hospitals in Baghdad city (toward children with meningitis). The researcher of this study found that more than half of the sample (65.0%) was females and 45% of

the nurses were in age group of 20-29 years old (Atshan, 2016), this results agreement with the present study.

In regard to marital status, the majority (62.0%) of the sample were married. These results agree with findings of Atiyah (2017), when he conducted a study to determine the effectiveness of education health program on nurses› practices toward neonates care with sepsis in incubator in neonatal intensive care unit in teaching hospitals at Baghdad city. Atiyah (2017) found that (62%) of nurses were married (Atiyah, 2017).

Concerning the level of education (40.0%) was nursing institute graduates of the study sample. Masehab in 2007 conducted a study to evaluated nurses' practices toward children undergoing cardiac catheterization in Baghdad teaching hospitals at cardiac units. The researcher of this study found that (30.0%) graduated from institute of nursing and that result agrees with the present study. Hickey, Gauvreau, Tong, Schiffer, and Connor in 2012 conducted a study to determine the characteristics of nurses and organization in the United States of America. Hickey et al. (2012) [5] reported that 70 percent of nurses had baccalaureate degree in nursing who works in child care unit [5]. This research not agrees with the present study.

Regarding years of experience in hospitals, more than half of the study sample had (1-5) experience years in hospitals that represented (56.0%), and (74.0%) of them had (1-5) experience years in cardiac units [5]. This result agreement with Curley, Hickey, Gauvreau, and Connor in (2013), they conducted a study to determine the effect of critical care nursing and organizational characteristics on pediatric cardiac surgery mortality in the United States of America. Curley et al. (2013) reported that the distribution of nursing experience included (52%) of the nurses having less than or equal to five years of nursing experience, nursing experience in cardiac units (62%) of the nurses had at most five year [5].

The findings indicated that most of the study sample (80.0%) had opportunity to be involved in training sessions concerning cardiologist and (70.0%) of them were sharing in training session inside the country and (4.0%) of study sample were sharing outside the country. That result disagrees with the study of Masehab in 2007when he found that (93.3%) has no training sessions concerning cardiologist.

The result indicated that the nurses have a high level of practices in nursing intervention of child before operation, and have high level of practice in explaining the nursing care to the child family pre and post operation. The result indicates that there is inefficiency in nurses' practices in child nursing intervention pre and post operation with moderate level.

The data analysis was conducted on a questionnaire that assessed of observation testing on three evaluation in various times which should be done in cardiac unit based on a rating scale of close ended responses, which had been reported and manifested out of the mean of scores of these items. The result has indicated that there has been no significant relationship between nurses' practices and gender, age, marital status, years of experience in hospital, sharing in training session, type of training session.

The result has indicated that there has been no significant relationship between nurses' practices and level of education, and a significant relationship between years of experience in Units and nurses' practices. [7] conducted a study to determine critical care nursing's impact on pediatric patient outcomes.

Conclusion

Most of nurses were in age group of 19-28 years, being married, were institute graduate, had 1-5 year work in cardiac units. The result indicates that there is inefficiency in nurses' practices in child nursing intervention pre and post operation and no significant relationship between nurses' practices and gender, age, marital status, level of education, years of experience in hospital, sharing in training session, and a significant relationship between nurses' practices and (years of experience in units, and number of training session).

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Ministry of Health, Iraq and all experiments were carried out in accordance with approved guidelines.

Assessment of Nurses' Knowledge towards Prevention of Sepsis at Neonatal Care Unite in Hilla Hospitals

Abdul Mahdi A. Hasan[1], Nada Khazal Kadhim Hindi[2], Rusull Hamza Kh. AL-Jubori[3]

[1]PhD, Pediatric & Mental Health Nursing, Collage of Nursing/University of Babylon, Iraq, [2]PhD in microbiology, Department of Basic and Medical Science, College of Nursing, University of Babylon, Babylon Province, Iraq, [3]Mscstudent Community Health Nursing/Babylon Health Directorate, Iraq

Abstract

A descriptive study is conducted throughout the period of (September 9th 2018 to Funerary 20th 2019) in order to determine the nurses' knowledge toward prevention of sepsis in neonatal care unit in Hilla Hospitals and to determine the relationship between nurse's knowledge and their Scio-demographic characteristics. A non-probability (purposive sample) of (50) nurses who are working at neonatal care units. These sample distributed in four hospitals includes; Babylon Teaching Hospital for Maternity and Pediatric, AL-Noor hospital, Hilla Teaching Hospital, and Imam Sadiq Hospital. Data are collected through the use of a self-report by the used questionnaire as means for data collection. Data are analyzed through the application of descriptive and inferential statistical data analysis approach that includes, frequencies, percentages, mean of scores, standard deviation; Chi-squared test. The study results indicate that the (58%) of nurses within age (21-25) years old female graduated a Diploma degree. The majority of (70%) were fairly knowledge of nurses in Hilla City Hospital. As well as, the education, years of employment, years of experiences, and training course have been significant with nurses knowledge at p-value <0.05.

Keywords: *Assessment, Knowledge, Septicemia, Nurses.*

Introduction

Septicemia or sepsis are synonyms that indicate a serious disease in humans and animals characterized by a generalized inflammatory reaction as a result of bacterial infection and the emergence of germs and metabolites in the blood and tissues, leading to sepsis. The most common causes of sepsis are staphylococci and nodules, and rarer ones are pneumococci and colorectal partners. These labels have been used inconsistently in the past by medical professionals, for example as synonymous with transgression[1]. Sepsis is characterized by inflammation of the entire body. The body may show symptoms of inflammatory response to infection by the immune system's response to microbes in urine, blood, lungs, skin or other tissues. Another term used for infection is septicemia. Severe sepsis is the systemic inflammatory response, in addition to infection in addition to the presence of organ failure[2]. Clinical studies have shown that cases of septicemia may be persistent or intermittent. Continuous blood poisoning occurs primarily in patients with vasculitis (e.g., endotracheal inflammation, inflammatory thrombophlebitis, inflammation associated with vascular catheterization), or with major septicemia (e.g., septic shock). Intermittent blood poisoning occurs in patients with localized infections (e.g., lungs, urinary tract, skin, soft tissues)[3]. Neonatal sepsis is a type of sepsis that specifically refers to a bacterial infection in the blood (inflammation of the bloodstream), such as meningitis, pneumonia, pyelonephritis, or gastroenteritis associated with fever. Symptoms of circulatory or respiratory failure are not clinically useful because these

Corresponding Author:
Abdul Mahdi A. Hasan
Pediatric & Mental Health Nursing, Collage of Nursing/University of Babylon, Iraq

symptoms often do not arise in newborns until the child is about to die and can not be prevented[4]. It can be said that sepsis remains a major cause of death and morbidity, especially during the first five days of life in the newborn and in low- and middle-economic countries. Hospital infection also remains a major cause ofmortality in children despite progress encountered in the last decades [3]. Science on epidemics and publically health problems mortality rate is progressively known as a very Global Public Health Challenge it must be addressed if on the basis of reducing the disparity between child mortality between rich and poor countries. More than four million occur deaths newborns per year in low- and middle-economy gain. over one-third of infant deaths square measure calculable to result to severe infections, and 1/4 is because of the correlative clinical of neonatal sepsis [5]. Most dangerous period in human life is the time of birth and the early days of life. 3 million children die in the first week of life every year, and up to two thirds (2/3) of this die in the first 24 hours after birth. Bacterial septicemia is one of the seven dangerous signs presented by middle and low income countries that can be used to select or determine children with very severe satisfactory obstacles, including septicemia [4]. The major cause of morbidity and mortality worldwide is still posed by septicemia, despite significant advances in antimicrobial medical care, infant life support measures and early detection of risk factors. neonatal sepsis and pneumonia have been estimated by the World Health Organization in its report 2000-2003, especially in developed countries, responsible for approximately 1.6 million deaths each year. In poor countries, antibiotic resistance is an important resource problem [6].

Methodology

Study Design: A descriptive study is conducted to explore knowledge of nurses regarding prevention sepsis at neonatal care unit in Hilla City hospitals for the periods of September 9th 2018 to February 20th 2019.

Study Sample: A non-probability "purposive sample" of (50) nurses who are working at neonatal care units. These sample distributed in four hospitals includes; Babylon Teaching Hospital for Maternity and Pediatric, AL-Noor hospital, Hilla Teaching Hospital, and Imam Sadiq Hospital who accepted to be involved in the study.

Study Instrument: data collection tool that included the following:

Part I: Which composed of demographical characteristics.

Part II: This part is composed of (50) item and divided into (6) sections. They include: Nurses' knowledge about bacterial septicemia (definition), Nurses General information related septicemia, Nurses' knowledge about ways of transmission, Nurses' knowledge about the prevention of bacterial infection, Nurses' knowledge about infection control for bacterial septicemia and precautions in neonatal care and Nurses' knowledge about management of neonate with sepsis.

Data Collection the Method: The data is Collected through the use of a developer questionnaire Self-management "Self-Administrative" nurses. The researcher introduced himself to the participants and explained the purpose of the study in order to get oral agreement.

Statistical Analysis: The statistical data analysis approach by using (SPSS-ver.20) is used in order to analyze and evaluate the data of the study. A descriptive statistical data analysis approach used to describe the study variables : Frequencies, Percentages, and standard deviation. Inferential statistical data analysis approach: used by application of the Chi-square test.

Results and Discusion

"χ^2obs.= Chi-square observer, χ^2crit.= Chi-square critical, Df = Degree of freedom, S= significant, NS = non significant, HS = high significant"

This analysis depicts the relationship between nurses knowledge towards prevention of septicemia in neonatal care unit and their demographic characteristics. Insignificant associated between their knowledge and their demographic characteristics at p-value >0.05. except, there is education and training course about septicemia there is a significantly associated at p-value ≤ 0.05. Present study findings reveals that the (58%) of the study population are within first age groups (21-25) years old. As well as the mean age is (1.50) at standard deviation (0.64). This result come because that the majority of the nurses they dealing directly with the patients are from those with this age group because the action with the patients require a high physical activity and the nurses who are advanced age fail to dealing with the patients. This results consisting with finding of study has been conducted at neonatal critical care unit in University of El-Mansoura for Child's Hospital. Findings depicts that the (35% and 30%) of nurses are within age groups (20-25) years old respectively [7]. Female nurses in the study were more than half of the study sample. It constituted (54%) out total number of the study population and the remaining is male. This results come because there is a growing need to female nurses especially in maternity and pediatric hospital, and today more females than males during the expansion of the opening of institutes and colleges of public health. This results agree with findings of study was conducted in Nigeria that deals with knowledge of nurses related to prevention and management of neonatal sepsis. Their findings of these study indicated that (91.7%) of study population were female nurses as more involved with children [8].

The distribution of study sample between married and single. Where the proportion of married couples was the majority, it constituted (64%) out total number. It's also, there is no divorced, separated and widowed among those findings. As well as, the urban residents of them constituted the largest percentage (82%) out total number of the study population. This result come because most of these age groups are the age of marriage, especially after the completion of the study and appointment in the field of nursing. Where the Iraqi young after graduating from the study and the presence of employment opportunity take the side of marriage Results of present study come with findings of study has been assessed knowledge of nurses who works at neonatal care unit in district hospitals at Minia Governorate. By a descriptive design was conducted on (41) nurses and questionnaire as a means of data collection. Findings reveals that the most of nurses were married, it constituted (75.6%) out total number of the study participants and most of them residents in rural areas [9]. The differences with present study, the hospital in Minia Governorate were distributed in rural areas while in the current study, Hilla hospitals were distributed in urban areas.Also, results were in the same line with (Abd-Alla, 2008) who

observed that most of nurses who works in pediatric critical care units were married [10]. The above results agree with findings of study has been conducted at neonatal intensive care units among "pediatric nurses" in Menofia University Hospital and EL-Bagour Central Hospital. as assessed their knowledge and identification of sepsis. By a descriptive design and convenient sample conducted on (90) nurses and the using the questionnaire data were collected. Findings reveals that (54.5%) were diploma in nursing graduated and (100%) without training program [11]. Results depicts that the (74%) of nurses were diploma attainment as institute graduated [16].Findings presented the overall nurses knowledge to prevent septicemia in neonatal care unit. Present study reveals that the majority of (70%) were fairly knowledge of nurses in Hilla City Hospital. These results come in the same line with results of study conducted at selected hospitals of Biratnagar in Nepal. A cross-sectional descriptive study and developed questionnaire to assess knowledge of nurses regarding neonatal sepsis. By an structured interview data were collected and analyzed through the used descriptive and inferential Ch-square data approach. Results reveals the majority of knowledge were moderately [17].While, While a study was conducted in Syria related to assessing the quality of nursing performance of the newborn in the incubator. It was found that about two-thirds of the sample had approximately (33%) of the moderately level of nursing performance [18].Furthermore, a study conducted in Southwestern United States in regarding the neonatal sepsis as early recognition by the nurses. Their findings confirmed don' not identify these indicators related to the level of nursing knowledge but was associated with work in the intensive care unit for newborns [19].Findings depicts the relationship between nurse's knowledge towards prevention of septicemia in neonatal care unit and their demographic characteristics. There is a non-significant association between their knowledge and their demographic characteristics at p-value >0.05. Except, there is education and training course about septicemia there is a significantly associated at p-value ≤ 0.05. A study conducted in Italy has been investigation a domains of nurses' knowledge. Their results in the same line with results of those study, it depicts the level of education was significantly with nurses knowledge [20].As well as, a quasi-experimental study of training program on the care of newborn sleep on the knowledge of nurses in Iran effect. The results showed that the average degree of knowledge of nurses after training has increased significantly compared to training at P <0.001 [21].

Conclusions

Overall knowledge in terms of prevention of sepsis at neonatal care unit in Hilla Hospitals, nurses were fairly knowledge and educational attainment, years of employment in hospital, years of experiences, and training course have affected those knowledge. its needs to be employed intensive training courses related to neonatal care unit to improve knowledge and exploitation of young energies and studies could be undertaken to involve the national level of evaluation of nurses practice in neonatal care unit.

Assessment of Some Salivary Parameters in Xerostomic Hypertensive Patients

Fawzi Al-Fatlawi[1], Maha Adel[1]

[1]College of dentistry, University of Baghdad, Iraq

Abstract

This study included 100 subjects, xerostomic hypertensive and 30 control persons. A high-molecular-weight glycoprotein-α-amylase complex is a growth inhibiting factor that able to inhibit Glucosyltransferases (GTFs) from S.mutans. Consequently, it assists in the control of S.mutans colonization. The enzyme α-amylase helps digestion to be initiated in the oral cavity. The α-amylase is mentioned to as a very good sign of the function of the salivary glands, and represents 40% to 50% of the protein content of saliva. Amylase is found in developed enamel pellicle and may modulate the adhesion of bacteria. Amylase may bind with high affinity to a nominated group of oral streptococci and contribute to bacterial clearance. The immunoglobulins in saliva mainly belong to the IgA subclass (more than 85%) and, to a lesser amount, to the IgG and IgM subclasses.eptor super family, The level of IgA is changed by many circumstances, such as infections, malnutrition, obesity, smoking, salivary flow rate, stress, hormonal factors, emotional states and physical activity. A decreased level of IgA in elderly people is accompanying with an increase in root caries and candidiasis. Latest research showed no association between IgG and caries. Saliva contains cytokines, and interleukines (IL).

Keywords: *Salivary parameters, Xerostomia, Buffering Capacity, Salivary flow rate, Dental caries, Hypertension.*

Introduction

Hypertension is defined as blood pressure readings raised on at least two cases with or without provocation[8]. Even though more than 70% of hypertensive patients are aware of the disease, only 23–49% is under treatment, and fewer (20%) achieving control Hypertension prevalence differs by race, age, education, and so forth. Xerostomia, A medical case associated with a decrease in the amount of saliva produced and an alteration in the saliva chemical composition causing a dry mouth called Xerostomia. This case can have a harmful consequence on many aspects of oral function and general wellbeing. By reducing taste sensation and impairing chewing ability, Xerostomia can cause a significant deterioration in quality of life[9]. Moreover, Xerostomia may alter consistent eating patterns, decreasing the pleasure of eating as a result of impaired or diminished taste sensation. Patients with xerostomia frequently report an avoidance of some foods, for example the dry foods (such as bread) and pasty foods (such as peanut butter), due to the incapability to chew or swallow effectively[10]. Furthermore, xerostomia may damage a patient's capability to speak, cause cracks and fissures in the oral mucosa and halitosis. It can also cause denture wearing to be very uncomfortable due to a decreased surface tension between the dry mucosa and the denture. All the above mentioned points can lead to poor nutrition habit[11]. Numerous aspects of oral function, pain, caries and oral infections could be affected by Xerostomia[10]. Saliva is liquid material formed from major (parotid and submandibular glands) and minor salivary glands in the human and animal mouths[12,13]. Water is the main components of human saliva, comprises 99.5%, in

addition to white blood cells, epithelial cells (from which DNA can be extracted), enzymes (such as amylase and lipase), electrolytes, mucus, gingival crevicular fluid (GCF), food debris, hormones and antimicrobial agents such as secretory IgA and lysozyme[14]. The enzymes found in saliva play a vital role in the process of food digestion that entrapped within dental crevices, thus protecting teeth from bacterial decay[15]. Saliva also helps the function of lubrication and permitting the initiation of tasting and swallowing[12]. There are three major enzymes found in saliva: 1- α-amylase or ptyalin, secreted by the acinar cells of the parotid and submandibular glands, starts the digestion of starch before the food is even swallowed; it has a pH optimum of 7.4. 2- Lingual lipase, which is secreted by the acinar cells of the sublingual gland; has a pH optimum around 4.0 so it is not activated until entering the acidic environment of the stomach. 3- Kallikrein, an enzyme that proteolytically cleaves high-molecular-weight kininogen to produce bradykinin, which is a vasodilator; it is secreted by the acinar cells of all three major salivary glands. In addition to Antimicrobial enzymes that kill bacteria and lysozyme[12]. The immunological contents of saliva involve the Immunoglobulin IgA (that produced by the plasma cells in connective tissues), IgG and IgM (both produced mainly from the GCF) [16]

Materials and Method

Materials: A Mitis salivaris agar base (we obtained from HiMedia, India), Cystine Trypticase Agar (CTA) (we obtained from bioMérieux, France), Bacitracine antibiotic powder(we obtained from AppliChem, Germany), Gram stain solutions(germany),sucrose (france), mannitol(china), IgA Saliva ELISA KIT(LDN/ Germany), a-Amylase Saliva ELISA(LDN/Germany), Human OPG(Osteoprotegerin) ELISA Kit (My biosource 2USA)

Method: The total sample consisted of 70 xerostomic hupertensive patients and 30 healthy control women aged 50_65 years, their age was recorded according to the last birthday [17] they were carefully informed about the aim of the investigation and they were freely allowed to accept med. informed and ethical approval had been obtained. Saliva Sample collection was made in early morning at time between 8am to 9 am. Subjects were instructed not to eat or drink for 3 hours in same day prior to sample collection. Around 1-3 ml of whole un-stimulated saliva was collected simply by drooling into an sterilized graduated tubes, with the forward tilted head or by allowing the saliva to accumulate in the mouth and then expectorate into a tube (avoiding any possible contamination), the resulting saliva was centrifuged for 3000 rpm for 10 min. The clear supernatant was collected and stored in freezer at -20°C.

Result

The differences between the study group and the control group in regards to the Amylase level were non-significant, however the mean value (168.75) was higher in the study group when compared to the control group (149.51) as illustrated in Table 1 and figure 1.

Table (1): Groups Descriptive and statistical test of amylase

Statistics	Groups	
	Patient	Control

Df	98	
P value	0.866	
C.S	NS	

The mean value of igA were 270.80 and 262.65 for patients group and control group respectively, Differences between the two study groups were statistically not significant as shown in table 2 and figure 2.

The results of the salivary osteoprotogerin level in both studied group were showed in Table 3 and figure 3 there were no significant differences in the osteoprotogerin level between the study and control groups despite it is higher in the control group as compared to the study group. The study reveals a negative relationship between the salivary osteoprotogerin level and the hypertension.

Current study is designed to study more about the influence of hypertension on salivary function, and it revealed a decline in salivary flow rate among the study group compared to the control one and the differences were statistically highly significant. Currently, saliva considers as a significant marker in diagnosis, treatment, and control of different systemic diseases, occasionally, the initiation of salivary changes even occur prior to serum and systemic changes[18,19]. Therefore, there is a strong tendency toward exploiting saliva to diagnose diseases in the early stages[20,21]. Exploiting Saliva is safe, non-invasive for the examiner, easy, cost effective and does need wide-ranging equipment and facilities. In the study group, the results revealed a positive relationship between D1, D2 and D3 and the amylase level, while D4 give a negative relationship, all with no significant differences. In addition, the results showed a strong negative relationship between D1, D3 and D4 and the IgA biomarker with highly significant differences, while D2 shows a weak negative relationship with the IgA in the same group. In regards to the osteoprotogerin in the study group, the results indicated a positive relationship between all caries severity grades and the osteoprotogerin with no significant differences. In control group, the three studied salivary biomarkers (amylase, IgA and osteoprotogerin) showed a positive correlation with the caries severity. Diet is the key feature for the relationship between the amylase and the dental caries; because starch is common in the human regime, knowledge of its association with salivary α-amylase is well known. Therefore, a synergistic effect between sucrose and starch may be due to the boosted

fermentation of starch by α-amylase with a consequent increase in caries activity. The defensive role of salivary IgA against dental caries has been examined in several studies. However, the association between them remains unresolved due to mutable sampling method, diverse inclusion criteria for subjects and different laboratory examinations. Numerous studies have confirmed a direct correlation between IgA levels and Caries severity; it reported increased levels of salivary IgA in relationship with decreased caries activity. However, no studies have been found to demonstrate the relationship between IgA and dental caries in hypertensive patients which considered as a limitation for our study. The results of the present work gave different findings in regards to the relationship between the caries experience (DS, MS, FS and DMFS) with the salivary biomarkers (amylase, IgA and osteoporoton) in both the study and the control groups. Several studies have been displayed this relationship in free disease people, however, the lack of resources regarding this relationship in hypertensive patients considered as a limitation in this part of our research. Therefore, our data should be interpreted carefully and more examinations is needed to find out the exact relation between salivary biomarkers and dental caries experience in hypertensive individuals. It was found that the effect of starch on caries development is provided by the findings that amylase inhibitor significantly decreased caries experience in rats fed a processed starch diet [30]. In a study of the association between α-amylase activity and caries experience, it was found high caries experience with low α-amylase activity and the only significant variance noted between the caries inactive and high caries experience individuals was the level of α-amylase. For specific IgA level for normal and hypertensive subjects, it has been shown that salivary IgA does not have a straight protective role against dental caries experience but reflects a past exposure of the subject to some microorganisms for example Streptococcus mutans in their oral cavities. Decreasing the level of IgA leads to increasing the prevalence of dental caries experience. Consistently, as it is indicated that a higher incidence of caries experience is associated with lower concentration of IgA. The dental caries with the secretion of salivary IgA in patients was discussed in diverse studies; some indicated that increasing the number of decayed teeth resulted in increase of salivary IgA level. In contrast, some other studies indicated that the amount of salivary IgA decreased following the increase in the number of decayed teeth, this decreasing could be as a result of body defense mechanism along with other factors such as age, IgA assessment method, sample size, and race.

Conclusion

We found in this study that simple diffrenenes in IgA, Amylase and osteoprotogerin levels between xerostomic hypertensive and control persons,however; the mean values were higher in the study group when compared to the control group for Iga and Amylase while the opposite for osteoprotogerin.

Association of TLR4 Polymorphisms with Susceptibility to Urinary Tract Infection Caused by Gram Positive Bacteria in Pregnant Women

Mohammed A.K. Al-Saadi[1], Nadia M.S. Al-Hilli[1], Nazar A. Sheriff[1]

[1]*College of Medicine, University of Babylon, Iraq*

Abstract

Urinary tract infection (UTI) is the most common disorder caused by bacterial agents in pregnancy. This study aimed to investigate the association of TLR4 gene polymorphisms with susceptibility to urinary tract infection caused by Gram positive bacteria in pregnant women a total of 39 clinically confirmed UTI pregnant women and 35 healthy control were enrolled in this study. Urine and blood samples were collected in Babylon teaching hospital for gynecology and pediatrics in Babylon province, Iraq during the period from January 2018 to February 2019. Urinary sample isolates were identified by traditional method. DNA was extracted using blood samples. TLR4 gene amplification and SNP genotyping was done using PCR-RFLP. Cytokine profile was assessed using ELISA technique. The present study showed 22 (56.4%) isolates was *Staphylococcus* species and; 17 (43.6%) was *streptococcus* species. the results showed the presence of homozygous variant in 16 patient from the study group at site 299 (A/G). twentyhomozygous variant and 9 heterozygous variant at site 399 (C/T). Serum IL17 results showed a significant difference (p value=0.016) between patients and controls. Serum TNF-α results showed a significant difference (p value=0.021) between patients and controls.

Keywords: *UTI, SNP, TLR4, TNF-α, IL17.*

Introduction

Urinary tract infections (UTI) are serious health problemsaffecting millions of people each year [1]. It is caused by invasion of a range of pathogenic microorganisms into the urinary tract system. Urinary tract infectionsare classified into three types: acute pyelonephritis, lower UTI and asymptomatic bacteriuria. The acute pyelonephritis is the most severe type of the disease[(2)]. Although the majority of bacteria causing infections among all patient populations are gram-negative bacilli, Gram-positive cocci contribute to large numbers of infections among hospitalized and institutionalized patients. *Staphylococcusaureus* is a Gram-positive cocci occurring in group;non motile, non-capsulatedand it is catalase, DNase and coagulase positive, and ferment mannitol. *Staphylococcus aureus* only accounts for between 0.5% and 2% of all urine positive cultures, this gram-positive pathogenis not typically considered a major cause of urinary tract infection[(3)]. The urinary tract relies predominantly on innate immunity for its defense [(4)].In the urinary tract, chemokines and cytokines are produced by epithelial and immune cells and mediate recruitment of neutrophils to the site of infection, induction of pyrexia, secretion of IgA and release of neutrophils from the bone marrow [(5)]. The innate immune system in the urinary tract comprises various resident and recruited cells that express a wide range of pattern recognition receptors (PRRs) such as Toll-like receptor 2 (TLR2), TLR4, TLR5 and TLR11 which enable early recognition of pathogens and transduce this signal to induce a rapid and robust pro-inflammatory immune response[(6)]. The important role of TLR4 in UTI has now been translated into humans. For

example, in pediatric populations it has been shown that TLR4 gene polymorphism, resulting in a dysfunctional receptor, makes the patients susceptible for ABU with a low inflammatory response [7]. The magnitude of host response varies among persons with ABU, probably due to individual variation in TLR4 function, thus a genetic predisposition toward development of UTI and ABU seems possible [8].

Materials and Method

A case-control study included 39 clinically confirmed UTI pregnant women with different gestational ages, their ages ranged from 15 – 44 years old attended to gynecology consulter clinic in the Babylon teaching hospital for gynecology and pediatrics in Babylon province, Iraq during the period from January 2018 to February 2019. Thirty five apparently healthy pregnant women with different gestational ages whom their urine culture results showed negative results and their ages had a range of 16 – 44 years old were taken as a control group. General urine examination and urine culture were carried out for all participants (patients and controls).

A midstream urine samples were collected in a sterile screw-cap containers from all participants and immediately subjected to aerobic culture on MacConkey and Blood agar medium. General urine examination were also conducted for each sample.Five milliliters of venous blood was collected from all participants; two milliliters of which was kept in EDTA tube, then forwarded for human DNA extraction. The other three milliliters was transferred into plane tube. The latter was undergone centrifugation where the serum was obtained and preserved at -20ºC until be used.DNA was extracted from blood samples using ready kit (gSYNCTM DNA Mini Kit Whole Blood Protocol/Geneaid/ Korea) according to the manufacturer's instructions. Extracted DNA from blood samples was used in PCR for amplification of TLR4 gene. Two pairs of specific primers of TLR4 gene (table 1). PCR Mastermix (NEB/USA) was used for amplification of TLR4 gene.Successful PCR amplification was confirmed by agarose gel electrophoresis [9]. Restriction endonuclease digestion for TLR4 PCR products (15 UTI patient, and 35 controls) was done using *Hinf I* and *Nco I* endonucleases (New England Biolabs Inc./USA).Serum IL17 and TNF-α concentrations were estimated according to the instructions provided by the manufacturing company (Elabscience/USA).

Table (1): Primers used in this study

Genes	Primers sequence 5'→3'	Amplicon size (bp)	Reference
TLR 4 Asp299Gly	F: ATACTTAGACTACTACCTCCATG R: TTGTTGGAAGTGAAAGTAAG	213	Zakeriet al. (2011)
TLR 4 Thr399Ile	F: TGTTATCAAAGTGATTTTGGGAGAA R: AGGTAAATGAGGTTTCTGAGTGATAGG	185	

Statistical Analysis: The Statistical Package for the Social sciences (SPSS, version 19) was used for statistical analysis. Numeric variables were presented as mean and standard deviation while nominal variables were expressed as number and percentage. student test was used to compare mean difference between any two groups in case of normal distribution. Odds Ratio, Chi-square and or corrected Ch-square tests were used for the study of associations between nominal variables. P-value was considered significant when it was less than or equal to 0.05.

Results and Discusion

Bacterial Isolates: Patients with *Staphylococcus* speciesinfection accounted for 22 (56.4%); and only *streptococcus* specieswas 17 (43.6%). All control subjects were free of infection. These results are shown in table 2.

Single nucleotide polymorphism of TLR4 and susceptibility to UTI: Restriction fragment length polymorphism of PCR products of *TLR4*-A299G gene revealed only two genotypes; AA, and GG. In UTI

patients, the AA, and GG genotypes account for 16 (42.6%) and 23 (57.4%) respectively, compared to 5 (14.28%) and 30 (85.72%) respectively, in control group. The RFLP-PCR products of *TLR4*-T399I revealed three genotypes; CC, CT, and TT. In UTI patients the CC, CT, and TT genotypes account for 10 (25.6%), 9 (23.2%) and 20 (51.2%) respectively, compared to 25 CC genotypes (71.42%), and 10 TT genotypes (28.58%) only in control group, table (3). Logistic regression test for the association of genotype with incidence of UTI in pregnant women revealed high significant protective association between GG genotype of Asp299Gly SNP in TLR4 gene and UTI in pregnant women (OR=0.158, 95%CI= 0.211-1.396, p=**0.032**). For the SNP Thr399Ile in the TLR4 gene, there was no significant association with UTI in pregnant women (table 3).

Table (2): Isolated bacteria in patients enrolled in the present study

Type of bacterial isolate	Number	Percentage
Staphylococcus species	22	56.4%
streptococcus species	17	43.6%

Table (3): SNP Thr399Ile in the TLR4 gene, there was no significant association with UTI in pregnant women

Serum IL17 concentration: This study found that there is a significant difference (p value=**0.016**) in serum IL-17 concentration between UTI pregnant women infected with Gram positive bacteria and control group, table (4).

Serum TNF-α concentration: This study found that there is a significant difference (p value=**0.021**) in serum TNF-α concentration between UTI pregnant women infected with Gram positive bacteria and control group, table (5). This finding was in agreement with previous study conducted in Iraq by Al-Wazni and Hadi[10] who found that the most predominant isolated

pathogens was Gram positive bacteria (83%). This work is also concordant with another two studies conducted by Almukhtar [11] in Iraq and Tadesse*et al*., [12] in Ethiopia, who both reported that the percentage of gram positive bacteria was higher than Gram negative bacteria (44%) and (45.6%) respectively.

The presence of *Staphylococcus*species and *Streptococcus* species indicated that the gram-positive cocci are also causative agents of urinary tract infections. Although, *Staphylococcus* species was known for years as a rare urinary isolate, Oneof the studies showed the high frequency of *Staphylococcus* and was the main cause of UTI in Nigeria[13], where, the most prevalent isolates were *S.aureus* and *S. saprophyticus*, and it's the first isolated microorganism in the current studywith a rate of 40.8% of total UTI positive cultures. *Staphylococcusaureus* has been reported to colonizethe vagina in 4%-22% of pregnant women[14]. Some of studies hadpreviously linked the increasing cause of UTIs by *Staphylococcus* to increased use of instrumentation such as bladdercatheterization[15], [16].

This study indicate that homozygous mutant (GG) of TLR4SNP Asp299Gly has a protective role againstUTI (Odds ratio indicates that pregnant women carrying this allele is 6.32 fold less likely to affect with UTI). This finding is in agreement with Hawn *et al*., [17] who found that TLR4_A896G is associatedwith protection from UTI in women. To explain these findings, Arbour*et al*., [18]were the first to report that individualswith either the Asp299Gly and/orThr399Ile polymorphisms had a blunted (hypo-responsiveness) response toward inhaled LPS.

In this study, TLR4 *Thr399Ile* genotype has been observed in UTI pregnant women only while the genotype *Ile399Ile* has been found in UTI patients and controls. Both genotypes (*Thr399Ile* and*Ile399Ile*) were with no statistically significance and showed no association with the development of UTI in pregnant women. This finding was in agreement with Chaloob and Mohsen, [19] who found no association between TLR4 *Thr399Ile* polymorphism and *Trichomonasvaginalis* infection in Iraqi women. It was also agreed to Ahmad-Nejad*et al*., (20) who reported that the mentioned genetic polymorphism correlate with neither development nor outcome of sepsis in patients from multidisciplinary surgical intensive care unit (ICU).Despite the fact that Humansubjects carrying the *Thr399Ile* polymorphism either exhibit amilder LPS-hyporesponsive phenotype or do not manifest itat all [18], [21], [22], there are multiple studies conducted in different populations that have linked the *Thr399Ile*polymorphism with different disease conditions for example Goepfertm*et al*., [23] reported that *Thr399Ile* polymorphism have a protective role against bacterial vaginosis in American pregnant women. A study conducted by Ajdary*et al*., [24] in north Iran reported that *Thr399Ile* SNP increase the risk to infection with cutaneous leishmaniasis.

In this study, the serum TNF-α concentration in control group was significantly higher than patients than in control group. This finding was comparable with Capossela*et al*., [25] who confirmed a significant decrease of TNF-α cytokine in chronic backpain patients compared to the healthy control group. Pavlicek*et al*., [26]reportedthat people with spinalcord injury have a lower plasma levels of TNF-α and othercytokines when compared with age matched able bodied healthycontrols. Decreased serum TNF-α cytokine levels in patients group could be attributed to the molecular mimicry mechanism of bacteria interferingwith host TLR signaling by Tcps (TIR domain containing proteins), through blocking endogenousprotein's association[27]. TcpC of *E. coli* and TcpB of *Brucellamelitensis*were found to impair the signaling of TLRs and the secretionofproinflammatory cytokines IL6 and TNF-α. Furthermore, *tcpC* was associated with the severity of urinary tract infections[28].

In this work it was found that serum IL-17 levels in patients was significantly lower than control group. And this finding was along with Andelid*et al*., [29] who reported that levels of IL-17 in obstructive pulmonary disease with chronic bronchitis were markedly lower compared to never-smoker controls. This study was also comparable to another study conducted by Baharlou and co-workers [30] in Iran who showed that the serum concentration of IL-17 in patients with bladder cancer was significantly ($p<0.0001$) lower than in healthy controls. Low levels of IL-17 cytokine in UTI pregnant women in this study could be attributed to the impaired cytokines signaling due to bacterial colonization and infection [29]. It's worthy to mention that serum levels of cytokines are time-dependent following the initiation of infection, therefore, a serial examination of IL-17 at different time intervals would be more conclusive [31]. Findings of this work could be artifact, but could also reflect complex andsystematic immunological interplay. Furthermore, age, sex, hormones, nutrition and BMI are commonlyreported to affect cytokine levels[32].

Conclusion

This study suggest that *Staphylococcus*species is the most predominant Gram positive causative agent of UTI during pregnancy. Polymorphism in TLR4 Asp299Gly has a protective role against UTI in pregnant women, Thr399Ile has no association with UTI. Serum TNF-α and IL-17 levels may decrease during bacterial infection.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the College of medicine, University of Babylon, Iraq and all experiments were carried out in accordance with approved guidelines.

Detection of Some Virulence Factors Genes of Staphylococcus Aureus Isolated from Patients with Ventilator-Associated Pneumonia in Al-Hilla\Iraq

Zainab Hashim Nasser[1], Huda H. Al-Hasnawy[1], Ali S. Baay[1]

[1]Dept. of Microbiology, College of Medicine, Babylon

Abstract

A total of (96) lavage specimens were taken from patients with ventilator associated pneumonia (VAP), and bronchioalviolar lavage (BAL), during the period from February to June (2018) admitted to the Al-Hillah General Teaching Hospital, Al- Imam Al-Sadiq Hospital and Tiba Center. Among them 24(25%) of specimens were found to be with *S. aureus* bacteriuria. In the present study, it was observed that the number of patients with 30(31.2%) isolates were classified as *Staphylococcus* spp. Among them, 24(25%) isolates were identified as *Staphylococcus aureus*, the remaining isolates 6(25%) were classified as coagulase negative Staphylococcal species. Molecular detection of virulence (*hla*, *tst*, *agrII* and *pvl*) genes, molecular investigation among all *Staphylococcus aureus* isolates showed that all isolates (100%), (91.6%), (0.0%), (0.0%) respectively.

Keywords: *Staphylococcus aureus,ventilator associated pneumonia, PCR technique,virulence genes.*

Introduction

Ventilator-associated respiratory infection is the commonest hospital-acquired infection in intensive care units (ICUs)[1,2]. The condition includes both ventilator associated tracheobronchitis (VAT) and ventilator-associated pneumonia (VAP) [3]. The bacterial pathogens responsible for VAP also vary depending on patient characteristics and in certain clinical circumstances, such as in acute respiratory distress syndrome or following tracheostomy, traumatic injuries, or burns. However, these differences appear to be due primarily to the duration of mechanical ventilation and/or degree of prior antibiotic exposure of these patients [4]. The diagnosis of VAP is usually based on clinical, radiographic, and microbiologic criteria and will be covered elsewhere [5]. Ventilator-associated pneumonia (VAP) is the most common nosocomial infection in the intensive care unit and is associated with major morbidity and attributable mortality. Strategies to prevent VAP are likely to be successful only if based upon a sound understanding of pathogenesis and epidemiology [6]. The major route for acquiring endemic VAP is oropharyngeal colonization by the endogenous flora or by pathogens acquired exogenously from the intensive care unit environment, especially the hands or apparel of health-care workers, contaminated respiratory equipment, hospital water, or air [7]. VAP is usually caused by bacteria, whereas fungi and viruses are rarely involved. Generally, early-onset VAP is caused by pathogens more susceptible to antibiotics, including *Streptococcus* pneumoniae, Haemophilusinfluenzae, and methicillin-susceptible *Staphylococcus aureus*[8]. Staphylococci are members of the newly formed family Staphylococcaceae. *Staphylococcusaureus* is an important bacterial pathogen causing pneumonia in both adult and pediatric populations [9,10]. In recent reports, workers have described the growing incidence of severe *S. aureus* pneumonia in otherwise healthy individuals, often caused by multi-drug-resistant strains [11,12]. In addition, *S. aureus* remains one of the most common causes of ventilator-associated pneumonia, contributing to significant morbidity and mortality. Little is known about the *S. aureus* virulence factors that play a role in lower respiratory tract disease [13,14]. The alpha-hemolysin or a-toxin (*Hla*) is one of the major virulence determinants implicated in the pathogenesis of *S. aureus*, associated to severe skin and

soft tissue infections (SSTI), necrotizing pneumonia. In addition, even sepsis *Hla* is the most prominent *S. aureus*cytotoxin that can act against a wide range of host cells including erythrocytes, epithelial cells, endothelial cells, T cells, monocytes and macrophages [15]. The accessory gene regulator (*agr*) operon of *S. aureus* is a key global regulon that coordinately controls many critical virulence pathways in this organism, including those involved in exoprotein, exotoxin, and adhesion expression [16]. The *pvl* locus is one of the most important genetic marker of CA-MRSA strains, which explains the cases of necrotizing pneumonia and frequency of skin infections and lesions associated with CA-MRSA [17].

Materials and Method

Patients and clinical specimens: A total of (96) lavage specimens were taken from patients with ventilator associated pneumonia (VAP), and bronchioalviolar lavage (BAL), during the period from February to June (2018) admitted to the Al-Hillah General Teaching Hospital, Al- Imam Al-Sadiq Hospital and Tiba Center. The patients' samples were chosen for convenience, and the method of recruitment was standard for a consecutive period of six months. Clinical samples were collected using Artificial respiration tube from lung and bronchoscope tube (from ventilator associated pneumonia VAP and bronchiectasis patients). Transferred to the laboratory by ice bag. No duplicate samples from the same patients and no environmental isolates were included in this study. This study included women, children and the elderly; the age groups of patients span from (2 to 94) years old.

Ethical Approval: The necessary ethical approval from ethical committee of the Hospitals and patients and their followers must obtained. Moreover, all subjects involved in this work are informed and the agreement required for doing the experiments and publication of this work is obtained from each one prior the collection of samples.

Colonial morphology and microscopic examination: A single colony from each primary positive culture on blood, MacConkey, mannitol and nutrient agar and identify it depending on its morphological properties (colony shape, size, color, borders, and texture) and exam it by light microscope after being stained with Gram's stain. After examination it, biochemical tests were done on each isolates to complete the finale identification[18-20].

Molecular Method:

Extraction of Genomic DNA: Genomic DNA was extracted by using a commercial extraction system (Genomic DNA Favorgen Kit).

Results and Discussion

Isolation and Identification of S. aureus Isolates: Total of (96) specimens were collected during this study for isolation of *S. aureus* isolates. Out of which, 30(31.2%) isolates were classified as *Staphylococcus* spp. Among them, 24(25%) isolates were identified as *Staphylococcusaureus*, the remaining isolates 6(25%) were classified as coagulase negative Staphylococcal species. The results were shown in Figure (1). However, 66(68,7%) isolates were identified as Gram negative bacteria similar with result in Europe and South America, *P. aeruginosa* (27%) is the most common causative pathogen taken all regions together, and *S. aureus* (20%) *Acinetobacter species* (14%) follow *P. aeruginosa* and deferent with result in the US, *S. aureus* (32%) is the most common causative pathogen, followed by *P. aeruginosa* (21%), *Enterobacter* species. *Acinetobacter* species (4.4%) while, according to a recent study on the causative pathogens of nosocomial pneumonia in Asia, *S. aureus* 27(%). On 22 (91.6%) were gave β- hemolysis, and two (8.3%) isolates showed alpha hemolysis according to [20] categorization in Table (3). Production of β and alpha hemolysins by *S. aureus* in (20) hours different with result option by [25] who obtained the beta hemolysis equal with alpha hemolysis.

Distribution of S. aureus isolates according to the age and gender: For the distribution of *S. aureus* isolates in different age group (1-94) years, the highest percentage 5(20.8%) of *S. aureus* isolates were found at (61-70) years old in regard to other age groups. For gender distribution of *S. aureus* isolates, it was found that out of (55) patients, 18(75%) isolates of *S. aureus* were found in male. However, *S. aureus* isolates in (41) female were found to be 6(25%). The results were shown in Table (4). These results were agreement with the results obtained by [26] men (79%) and women (21%). Despite a higher incidence of VAP among males but mortality was higher in females. In the present study, *S. aureus* was the all commonly isolated from lavage from patients with ventilator-associated pneumonia and BAL Bronchi alveolar lavage from patients with bronchiectasis, as shown in Table (5). Ventilator-associated pneumonia is one of the most common infections in the intensive

care unit and methicillin-resistant *Staphylococcus aureus* has emerged as a common cause of ventilator associated pneumonia. Characteristics of once weekly active surveillance culture of methicillin- resistant *S. aureus* colonization in predicting the development of methicillin-resistant *S. aureus* ventilator-associated pneumonia. This result agreed with present study, while not agreed with results who found that (12%) for *S. aureus* for bronchiectasis *S. aureus* was isolated from (61) VAP and (35) BAL in (36%, 5.7%) respectively. All the patients taken the samples from one week to months. The ventilator associated pneumonia patients taken Vancomycin and steroid drug, and some of them take the Tobago and three of them take alcohol.

Molecular Characterization of *S. aureus* Isolates by PCR technique:

Molecular detection of virulence (*hla*, *tst*, *agrII* and *pvl*) genes: Molecular investigation among all *S. aureus* isolates showed that all isolates (100%) were harboured the *hla* gene with a molecular weight of (209) bp as shown in Figure (3). *Staphylococcus aureus* causes serious infections that increase morbidity and mortality, especially life-threatening conditions are Hospital-associated pneumonia (HAP) and ventilator-associated pneumonia (VAP), caused by *S. aureus*[2]. The α-toxin is essential for the pathogenesis of *S. aureus* pneumonia. High a-hemolysin activity are markers for VAP found high percentage of *Hla* gene (100%), these results confirmed the major role of *hla* in the murine *S. aureus* pneumonia. Another study found that Alpha-toxin (*hla*) was found in most isolates (98.5%). On the other hand, observed *hla* gene in (81.81%) of isolates. Furthermore, the results of PCR among *S. aureus* isolates showed that the high prevalence (84.24%) of *hla* genes. the *tst* gene result, in the present study out of (24) *S. aureus* isolates, 22(91.6%) were found to be positive for this gene. This finding was relatively similar to the result (100%). On the other hand, the present result was more than the result in Iran who found (45%) of *S. aureus* isolates were harbored this gene. The prevalence of *pvl* gene in current study was (0.0%) that was agreed with results found that none of the *S. aureus* isolates from hospital environment were carried this gene. Absence of *pvl* among *S. aureus* isolates from hospital environment indicates its poor association with hospital acquired *S. aureus* infections. The accessory gene regulator (*agr*) system of *Staphylococcusaureus* is responsible for controlling the expression of many genes that code for virulence factors. In present study, the *agrII* gene in *Staphylococcus aureus* isolates was showed that (0.0%). These results were agreement with results obtained by [50] who found none of the isolates belonged to *agr* group II. While the present study was not agreement with study who found majority of isolates belonged to *agr* Group I (43.3%), followed by *agr* Group III (28.87%), *agr* Group II (22.68%), and *agr* Group IV (5.15%).

Table (1): Production of hemolysin by *S. aureus* isolates on blood agar

Development of Hatching Microstructure on Cp-Titanium Surface By Fiber Optic Laser Processing

Ali N. Ahmed Hussein[1], Raghdaa K. Jassim[2]

[1]Faculty Member in prosthetic Department, College of Dentistry, University of Baghdad,
[2]Head of prosthetic Department, College of Dentistry, University of Baghdad

Abstract

Titanium is a common dental biomaterial. The response of the bone cells depends on the implanted surface texture to improve fixation and prevent unwanted adhesion. Laser surface texture of titanium and the impact of laser variables; power (P), scanning speed (V) and hatching distance (HD) on the textured area's shape and dimensions was evaluated. The surface texture was achieved with three rounds of fiber optic laser and a central wavelength of 1064 nm. Various surface textures were created with excellent uniformity and repeatability on a desired portion of the surface. Surface Texturing that was carried out directly by a fiber optic laser yield a hatch configuration over multiple length micron scales. Thus, several sets of hatches were formed with different hatch parameters. Surface topography and chemical composition characterization were investigated via scanning electron microscopy and electron dispersive spectroscopy, X-ray diffraction, and surface roughness. The most advantageous results of roughness have been detected in 20 mm/s scan speeds of laser beams. On the other hand, a dependence between roughness values, in terms of Ra (10nm) and Rz (11.7nm), and pulse power of 20 watts were observed.

Keywords: *Texturing, Hatch, Roughness, Fiber optic laser.*

Introduction

Different surface textures and their advantages regarding the speed of bone healing, osteointegration or stability were observed[1]. One main objective is to increase the surface area of the implants as it improves contact between the bone and the implant. On the other hand, a macro and micro- scale surface topography can be modified to clarify different responses.[1,3] Macro size topographies contribute to the initial stability of the implant. Micron and submicron characteristics have shown a significant advantage in osteoblast response and bone growth along the implant surface and biological fluid distribution[4]. Laser surface texturing had great potential to produce unique surface structures. The benefits were obvious. It can effectively change the surface without direct contact (avoiding unwanted contamination and impurities)[5]. Moreover, the heat absorption is fast, with the ability to focus the laser beam on little areas of the surface and reduce heat-affected area, thus only minor adverse concentrated areas of material deposition were formed around the texture[6]. Texturing by the laser is also easily automated and online monitoring[7]. Simplicity and reproducibility with cost-effective results. However, local heating during laser processing leads to more physical and chemical changes that can affect cell behavior[8]. The fiber lasers with much greater frequency offer great potential for high-speed surface texturing with attractive features such as low-cost, robust operation, compact size, low-intensity noise, and limited diffraction quality beam. During hatch formation, specific laser parameters can be used to create optimal physical and chemical properties with significantly reduced or no thermal effects for improved osseointegration.[9] Chen et al.[10] Report that bioactivity depends on surface topography.

Methodology

Experimental Procedure:

Sample Preparation: This study was conducted on one side of a flat surface of commercially pure titanium (ASTM grade 2, McMaster-CARR, USA)circular discs (30x5) mm diameter and width respectively. The discs were ground and polished with a grit sequence of SiC papers (500 and 1000 grit) using a rotary grinding and polishing machine with 250 rotations per minute (rpm) in 2 minutes for each grinding step in distilled water. The purpose of polishing the discs before micro-texturing to create a uniform surface in order to measure the morphological changes induced by the laser.

Surface Texturing with the Laser: Laser texturization was carried out using a laser source under (25 K_{Pa}) atmospheric pressure in the open air. The process was carried out by moving the laser beam via a computer-controlled XYZ stage over the discs with scanning speeds measured in mm/s. In order to achieve complete surface coverage, consecutive laser tracks were graved by a lateral shift in the optical direction. Before and after the laser texturing, surfaces were ultrasonically cleaned in Ethanol 99.8% absolute (SIGMA- ALDRICH, Germany), Acetone absolute (SIGMA- ALDRICH, Germany), and Deionized water (Iraq) to remove surface contaminants.

EzCAD software was used to convert the surface texture detailed to laser machine instruction files. The pulse repetition rate (f) was set at 1 kHz for the current study and the pulse length (pl) was 100 ns. For all treatments pulse width of 5 ns was used.Laser texture was performed by using a red laser beam of 1064 nm of central wavelength. The offset rate for hatch was 20 (μm). Three laser parameters: power, scanning speed and distance of the hatch were selected after performing pilot study for various parameters in order to select the best parameters that provide clear textures with optimum dimensions for successful osseointegration which were then selected according to scanning electron microscope images and as follows:

Round 1: Power 20 W, scanning speed of 5 mm/s, and hatch spacing distance of 0.75 mm.

Round 2: Power 25 W, scanning speed of 10 mm/s, and hatch spacing distance of 1.25 mm.

Round 3: Power 30 W, scanning speed of 15 mm/s, and hatch spacing distance of 1.50 mm.

After texturing, the morphology of samples was inspected with a photographic system in front of the laser-textured area using an optical stereomicroscope (Olympus, Japan).

Characterization: Quantitative evaluation of the surface topography of the textured areas was done by using a scanning electron microscope (FEI company, model S-50, Netherlands inspects), provided confirmation of the hatching parameters and classification of the formed features. Cross-sectional information was obtained by dicing discs with a diamond and repolishing them to get a fresh cut.In addition, energy dispersive spectroscopy (EDS), (Energy Dispersive Spectroscopy, Bruker Company-Germany, X-Flash, Model-6L) was used to provide elementary information on the surface regions in and around the hatches.X-ray diffraction device (XRD-Bruker, D2 phaser, Germany, 2010) have been used to detect fraction phases derived from diffracted discs.Surface roughness (Ra) and the maximum vertical height of the highest peak to the lowest valley (Rz) were perpendicular to hatch length, defined by International Standard ISO 4287;88:1996 in the textured areas by scanning probe microscope (AA3000 Angstrom Advanced Inc., USA) with the ability to profile the bottom of the textures with depth and roughness parameters. The measurement was carried out at several locations in the textured areas for ten grooves and ridges over a surface area of approximately (1x1) mm covering several individual hatches. For each reporting (Ra) result, an average value of the average roughness (Ra) was extracted from the data obtained to characterize the surface finish.

Results and Discusion

Topography: The interaction of the focused laser beam to the surface of the titanium was visualized by means of high-quality photography during the processing. The results of the three laser rounds were similar in topography as compared in Figures 1 (A, B and C). Which represent homogenous surface melting. When the power was raised to 25 W, in round 2, the laser hatches were more visible because the superimposed shots produced a hatch in the scan direction. When V=10 mm/s, the void between each laser pulse produces a discrete pattern.

The laser textured area was also inspected with a photographic system using an optical stereoscope to capture and store images. As illustrated in fig. 1. (D, E, and F).

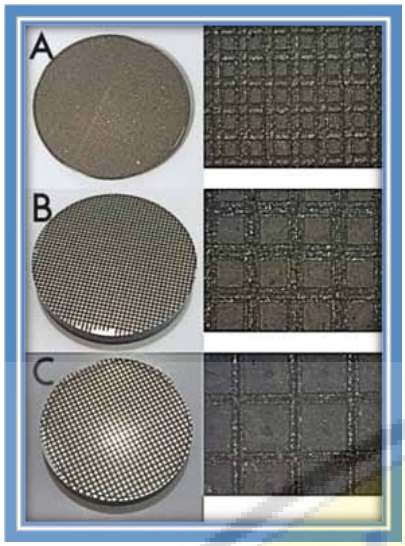

Figure (1): General view of the textured surface by fiber optic laser and Optical stereoscope pictures X40 from above left to right R1, R2, and R3 rounds.

Scanning Electron Microscopy: The impact of scanning speed in mm/s and hatch spacing distance in (mm) on the width of textures was analyzed after selecting the correct laser power. After scanning the surface by a laser beam with 5 mm/s and 0.75mm, the texture was obtained with a wide range of (130-152) microns. After scanning the surface by a laser beam with a 10 mm/s and 1.25mm, the width of the texture was (33-61) microns. After scanning the surface with a laser beam with a 15 mm/s and 1.50 mm, texture with a width ranging between (33-111) microns was obtained.

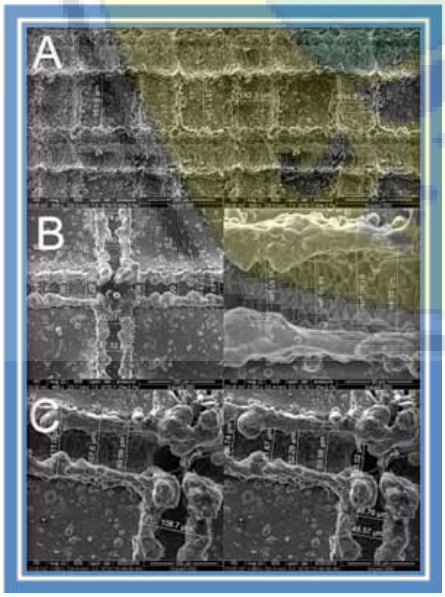

Figure (2): SEM micrographs with laser groove widths commercially textured pure titanium surfaces: (A) Round1 (B) Round 2and (C) Round 3.

After analyzing the microscopic results, a laser beam of 20W power, scanning speed of 5 mm/s and a hatch distance of 0.75 mm (R1) showed the best groove depth, the smallest heat-affected zone, the most regular edges, and the lowest vaporized material deposition. The depth of the groove was estimated at (198.8) micron compared to (130) micron for round 2. As shown in Fig.2 and 3.

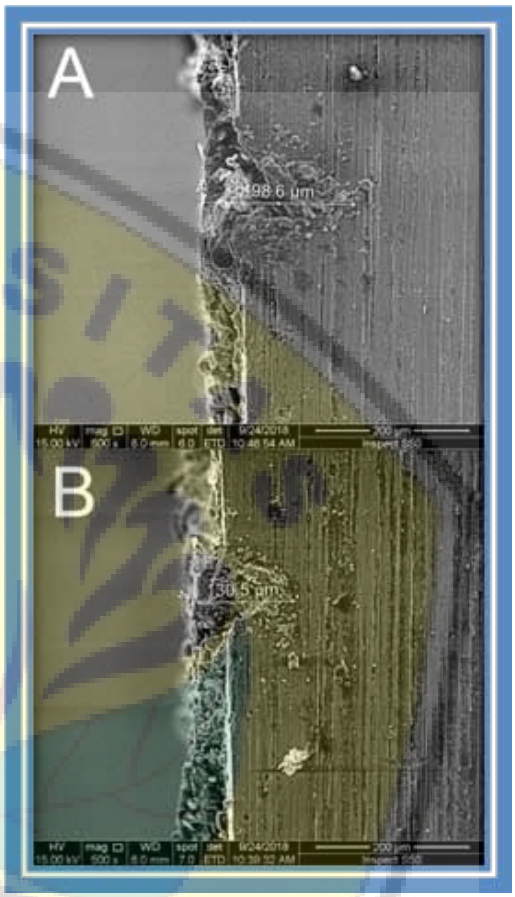

Figure (3): SEM micrograph 500X groove depths of a laser textured commercially pure titanium side surfaces as a function of the (A) Round 1 and (B) Round 2 parameter.

Energy Dispersive Spectroscopy: Chemical characterization and elemental concentrations in textured and untextured areas were summarized in Table 1. As noted, the main chemical change in the textured areas is titanium oxidation, which confirms the formation of oxides as the cause of coloration in the treated area. As shown in Fig. 4.

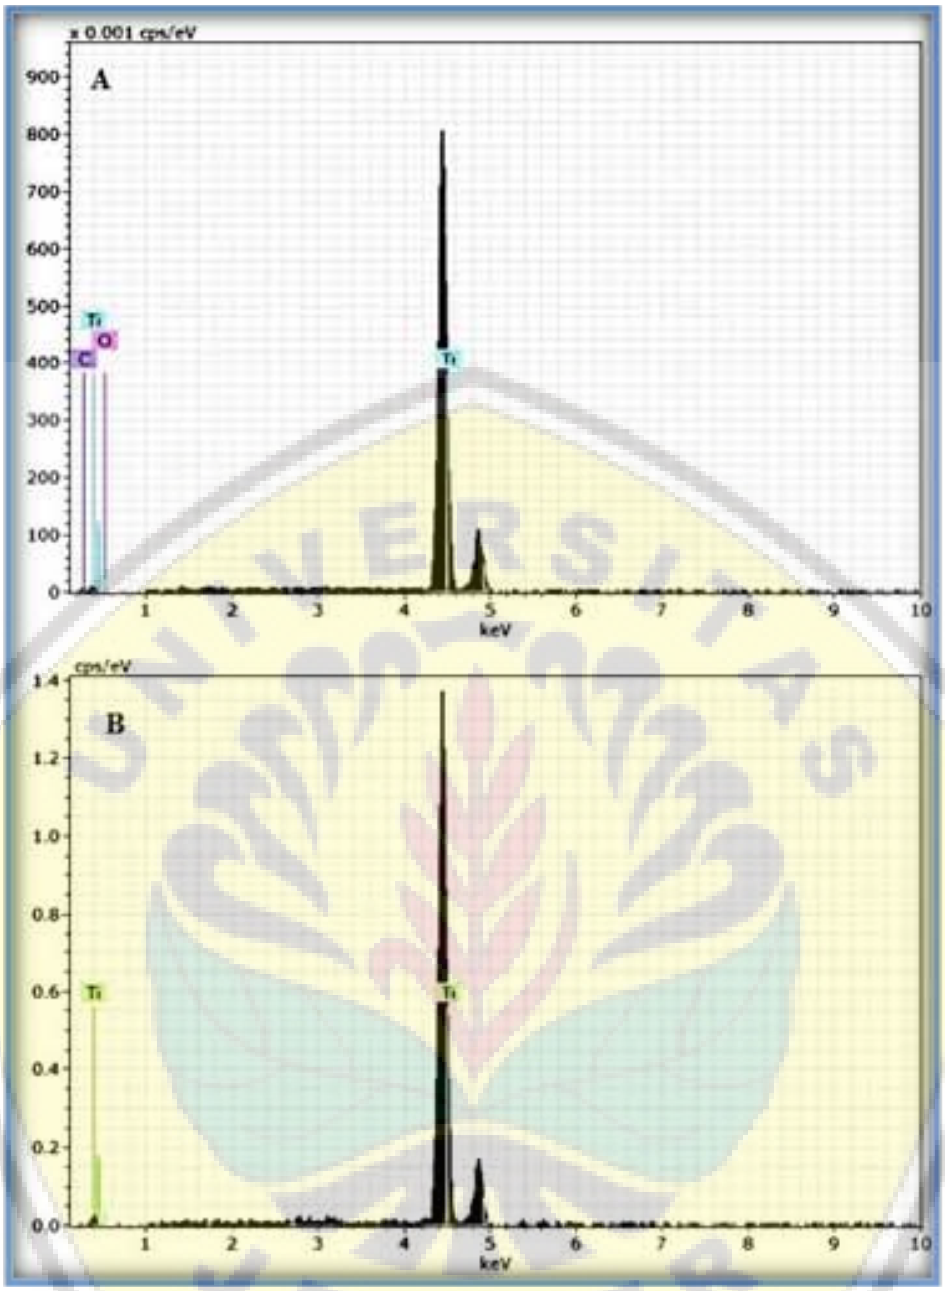

Figure (4): EDS analysis of the heat- affected zone of the titanium samples for various laser texturing processes: the textured lasers were (A) fiber optic and (B) untextured.

The laser texture tends to oxidize the surfaces, with the metallic titanium peak intensity disappearing, except for the fiber optic laser texture R1. The total TiO ratio increases while the Ti ratio decreases after laser texturing, indicating that the proportion of TiO increases in the oxide film, while the proportion of Ti decreases. As shown in Table 1.

Table 1: Elemental analysis of the fiber optic laser textured the substrate.

Element	Untextured	(R1)	(R2)	(R3)
Titanium	89.56	89.56	75.59	84.04
Oxygen	10.43	10.43	10.60	11.52
Nitrogen	0	0	11.77	2.47
Carbon	0	0	2.02	1.95
Sum	100	100	100	100

X-ray Diffraction: Figure 5 shows the X-ray diffraction patterns of the sample surface under the laser texture condition. The rapid resolidified layer in all samples can influence the balance of α and β phases of the original material and is a typical feature of laser processed metallic materials. The β-Ti amount of the non-structured material was 100 percent, as measured by X-ray diffraction (XRD). After laser texturing, the amount of β-Ti was lower than the non-structured material but was barely the same under all conditions at 100 percent.

Surface Roughness: Starting with untextured Ti samples with average values of arithmetic roughness Ra= 1.16 µm and a maximum height of the roughness profile Rz= 1.32 µm, the surface finish of the texturization shows that variations in laser texturizing parameters have a significant influence on the absorption of laser radiation, resulting in significant variability of the roughness. In addition, different shapes were observed in the profiles obtained for different combinations of pulse power and scanning speed, as illustrated in Figure 6.

The roughness profiles were created using the three parameter types shown in Table 2. The type of texture consists of microgrooves with a rough cross-section (fiber-optic/round 1 laser), forming a surface roughness distribution. These textures are not commensurate with the grain size of the material and have no relation to the material microstructure.

In order to understand, Ra and Rz values of the untextured surface are marked dark brown polished surfaces. When the roughness is above this level, light brown surfaces are marked, which were rougher when compared with the original values.

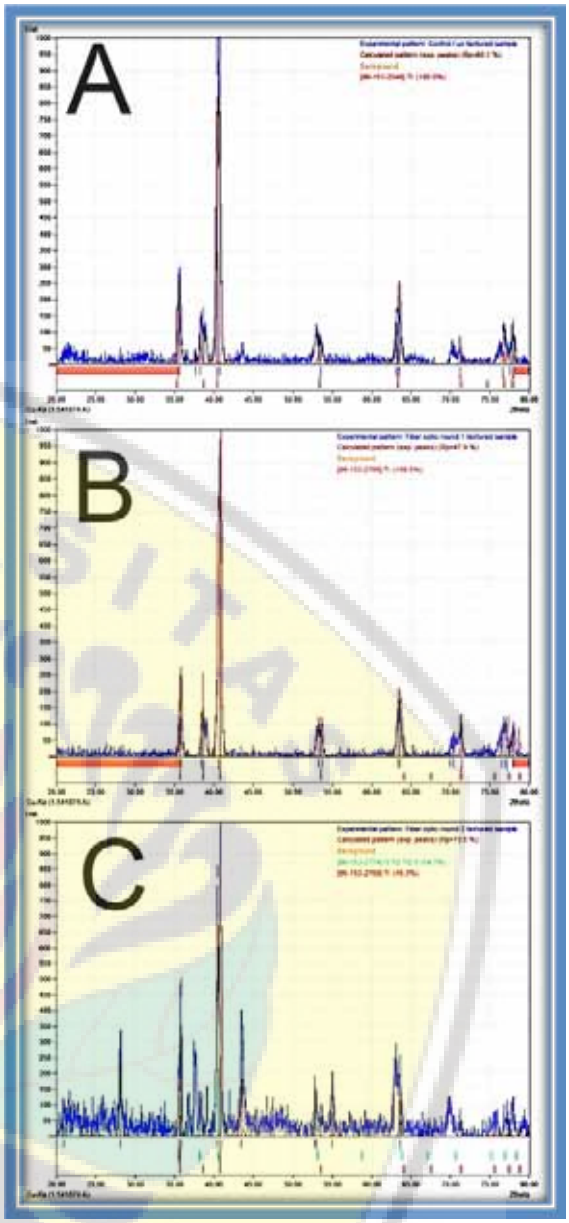

Figure (5): Analysis of the heat- affected zone diffraction patterns of the titanium samples for different laser texturing processes: (A) un textured region, (B) fiber optic (R1) and (C) fiber optic (R2).

Table (2): Average values Ra and Rz of the Ti substrate textured by different fiber optic laser parameters.

	Un textured	(R1)	(R2)	(R3)
Ra	1.16 nm	10.00 nm	6.78 nm	1.49 nm
Rz	1.32 nm	11.7 nm	7.85 nm	1.7 nm

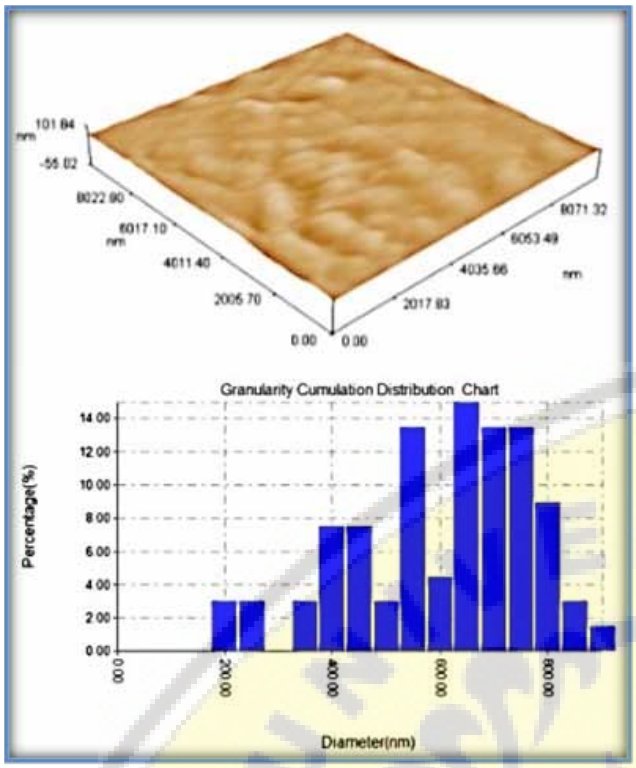

Figure (6): Analysis of surface roughness and distribution chart for untextured CP Ti sample.

The overall surface texture of fiber optic laser results is a combination of several different features: machined hatches; resolidified droplets overlapped on the ridges between the hatches; ribs indicating the edge of the craters generated by each individual laser beam overlapped on the bottom of the hatches. The surface has three distinct areas: the bottom of the grooves, the ridges between the grooves and the side walls of the grooves. as mentioned by Antończak. The two fundamental primary properties of hatches are the depth and width. As shown in Fig. 2 and 3.

Energy Dispersive Spectroscopy: The existence of a thermally affected area can be determined. It is observed that the zone affected by the direct incidence of laser pulses presents variations in the initial composition, allowing to detect alterations in the substrate microstructure and oxidation rates of the Ti.Although physical changes are the primary consequence of laser texturing, chemical changes also occur and can be measured by EDS. Changes in the chemical composition of the surface influence how cells attach and react to the metal. Which could be tested with cell studies. As mentioned by Vrancken et al. The surface feature revealed a large hatching distance which did not lead to significant changes in surface chemistry regardless of the laser power. This is consistent with a transient molten region on the surface, which preferably does not evaporate titanium due to its lower vapor pressure. And this can provide an opportunity to combine laser-created hatches with surface bio-activation. And these findings were in agreement with Yavas.

Conclusion

This study evaluates titanium laser parameters, including laser power (P), scanning velocity (V) and hatch distance (HD). The properties of the surface hatch had been width and depth. Those properties were related to a homogeneous textured layer, low energy of 20 Watt, a scanning speed of 5 mm/s, the resulting surface finish with the most reliable width and depth for osseointegration and those laser parameters were recommended for long-time period dental implants. At high speeds and powers, i.e. (10-15) mm/s, the resulting hatches were visible on the surface. The laser texturing approach contemplated the roughness values measured. Taking into consideration the initial values of Ra and Rz, The most roughness values were 10 μm (Ra) and 11.7 μm (Rz) for round 1 and the average values for round 2 and the minimum values were for round 3. After texturing, an X-ray diffraction and energy dispersive spectroscopy detected a TiO layer. It became expected that the oxide thickness expanded with increased heat input. The heat input related to the laser power applied, with minimal values for the round 1 laser parameters.

Effectiveness of an Instructional Program on Knowledge of Patients Undergoing Chemotherapy toward Self-care in Baqubah Teaching Hospital

Abbas H. Kamil[1], Suad J. Mohammed[1]

[1]Adult Nursing Department, College of Nursing/University of Baghdad/Iraq

Abstract

The main aim of the study is to determine the effectiveness of an instructional program on the knowledge of patients undergoing chemotherapy toward self-care. A quasi experimental study design is carried out at Baqubah Teaching Hospital, from 7th October, 2018 to 22th April, 2019. The program and instruments were constructed by the researcher for the purpose of the study. A purposive random sample comprised of (60) patients undergoing chemotherapy was divided into two groups; study group consisted of (30) patients who were exposed to an instructional program and control group consisted of (30) patients who were not exposed to the program. The socio- demographic characteristics of the patients. Clinical data of the patients. Knowledge of patients undergoing chemotherapy toward self-care. Validity of the study instrument was determined through a panel of experts and reliability of the instrument was determined through Cronbach's Alphamethod. The analysis of the data used was descriptive statistics and statistical inferential, in order to find the differences between the study group and the control group. The study findings indicate that there are significant differences between pre and post-tests in the study group in overall III main domains regarding patient' knowledge toward self-care.

Introduction

Cancer is not a single disease with a single cause; rather, it is a group of distinct diseases with different causes, manifestations, treatments, and prognoses,cancer is a disease of the cells, which are the body's basic building blocks. The body continuously makes new cells to help us grow, replace worn-out tissue and heal injuries. Normally, cells reproduce and die in an systematic way. Sometimes cells unable to grow, divide and die in the normal way. This may cause blood or lymph fluid in the body to become abnormal.(1) Chemotherapy is a kind of treatment that uses drugs to attack cancer cell. It is called as "systemic treatment" since the drug, entering through the blood stream, travels throughout the body and destroys cancer cells at their sites. These drugs may rarely be intended to have a local effect, but in most cases, the target is to destroy cancer cells wherever they may exist in the body. Chemotherapy are chemically designed to target cells that are multiplying and growing rapidly. Once they reach the cancer cells, they act to retard their growth eventually resulting in their destruction. Chemotherapy is usually given in cycles. People receive treatment for one or more days. Then they have a recovery period of several days or weeks before the next treatment session(2). Firstly it was thought that chemotherapy drugs specifically kill the cancer cells only but now it is well known that it also damages to the normal cells resulting the chemotherapy dose dependent side effects such as Nausea, Hair loss,

e-mail: abbasnurse1992@gmail.com

Fatigue, Constipation, Fever, Diarrhea, Stomatitis or Mucositis, Burning micturition, Infection, Skin rashes, Gum bleeding, Toothache, Cough, Jaundice, swelling, dizziness etc. and even death may also occur in severe cases. The main strategy of chemotherapy drugs based on the phenomenon that these drugs selectively target the tumor cells, largely by the means of genotoxicity partially caused by the production of reactive oxygen species, which does not specifically damages the cancer cells but also the normal cells[3].Self-care behaviors are preparation before receiving chemotherapy, self-conduct during and after chemotherapy and self-care at home. This way, patients can return to normal life in their own environment and society [4].Self- care as the practice of activities that individuals personally initiate and perform on their own behalf to maintain life, health and well-being. Processes for achieving these goals include selecting healthy lifestyles, self-monitoring and assessing symptoms, perceiving and assigning meaning to symptoms, evaluating the severity of the situation, and determining treatment alternatives. Outcomes of self-care activities include reduction in morbidity associated with illness, increase use of health resources, more effective coping strategies, enhanced role performance, and increased independence in performance of daily living activities and enhanced self- esteem and well-being[5].

Material and Method

To achieve the aims of this study, a quasi-experimental study was conducted in Baqubah Teaching Hospital from 7th, October 2018 to the 22th, April 2019.

The program and instruments were constructed by the researcher for the purpose of the study. A non- probability purposive sample of (60) patients undergoing chemotherapy were divided into two groups; study group consisted of (30) patients who were exposed to an instructional program and control group consisted of (30) patients who were not exposed to the program. The study instrument is composed of three parts: first part dealing with the socio- demographic characteristics of the patients, second part dealing with the medical information, while the third part dealing with the Knowledge test which consists from (24) items (multiple choices) questionnaires divided into (3) main dimensions related to patients knowledge towardself-care.

Each question was composed of (3) items in alternative form of a multiple choice and given the correct answer score (2) and the incorrect answer scored (1). About (25-30) minutes are given for the test completion.

The instructional program consists of three sessions and is implemented for four weeks period in oncology department. Time required for each session was (40-50) minutes .

Validity of the study instrument was determined through a panel of (17) experts and reliability of the instrument was determined through Cronbach's Alphamethod. The analysis of the data used was descriptive statistics and statistical inferential, in order to find the differences between the study group and the control group.

Data were analyzed through the use of SPSS application version 22.0. Descriptive data analysis including Mean of score (M.S),with their Standard Deviation (S.D), and frequency (f). Inferential data analysis includes Chi-Square test, Contingency Coefficients (C.C.) test, t-test, Pearson correlation.

Table (1): shows medical information for the study and control which as more of the participants in the study group have been diagnosed between 1-6 months (n = 12; 40.0%) followed by a lesser proportion for those who have been diagnosed within less than a month (n = 3; 10.0%). On the other hand, more than a third of participants in the control group have been diagnosed between 7–11 months (n = 14; 46.6%) followed by those who have been diagnosed within 1-6 months (n = 12; 40.0%). The majority of participants both in the study and the control groups reported that the family history of cancer was nonexistent (n = 18; 60.0) for both group. The majority of participants in the study group and control group had breast cancer (n = 9; 30.0%; n = 8; 26.7%) respectively .Furthermore, most of participants both in the study and the control groups reported that given him chemotherapy after diagnosis with cancer (n = 17; 56.7%) for the study group and (n = 21; 70%) for control group .Suffer from chronic disease shows that the highest percentage of the study and control groups that had experienced chronic disease (n = 16; 53.3%) for the study group and (n = 17;56.7%) . The highest percentage of participants in the both groups reported that they had not any previous information about chemotherapy and self-care (n = 22; 73.4%). Ultimately, less than a fifth of participants in the study group who reported that they had previous information about chemotherapy and self-care reported that the sources of such information included the books and magazines (n = 3; 37.5%). On the other hand, less than a third of participants in the control group, who reported that they had such information, reported that the sources of such information include a health care provider (n = 7; 87.5%) . The results show that there is no significant relationship for the selected variables at p-value > 0.05. There was no statistical significant difference majority of items between pretest and posttest of study sample for the control groups patients knowledge. revealed that the total mean for patients knowledge toward the instruction program domains at pretest was middle level of knowledge (1.2, 1.1,1.2) and at posttest was middle level of knowledge (1.2, 1.2,1.1) domains of Patients knowledge about cancer and chemotherapy, self-care of chemotherapy side effects, and the patients knowledge about self-care during daily living activities. There was statistical significant difference majority of items between pretest and posttest of study sample for the study groups patients knowledge revealed that the total mean

for patients knowledge toward the instruction program domains at pretest was middle level of knowledge (1.1, 1.2,1.1) and at posttest was high level of knowledge (1.6, 1.7,1.8) domains of Patients knowledge about cancer and chemotherapy, self-care of chemotherapy side effects, and the patients knowledge about self-care during daily living activities .

Table (2): The correlation between some variables with patients knowledge toward self-care for the study group

Knowledge / Variables	Posttest study (N=30)		
	Pearson Correlation	P-value (2-tailed)	Sig.
Age	.463**	.010	S
Level of eduction	-.371*	.043	S
Marital status	-.170	.369	NS
Occupation Status	-.202	.284	NS
Residency	.157	.407	NS
Monthly Income	.194	.305	NS
When had you been diagnosed?	-.005	.979	NS
Past family history of cancer	-.173	.361	NS
Type of treatment given to him after diagnosis of the disease:	-.085	.655	NS
Do you have information about chemotherapy?	.319	.086	NS

**. Correlation is significant at the 0.01 level (2-tailed)., *. Correlation is significant at the 0.05 level (2-tailed).

Table 2 Revealed that there was significant relationship between the knowledge of instruction program, age and level of education at p≤ 0.01 level .Also, was no significant relationship between the knowledge of instruction program and marital status, occupation status, residency, monthly income, When had you been diagnosed, past family history of cancer, Type of treatment given to him after diagnosis of the disease and information about chemotherapy and self care at p≤ 0.01 level. In this study the statistics showed that more than a quarter of participants in the study group have been diagnosed between 1-6 months (40.0%) followed by a lesser proportion for those who have been diagnosed within less than a month (10.0%). On the other hand, more than a third of participants in the control group have been diagnosed between 7–11 months (46.6%) followed by those who have been diagnosed within less than a month (3.4%). This results agree with (Haryani et al, 2017) found have been diagnosed for less than one year (77.5%).[9] More half of participants in the study group and control group reported that they had not family history of cancer (60.0%) . Family member with cancer in the past can provide some information about disease and how to control the side effects of treatment. Lu et al., (2014) reported family health history is one of the strongest known cancer risk factors. For example, patients with three or more first-degree relatives with breast or prostate cancers have a four-fold and 11-fold increased risk for those diseases, respectively. With a detailed family health history, clinicians can identify these patients early and initiate personalized prevention strategies, such as increased screening, prophylactic surgery, risk-reducing therapeutics, and lifestyle changes during earlier, more treatable stages.[15] Most patients given chemotherapy after diagnosis with cancer (56.7) for study group and (70.0) for control group . This results supported by Moursy and Ead (2014) 50 participants about Self-Care Practices of Chemotherapy Patients at This study was conducted at the Oncology Therapy Unit, Alexandria Main University Hospital. The inpatient unit of chemotherapy consists of 12 beds, showed that 78% of patients had surgery, and all the studied patients received chemotherapy, while 18% of the studied patient received radiotherapy.[11] More than half of the participants in the study group reported that they do not have any previous information

about chemotherapy and self-care (73.4%), and a larger proportion for those in the control group who also reported that they do not have any previous information about chemotherapy and self-care (73.4%) . This finding supported by (Choenyi et al,2016) Regarding previous knowledge of chemotherapy and its home management 30 patients (50%) had previous knowledge and 30 patients (50%) didn't have any previous knowledge about chemotherapy and its home management.[13]

Conclusions

The majority of the study sample within age group (50 – 59) years, male,primary school graduates, married, unemployed, barely sufficient monthly income, and live in rural areas in the study group and urban areas in control group. The majority of the study group have been diagnosed within 1-6 months, and control group have been diagnosed within 7- 11. The majority of the study sample not have past family history of cancer, with breast cancer, suffer from chronic disease, do not have information about chemotherapy and self-care. There was no statistical significant difference majority of items between pretest and posttest of study sample for the control groups patients knowledge toward self-care. The knowledge of the patients toward self-care has been improved after implementation of the instructional program in the study group as shown in the post test results in all of the domains including: Patients knowledge toward cancer and chemotherapy, Patients knowledge toward self-care of chemotherapy side effects and Knowledge of patients undergoing chemotherapy toward self-care during daily living activities. The finding of the study indicates there was a statistical significance between (age and level of education) with patients knowledge. The finding of the study indicates there was no significant between (marital status, occupation status,residency, monthly income, When had you been diagnosed, Past family history of cancer, Type of treatment given to him after diagnosis of the disease, and Do you have information about chemotherapy?) with patients knowledge.

Effects of Abuse and Neglect on Adolescents in Kirkuk City

Khadija Shukur Mahmood[1], Hassan A. Hussien[2]

[1]M.Sc. Student, Department of Psych. Nursing, Collage of Nursing, University of Baghdad, Kirkuk City, Iraq,
[2]Department of Psych. Nursing, Collage of Nursing, University of Baghdad, Baghdad City, Iraq

Abstract

Abuse and Neglect is a social and public health problem with a serious impact on adolescents physical and mental health,well-being and development throughout their lives–and, by extension, on society in general. A descriptive design study in which assessment approach is applied to achieve the objectives of the study and was carried out to assess the levels of abuse and neglect, and indicate the possible effects of abuse and neglect on adolescents in Kirkuk city. The period of the study was from the December 15th 2018 to April 15th 2019. The data are analyzed through the use of Statistical Package for Social Science (IBM-SSPS version 24). The descriptive and inferential statistical procedures were used for analysis of data. The finding of the study revealed that physical abuse, sexual, emotional abuse, and neglect are causally linked to mental and physical health outcomes.

Keyword: *Effect, Abuse, Neglect, Adolescents.*

Introduction

Abuse and neglect is among the most prevalent and most complicated psycho-social issues in today society[1]. Every day, thousand of children and adolescents are burnt, beaten, suffering from hunger or abused by their caregivers. Though certain adolescents are targeted as victims of various forms of physical or sexual abuse, yet, they do suffer from psychological abuse and neglectlike being ostracized, ridiculed or scared[2]. Abuse and neglect can affect all domains of development—physical, psychological, cognitive, behavioral and social—which are often interrelated[3]. Data from the studies of abuse and neglect in the United States has indicated strong associations between abuse/neglect and health problems in adolescents,indicate that exposure to abuse doubled the odds of adolescents having overall poor physical health[4,7]. Researchers have found that abuse and neglect is associated with behavior problems in adolescence internalizing (being withdrawn, sad, isolated, depressed), and externalizing behaviors (being aggressive or hyperactive)[5]. Evidence suggests that all types of abuse and neglect are significantly related to higher levels of substance use and attempted suicide/ suicidal thoughts[6]. Also homelessness is more likely eventuate in adolescents[7]. In addition to feeling pain as exposure to abuse and neglect are at increased risk of inflicting pain and developing aggressive behaviors in adolescence[8]. Mental health problems, such as depression[9], anxiety and post-traumatic stress disorders, have consistently been linked with abuse and neglect, particularly for adolescents[10].

Methodology

A descriptive design study in which assessment approach is applied to achieve the objectives of the study and was carried out to assess the levels of abuse and neglect, and indicate the possible effects of abuse and neglect on adolescents in Kirkuk city. The period of the study was from the December 15th 2018 to April 15th 2019. The data are analyzed through the use of Statistical Package for Social Science (IBM-SSPS version 24).

Results and Discussion

The analysis of socio-demographic characteristics of adolescents in (figure 1 and 2) shows that more than half

of adolescents are male (62%) with age group 12-15years old (65%), whose average mean of age is 12.5 year. The highest percentages of adolescents are living with their parent (53%). Table 1 show socio-demographic characteristics of their parent concerning this study; the finding reveal the high cases of their father are working (77%), and (53%)of their mother are employed. College was the highly frequented educational level among their parent(27% father's educational level) (28% mother's educational level).Approximately (48%) of their family with insufficient monthly income. Regarding residence variable, more of adolescents are seem to be resident in urban area(51%). Also families of adolescents are composed of 4 – 6 members as seen with percentage of 47%, in which 66% of these families are nuclear. Table 2 shows the level of abuse among adolescents; the finding in this table reveal that adolescents are suffering from abuse with moderate level in which the total score (100%), and it's subtype are showing moderate level of abuse (96% of them are suffering from physical abuse, 82% sexual abuse, and 100% psychological abuse). Table 3 reveals that adolescents are suffering from neglect with moderate level (68%). Table 4 indicates that high significant correlation between level of abuse/neglect and level of mental health. Regarding participants' gender, more than half of adolescents are male were within the age group 12-15 years old whose average mean of age is (12.5 years). The statistics relevant to abuse and neglect demonstrate that individuals with age 12-years experience more abuse and neglect than other age groups, followed by those who are within the age group of (16-19) years old (35%). Also this relevant to that the gender is a critical determinant of health, it is influences power and control men and women have over the determinants of their mental health, including their socioeconomic position, roles, rank and social status, access to resources and treatment in society. As such, gender is important in defining susceptibility and exposure to number of mental health risks as result of abuse and negect[11]. And more than half of adolescents are living with their parent (53%). This finding could be explained as that the parent represent the largest source of abuse and neglect, because in the home where the greatest harm is possible in a close relationship, an abuser has ready constant access to the victim because of relationship between the victim(child) and abuser (parent). Regarding to father's occupation more than three-quarters are working, and more than half of mother' are employing. With respect to the parent's level of educationmore than a quarter have college. This finding could be explained as that they prefer job for them; the educational level has a role in this case[12]. Approximately, half of adolescents parent were associated with insufficient monthly income. This finding could be explained as inability of parent to meet their children's social and emotional needs, there is evidence also that high family income improves parental care and thus benefits child mental health and wellbeing. Approximately half of adolescents (51%), are resident in urban area, it related to that the geographic distribution of the Kirkuk city were seemed urban. Approximately, half of adolescents families (47%) consisted of 4-6 members, that is came with their families are nuclear family type (66%). The finding in (table 2), concerning adolescents' level of abuse study participants having a moderate level (100%) of abuse, in which 96% of them are suffering from physical abuse, 82% sexual abuse, and 100% of them are suffering from psychological abuse. This could be explained as that the variance in the status of parental socialization could be linked to the severity of abuse[6,10]. Concerning neglect level, study shows a moderate level (68%) of neglect, this could be explained that neglect is inherent pattern in all forms of it more harmful to children and adolescents. Analysis of current study indicated that there was significant association between level of abuse and neglect and the level of mental health. This could be explained as the less harassed the adolescents, the better mental health. And the higher of abuse/neglect in the adolescents, the more increase in their pathological symptoms and the more decrease in their mental health.

Table (1): Distribution of Adolescents according to their Family Socio-demographic Characteristics

Neglect	- 0.130	0.196	H.S

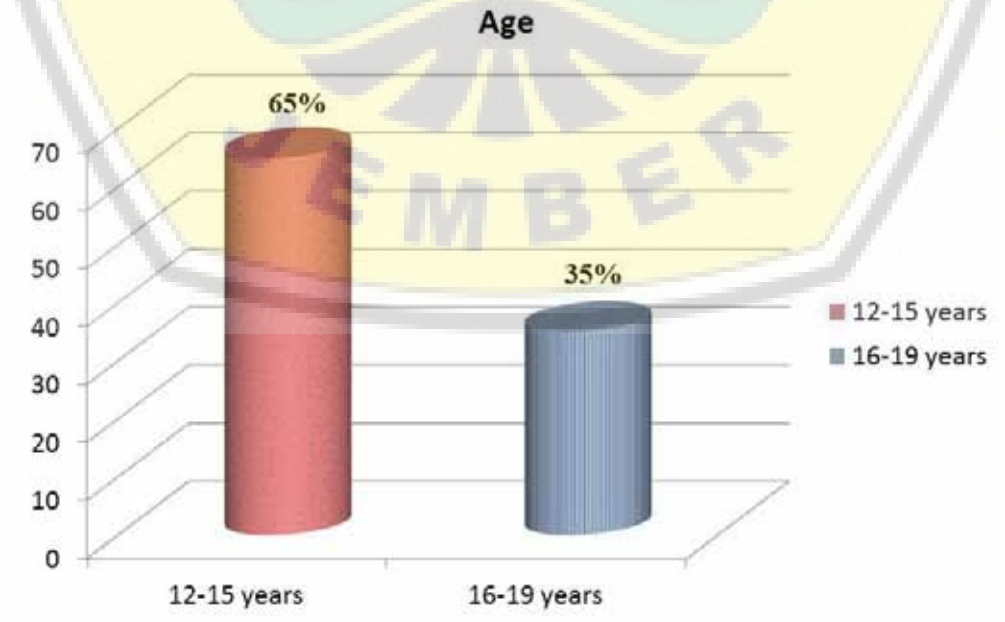

Figure (1): Distribution of Adolescents according to their Age (N=100)

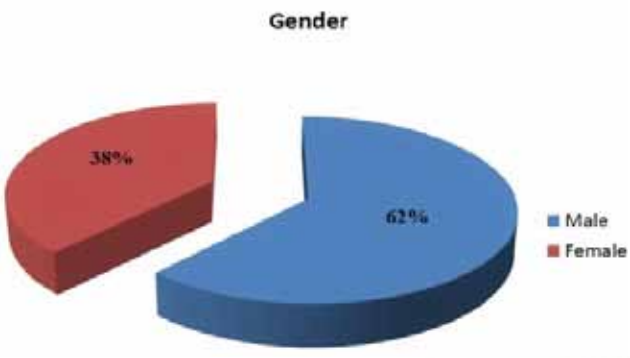

Figure (2): Distribution of Adolescents according to their Gender (N=100)

Conclusion

Abuse and neglect is a result of a process with origins of years, or sometimes even generations before the event. The process is different for every individual. Effects vary depending on circumstances of the abuse or neglect, personal characteristics of adolescents, and adolescents' environment. Effects may be mild or severe; disappear after a short period or last a lifetime; and affect adolescents physically, psychologically, behaviorally, orcombination of all three ways. Adverse experiences have strong long-term associations with health risk behaviors, health status, and diseases. More than half of adolescents are male with average mean of age is 12.5 years. The high cases are suffering from psychological abuse followed by physical abuse then sexual and neglect. Significant relationship between abuse and neglect with mental and physical health outcomes.

Effects of Different Human Urine Samples in Stimulatulating Growth of Leishmaniaspp

Rabia Ali Aboud[1], Amany M.al-kaysi[1]

[1]College of Medical & Health Technology, Baghdad City, Iraq

Abstract

The aim of this study was to establish novel culture media for some Leishmaniaspp parasites with a potential of obtaining hight amounts of promastigotes with long-term viability, with the presence of different human urine Samples in stimulatulating growth of *some Leishmania* Promastigotes from three different species of *leishmania major L. donovano* and *L. tropica* inoculated into culture media. Fresh urine was obtained from different individuals One group constituted of healthy filtered urine infants and diabetic patients and Two sets of biphasic medium (NNN) were prepared for the cultivation of the parasite. The first set consisted of a solid phase and no human blood part,while the second set contains human blood part. All media then modified by the addition of 2ml of urine after thawing of Lock's solution to the liquid phase. 20 ml of the solid phase media is poured into the tube then 7 ml of the liquid phase medium was over laid at the top. The presents study revealed biphasic medium (NNN) with adding of diabetic human urine, showed the higher growth rate of *leishmania major L. donovano* and *L. tropica.* Promastigote than growth enriched with urine of infants.

Keywords: *Human urine Samples, Leishmania spp.*

Introduction

Gnus *leishmania* causes various disease in humans and other mammals including cutaneous, mucocutaneous and visceral leishmaniasis, the parasite undergoes a digenic life cycle, a nonmotile intra-phagocytic amastigote stage and motile flagellated promastigote stage in the midgut of its vector, the sandfly[1]. Leishmaniapromastigotes were first grown biphasic blood agar (NNN). Later, the media were enriched with some additives such as brain, heart infusion, Promastigote developed when parasite are cultured in cell-free medium[2]. In vitro cultivation of Leishmaina is an important tool to gain enough amounts of the parasites for diagnosis purposes, parasite developed in culture provide means for studying host parasite relationships and for the determination of biologic and immunologic characteristics of the parasite [3]. Most culture media used for cultivation of Leishmania contain either fetal calf serum an expensive ingredient in these media and reliable supplies in various parts research, are very difficult to obtain). It has been found that blood lysate is quite difficult to sterilize [4] . The commercially available media are sometimes difficult to prepare due to the involvement of many steps, and they must be sterilized by passing through membrane filters. Most of the steps in the preparation of these media need to be done in biological safety cabinets and strict aseptic precautions must be followed. However, not all of these facilities are available in many of the developing countries where Leishmaniasisis,it has been reported that exogenous source of heme in the form of hemin chloride, blood or serum is an obligatory requirement for growth of promastigotes and transformation of one form of the parasite to the other in vitro [5] Serum-enriched tissue culture media have been successfully used to cultivate several Leishmania species. Attempts to replace serum by bovine serum albumin or mixture of purine bases,

Corresponding Author:
Rabia Ali Aboud
College of Medical & Health Technology, Baghdad City, Iraq

vitamins, and bovine albumin fraction IV (Berens RL and Marr JJ, 1978) were also made for cultivating L. donovanipromatigote.[6] More recently, human urine was used as main factor in preparation of leishmania growth media [6] A completely chemically defined culture medium free of serum, macromolecules, proteins and peptides that supports the growth and maintenance of promastigote form of various Leishmania species was reported[8]. An autoclavable liquid medium that has no FCS or blood lysate was also reported.[9]

The present work explore the possibility of using human urine as a substitution for FCS in the culture media for Leishmania parasite.

Materials and Method

Promastigotes from three different species of leishmania parasites were used in this study obtained in Medical Research Center (MRC) at Al Nahrain University, Baghdad, Iraq, MHOM/IQ/2003/MRC 20 for *L. donovano;* MHOM/IQ/2003/MRC 22 for L. major and MHOM/IQ/2003/MRC 21 for *L. tropica*. A total number of 1x10 promastigotes from each parasite strains were inoculated into culture media.

Urine collection and sampling: Fresh urine was obtained from different individuals included in this One group constituted of healthy filtered urine infants under one year of age (all breast fed) males and females. The second group were positive diabetic patients mean age 50.7 ± 7.2 years, that were tested by the Iraqi National Center, they were all adults males and females.

Urine samples from both groups were collected in clean and sterilized containers. Immediately after collection, all samples from each group pooled, filtered with Millipore vacuum filtering system and stored at -20 Cº for later use.

Preparation of the culture media: Two sets of media were prepared for the cultivation of the parasite. Each constituted of biphasic medium (NNN) that prepared in Medical Research Center according to method by Al-Mulla Hummadi, 2004[10]. The first set consisted of a solid phase and no human blood part,while the second set contains human blood part. All media then modified by the addition of 2ml of urine after thawing of Lock's solution to the liquid phase. They were placed in a slant position, 20 ml of the solid phase media is poured into the tube then 7 ml of the liquid phase medium was over laid at the top (5 ml of liquid phase medium + 2ml of urine or Lock's solution).

As a result 6 types of media are prepared as follows:

The first set:

Media 1: 7 ml of solid phase without human blood +2 ml infant urine

Media 2: 7 ml solid phase without human blood + 2ml diabetic urine

Media 3: 7 ml solid phase without human blood + 2ml Lock's solution

The Second Set:

Media 4: 7 ml solid phase with human blood +2ml infant urine

Media 5: 7 ml solid phase: with human blood +2ml diabetic urine

Media 6: 7ml solid phase: with2ml. Lock's solution

During the process of solid phase and liquid phase preparations, PH was adjusted to 7.4 and the prepared media were incubated at 37 ºC for 24 hours to insure proper sterilization before used in the actual experiment.

Cultivation of parasite: Under sterilization hood, 1ml of the stock culture (1x10 promastigotes/ml) from each strain was drown by automatic pipette and injected into the culture tubes that has the biphasic media. The tubes were screwed closed and incubated in orbital incubator at 26ºC for 7 days. Cultures were examined daily throughout the experimental period for the growth of parasites. MacMaster was used to count number of live promastigotes from each culture media.

Results and Discusion

Table (1): Showed cultivation of Leishmania majorin different type of media without blood included in this study

Media without blood	(No. of promositgte within 7 days) ×10^6 cell/ml						
Days	1	2	3	4	5	6	7
Agar+ urine (Infants)	1 1 0.9	0.8 1 1.1	0.7 1 1.3	1 - -	1 0.9 0.7	0.6 0.8 0.75	0.8 - -

Table 4 showed NNN media with blood showed high number of promastigote (3,6,5× 10^6) of *Leishmania**tropica*** in media agar with urine of diabetic patients at day (4,5,6***)*** cultivation of parasite.

Table (5) Showed cultivation of Leishmaniadonovani in different type of media withoutblood included in this study

Media without blood	**(No. of promositgte within 7 days) ×10^6 cell/ml**						
Days	1	2	3	4	5	6	7
Agar+ urine (Infants)	1	1	1	1	1	2	2
Agar+ urine (Diabatic)	1	1	1	1	2	2	2
Agar+ lock's	1	1	1	0.9	0.9	0.9	0.8

Table 5 showed NNNmedia without blood showed high number ofpromastigote 2× 10^6 of *Leishmaniadonovani* in media agar with urine of diabetic patients at day (6***,7)*** cultivation of parasite.

Table (6) Showed cultivation of Leishmaniadonovani in different type of media without blood included in this study .

Media with blood	**(No. of promositgte within 7 days) ×10^6 cell/ml**						
Days	1	2	3	4	5	6	7
Agar+ urine (Infants)	1	1.9	3	3.8	4	3	3
Agar+ urine (Diabatic)	1.5	2	3.5	4	4	3.5	3
Agar+ lock's	1	1	1.7	3	3.2	3.2	2

Table 6 showed NNN media with blood showed high number of promastigote (3.5×10^6)of *Leishmaniadonovani*i in media with urine of diabetic patients at day (3***,6)*** cultivation of parasite .Parasite cultivation techniques constitute a substantial segment of present day study of parasites, especially of protozoa [11]. Success in establishing *in vitro* and *in vivo* culture not only allows their physiology, behavior and metabolism to be studied dynamically, but also allows the nature of the antigenic molecules in the excretory and secretory products to be vigorously pursued and analyzed Long-term maintenance of active and dividing parasite is the main target in developing new culture media [3].In the cultivation promastigotes of *Leishmania major L.tropica and L.donovani*, the routine commercially culture media like RPMI-1640 and M199 and NNNmedia that enriched by Fetal Calf Serum which is expensive, and not manufactured in many countries, specially in poor tropical countries, that leishmaniasis is one of the major health problems of them [12,13] In the present study, it was observed that healthy human urine stimulated the growth of Leishmaniapromastigotes in vitro, and this indicated that healthy human urine can replace the FCS for supplementing culture media for Leishmania, this may related to many factors found in urine responsible for this enhancement [14] The presents study revealed biphasic medium (NNN) with adding of diabetic human urine, showed the higher growth rate of parasites growth, the results was in agreement with [12] who established that parasite cultivation may be used to study the biochemistry, physiology, and metabolism of the parasites, determine their nutritional requirements, understand their ultra-structural organization, elucidate their patho-physiology, life-cycle and host-parasite relationship, as well as assess functional antibodies and cell-mediated protective systems against the parasites[15] .our finding also showed that suitable replacements for FCS, by human blood, are suitable for cultivation of promastigotes of Leishmania major L.tropica and L.donovani this was in agreement with [16] who documented that all modified media they contained blood and additives as important factors for parasite replication, which complicate biologic and immunologic studies. Important progress has been made with the use of serum-enriched liquid monophasic media and many substances were reported as additives to improve the culturing property of media .In vitro cultivation of Leishmania parasites plays an important role in vaccine and drug development studies and also in diagnosis and treatment of leishmaniasis, Therefore, other growth factors have been trialed as substitutes for FCS. Some studies showed the stimulatory effect of human urine as an alternative to FCS.

Conclusion

Our stud concluded that using of a novel, inexpensive and easy-to-prepare culture media for Leishmania spp. with a potential suitable for producing high amounts of promastigotes with long-term viability, and consisting of ingredients available parasitology laboratories with no requirement for Fetal calf serum.

Abstract

The UC and Crohn's disease are chronic, idiopathic, inflammatory diseases of the GIT that share common symptoms such as diarrhea, abdominal pain, fever, and weight loss. Ulcerative colitis involves all or part of the colon, whereas, Crohn's disease commonly involves the terminal ileum and proximal colon. The two major forms of IBD share many clinical and epidemiological characteristics, suggesting that underlying causation may be similar. Yet, UC & Crohn's disease are distinct syndromes with divergent treatment and prognosis. The present study provided significant epidemiological evidence that infestation with round worm (helminthes) provided protection against acquisition of inflammatory bowel disease. The combined infestation with multiple intestinal helminthes has a better protective role than single parasite in protection against inflammatory bowel disease. The best method for diagnosis of helminthes infestation in terms of sensitivity and specificity was conventional PCR.

Keywords: *Crohn's disease, ulcerative colitis, IL1B and IL10,IBD.*

Introduction

Inflammatory Bowel Disease (IBD) comprises those conditions which tend to be chronic or relapsing immune activation and inflammation within gastrointestinal tract (GIT). Ulcerative Colitis (UC) and Crohn's disease are the two major forms of this disease with unidentified etiopathology[1]. The incidence of IBD has been rising not only in Western countries, but also in Asia, including Korea[2]. Thanks to the inventions of vaccines and anti-microbial agents that dramatically reduced the rate of infectious disorders. The big picture in the developed world can be summarized by two main trends. The first tread is that infectious disorders such as mumps, rubella, T.B, pneumonia, meningitis, etc., have reached very low incidence rates in these developed countries; the second trend however; on the other hand is that a number of disorders such type 1 diabetes mellitus, hay fever, celiac disease, asthma, Crohn's disease and ulcerative colitis have witnessed marked increase in incidence rate particularly when compared with their incidence rates in developing countries [3]. Epidemiologic studies have shown that the prevalence rates of idiopathic inflammatory bowel disease, Crohn's disease and ulcerative colitis, are higher in developed countries such as USA and Western Europe than in underdeveloped and developing countries. On the other hand, the prevalence rate of parasitic infestation with round worms, helminthes, is significantly lower in developed countries in comparison with developing countries. Based on these epidemiologic data, a number of authors has suggested a link between high incidence rate of Crohn's disease and ulcerative colitis and low incidence rate of helminthes infestation in developed countries and has hypothesized that under exposure to

Assit. Prof./College of Medicine, University of Qadissya, Iraq

children in their early lives to helminthes infestation resulted in maldevelopment of their immune system with subsequent predisposition to autoimmunity that may manifest itself in the form of either Crohn's disease of ulcerative colitis[3,4]. However; because of the lack of clear consensus about this suggestion and because of the high prevalence of helminthes infestation in our community in Iraq, the present study was planned and conducted to investigate the possible association among the immune system function, the prevalence of helminth infestation and the prevalence and pathogenesis of idiopathic inflammatory bowel diseases.

Methodology

After sterilizing the area with alcohol (70%), aspiration blood sample (5ml) was collected from cubital fossa vein from GIT patients and control groups. Collected sample was transferred immediately in to two tubes as follows:

A. Two milliliter of blood in 5 ml tube (EDTA tube) used for PCR technique to detect NOD/CARD15 gene polymorphism

Two groups were included in this study;

A. Patients Group: A total of fifty patients from Al-Diwaniyah province (males and females) with inflammatory bowel disease; 31 patients with Ulcerative Colitis and 19with Crohn's Diseases patients, who have been diagnosed by specialist physicians in Al-Diwaniyah Teaching Hospital for Gastrointestinal Tract and Hepatic diseases unit, depending on clinical features, biopsy for histopathology, and endoscopy. All were regularly attending the consultant clinic for treatment and follow-up during the period from January 2018 to august 2018.

B. Control Group: A total number of thirty individuals, who were apparently healthy, were involved as a control group. They matched the patients group regarding sex, and age and had no history of/or clinical features of IBD, no obvious abnormalities, none of them had an acute or chronic diseases.

Study Protocol and Sampling Members of the two groups were subjected all were subjected to the following assays:

1. GSE.

Stool examination for parasites

1. Saline wet mount: It is used to detect worms, bile stained eggs, larvae, protozoan trophozoites and cysts. In addition, it can reveal the presence of RBCs and WBCs.
2. Iodine wet mount: It is used to stain the glycogen and nuclei of the cysts. A cyst is appreciated better in an iodine preparation, but the motility of the trophozoite is inhibited in the iodine preparation.

Procedure:

- Place a drop of saline on the left half of the slide and one drop of iodine on the right half.
- With an applicator stick, pick up a small portion of the specimen (equivalent to the size of a match head) and mix it with a saline drop.
- Similarly, pick up a similar amount and mix with a drop of iodine.
- Put the cover slip separately on both and examine under the microscope.
- The ova, cysts, trophozoites and adult worms can be identified as per their characteristic features.

2. Screening the bellow:

- EDTA tube for blood extraction and then RFLP PCR.
- Tube for stool extraction and PCR.

Results and Discussion

The mean age of patients with IBD was 36.68 years and the range was 12 – 63 years, whereas the mean age of control subject was 37.22 years and he range was 12 – 63 years. Indeed, there was no significant difference in mean age between patients and control subjects (P = 0.828), table 1. According to gender, patients included 38 males (76%) and 12 females (24%) while control subjects included 33 males (66%) and 17 females (34%); the difference in the distribution of patients and control subjects was statistically insignificant (P = 0.978), table 4.2. Moreover, there was no statistical significance difference in the distribution of patients with IBD and control subjects with respect to residency (P = 0.829), as shown in table 3. Alcoholism was seen neither in control

group nor in patients group, table 4; however, smoking was observed in 14% of patients (7 out of 50) and in 12% of control subjects (6 out of 50); the difference in distribution of patients and control subjects according to smoking was statistically insignificant (P = 0.766), as shown in table 4. Positive family history was seen in 8 patients out of 50 (16%) and in 6 out of 50 control subjects (12%); there was no statistical significant difference in the distribution of patients with IBD and control subjects with respect to family history of idiopathic inflammatory bowel disease, as shown in table 5.

Association between parasitic infestation and inflammatory bowel disease: The distribution of patients with inflammatory bowel disease and control subjects according to presence and type of parasitic infestation is demonstrated in table 9. First of all, the helminthes (round worms) that were detected in the current study included *Ascaris lumbricoides, Enterobius vermicularis,* and *Strongyloides stercoralis. Ascaris lumbricoides* was seen in 12% and 26% of patients and control subjects, respectively, that is it is more common in control subjects than in patients with IBD; however, the difference did not reach statistical significance (P = 0.074); in terms of risk the odds ratio was 0.43 which means that patient with *Ascaris lumbricoides* are less liable to get IBD by a fraction of 0.57 and the preventive fraction was 0.30. *Enterobius vermicularis* was seen in 34% and 50% of patients and control subjects, respectively, that is it is more common in control subjects than in patients with IBD; however, the difference did not reach statistical significance (P = 0.105); in terms of risk the odds ratio was 0.52 which means that patient with *Enterobius vermicularis* are less liable to get IBD by a fraction of 0.48 and the preventive fraction was 0.28.*Strongyloides stercoralis* was seen in 28% and 38% of patients and control subjects, respectively, that is it is more common in control subjects than in patients with IBD; however, the difference did not reach statistical significance (P = 0.288); in terms of risk the odds ratio was 0.63 which means that patient with *Strongyloides stercoralis* are less liable to get IBD by a fraction of 0.37 and the preventive fraction was 0.20, table 9.Total parasite burden was seen in 52% and 62% of patients and control subjects, respectively, that is it is more common in control subjects than in patients with IBD; moreover, the difference was statistically significance (P = 0.039); in terms of risk the odds ratio was 0.42 which means that patient with round worm infestation are less liable to get IBD by a fraction of 0.58 and the preventive fraction was 0.37, table 6.

Table 6: Association between parasitic infestation and inflammatory bowel disease

IBS: inflammatory bowel diseases; *n*: number of cases; ¥: Chi-square test; NS: not significant at $P \leq 0.05$; OR: odds ratio; CI: confidence intervals; PF: preventive fraction

The present study showed that the mean age of patients with IBD (ulcerative colitis and Crohn's disease) was 36.68 years and the range was from 12 to 63 years. This finding agrees to the findings of several other studies which described a mean age ranging from 35 to 37 (Prelipcean *et al*., 2014); this study also agree with Velonias *et al.* (2017), who found that the mean age of majority of patients with ulcerative colitis and Crohn's disease was 36 years. In the current study, majority of cases were male patients and female patients constituted a minority, 75% versus 24%. This finding agrees with Baars *et al*., (2012), who found the majority of patients with inflammatory bowel disease were males (64%); also agrees with the finding of Yang *et al*., (2014) who found that male patients constituted 66.7% out of all patients with Crohn's disease. On the other hand, some authors described no sex predilection for inflammatory disease. Collectively, the results of the present study, in addition to previous studies indicated the lack of clear consensus on sex predilection of inflammatory disease; this may explain the absence of factors related to either gender in the predisposition to inflammatory bowel

disease, namely hormonal influences. The current study showed no significant association between smoking and inflammatory bowel disease since rates of smoking were 14% versus 12% in IBD patients and control group respectively. In the present study the prevalence rate of positive family history was 16%; however, there was no significant association between the IBD and family history of IBD. In agreement with the present study, it was found the rate of positive family history in patients with IBD approaches 13%. Some authors found no significant association between family history of IBD and occurrence of inflammatory bowel disease [7,8], in agreement with the findings of the current study. However, some studies found significant association between inflammatory disease and positive family history [10-13].These findings suggested a protective role for helminthes against development of inflammatory bowel disease. The authors of the current study were able to find that multiple parasitic infestations were significantly protective against both ulcerative colitis and Crohn's disease with an estimated odds ratio of 0.42 (95% confidence interval of 0.18-097). Similar observations have been recorded by a number of cross sectional studies. In a case control study from South Africa, childhood exposure to helminthes was protective against both CD and UC development (adjusted OR of 0.2 [95% CI 0.1–0.4] for CD and adjusted OR of 0.2 [95% CI 0.1–0.6] for UC).

Conclusion

The present study provided significant epidemiological evidence that infestation with round worm (helminthes) provided protection against acquisition of inflammatory bowel disease. The combined infestation with multiple intestinal helminthes has a better protective role than single parasite in protection against inflammatory bowel disease. The best method for diagnosis of helminthes infestation in terms of sensitivity and specificity was conventional PCR.

Febrile Seizures in Children Aged 6 Months up to 5 Years in Al-Diwahiyah Province, Mid-Euphrates Region of Iraq: A Cross Sectional Study

Flayyih Hasan Shnawa

Pediatric Specialist/Al-Diwaniyah Maternity and Child Hospital/Al-Diwaniyah Province/Iraq

Abstract

The present cross sectional study was carried out in Al-Diwaniyah province, Mid-Euphrates region of Iraq aiming at highlighting the prevalence rate and risk factors associated with febrile seizures in children. The present cross sectional study was carried out at Afak General Hospital in Al-Diwaniyah province, Mid-Euphrates region of Iraq. The beginning with this study started on December the 1st 2015 and continued till June the 30th 2018. At the end of the study 100 children aged 5 months to 5 years were included. The a peak incidence between 18 months to 24 months in 28 (28%) and less incidence after 4 years of age in 4(4%) only. There was a slight difference on the basis of gender among, patients with male: female ratio 1.3:1. The most common type of febrile seizure was simple with seizures duration less than 15 minutes in 87 (87%), while complex type with seizures duration more than 15 minutes was encountered in 13 (13%) without out gender predilection, (P> 0. 05). The characteristic seizures activity were generalized tonic– clonic in 98(98%) and only 2 (2%) present with focal or partial seizures, without out gender predilection (P> 0.05). Single febrile seizures during the first 24 hours presented in 93 (93%) while multiple seizures occurs in 7 (7%) only, without out significant gender predilection (P> 0.05).

Keywords: *Febrile seizures, Al-Diwahiyah Province, Mid-Euphrates region, Iraq.*

Introduction

When seizure happens in children between 6 months to 5 years of age in association with body temperature more than 38 ºC it is called febrile seizure, provided that an organic cause is lacking such as head trauma, intracranial mass, hypoglycemia, electrolyte imbalance and drug discontinuation and the lack of previous history of afebrile seizure[1-3]. Because of high rate of incidence in young children and high rate of recurrence, febrile seizures are important clinical problems in daily pediatric practice. It has been estimated that 2-5% of children are affected by febrile seizures and that the second episode has been reported in up to 30% of children previously affected [4,5]. The etiology of febrile seizure is considered in the context of multifactorial causation so that genetic predisposition in interaction with environmental factors affects the developing central nervous system in growing children. Therefore, it is suggested that the neuronal hyperexcitability accompanying neuronal maturation in growing children predisposes them to febrile seizures [4,6,7]. Evidence for genetic predisposition has emerged from family history and twin concordance rate. It has been shown that positive family history is seen in about one third of children with febrile seizure and that the concordance rate among twins has ranged from 14 – 69% [8,9]. Several genes located on chromosomes 1,2,3 and 5 have been linked to higher risk of febrile seizure and a number of inheritance modes have been suggested; however, multifactorial inheritance have widely accepted [10-13].It has been suggested that the magnitude of temperature rise rather than the speed by which this level of temperature is accomplishes is the

Dr. Flayyih Hasan Shnawa
Pediatric specialist/Al-Diwaniyah Maternity and Child Hospital/Al-Diwaniyah Province/Iraq

principal risk factor and the higher the temperature level is, the greater the risk is [14-16]. Febrile seizures are most often encountered following viral infections; however, immunization has been also associated with increased risk[17-20]. Premature infants and those born to women addicted to nicotine and alcohol are also at increased risk [21,22]. Clinically the febrile seizure is either simple or complex. The more common simple febrile seizure is generalized and associated with tonic–clonic movements of the limbs and rolling back of the eyeballs and it lasts less than 5 minutes and associated with loss of consciousness at time of seizure [8,22]. Complex is usually focal, lasts for more than 15 minutes, in contrary to simple type recurs during the same day and may be associated with Todd's paralysis.

Methodology

The present cross sectional study was carried out at Afak General Hospital in Al-Diwaniyah province, Mid-Euphrates region of Iraq. The beginning with this study started on December the 1st2015 and continued till June the 30th 2018. At the end of the study 100 children aged 5 months to 5 years were included. Those children were diagnosed by pediatric specialist to have febrile seizures following history taking, clinical examination and the conductance of necessary investigations. Dmographic characteristics such as age, gender, residency and place of seizure occurrence were obtained in addition to duration and onset of febrile illness and duration and onset and duration of seizure attack. Axillary temperature at time of presentation was obtained for all enrolled children. History of previous attack, the recurrence during the present 24 hours, type of seizure (generalized versus focal), family history, vaccination history, developmental history and underlying causes for the febrile seizures were also recorded. All admitted patients were followed up daily during the period of hospital stay. The study was approved by institutional ethical approval committee and verbal consent was taken from parents and care giver of all participant children. The data were then transferred into and (SPSS version 23) spread sheet for purpose of statistical analysis. Data were presented as mean, standard deviation, range, number and percentage. Chi-square test was carried out to study association between categorical variables while independent samples t-test was performed to assess difference in mean between two groups. The level of significance was considered at $P \leq 0.05$.

Results

This study has showed that the ages of patients has ranged between 5 months and 60 months, with a mean of (32.7 months); 65 (65%) occurs among children between 12 months to 30 months of ages, with a peak incidence between 18 months to 24 months in 28(28%) and less incidence after 4 years of age in 4(4%) only, table 1. There was a slight difference on the basis of gender among, patients with male: female ratio 1.3:1, as shown in table 1. The most common type of febrile seizure was simple with seizures duration less than 1 5 minutes in 87 (87%), while complex type with seizures duration more than 15 minutes was encountered in 13 (13%) without out gender predilection, (P> 0. 05). The characteristic seizures activity were generalized tonic–clonic in 98(98%) and only 2 (2%) present with focal or partial seizures, without out gender predilection (P> 0.05).Single febrile seizures during the first 24 hours presented in 93 (93%)while multiple seizures occurs in 7 (7%) only, without out significant gender predilection (P> 0.05), table 2. It has been found that 88(88%) children were from urban area and that 12 (12%) from rural area. The most common place of occurrence of febrile seizures has been athome in 85(85%) and seizures has stopped in the majority when reaching hospital. Positive family history of febrile seizures has been described in 33 (33%)with no sex difference among them. Most attacks of febrile seizures have been for the first tinge in 76 (76%)while 24(24%) patients have experienced recurrent attacks, 18 (18%) second attacks and 6 (6%) third attacks, table (3).Ten (41%) patients with recurrent febrile seizures had positive family history. The study has shown that the duration of febrile illness before the onset of seizures has been less than 24 hours in 53 (53%) patients and more than 24hours in 47(47%). The temperature at time of' hospital admission has been more than 38.5 ºCin 74(74%) and less than 38.5 ºC in 26 (26%), table 4. Lumber puncture has beenjustified in 18 (18%) patients, 3 (young age < 12 months), 2 (focal seizures), 7 (prolong and multiple seizures), 2 (possibility of meningitis) and 4 (unrecognized causes of fever); however, only 12 children have been subjected to lumbar puncture as parents of 6 children have refused to do so. The most frequent underlying causes of febrile seizures in this study have been related to upper respiratory tract infections in 75 (75%) patients, while other causes including pneumonia, gastroenteritis, urinary tract infections and post immunization have been recorded in 21 (2l%). On the other hand unrecognized causes have the rule in 4 patients (4%), table 5.

Table 1: Distribution of children according to age and gender

Age (Months)	Males		Females		Total	
	n	%	n	%	n	%
5-<12	5	5%	3	3%	8	8%
12-<18	9	9%	8	8%	17	17%
18-<24	15	15%	13	13%	28	28%
24-<30	12	12%	8	8%	20	20%
30-<36	8	8%	5	5%	13	13%

	Female	16	16%
Febrile seizures attacks	First attacks	76	76%
	Second attacks	18	18%
	Third attacks	6	6%

Table 4: Distribution of febrile illness duration before seizures and temperature at hospital in 100 patients

Characteristic		n	%
Febrile illness duration (hours)	< 24 hours	53	53%
	> 24 hours	47	47%
Temperature at hospital (axillary corrected)	< 38.5C	26	26%
	> 38.5C	74	74%

Table 5: Underlying causes for febrile seizures in 100 patients

Underlying causes	n	%
Upper respiratory	75	75%
Pneumonia	10	10%
Gastroenteritis	6	6%
Urinary tract infections	3	3%
Post immunization	2	2%
Unrecognized cause for fever	4	4%

Discusion

Febrile seizures are the most common type of seizures in Childhood. This study shows that 65 (65%) patients were found among age group 12-30 months, with a peak incidence between 18 – 24 months and less incidence after 4 years of age in 4 (4%) only. Farwell reported in his study in 1991 that (64%) of' patients were found among age group 1-2 years. Berg et al. in their study in 1992 reported that 50% of patients founds among age group 1-2 years[27]. The results of this study were similar to that reported by these studies and this prove the fact that febrile seizures had specific age limited and convulsive threshold not static throughout childhood, and this age specificity may be related to brains sensitivity to fever; the incidence decreasing with advancing age which may be related to mature brain growth and less sensitivity to fever. This study shows slight sex difference among patients with male: female ratio of 1.3:1. Farwell reported in his study those febrile seizures slightly more common in boys. Some large studies showed that febrile seizures had no significant difference on the basis of gender. The results of this study were similar to other studies of gender difference basis, whether there is biological susceptibility or whether boys simply contract more fever, which may need further studies to be shown[25]. This study shows that the most frequent type of febrile seizures was simple (i.e. seizures duration < 15 minutes) in 87 (87%) patients, while complex type (i.e. seizures duration> 15 minutes in 13 (13%) only (P value > 0.05 not significant). Farwell in his study reported that the most common type of febrile seizures is simple with frequency (93%). The present study has shown that 88 (88%) patients were from urban area and 12 (12%)from rural area this probably due to short and self-limiting Seizures or may be due to delay seeking medical advice and traditional believes of suggestion in rural areas. This study shows that (85%) of seizures were occurred at home and the majority stopped when reaching hospital and this may be related tobenign and self-limiting behaviors of febrile seizures. Positive family history of febrile seizures were found in 33 (33%)patients, with no sex difference among them and this finding slightlymore than to that reported by Farwell and berg *et al*. studies (29%, 25%)respectively. This study shows that (76%) of febrile seizures occurs for the first time and (24%) experienced recurrent attacks. Berg et al. reported in their study that one-third of children who will febrile seizures will have recurrent episodes. Ten (41%) patients with recurrent seizures had positive family history and this may indicate the significant role of family history on the possibility of occurrence of febrile seizures. In this study 53 (53%) patients had febrile illness duration less than 24 hours before the onset of seizures. The temperature at time of hospital admission was more than in 38.5Cº in 74 (74%) patients. In most children, primary causative factor of febrile seizures seem to be the height and rapidity of temperature elevation usually exceed 101.8º F (38.8ºC) and the seizures usually occurs during the temperature riserather than after a prolong elevation[27,29]. This study shows that lumbar puncture were indicated in 18 (18%)patients and were done in 12 patients and 6 parents refuse it, because some parents think that lumbar puncture may cause paralysis and somethink it is not necessary as febrile seizures occurs before and it is self-limited associated with fever only.

Conclusion

In conclusion, the vast majority of febrile seizures are simple, brief, benign self-limiting attacks, occurs most frequently among children with age group 12 to 30 months and less frequently after 4 years of age with slight male predilection, family history was a major risk factor.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Pediatric specialist/Al-Diwaniyah Maternity and Child Hospital/Al-Diwaniyah Province/ Iraq and all experiments were carried out in accordance with approved guidelines.

Microbial Control Agent (Beauveriabassiana) in Biological Control of Tetranychusurticae Koch (Tetranychidae:Acari)

Alyaa Abdul-ridha Hanash[1], Alaa Najee Salih[1]

[1]Collage of Education for Pure Sciences, Iraq

Abstract

Present study objective was to evaluate the effect of the pathogenic agent of insects (Beauveriabassiana) in control on nymphs and adults stage of tetranychusurticae in cucumber . Two local isolates of this fungus were used and symbolized as (beauveria 60, beauveria 65) with concentrations ($1x10^6$, $1x10^7$,$1x10^8$) spore\ ml. The results showed superiority (Beauveria 60) rather than (Beauveria 65) in the incidence of high mortality rates. Where the spore suspension of both isolates gave high mortality rates which differ significantly from the comparison treatment (control). Where the spore suspension of both isolated (B 60 and B65) achieved in field with concentration ($1x10^8$) spore\ml. The highest mortality rate reached (39,02, 35.68) respectively. The (Beauveria 60) filtrate in concentration of 100% has achieved high mortality rates in nymphs and adults of tetranychusurticaeamount to (52.17, 54,10) respectively, While the (Beauveria 65) filtrate it has achieved a mortality rate reached(55.50,50.60) in nymphs and adults of tetranychusurticae respectively . This assure importance of use Beauveriabassiana in biocontrol of plant pests.

Keywords: *Tetranychusurticae, Beauveriabassiana, cucumber, biological control.*

Introduction

The tetranychusurticae belongs to the tetranychidae family and the Acari order It is a serious economic pest which affects many plants and causes major economic losses. Where moving individual of the pest absorb the vegetable juices of the leaves and buds as well as the accumulation of dust on the woven network, which leads to disruption of the photosynthesis process and lack of composite of new leaves and flowers and dry and infected parts and death also this pest will be able to produce toxic compounds.[1] Where the ferocity of this pest returns to high reproduction rates when appropriate conditions are available [2] A number of method have been used to control this pest. Chemical pesticides have been used, including sulfur, in all its forms, such as sulfur and sulfur, which can be wetted.[3] also pesticide polo, netron, vertimec was used and good results were given.[4] However, the excessive and improper use of these pesticides resulted in many negative and harmful effects in the ecosystem such as the disappearance of certain natural enemies such as predators, parasites, Resistant to the pesticide act in addition to the environment pollution.[4-6] And because the subject of environmental pollution has become important in all societies until 1990, Paying the competent research centers to think of alternative method of chemical control, so increased interest in the biological control of as Safe and pioneering method in this field and to find ways to control such pests and these method are microbial control such as viruses and bacteria Fungi, primates and nematodes or the use of toxins produced from these organisms in certain structures either in spray, dust, wet liquid, concentrated liquid, soluble powder or granules[7-8] of these organisms, which is one of the earliest entomopathogenic fungi used as a pesticide and was known as an effective control agent against pests and causes disease white museardine and spread to a wide range of families around the world compared to other deuteromycetes fungi and infect most of the insects orders[10] use of entomopathogenic fungi

(beauveriabassiana) to decrease the population of the pest, where it appears to have an lethal and strong role on active stages of the pest.[11]

Materials and Method

Laboratory Tetranychusurticae Breeding: The cucumber were planted in plastic containers under laboratory conditions. The plants were polluted with infected cucumber leaves to obtain a permanent colony of the pest and used in subsequent experiments.

Population Density Study of Pest: The study was conducted in the Kut province/Iraq, where the cucumber plant (local category) was planted in the form of tablets, the area of one tablet is (3x0.5m) and the distance between tablet and another is (0.5m) and the distance between plant and another is (30cm). Agriculture was established in March. After the emergence of the infection was taken samples of infected plant and the fact take 10 leaves and three replicates according to the number of live individual of pest per one square inch during the season of production of the crop (May, June, July)

Laboratory Experiments: Evaluation of the effectiveness of some elements of biological resistance factor against adults and nymphs of the pest

A. **Preparation of spore suspension:** The spore suspension was prepare by taking disk was diameter(0.5cm) and placing in (9.5 ml) of distilled water and shake for 5 minute for remove the spore from conidiophores and prepare the concentrations ($1x10^6$, $1x10^7$, $1x10^8$) spore \ ml with help (haemocytometer) [12]

B. **Study effect spore suspension of two isolates of beauveria in nymphs and adults of pest in lab:** Brought leaves of cucumber plants and placed 10 individuals on each of the nymphs and adults separately. The leaves were placed in plastic plates with a diameter (9 cm). A piece of wet cotton was placed in it to ensure continuous moisture. The leaves were treated with the spore suspension for both isolates. Comparative treatment was sprayed with distilled water and the remaining living individuals were recorded after (24,48,72) hours of spraying. Temperature and relative moisture have been fixed(13)

The fungi were then isolated from the treated insects, which showed the pathological symptoms to prove that the fungus was the cause of the death of the insect to ensure the pathogenicity of these fungi. These isolates were selected for experiments following Because of its high morbidity to insect and their not effect in cucumber.

The percentage of mortality was calculated and corrected and converted to angles according to Equation of orell and Schneider (14).

Mortality % = (Death ratio in treatment – Death ratio in control / Death ratio in control 100–) × 100

Study effect spore suspension of two isolates of beauveria in tetranychusurticae in field

The concentrations were used($1x10^6$, $1x10^7$, $1x10^8$) spore\ml from two isolates(beauveria 60, beauveria 65) For the purpose of control of tetranychusurticae in field, And calculated the numbers of the mite in One square inch A day before spraying, Then sprayed at a rate of three replicates per concentration, While the comparison treatment was spray with distilled water only.Then the living individual were calculated after(24, 48 and 72, and after one week and two weeks of spraying), the percentage of the mortality was calculated and corrected and converted to angles by equation of orell and Schneider (6)As in the previous paragraph

Study effect spore suspension of two isolates of beauveriain nymphs and adults of pest in lab

A. **Preparation two isolates filtrates**

1. Prepare the liquid food medium(Potato Dextrose Broth)(P.D.B), then distribute in a glass flask size 250 ml at a rate of 150 ml/flask, The bottles containing the liquid medium in autoclave were sterilized under 121 ° C and air pressure 15pound \ $inch^2$ for 30 min, And then left to cool and then added to the antibiotic(Chloramphenicol) at a rate of 250 mg/liter and then inoculate each flask with several disks diameter(0.5)cm of the colonies of two isolates and seven days old and then incubated the flask in the incubator under the temperature of 25 + 2 for 28 days, and shake the flasks every 2-3 days For the purpose of distribution of fungal growth then filtration using filter paper type Whatman No.1 by Air discharge device.(15)
2. 10 cucumber leaves were brought and put it on 10 nymph and 10 adult both separately and three replicates for each treatment in 9 cm diameter

plastic dishes. A piece of cotton and wet were placed underneath to obtain continuous moisture. Use filtrates with a concentration (25,50,75,100) % with rate 1 mL\replicate. The comparison treatment was sprayed with distilled water only and the percentage of mortality was calculated after (24, 48, 72) hours of spraying. The values were corrected and convert to angle was made by equation orell and Schneider(14) as in the previous paragraph

Statistical Analysis: All experiments were carried out according to Completely Randomized Design (C.R.D.) as single-factor experiments, and data were analyzed by variance analysis, the averages were compared by the least significant difference (R.L.S.D) and at a Probable value (0.01) in lab experiments and 0.05 in field experiments (16)

Results and Discusion

Effect of spore suspension of two isolates in tetranychusurticae in field: It was observed through the study that the spore suspension of two isolates (beauveria 60, beauveria 65) Has given high rates of mortality for pest which differ significantly from the comparison treatment, the beauveia 60 Superiority beauveia 65 in mortality rate,where high mortality rate reach 39.02% in $1x10^8$ spore\ml concentration .Which differed significantly from the rest of the concentrations that reached the rate of mortality in which 33.96,25.74% for $1x10^7$,$1x10^6$ spore\ml Respectively .While the beauveria 65 mortality rate reach 35.68% in the same concentration And a significant difference from $1x10^7$,$1x10^6$ spore\ml,where mortality rate reach in which 30,94,23.64% Respectively Table (1).

This study coincided with Samson and others(1988) Who referred to that beauveriabassiana has ability to infect Aphis craccivora insect And infection rates are increasing with increased concentration due to increased number of spores, He also noted Al-Jaber and shuweir (1999) that B. bassiana Has affected in Rhynchophorusferrugineus, Where the fungi achieved a percentage of mortality reached 40,55% for both male and female respectively, also Increased concentration led to an increase in the rate of mortality when used spore suspension with $1x10^8$ spore\ml the mortality rate reached 50 and 55% for male and female respectively. The effectiveness of the fungus in the pest may be due to its production of some extracellular enzymes and this is explain by Ito and others(2007) that B.bassiana produce enzyme extracellular in the liquid medium. Effect of B.bassiana in Aphis craccivora And gave a rate of mortality ranged from (58-91%) seven days after the treatment.

Effect of beauveria(60) filtrate in nymphs and adults of tetranychusurticae in lab: The results shown in the tables (2,3) were explained that beauveria 60 filtrate has effect in nymphs and adults of pest,where the concentration 100% has been given high mortality rate amount to (52.17 and 54.10%) in nymphs and adults Respectively. This concentration differed significantly from the rest of the concentrations in the nymphs, which reached the rate of mortality 44.70 and 38.47 and 18.37% for concentrations 75,50,25% Respectively.As well as in the adults It is significantly higher than the rest of the concentrations 75,50,25% In which the rate of mortality was 33.94 and 30,50 and 21,50% Respectively, The period of time was three days of treatment with the highest rates of mortality reached to 42,10 and 44,00% in nymphs and adults Respectively.

Effect of beauveria(65) filtrate in nymphs and adults of tetranychusurticae in lab: It is observed through the study that beauveria 65 filtrate has influence in nymphs of the tetranychusurticae and the concentration 100% has high effect where the mortality rate reached 55.50%A significant difference was obtained from the rest of the concentrations used, in Which mortality rates reached 43.90 and 29.40 and 18.33% for concentration 75 and 50 and 25% Respectively (table 4) It was also found from the same table that the period of time three days was more influential than others with a rate of mortality 38.38%, And differed significantly from the rest of the time periods, noting that the three time periods differed significantly between them .

Conclusion

The (Beauveria 60) filtrate in concentration of 100% has achieved high mortality rates in nymphs and adults of tetranychusurticaeamount to(52.17, 54,10) respectively, While the (Beauveria 65) filtrate it has achieved a mortality rate reached (55.50,50.60) in nymphs and adults of tetranychusurticae respectively . This assure importance of use Beauveriabassiana in biocontrol of plant pests.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Collage of Education for pure Sciences, Iraq and all experiments were carried out in accordance with approved guidelines.

Phonological Awareness of Students with Speech Disorders

Mtab Abdulhossein Dawood Al-Rikabi[1], Imad Hussain Al-Morshedi[1], Jalal Aziz Farman[1]

[1]University of Babel, Faculty of Basic Education, Iraq

Abstract

The current research aims to identify the phonological awareness of students with speech disorders registered in the Directorate of Education DhiQar/Al-Rifai district for the academic year (2018 - 2019). The basic research sample was deliberately selected(60) students and students with speech disorders after being diagnosed by researchers on the diagnosis of speech disorders, and the researchers adopted the descriptive approach to the current research steps The researchers adopted the phonological awareness scale prepared by Nubian (2010) by studying the literature, studies and measurements related to the subject of their research, and the measure of (60) divided by six dimensions and each after a set of paragraphs amounted to (10) paragraphs for each dimension and Extraction of psychometric properties from (sincerity and persistence) was applied to the basic sample, And after the data were unloaded for the purpose of extracting the results were statistically processed using a number of statistical method including the TEST test for one sample. The results showed that the mean was less than the theoretical average of the phonological awareness scale. The calculated value is less than the tabular value. Pronunciation did not have a phonological awareness.

Keywords: *Phonological awareness, students, speech disorders.*

Introduction

Phonological awareness plays a large role in the life of the child in various social, personal, psychological and educational aspects, based on his life, including his education, his various activities, his job and various transactions. So that the average child can keep abreast of developments in various fields.[1] But some of these children with speech disorders may have a problem learning this phonological awareness correctly, which is the rest of their ordinary peers, which is evident through the difficulty of learning what is given to them texts and sentences or even words, which causes them to refrain from learning the phonological awareness of all They are the result of their inability to know that the words they hear are composed of individual sounds consisting of the word[2]. These sounds are called phonemes or phonological awareness, as well as their inability to analyze and synthesize the sounds that make up the word.[3] Since phonological awareness is one of the fundamental aspects of the detection of learning difficulties in language skills (listening, speaking, reading, writing), the first difficulty in this failure may be due to difficulties in the level of phonological awareness among pupils with speech disorders.Hence, the current research problem is the identification of phonological awareness among pupils with speech disorders[4].

The manifestations of the difficulties of phonological awareness in language skills are as follows:

1. The storage of verbal language in memory, where people with learning difficulties use meanings or semantic coding, which is related to the meanings of words, while students who do not suffer from those difficulties use sound or phonological or phonological coding.
2. Use verbal information in working memory as people with learning difficulties are less accurate and efficient in using verbal information that helps them to remember

Corresponding Author:
Mtab Abdulhossein Dawood Al-Rikabi
University of Babel, Faculty of Basic Education, Iraq
e-mail: hajeabdu@gmail.com

3. Retrieval of information from long-term memory, where learning disabilities draw information at a slower and less accurate level, as well as that the extraction is less in its details organized than the performance of peers who do not suffer from such difficulties.
4. Using learning strategies, where people with learning difficulties use strategies similar to those used by peers who do not have learning difficulties, although their use is less efficient than using their peers to those

Strategies: The acquisition of language skills and communication skills is critical to the overall integrated growth of the student and because the child with speech disorders is unable to interact properly with others and seeks to move away from society and sit in the same closed and does not want to move and activity usually,

All types of behavior, including speech disorders, are the result of the environment and the social conditions surrounding the child, and these disorders are a kind of abnormal behavior that occurs as a result of the experiences experienced by the child. Based on this, The child is due to the surrounding environmental conditions and is also due to social factors and improper grooming both at home and school [5] The brain is the physical machine of thinking and the ability to create the ability of human perception and expression as well as understanding meanings and respond to instructions, and the human is not only a notebook, and hence the discovery of the scale of electrical brain to some understanding of how the brain works, and that neurons are the basis of learning and memory, It is the brain that is a member of learning and thinking. Therefore, the brain is the floor of desire, the place of learning, memory, knowledge of objects, people, images and colors. It is the center of consciousness of the body[6]. It is the voice of the human self and its environment. It describes, distinguishes, compares, reflects and dreams The work and shape of the brain, if every new experience and experience passes through the individual really changes from the electrical chemical structure of the brain, and that the receiving of the brain is exciting of any kind. The process of communication between the neurons is activated, and the more exciting the stimulus That the ability of the brain to form ideas and identify and deal with it make it effective in dealing with the surrounding, which has the ability to speed recognition and interaction with Khdair

Theoretical Importance:

1. Pay attention and attention to the class of students with speech disorders in terms of helping to develop solutions that reduce the negative effects.
2. Research may be useful to curriculum developers and practitioners to ensure that some method are used to suit this category.
3. We hope that this research will open new horizons for researchers in the future to conduct further studies and scientific research to serve this segment of students with speech disorders and achieve the desired goal

Applied Importance:

1. Helps provide diagnostic tests for people with speech disorders, leading to understanding of their abilities and helping them to develop them to the maximum extent possible.
2. It may help to establish specialized centers that help students with speech disorders develop their phonological awareness

The two objectives of the research: The current research aims to identify:

1. The neurological awareness of pupils with speech disorders?
2. Are there significant statistical differences in the degree of phonological awareness among pupils with dyslexia with regard to sex variable (male/ female)?

Fourth: Research limits: The current research is limited to the following limits:

1. Human boundaries: students with speech disorders.
2. Spatial boundaries: primary government schools affiliated to the Directorate of Education DhiQar - district of Rifai.
3. Time Limits: The academic year (2018-2019).
4. Cognitive boundaries: phonological awareness - speech disorders

Research Terms:

*** Phonological awareness: defined by:**

1. "The ability to understand that the word from one passage like a leg can be cut into first, middle, and last voices. It also requires an understanding that the

individual sections of phonemonic sound can merge together to form words", 2010: 13).

2. Allam (2009): "The ability of the child to know that the words he hears consist of individual sounds consisting of the word and these sounds are called phonemes

Speech disorders: defined by:

1. Al-Zaher (2010): "The problem with issuing the votes correctly and may be in the static votes or in the moving votes or both" (Al-Zaher, 91: 2010).
2. Al-Ghazali (2010): "The inability to pronounce the language sounds correctly due to problems in the consistency of muscle or defect in the exits of the voices of letters or poverty in the efficiency of sound or organic disorder" (Ghazali, 51: 2011)

The research community and its sample: The research community includes students with speech disorders in the schools and government centers of the Directorate General of Education DhiQar/district of Rifai for the academic year (2018 - 2019). In the study sample, the researchers chose students with speech disorders in the public schools in DhiQar, which the researcher presented to them the phonological awareness scale. They were selected in a random manner and numbered 60 students

Research Research: To achieve the objectives of the research and after the study of the yard on the scales and previous studies related to this subject, the researchers adopted the scale of the phonological awareness prepared by Nubian (2010) in Egypt being the closest to the subject of their research

- The paragraphs of the scale and its dimensions and instructions: Be the denominator of six dimensions and each dimension (10) paragraphs to become the total number of paragraphs of the scale (60) paragraph, while the instructions of the scale is consistent with the evidence that guides the respondent to how to answer, so researchers were careful to prepare instructions to be clear, And easy to understand, and suitable for the level of the examinee and the instructions are intended to explain the idea of the scale in the simplest picture to facilitate the process of application
- Validating the scale: The researchers used two types of honesty are the apparent honesty and honesty of the building. These two types were confirmed by the paragraphs of the scale on a group of arbitrators of 10 arbitrators who are specialized in education, psychology and special education. The results showed that honesty Al-Dhahiri had obtained a percentage of agreement (80%) by the arbitrators and specialists and did not delete any paragraph. As for the validity of the construction, the results showed that all the paragraphs of the scale are statistically significant, so the vertebrae are true for what they measure
- Stability of the measurements: The researchers used a method or so-called equation (Alpha Cronbach), which is often used in the calculation of the stability of psychological standards, which depend on the variation of the degrees of individuals on the paragraphs of the scale, and uses the coefficient of Vkronyach because it provides us with a good estimate in the attitudes, if it depends on the stability (0.86) is a high stability coefficient and is an internally consistent measure because this equation reflects the consistency of the paragraphs internally. It is an indicator of the stability of the scale. The phonological awareness is good and acceptable

Application Exploration: This application includes the following:

A. The phonological awareness measure was applied to students with speech disorders. The number of students was 30 students. The purpose of this study was to know the clarity of the instructions, the extent of understanding and clarity of the vertebrae, and the calculation of the time scale required for the scale. By the survey sample and the average time was (28) minutes.

B. The second survey application (statistical analysis): The scale was applied to a sample of students consisting of (100) students and students and the purpose of the analysis of the paragraphs statistically by distinguishing the paragraph, the important qualities and must be provided in the paragraphs of the scale is the characteristic of discrimination and the possibility of paragraphs in the disclosure (0,65-0.28). Thus, all the test paragraphs have a good and appropriate discriminating factor and no deletion of any paragraph

Eighth: Results: The researchers applied the scale to the basic sample of (60) students and students with speech disorders. The results showed that the calculated T value of (1.72) was less than the (1.96) (0,05) and

the degree of freedom (59), which is not statistically significant, and the results showed that there are statistically significant differences in the phonological awareness of the sex variable (male and female) and for females

The researchers explained the first outcome and the second result that students with speech disorders in general suffer from a weakness in the auditory awareness, and may be due to the reasons for the Bailujie relating to the pronunciation device or for environmental reasons due to the nature of the formation and method of education and support provided to children, both family and school Has affected the phonological awareness, while the differences of statistical significance that showed that females are more aware of males in the phonological awareness, it may be due to the roles and games performed by females that require them to use the language compared to the roles and games that require males Use of language, and the results are consistent with previous studies in this area.

Conclusion

The results showed that the mean was less than the theoretical average of the phonological awareness scale. The calculated value is less than the tabular value. Pronunciation did not have a phonological awareness.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the University of Babel - Faculty of Basic Education, Iraq and all experiments were carried out in accordance with approved guidelines.

Prevalence of Whooping Cough among Children Under Five Years During the Last 5 Years Ago in Hilla City

Mohammed Malih Radhi[1], Hider, M.H. Al-Shirifi[2], Mays Hadi Jebur[3]

[1]M.Sc. Community Health Nursing, Kut Technical Institute, Middle Technical University, Iraq, [2]Medical Microbiology, Al-Furat Al-Awsat Technical University, [3]Microbiology, Department of Basic and Medical Science, College of Nursing, Babylon University, Babylon Province, Iraq

Abstract

Whooping cough is a highly infectious disease that affects the respiratory tract. The disease can be distinguished, when most people, acute intermittent surface cough, which followed a high-pitched voice inspirations looks like “cock”. The study aims at identify prevalence of whooping cough among those who under five years descriptive analytic design was used for the purpose of the study is conducted at Babylon Teaching Hospital for Maternity and Pediatric. Non probability a “convenience” sample was were collected retrospectively from medical records as a statistic for each year of the (2014 to 2018). Data were analyzed through the used descriptive statistic as frequencies and percentage the study results in corresponding with study objective were the July, December, and May as the most months of infections recorder by the hospitals. As well as, the majority of (31.2%) among five years were recorded for 2018 as the highest recorded casualties. The study concludes that there is a very large disparity between the years of prevalence that the more time progresses the increased prevalence depending on health services.

Keywords: *Prevalence, Whooping Cough, Under Five Years.*

Introduction

Although it is similar to normal colds it is possible that the condition develops and becomes a problem that control of whooping cough source of public health concern all over the world, where it is estimated that more than 10 million cases and about 400,000 deaths linked to whooping cough occur annually, with 90% of the burden in infants from developing countries[1][2]. Whooping cough affects all age groups and can occur in individuals who have been previously vaccinated or infected [3]. The introduction of mass vaccination of children in the middle of the century dropped 20 of a whooping cough dramatically. However, under the whooping cough endemic because the vaccines available to prevent the disease but less infection and transmission degree[4]. The infection continues to kill young children and even in countries that have strong immunization programs, doctors miss the diagnosis[2]. Over the past two decades, there was a return of whooping cough in the fortified gatherings disease well all over the world, due largely to the rapid loss of protective immunity and adapt to the pathogen. This was associated with the emission shift to older age groups, which raised concerns about the transfer of families to vulnerable infants and the need to strengthen vaccination strategies [5].Whooping cough is a type of microbes discovered by the scientist and researcher Burdt in 1906 and are found in the secretions of nasal and fecal secretions and respiratory tracts such as sputum and the spit produced after the outbreak of cough, where it is usually filled with these microbes effective and that the regular sterilizers and even ordinary water with soap have the ability to eliminate these microbes, These microbes within the body are very effective with

Corresponding Author:
Mays Hadi Jebur
Department of Basic and Medical Science, College of Nursing, Babylon University, Babylon Province, Iraq
e-mail: mays_hj_84@yahoo.com

the severity of resistance, especially in the pathological period preceding the occurrence of cough attacks of the disease[6]. The duration of the infection is one week after the onset of infection up to three weeks after the onset of symptoms on the patient and the infection is transmitted either directly through the fly spray from the patient or indirectly using the tools of the patient contaminated with the microbial[7].Symptoms appear two or three weeks after the patient has been picked up in the form of an undifferentiated and mild cough for about two weeks. Suddenly, the cough begins with an increase in intensity and frequency. It comes in the form of strong spells ending with a characteristic, The child may refuse to feed and feed, which may affect his or her health. These seizures will continue for two weeks, and the cough will decrease. For two weeks before the patient healed[8]. Oxford University said the study of 172 children showed that Pertusis was very common in young children, but the study of 172 children between the ages of 5 and 16 who visited their doctor for at least 14 days of coughing showed that it was desirable That doctors consider the diagnosis of Pertusis, even in children who have received full vaccination. Children receive anti-cirrhosis shortly after giving birth and before entering school, and the vaccine currently used does not provide immunity throughout life. In 2004, 237 children between the ages of 4 and under were diagnosed, up from 289 in 2005[9].

Methodology

The Study Aims: To identify prevalence of whooping cough among those who under five years.

Study Design: A descriptive analytic design was used for the purpose of the study is conducted at Babylon Teaching Hospital for Maternity and Pediatric.

Study Sample: Non probability a "convenience" sample was were collected retrospectively from medical records as a statistic for each year of the (2014 to 2018).

Data Analysis: In order to determine whether the objectives of the study have met or not, that data of the present study has been analyzed through application of the descriptive statistic analysis approach that includes as the following formula:

$$\left(\frac{Number\ of\ Cases\ in\ month}{Total\ Numbe\ of\ Children\ in\ year}\right)\ 100$$

Results and Discusion

Table (1): Prevalence of Whooping Cough among Children under Five Years during 2014

Month	No.	%

November	1	0.4
December	11	4.3
Total	**257**	**100**

In 2018 the infection recorded as a majority in May, it recorded (18.3%) out total number.

Where it recorded the highest percent in 2018 and the lowest rate in 2015 and also note the variance from 2015 to 2018 as shown in figure below:

Globally, it is estimated that there are 24.1 million case Pertusis and 160 700 deaths from Pertusis in children less than 5 years in 2014, with periodic epidemics every two to five years. Whooping cough is transmitted from infected individuals to vulnerable to infection through portable spray air[10].

Clinical studies have shown that cases of Pertusis or also known whooping cough may be persistent or intermittent. In present study, findings reveals that the (32.1%) out total years were registered by 2018. Where to increase infections with the progress of years and this is due to the health institutions of the country is facing economic crises affecting the health aspects.

Studies has been shown between 2001 and 2005, evidence of recent Pertusis infection was reported in UK were (37%) preschool age children presenting with persistent cough in primary care[11].

A prospective cohort study has been included in their study the school age children presenting with persistent cough in United Kingdom deals with preschool Pertusis booster vaccination. Findings 56 (20%, 95%) confidence interval (16% to 25%) children had evidence of recent Pertusis infection, including 39 (18%, 13% to 24%) of 215 children who had been fully vaccinated. The risk of Pertusis was more than three times higher (21/53;40%, 26% to 54%) in children who had received the preschool Pertusis booster vaccination seven years or more previously than in those who had received it less than seven years previously (20/171;12%, 7% to 17%). The risk of Pertusis was similar between children who received five and three component preschool Pertusis booster vaccines (risk ratio for five component vaccine 1.14,0.64 to 2.03). Four of six children in whom cough frequency was measured coughed more than 400 times in 24 hours[12].

In urban Uganda, has been investigated the prevalence of whooping cough among children with persistent cough. The results indicate a high prevalence of whooping cough among children with persistent cough in a health facility was marked in children> 59 months old rate[13].

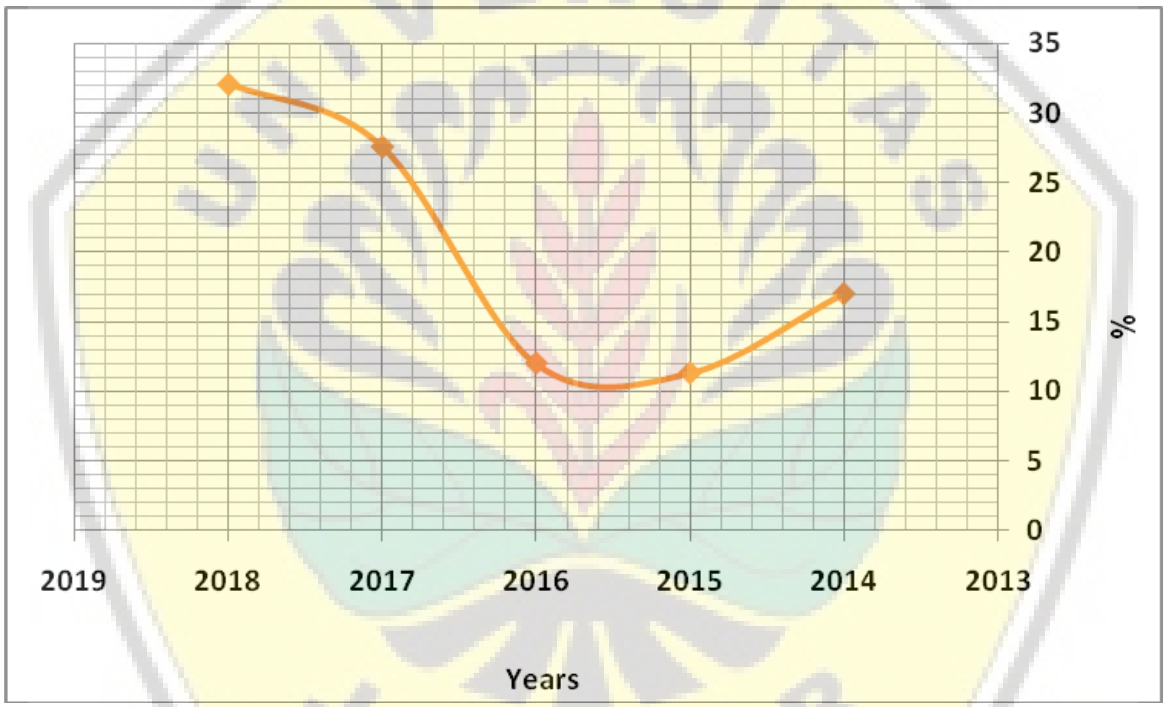

Figure (1): Prevalence Rate of Whooping Cough in Hilla City

Conclusion

The study concludes that there is a very large disparity between the years of prevalence that the more time progresses the increased prevalence depending on health services.

Selected Oral Variables in Children of Inbreeding Parents and Children of Not Inbreeding Parents in Babylon Government/Iraq

Zahra Muhamad Weiss[1], Nadia Aftan Al Rawi[2]

[1]B.D.S., M.Sc. Student, Department of Pedodontics and Preventive Dentistry, College of Dentistry, University of Babylon, [2] B.D.S., M.Sc., Ph.D. Assistant Professor, Department of Pedodontics and Preventive Dentistry, College of Dentistry, University of Baghdad

Abstract

Consanguineous marriage is a relationship between biologically related individuals. Genetic factors have role in gene environment interactions take the center stage. The evidence of oral disease (dental caries, enamel anomalies and teeth wear) is based on the study of inherited diseases, genetic syndromes, familial studies etc.Aim of study: This study was conducted to assess the impact of consanguineous marriage on the occurrence and prevalence of dental caries, enamel anomalies and teeth wear in children of inbreeding parents with children of not inbreeding parents among primary schools in Al-Qasem city/Babylon government, in Iraq Three hundred ninety eight (398) student, 6-12 years old, from 4 primary school, 199 child that their parents of inbreeding marriage (study group), and other 199 child their parents not inbreeding marriage (control group), were included in this study. Dental caries and enamel anomalies were diagnosed and recorded according to World Health Organization criteria (WHO, 1987)(1) (WHO, 1997)(2) respectively in addition, teeth wear was assessed according to criteria of Smith and Knight Index, 1984. A higher percentage of caries experience and enamel defect were recorded in children of inbreeding parents than children of not inbreeding parents.

Keywords: *Consanguineous marriage, oral health.*

Introduction

Consanguineous marriages have generally been accepted as having important detrimental effects on offspring. There is a lot of genetic research about consanguineous marriage and its detrimental effects on offspring.(4 & 5) Although consanguineous marriages are common in the world, the relationship with oral health status has been thoroughly still investigated. There are many studies found that genetic basis of occlusal trait and dental anomalies through analysis result of inbreeding study in subdivided isolated community, also see the role of heredity, exacerbated through inbreeding, in the etiology of tooth wear(6 & 7).

Dental caries is a localized, progressive, irreversible, microbial disease of mineralized tissues of the teeth, characterized by demineralization of inorganic portions, and destruction of organic substances of the tooth. It is a multifactorial etiology related to the interactions overtime between tooth substance, certain microorganisms, and dietary carbohydrates producing dental plaque (8). Most of the oral diseases are complex in nature, resulting from infectious microbial agents coupled with hereditary and environmental factors, with application of newer genetic techniques, an increased understanding of genetic risk factor relationships between dental caries and individual phenotypic expression is coming into light(9). Dental caries was affected by nutrition as seen in study by (10 & 11).

Tooth enamel is formed during only a certain period of the tooth development and is irreplaceable. Ameloblasts, which are secretory cells that produce dentalenamel, are particularly sensitive to changes in their environment during the long process of enamel production. Dysfunction of ameloblasts may occur resulting inchanges in the appearance of the enamel in the dentition.(12).

Materials and Method

Subjects: Three hundred ninety eight (398) students, 6-12 years old, were collected from 4 primary school, they were divided into 199 child that their parents of inbreeding marriage (study group), and other 199 child their parents not inbreeding marriage (control group),in Al-Qasem city/Babylon government, in Iraq

This study was done during the period from December 2018 to February 2019. A pre-study ethical approval was assigned, also the children's parent consent form which taken before start the study.

Inclusion Criteria: Students with

- No history of medication, (anti- inflammatory or antimicrobial therapy) within previous 3 months.
- No history of orthodontic treatment.
- No history of any systemic disease.

Diagnostic criteria included the sex, age and history of family if inbreeding parents or not.

Oral examinations was performed on chairs, under good illumination by using dental mirror, probe and dental tweezers Dental caries experience, were diagnosed and recorded according to the criteria of WHO, (1987).[1] Clinical examination was conducted using plane mouth mirror and dental explorer. A systematic approach of the dental caries was performed, starting from the upper right second molar proceeding in an orderly manner from tooth to the adjacent tooth reached upper left second molar, then going to the lower left second molar passing to the lower right molar (WHO, 1987).[1]

The developmental defects of enamel index was used WHO, (1997)[2]. Enamel abnormalities were classified in to one of three types on the basis of their appearance. They vary in their extent, position on the tooth surface and distribution within the dentition. Ten index teeth were examined on the buccal surface only, if any index tooth is missing, the area was excluded. These teeth include: 11, 12, 13, 14, 21, 22, 23, 24, 36, 46 for permanent teeth and 51, 52, 53, 54, 61, 62, 63, 64, 75, 85for primary teeth was examined according to The Criteria of Enamel Anomalies

Results

Dental Caries: Table (1) illustrates the distribution of caries free and with caries with among children of inbreeding parents and children of not inbreeding parents. For total sample found that a high percentage of children with caries in study group than control group. The same table illustrates that, children in study groups has a low percentage of caries free compared with children among control group.

Table (1): Distribution of dental caries and caries free among children of study and control groups.

Groups	Caries Free No. (%)	Dental Caries No. (%)
In breeding	3 (23.08)	196 (50.91)
Not breeding	10 (76.92)	189 (49.09)
Total	13 (3.3)	385 (96.7)

Table (2) illustrates that mean and standard deviation of caries experience of the permanent dentition by age among study and control groups.

Table (2): Caries experience of the permanent teeth among children of study and control groups.

Age (Y)		Groups						P value
		In breeding			Not breeding			
		N	Mean	±SE	N	Mean	±SE	
<=10	DS	114	3.50	.28	136	1.43	.16	.000

	DMFS	184	4.71	.32	196	2.12	.20	.000

Caries experience was found higher mean value in inbreeding group than not inbreeding. Difference was statistically highly significant existed between groups.

Decayed surface was recorded a largest fraction of DMFS value compared to MS and FS among both groups with highly significant difference. Regarding MS and FS fractions, statistically, no significant difference was found between study and control groups.

Enamel Defect: Table (3) illustrates the percentage of children with enamel defect in study and control groups. The result showed that a slightly the same values were recorded between both groups with no significant difference. According to the gender, the result showed that male had higher percentage of enamel defect than female**.** Regarding to the age, among children of total sample, the result showed that age (10-12) years old had higher percentage of enamel defect than (6–10) years.

Table (3): Distribution of enamel defect among children of study and control groups.

Teeth Wear: Table (5) illustrates the distribution of the children (study and control groups) according to the mean of teeth wear index by age groups. The results revealed that mean of teeth wear higher in control group than study group. According to the age, the result showed the children in age 6–10 years old have higher teeth wear mean value than children in age 10–12. Regarding to gender, the results showed that tooth wear in general was higher among females than males.

Table (5): Distribution of teeth wear among children of study and control groups.

Age (Y)	Gender	In Breeding		No Breeding		P Value
		Mean	±SE	Mean	±SE	
<=10	Male	1.64	.27	3.81	.44	.000

Dental Caries: Generally, there were controversy between studies who searched about caries experience as it was well known that the caries is multifactorial disease and can change from a population to another one, from an individual to another one and even from a group of teeth to another one [14].

In the present study, the percentage of caries experience in the siblings of the consanguineous group is (50.91) which higher than non-consanguineous group's (49.09) in Al_Qasem city. The results of the present study of permanent teeth revealed that the siblings of the consanguineous group had mean of DMFs was (4.71), and the Decay surface fraction was (4.37) which represent the highest proportion of this fraction in the DMFs, followed by MS (.38) and then FS fraction (.06) which represents the lowest one, the siblings of the non-consanguineous group had mean of DMFs was (2.12), and the Decay surface fraction was (1.89) which represent the highest proportion in the DMFS, followed by MS (.25) and then FS fraction (.04) which represents the lowest one. This higher caries in study group than control group could be due to genetic factor in inbreeding marriage [16]. The current study was agree with a study done by Elfaki (2015) that was carried out among 120 school age students and their families in Najran – Saudi Arabia (Consanguineous marriage is very common among the inhabitants of Najran), Elfaki found significant association between hereditary factor and the occurrence of dental caries among school children. The study concluded that dental caries experience of children is strongly influenced by hereditary factor and consanguineous marriage could be the source of the genetic factor that behind the high prevalence rate of dental caries [17].

Enamel Anomalies: Percentage of enamel anomalies was 49.33% in the siblings of the inbreeding group and 50.67% in the siblings of the not inbreeding group so that there is no significant difference between two groups. The percentage of enamel defect was found to be higher among 6–10 years children than 10–12 years children in both study and control groups. The percentage of enamel defect was found in the present study to be higher among boys than girls for both age groups. This finding is in agreement with Slayton et al (2001)[20]. Mestrinho et al (2007) [21], Murad (2007) [22], Masumo et al (2013) [23] and Robles et al (2013)

[24], while it was disagree with Gatta (2005) [25] and Jabber (2008) [26]. Definitive reason for this finding is not documented but suggested to be because of greater intra uterine nutritional demands in boys than in girls, since boy's weight more, have more muscle mass, and are developmentally delayed both in the uterus and at birth.[27 & 28]

Conclusion

The impact of consanguineous marriage was recorded on dental caries and enamel anomalies in children of inbreeding parents than children of not inbreeding parents.

The Impact of Mind Maps Strategy in Teaching and its Effects on the Mental and Emotional Aspects of the Student's Fifth Preparatory Students

M.A. Huda Salam Ibraheem[1], Muna M.A. Al-Khateeb[2], Abd Ali Nayif Hasan[2]

[1]M.A. Candidate in TEFL, [2]Asst. Prof. Dr in TEFL, College of Basic Education/University of Babylon, Iraq

Abstract

The present study aims at identifying the effect of mind maps strategy on developing the performance of the student fifth preparatory school students . In order to achieve the goal, the researcher put the zero hypothesis, It is hypothesized that there is no statistically significant difference at the level of significance (0.05) among the average of the students of the experimental group, the average score of the students of the control group which will study according to the conventional method, and to verify the application of her experience in the first half of the academic year (2018-2019). The sample consists of (57) students of the fifth grade in Al-Nijoom secondary school for boys, they are distributed randomly, (29) students in the form of the experimental group and (28) students of the control group. The two groups are equalized in the following variables: age, IQ, linguistic ability test and parents education. The researcher has prepared a test to recognize the student's ability and constructed the diagrams of the mind maps of their material, The experiment lasted over 8 weeks, and at the end of the experiment the post test was applied After the results analysis

Keywords: *Investigating, Mind Maps Strategy, EFL students.*

Introduction

Based on the assumption that the more teachers know about brain science, the better prepared they will be to make instructional decisions[1]. Mind map is a powerful tool for assisting any form of learning grammar. Mind map is a creative way to represent ideas or information through a diagram, so it is effective in improving students' achievement of English . The term "mind map" was first used by Buzan, who describes it as an instruction strategy where the learner places supra- ordinate concept on paper as subsequently links subordinate concepts as appropriate". Buzan says that the idea of "mind map" comes from the note books[1]2 of Leonardo da Vinci. Buzan tries to support the exclusive use of mind mapping over other forms of note making. Buzan develops mind map by using colors and pictures to help students and every one take notes effectively. Svantesson (1989) says that "mind map goes under a variety of names, they are known as concept maps, semantic mapping, [3]knowledge mapping, think links, graphic organization or cognitive map". Mind map has been used for centuries, for learning, brainstorming, memory, visual thinking & problem solving by educators, engineers, psychologists & people in general. Subject matters and thinking skills are interrelated as the former is the context which stimulates the learners' thinking[4]. Some of the earliest examples of mind maps were developed by Porphyry of Tyros, a noted thinker of the 3rd century as he graphically visualized the concept categories of Aristotle. Roman Liu II also used these structures. Mirabella (2012) says that mind map was first popularized by the British psychology author Tony Buzan 1974 when BBC TV ran a series hosted by Buzan called "Use Your Head". The purpose of this study is

e-mail: hudasalam1990@gmail.com

to simplify teaching and learning English language and make it more influential and to investigate the impact of using a mind map strategy on achieving English language among fifth grade of secondary school in Babel[4]. Now a days the word has become a small village, especially with the appearance of the satellites, technology, information and internet, The demand of learning English has increased and it became a necessary need for individuals who tend to follow up the vast changes in this world. However, learning English grammar is not an easy job for the majority of our students, especially within our schools limited possibilities[5]. A lot of barriers such as crowded classes, difficult curriculum and traditional evaluation instruments force teachers to modify or even change their techniques to overcome these barriers towards the targeted objectives. Though the students' low achievement level in English language in general requires a serious research for alternative techniques that may improve our students' level[6]. So, the inability of EFL secondary students to organize their ideas and thoughts is sometime due to lack of knowledge about different techniques in this respect which can be applied during the pre-learning process[7].

Mind Maps: Brain Tool Extraordinary: Why does a mind map such a powerful brain-friendly tool? Mind maps engage in bothsides of the brain because they use image, color, and imagination (realms of the right brain) in combination with the way the branches grow outwards to form another level of sub branches that encourage you to create more ideas out of each thought you add to your mind map. words, number, and logic (realms of the left brain [8]. In Brain Rules the American neurobiologist, John Medina (2008:186) suggests that humans are visual creatures and can assimilate and store visual information far more effectively than, say, acoustic information . states that the more visual the information is the more easily it's absorbed and retained. The reason for this is evolutionary, in our distant past we received much of our essential information in the form of moving images and so our brains are particularly good at recognising, storing and recalling visual information[9].

Steps to making a mind map:

1. Start in the centre of a blank page turned sideways.
2. Use images or pictures for your central idea
3. Use colors throughout
4. Connect your main branches to the central image and connect your second- and third-level branches to the first and second levels, etc.
5. Make your branches curved rather than straight-lined.
6. Use one key word per line.
7. Use images throughout

The brain as a radiant thinking association machine

Receiving, holding, analyzing, outputting, and controlling – are explained as follows:

The amazing machine, the brain, has five major functions:

1. **Receiving:** Anything taken in by any of ones' senses.
2. **Holding:** One's memory, including retention (the ability to store information) and recall (the ability to access that stored information).
3. **Analyzing:** Pattern-recognition and information-processing
4. **Outputting:** Any form of communication or creative act, including thinking.
5. **Controlling:** Referring to all mental and physical functions.

Buzan and Buzan show that these five categories all reinforce each other . For example, it's easier to receive data if you are interested and motivated, and if the receiving process is compatible with brain function. Having received the information efficiently, you will find it easier to hold and analyze it. Conversely, efficient holding and analysis will increase your ability to receive information.

Similarly, analysis requires an ability to hold (retain and associate)that which has been received. The quality of the analysis will obviously be affected by the ability to receive and hold the information.

These three functions (receiving, holding, and analyzing) converge into the fourth- the outputting or expression by Mind mapping, speech, gesture, etc. of that which has been received, held, and analyzed.

The fifth category, controlling, refers to the brain's general monitoring of all your mental and physical functions, including general health, attitude and environmental conditions. This category is particularly

important because a healthy mind and a healthy body are essential if the other four functions of receiving, holding, analyzing and outputting are to operate at their full potential. Although the definition of thinking skills often includes habits of mind or thinking behavior, which translates trends and assumptions of good thinkers. (Hafudh, 2019:3).

Research Method

Research method include a presentation of the procedures used to achieve the objectives of the study, starting from selecting the population and samples, neutralizing the variables of both samples, designing the instruments and tools of the study, conducting the experiment and analyzing the results.

Experimental Research Design: The experimental design contains one independent variable (mind maps strategy) and a dependent variable (the test scores).Thus, the experimental design was adopted on two equivalent groups one experimental and the other is controlled.

Population and Sampling: The population of the presented study is represented by the fifth-grade preparatory school students in the province of Hilla for the accademic year (2018-2019). Al Nijoom preparatory school for boys located at the core of the province was chosen to represent both samples the control group and the experimental one, and we randomly selected class (B, 30 students) to represent the experimental set that received mind maps strategy based instruction and class (A, 31 students) to represent the control set which received conventional way of teaching.

Samples Equivalence: The researcher has conducted a statistical equivalence between the experimental and control groups in some variables that could influence the results of the experiment. Although the researcher chose the two groups randomly, the students of the research sample form similar social and economic status and study in one school. We were acute to make equality by making the equivalence between these variables (the age measured by months, first course scores, and parent's academic achievement). The statistical results demonstrate that the two sets are equivalent in all the aforementioned variables.

The researcher equalizes the two groups of the research in their variables the age in the parents qualification marks of the history and

Extraneous Variables Equivalence: Although the researcher verified the equivalence of the two sets of research in some variables that are believed to affect the course of the experiment, we also tried to avoid the effect of some extraneous variables in the course of the experiment. Some of these variables and how to control them are as follows: Accidents associated with the experiment. There were no accidents during the administration of the experiment. No students left the school or got transported to another one. The sample was chosen intentionally and the two sets were equalized accordingly. The maturity factor: Since the duration of the experiment was unified between the two research groups as well as the age of students in the two groups all the growth that occurred will be unified between all the students because they are on the same level, so this factor did not have an impact on the research. the impact of experimental procedures, the researcher worked to reduce the impact of experimental procedures that can affect the dependent variable during the course of the experiment) such as level of students and what they need to develop and work on (Brown. 2003). The achievement test was constructed by following these steps:

- The purpose of the test: the desire of constructing the test is to measure students' achievement in the English languageby depending on the behavioral objectives specified by the teachers' guide.
- Determining test items: the test items are determined by the researcher to 5 questions that contain 25 items and prepared a scoring scheme for the test.
- The test is designed by depending on the revised Bloom's Taxonomy of educational objectives.
- Test scoring: the scoring of the test is done by giving one mark to each right answer and a zero to each wrong one. The highest score is set to be (50) and the lowest to be (0).
- Test validity: the test is validated by jury members of language teaching specialists which gave some recommendations and modifications that the researcher took into consideration and adjusted his test accordingly. The test was also validated by testing it on a pilot study.

Pilot study testing: the researcher has chosen the students of one school that is located near the main school on which the experiment was conducted. The school was Ibin sina preparatory school for boys of (50) student from this school. The test items were statistically

analyzed and found that the item difficulty ranged from (0.75-0.30) by which the test items are considered valid in difficulty. The item discrimination ranged from (0.72-0.31) which is accepted also.

Conducting the test: The students of both groups are reported before a week of the exam .the researcher supervised both of the exams at the same time.

Results and Discusion

The T-test formula is applied to indicate pupil score in pre-test and post-test and if there is any significant difference between the two groups score or not. To achieve the research aims, a null hypothesis is formulated.

The results showed that the null hypothesis is rejected because there is a statistically significant difference at the level of (0.05) as clarified in the tables below:

Table (1) The Students' Scores in Pre-test for the two Groups

Group	N	Mean	SD	DF	t-value		Level of significance
					Computed	Tabulated	
E G	30	22.57	3.839	59	1.380	2	0.05
C G	31	21.19	3.928				

With regard to the control group, the mean scores of the pre-test is (21.19), while that of the pre-test of experimental group is (22.57). The results show that the computed t-value in the pretest is (1.380) whereas the tabulated t-value was (2). This means that there is a little difference between them.

Table (2) The Students' Scores in the Post-test for the two Groups

Group	N	Mean	SD	DF	t-value		Level of significance
					Computed	Tabulated	
E G	30	47,50	7,075	59	4.275	2	0.05
C G	31	40,10	6,446				

In the experimental group, the mean score of the post-test is (47,50), while that of the control group is (40,10). The results show that the computed t-value in the posttest was (4.275) whereas the tabulated t- value was (2) and the level of significance (0.05). This denoted that the pre-test and post-test are significantly different at (0.05) level of significant and under 59 degrees of freedom. Namely, the post-test of the experimental group is much better than the pre-test by applying the T-test formula to compare the mean scores of the experimental group and control group in the post-test. This means that the strategy determined and used by the researcher is more effective and fruitful than the traditional strategies followed in teaching English

Conclusion

The use of Mind Maps strategy is effective on the enhancement of overall quality of Iraqi EFL learners' comprehension in English language. Mind mapping is a cognitive strategy that helps to improve students' abilities in learning English such as in conceptualizing, note taking and summarizing the crucial information for better understanding and memorization. Mind maps strategy helps students associate ideas, think creatively, and make connections that one might not otherwise make in the conventional approach. It also helps the students improve their innovative and creative thinking as reflected in their classroom discussions and learning. Mind maps strategy is appropriate for students

to maximize their ability in exploring ideas and using their imagination while learning English. The subjects in the experimental group of the present study have dealt positively with the new strategy (mind maps), showing high interest and motivation.

The Impact of Strategy to Draw Your Ideas in the Collection and Development of Creative Thinking among Students

Qassem Subhi Abbas Al-Jariawi[1], Mohammed Hamid Al-Masoudi[1], Qais Hatem Hani Al-Janabi[1]

[1]Babylon University College of Basic Education

Abstract

The present research aims to identify "the impact of strategy to draw your ideas in the achievement of students in the first grade intermediate in social subjects". To achieve the objective of the research, the researcher put the following zero hypothesis: There is no significant difference at the level of (0,05) between the average score of students of the experimental group studying the history of ancient civilizations using the strategy of "draw your ideas" and the average score of students of the control group who study In the traditional way, and to verify the hypothesis of research, the researcher chose a experimental design with partial control, and represents the current research community students in the first grade intermediate in the middle and secondary schools for boys in the Hashemite district of the Directorate General of Education in the province of Babylon for (2018- 2019). In the random sampling method, the researcher chose from his secondary research society a sample of the current research. In the same way he chose (c) to represent the experimental group with 35 students and B to represent the control group (68 students).

Keywords: *Impact of strategy, Creative thinking.*

Introduction

The researcher conducted a statistical equivalence between the students of the research groups (experimental and control) in the variables that may affect the results of the experiment[1] and these variables are: Students' chronological age calculated in months, academic attainment of Parents, mothers' academic achievement, average test scores for the previous year for social subjects taught in the sixth grade for the academic year (2018 - 2019), previous historical information test[2], Dylan's IQ test). The researcher formulated 100 behavioral goals distributed at the levels of knowledge, understanding, and application of the Bloom field of the three chapters defined in the experiment (Chapter 1, Chapter 2, Chapter 3). Of the objectives and tests for the two sets of research plans for the teaching of the subjects of the course to be taught during the experimental test plan for the experimental group and control according to the strategy (draw ideas) as well as the traditional method,. After the experiment was implemented, the researcher applied research tools to the two research groups. The researcher obtained data for the two research groups. The data were statistically treated by t-test for two independent samples[3]. The results showed that the experimental group's students exceeded the control group according to the drawing strategy Your thoughts. It is an educational strategy developed by Harst, Short and Burke in 1988. It comes after reading the content if it is a story or a scientific content[4], and by focusing on the ideas contained in the content as well as the concepts, linking the student ideas in the teaching as well as deepening the thinking for the absorption of During drawing, a strategy must be taught to students before. It is a strategy that must be taught to students before their application and requires a mental perception such as becoming a film in the student's mind or an integrated and coherent picture as well[5].

Creative Thinking: Creativity in its general sense expresses the ability to conceive, create, create, and evangelize an authentic work of an expressive, composition, productive or behavioral character, and its aesthetic, moral or utilitarian value. Gelford refers to creativity through attributes of ability that develop logically and clearly to creativity As well as the

originality, the ability to sense problems, and the ability to redefine and formulate in a capacity of virtual creative thinking.[6] Increasing the number of cells involved in the process of thinking, and the increasing and varied communication between them, and this is reflected on the external behavior of the learner, and it is more positive and interactive, and participate in the initiative of opinion and ideas and enthusiastic and vigilant [7] The researcher believes that active learning should be the role of the learner is the focus of the educational process and its effectiveness and positive activity in the process of education to be a learner is more steadfast in the They are educated and when the value of education has a meaning when the learne [8]. The researcher believes that employing a strategy with real and interrelated steps in teaching leads to raising the level of education, raising their levels and learning achievement and enlightening their ideas in a modern way in the study. These strategies are a strategy to draw your ideas from the modern method of teaching the activist**.** The academic achievement is not only a product of the educational process, it is also a measure in which the level of academic learners is determined[9]. Academic achievement is one of the concepts that give great attention to the educational system, educational institutions and many classroom tests bearing the title of achievement.

Steps to work with a strategy to draw your ideas: The teacher training to use this method and represent the mental perception of the read or heard from the teacher in front of students and enable them to practice in the learning processes can be applied steps to employ the text or listen to it carefully and focus on the ideas, concepts and events And attitudes and facts[10], and the teacher in this step to remind students to think about what is read in the read or audio and try to represent mentally in their ideas and visual image, mental perception of the content read or heard after reading or listening as the teacher asks students to visualize ideas and concepts received and make mental images They can express them in tangible forms or drawings expressing their perceptions in a way that gives the students an opportunity to imagine, which can be five minutes[12] or less according to the size of the audio or the reading. The drawing of the mental images after their conception. Each student paints what constitutes in his mind a perception of the contents of the content Or the shape with or lines is important to be understood and has implications and meanings can be understood from the drawing or shape notes with the possibility of using some words and short sentences written as indicators indicate the intent or content Share drawings and discuss and raise questions about them and answer questions The process can be discussed by group members first and then among all students[13]. It is preferable that the lesson or activity be dealt with in a way that is not homogenous, so that each learner will be informed about the way his or her partner thinks and exchanges experiences. After considering the drawings, a number of them can be chosen to hang in a special place or board somewhere in the classroom so that they will not be a reason to distract the students in subsequent lessons and can be replaced by others in the next lesson. The teacher can ask each student to keep With drawings in a booklet so that it is easy to return to when needed.

Creative Thinking. Creative ideas vary among cultural backgrounds, The creative thinking of children is different from creative thinking in adults, and they are similar in the same way. Creative thinking is a complex and original thinking, as is the case of creativity. It requires a set of tendencies and preparations in the individual and uses the higher levels of thinking, thinking strategies used in problem solving, decision making, and conceptualization .ohnal Some of the important terms that should be clarified:Ibrahim (2009) that: “the ability of the subject of the study to achieve a positive result, but if this outcome has not been achieved, the factor may be a direct cause of the consequences of negative.”Attia, (2018) as: “It is one of the modern method of active education involves the implementation of the thinking of learners in transforming the content of the lesson and its ideas and concepts to the mental perceptions of what is in the minds of learners after they The understanding of the content of learning purpose is not mastering the art of painting and the quality of the form, but the representation of concepts and ideas in the imaginary images are converted to visual images reflect the mental images that formed the learner “Allam, 2002 as: “the degree of acquisition achieved by an individual or the level of success achieved or reached in a particular subject or field of education or training.

Experimental design of the research: It includes the independent variable (drawing your ideas) and (the usual method), and the variable is dependent (mental perception), so the researcher used experimental design and the equivalence of the two sets of research, one experimental and the other control

Table 1. Number of students in the experimental group and control in the search

Collection	Number
Experimental	35
Control	33

The current research community: consists of the first grade students, all of them in the secondary and intermediate schools in the governorate of Babil for the academic year (2018-2019). The sample of the study is (middle school for boys) (33) students who will study their students according to the usual method.

Equal search groups : The researcher conducted a statistical equivalence between the students of the experimental and control groups in some variables that affect the results of the experiment. For the difference of the study society between the control and experimental groups, the researcher sought to achieve equivalence with the following variables (the age of time calculated by months, the collection test) To make the equivalence in the variables mentioned for the two groups of research and showed the results according to the following table (2).

Table 2. Variables (the age of time calculated by months, the collection test) To make the equivalence in the variables mentioned for the two groups

Variable	Group	Sample size	Standard Mean Sample	Standard deviation	Freedom Value	Value T		Level Significance
						Calculated	Tabular	
Age Calculated At month	Experimental	35	152.66	87.5	66	318.0	000.2	Statistical marker
	Control	33	12.153	16.6				
Test Previous l information	Experimentals	35	94.63	04.11		220.9	000.2	
	Control	33	38.64	38.10				
Dunlase Pilot	Experimental	35	71.26	8.6		507.0	000.2	
	Control	33	85 5.25	27.7				

Adjust search variables: The researcher investigated the equivalence of the two sets of research for some variables that are believed to affect the course of the experiment. He tried to avoid the effect of some variables that affect the operation of the experiment and the variables and how to control them. Accidents that accompany the experiment: The research experience did not experience any accident or emergency The sample was randomly selected and the equivalence of the two research groups was determined. The maturity factor: Due to the duration of the experiment in being uniform among the members of my group as well as their age, What happens to individuals Is the same for the two groups of research, so this factor has no effect in the experiment, the impact of experimental procedures, the researcher worked to limit the impact of those actions that affect the dependent variable during the course of the experiment).

Search Tools:

The scientific material (content): The scientific material that the researcher is teaching to the students of the two research groups during the period of conducting the experiment was determined for the first semester of the academic year. 2018-2019). The researcher prepared (17) a study plan for the experimental group, which is taught according to the strategy (draw your thoughts) and the same for the control method taught according to the usual method..

The power of distinguishing the paragraph: The researcher considers the qualities to be provided and the task in the test paragraphs is the distinguishing feature and means the possibility of detecting the individual differences of the students and the test items are valid as the coefficient of discrimination is 0.20 and above, and the value of the discrimination coefficient of the paragraph

in the test of achievement between (0.33-0.70), thus the paragraphs in the collection test are considered to have an appropriate and good discrimination coefficient.

The effectiveness of the wrong alternatives: So the researcher to extract the wrong alternatives and each of the paragraphs of the test (30) paragraph using the equation of the effectiveness of the wrong alternatives.

*** Method of finding the stability of the test - the method of half-fragmentation**: This method is one of the most used method, because it avoids the other defects of some method and to obtain two images of the test,

Kuder-Richardson (20): The researcher extracted the coefficient of stability and found that it is equal to (0.82), and this is a coefficient of stability acceptable, as indicated by the researchers and workers in the field of psychological and educational measurement and thus kept all paragraphs of the test and the test is ready to be applied Finalize the search sample.

Application of the research tool: The control and experimental research groups were notified a week before the date of the test and were applied after the completion of the teaching of the material identified for the two research groups at the same time. The researcher supervised the application of the test.

Statistical Method: The researcher used the t-test equation for two independent samples to make the equivalence between the control and experimental groups, and the correlation of Pearson and the equation to correct the coefficient of correlation between the test segments (degrees of individual and individual verbs) and Pearson correlation coefficient. And the coefficient of ease and difficulty paragraph and the power of excellence and effectiveness of the wrong alternatives and the box Kay (2 - x2 - quire - his).

Results and Discusion

The researcher prepared a final test after the completion of the teaching material for both groups which the researcher taught them. The results showed that the experimental group was superior to the control group according to the following table:

The mean and the deviation and the two values (favoritism and tabularity) and the variance and degree of freedom between the mean of the two groups in the achievement test

Table 3. Shows that the experimental group studying social subjects is superior to using the strategy of "drawing your ideas"

Group	Group Number	Standard Mean Sample	Standard deviation	Variation	Freedom Value	Value T		Level of Significance at (05, 0)
						Calculated	Tabular	
Experimental	35	49.27	41.5	27.29	66	248.3	000.2	Statistical Function
Control	33	55.22	06.7	84.49				

The above table shows that the experimental group studying social subjects is superior to using the strategy of "drawing your ideas" on the control group who study the same subject in the normal way. Thus, the null hypothesis is rejected and the alternative hypothesis is accepted.

Conclusion

In the light of the current research results, the researcher can find the following: Teaching a strategy I draw your ideas make the teacher in the preparation of good teaching plans on the basis of knowledge, education, application and evaluation. The strategy of drawing up your ideas contributes to guiding the science of education correctly with the goals set and organizing the educational classroom environment. I draw your ideas in the teaching of social history of ancient civilizations in line with the requirements of modern education. Teaching in accordance with the strategy of drawing your ideas leads to the installation of information in the minds of students through the multiple stages that pass through the students to the desired results. Teaching

according to the strategy and through the interaction of the researcher with students found that the adoption of this strategy enables students to be able to link their previous information with new information.

The Impact of Thinking Skills on the Achievement of Applied Fifth Grade Students in Chemistry

Ghada Falah Abdullah[1], Mohammed Hamid Al Masoud[1], Amjad Marza[1]

[1]University of Babylon, College of Basic Education, Babylon, Iraq

Abstract

The objective of the research was to identify the effect of thinking skills on the achievement of fifth grade students in the field of chemistry. To verify the objective, the researcher presented the zero hypothesis which states: There is no statistically significant difference at the significance level (0.05) The average number of students in the control group who will study according to the usual method in the achievement test is chemistry. In order to achieve the researcher's experience in the second half of the academic year (2018-2019), the sample consisted of (76) Application The two groups were rewarded in the following variables: age, intelligence test scores, semesters for chemistry, and in light of the relative importance of content and behavioral purposes, a test was constructed The experiment was carried out by a number of multiple choice types. The researcher achieved the test characteristics of the test. The experiment continued with the second course. At the end of the experiment, the experimental test was applied to the two groups. Who studied according to the thinking skills of the control group who studied the normal way in the collection variable

Keywords: *Product Skills, Achievement, Applied Fifth Grade Students, Chemistry.*

Introduction

Chemistry is one of the pillars of the natural sciences and is the basis of many other sciences, which are interested in studying, analyzing, interpreting and investing in natural phenomena, which have become more important for their effective[1] contribution to the technological development that the world is witnessing in a wide range in the fields of multiple life. Despite the importance of chemistry[2], The actual reality of teaching is still stagnant because teachers use traditional teaching method based on memorization, teaching and neglect of modern teaching method and method that help them to develop productive thinking skills in different and different forms among students of Applied V Most aspects and levels of thinking [3] and represents the thinking product part of the cognitive construction of individuals, and as life is represented by several positions exposed to the individual and paid to face them with the experiences of knowledge, skill, social or subjective, it produces [4]. The basic principle of productive thinking consists of two types of higher thinking skills: creative thinking and critical thinking. In the beginning, creative thinking is thought to generate better options and solutions, and then thinking In a manner To assess these options and solutions and choose the most suitable and best ones [5] Thinking is one of the highest mental and mental processes. It is one of the highest mental processes, a mental activity that is not directly observable, but is inferred from its effect. It is a cognitive process that is an essential element in the mental-cognitive construction that man possesses and is characterized by his social nature and his systemic work, The influence with the elements of the building, which consists of any influences and affects the rest of the other cognitive processes such as perception, perception[6], memory, etc., and affect and affect the aspects of emotional, emotional and social character ... etc. The thinking of the other cognitive processes as the most sophisticated and most complex Da and admire her on access to the depth of things and phenomena and attitudes and take them, enabling it to process information, production and re-new knowledge and information production, objectively accurate and comprehensive, concise [7]. Productive thinking: A pattern of patterns that allows the student's mind to be unleashed into the production and generation of uncommon and unguarded thoughts, a mental process

in which sensory cognition interacts with the story with external and internal motives or both. It is a systematic tool that combines creative thinking and critical thinking to solve scientific and life problems. As thoroughly as possible.

Methodology

In this study, the researcher used the partial experimental design of two equal groups, one experimental and the other a control for the purpose of the study, where the strategy was applied. The test was applied to both the tribal and remote study groups.

The society of the study: The current research community represents the students of the fifth grade applied in all schools (secondary and preparatory) the governmental day of the Directorate General of Education Karbala province (Kaza) for the academic year (2018-2019), where the number of people of the fifth grade applied in two divisions, As for the sample of the research, the researcher chose (Fawwat secondary school) in the province of Karbala deliberately to conduct its research, and Jeddah it consists of three people for the fifth grade applied (A, B, C), selected by the researcher (A) method of random drawing (draw method) (38) students and where they will study their students According to (product thinking skills). In the same way, the researcher randomly selected a (B) to represent the control group and the number of female students (38) who will study according to the experimental

Search group parity: The researcher conducted a statistical equivalence between the experimental and control groups in some variables that affect the results of the experiment. Although the researcher chose the two groups in the random drawing method, although the sample students from the social and economic environment are very similar and taught in one school,

Adjusting extraneous variables: Study Approach : In this study, the researcher used a partial experimental design of two equal groups, one experimental and the other a control for the purpose of the study, where the strategy was applied. The test was applied to both the tribal and post.

Study Society: The current research community represents the fifth grade students in all schools (secondary and preparatory) of the governmental day of the Directorate General of Education Karbala province (Kaza) for the academic year (2018-2019), where the number of people of the fifth grade applied in two divisions, The researcher chose (Fawwat secondary) in the province of Karbala deliberately to conduct her research, and Jeddah that it consists of three people for the fifth grade Applied (A, B, C), selected by the researcher (A) method of random drawing (the method of drawing) to represent the experimental group and the number of female students (38) is a student and will teach her students according to their thinking skills Product). In the same way, the researcher randomly selected a (B) to represent the control group and the number of female students (38) who will study according to the experimental.

Study Tool: The steps of the collection test are as follows

Determination of the purpose of the achievement test: The objective of the achievement test is to measure the achievement of the students of the fifth grade applied (information, skills and experiences) in chemistry for the four chapters (chemical movements, acids, bases and salts, chemistry of polymers, aromatic hydrocarbons) Formulated from the scientific material.

Determination of the objective of the achievement test: After the purpose of the test has been determined, the objectives of the test are determined to determine the extent of the achievement.

Determination of the test paragraphs: After the researcher reviewed a number of previous studies that targeted a sample of fifth grade students applied and polled the opinions of experts, the researcher identified the paragraphs of the test with (40) paragraph of the multiple choice.

Test Instructions: After verifying paragraphs' powers, instructions were prepared on how to choose one alternative, answer all test paragraphs, answer time, write the triple name, grade, division and answer to the question sheet with an explanatory example of the answer.

Correcting the test answers: After the test paragraphs were drafted and the test type was selected, a standard was developed to correct the answers. They set one score for each correct test paragraph and 0 for the wrong answer and the left paragraph that the student did not answer. Selection) and therefore the final high score of the achievement test (40) degree and the minimum grade (zero).

The validity of the test: After verifying the truthfulness and authenticity of the content, the results showed that the apparent honesty obtained 85% by the arbitrators and specialists. As for the validity of the content, the results showed that all the clauses of the test are statistically significant, In measuring the comprehension and comprehension of students of the fifth grade applied in chemistry.

The pilot application for the achievement test: It includes the following:

The first test: was carried out on a group of fifth grade students in the non-research sample. The number of female students was 30. The purpose of this test was to know the clarity of the test instructions and instructions, the comprehension of the test paragraphs for the students and the calculation of the time required for the test. The researcher recorded the exit time for each student. In calculating the arithmetic mean of time, it was found that the time needed to answer all the test paragraphs was (43) minutes.

The second test application: The test was applied to a sample of (100) students in the fifth grade applied without the research sample. The purpose of the test is to analyze the statistical achievement test paragraphs, namely paragraph difficulty.

Statistical analysis of the test scores: the test scores were analyzed as follows

The difficulty of the paragraph: The statistical analysis of the test paragraphs found that the coefficient of difficulty of paragraphs ranged from (0.37-0.70) and thus all the test scores are good and difficult.

The distinguishing features of the items are 0.22 and above. The value of the coefficient of distinction between the test scores is between (1) 0.33-0.52). Thus, the test scores are considered to have a good and appropriate discrimination coefficient.

Effectiveness of the wrong alternatives: The researcher ‘s wages were statistically analyzed (27% higher and 27% lower) to find the effectiveness of the wrong alternatives ranging from -0.04 to -0.26. As a result.

The stability of the test: The stability coefficient of the test depends on the relationship between each paragraph or between all paragraphs of the test, and this is evidenced by the stability of degrees and consistency of paragraphs, and can calculate the stability of the test using the legal relationship between the test units, and the specifications of the good test to be stable and accurate and to be The test paragraphs have a clear meaning that must be both true and consistent. Stability indicates that the test scores are identical when they are returned again, that is, it indicates the balance and stability of the students’ grades in the test.

Method of finding the stability of the test:

- **Half way split:** This method is one of the most widely used method, because it avoids the defects of some other method and in order to obtain two equal images of the test researcher by dividing the test paragraphs into individual and marital paragraphs and selecting the answers of the sample of the survey sample (100) Pearson correlation between the scores of individual and conjugal sections was obtained by the coefficient of stability (0.79). Since the half-stability coefficient of the test does not measure the total homogeneity of the test (because it is only half stability), the correction was done using the Spearman-Brown coefficient, Lg (0.88) is a good stability coefficient from the point of view of specialists.
- **Ceyord-Richardson-20 equation:** The stability coefficient was calculated using the Kord-Richardson equation 2020.R) if the stability coefficient (0.81) is a good stability coefficient.

Application of the Search Tool: the experimental and control groups were informed of the date of application of the test, one week prior to its completion, and was applied after the completion of the teaching of the specific material for the two research groups at one time and supervised by the researcher on the application of the test.

Statistical Method: the researcher used the t - test equation for two independent samples to make the equivalence between the experimental and control groups in the following variables: (the age of time calculated in months, the achievement of students in half the year in chemistry, the intelligence test (Danlys).

Results and Discusion

For the purpose of verifying the hypothesis, which states that there is no statistically significant difference at the level of significance (0.05) between the average score of the experimental group students who will

be taught with the thinking skills of the product and the average grade of the control group who studied according to the normal method of chemistry. The arithmetic mean and the standard deviation of the scores of the two test groups were calculated and the T value of two independent samples was calculatedthe calculated T value (0.974) is greater than the T-table value (2.0000) at the degree of freedom (74) and the significance level (0.05). Therefore, the null hypothesis is rejected. Thus, the students of the group who were taught according to the productive thinking skills May exceed the students of the control group who were taught according to the usual method used in the teaching of chemistry in the achievement test.Explanation of the results related to the first question: The results showed a statistically significant difference between the average score of the experimental group of students who studied chemistry with the skills of thinking product, and the average score of students of the control group who studied chemistry in the usual way in the collection variable for the benefit of the students of the experimental group[9]. This may be due to: To help the thinking skills produced in changing the attitude of students towards the material from the negative attitude to the positive attitude through the skills that drive students to learn themselves. The skills of thinking product provides the opportunity for positive interaction between the school and students[10], by increasing the discussions and active participation among students in the classroom by answering questions and interest in the scientific material and the application of information that they reach within and outside the classroom, which in turn helps to enhance their expertise and develop their abilities and increases Confidence in themselves because they are questions about their learning and raise their level of achievement in the article.Interpretation of the results related to the second question: Teaching the skills of thinking product has had a clear effect in increasing the achievement of students in the fifth grade applied in chemistry better than the usual method of teaching.

Conclusion

The skills of productive thinking contributed to raising the level of achievement of the fifth students applied in chemistry and increase their ability to understand information and knowledge and raise their academic level.

The Rate of Bacterial Contamination in the Operating Theatres of Al-Sadeer Hospital in Al-Najaf Province in Iraq

Ohood Aqeed Radhi

Sub Department of Basic Science, College of Nursing, University of Kufa, Iraq

Abstract

This study was conducted for the period from the first of October (2018) to the end of March (2019) to determine the rate and types of bacterial contamination in surgery theater in Al-Sadeer hospital in Al- Najaf Province. A total of 1709 bacteriological swabs were collected aseptically from different sites of surgical theater of Al-Sadeer hospital in Al- Najaf city. Swabs were streaked as soon as possible on blood agar and maCconky agar plates and incubated overnight. identification of bacterial species was based on standard bacteriological criteria. the inhibitory effect of 5%, 10% and 15% concentration of three commercially available disinfectants; Ioden, Minudes and incidine special spray solution. Solution were explored by agar diffusion method. Data were statistically analyzed. The result revealed that the overall bacterial contamination rate in surgical theater of Al-Sadeer hospital was 3.5%. Wall and floor had significantly higher contamination rate compared to disinfection solution and sterilized gauze (9.4% Vs 0%). *Escherichia coli* was the most predominant contaminant in surgical theater. The monthly distribution of positive cultures showed no clear pattern in different months and the result showed the month of March (2019) had significantly higher contamination, rate compared to November (2018) (5.7% Vs 2.08%).

Keywords: *Operating theatre, Surgical theater sites, disinfection solutions, Al-Sadeer hospital.*

Introduction

The operating theatre is the heart of any surgical hospital and contamination of this important site in hospital is considered one of the most life-threatening sources of nosocomial infection for patients, particularly in heart surgery, transurethral resection of prostate, transplant surgery, cystoscopy as well as bladder tumors[1]. Several reservoirs have been described as being accountable for the hospital contamination, particularly the operating theatre, including unfiltered air, ventilation systems and antiseptic solutions, drainage of the wounds, transportation of patients and collection bags, surgical team, extent of indoor traffic, theater gown, foot wares, gloves and hands, use of inadequately sterilized equipment, contaminated environment and grossly contaminated surfaces[2,3]. Depending on the numbers of pathogens involved, the influence of these above sources on the degree of microbial contamination differs. For instance, *Staphylococcus aureus* and the coagulase negative *staphylococci* are the major pathogens associated with infection of implantable biomedical devices[4]. The clinical implication of microbial contamination in operating theatre is dependent in both the caring surgical team and the patient itself Chacko et al., (2003). Studies have found about, 10% of all infections can have serious consequences in terms of increased patient morbidity, mortality, and length of hospital stay and overall costs(Reddy,2012, Haque et al., 2018). Nevertheless, it can be stopped through suitable application of infection control practices. Reduction of airborne bacteria in the operating theatre by around 13-fold, for instance, would decrease the wound contamination by approximately 50%[6,7]. Decrease of microbial contamination depends

primarily on developed cleaning and correct disinfection of operating theatre[9,10]. Numerous patients are worried about the risk of postoperative infections, Therefore, our study aimed to evaluate the incidence of bacterial contamination of operating theatres in one of the busiest hospitals in Al Najaf, Iraq, Al Sadeer Hospital, and to identify the contaminating agents and their distribution within different theatres.

Material and Method

Study Design and Setting: A cross sectional study had been conducted in operating theatres at Al-Sadeer hospital in Al-Najaf province, which is one of the southern province in Iraq for the period from 1st of October 2018 to the end of March 2019.

Sampling: A total of 1709 swabs were collected from different site of surgical theater including Walls & floors, Ventilation outlets, Sterilized gauze, Disinfection solution, Anesthesia trolley, Client bed, Sucker, and Surgery instruments. Cultural Media: Swabs were cultured as soon as possible on cultural media; Blood agar, MacConkey agar, being prepared according to the manufacturing companies, and incubated at 37°C for (24-48) hours.Culture examination and bacterial diagnosis: Isolation and identification of bacterial isolates were based on colonial morphology and biochemical criteria. Gram's stained film examination according to stander method Brooks et al., (1998).

Results and Discusion

A total of 1709 swabs were collected from different sites of surgical theater. 60 bacterial positives were recovered with an isolation rate of 3.5%. The highest isolation rate was from theater's walls and floors (9.4%) for each, followed by client bed (5.7%) and ventilation outlets (5.4). on the contrast, no bacterial isolation was recovered from sterilized gauze and Disinfection solution. The difference in the isolation rate among these sits was statistically significant ($p>0.05$) Table (1).

Table (1): Bacterial isolation rate from different sites of surgical theater.

Surgical Theater Sites	No. Examined	Bacterial Positive	
		No.	(%)
Walls & floors	212	20	9.4
Ventilation outlets	203	11	5.4
Sterilized gauze	203	0	0
Disinfection solution	200	0	0
Anesthesia trolley	206	5	2.4
Client bed	212	12	5.7
Sucker	270	9	3.3
Surgery instrument	203	3	1.5
Total	**1709**	**60**	**3.5**

In Table (2) identification of bacterial isolates revealed that, *Escherichia coli* was the most common isolate (58.3%), followed by *Staphylococcus aureus* (20%). However, *Klebsellia spp*. recorded in this study a very low rate (3.3%).

Table (2) Bacterial isolated as a proportion of the total number of positive cultures.

Bacterial isolates	No.	%	Type
Escherichia coli	35	58.3	Gram negative
Staphylococcus aureus	12	20	Gram positive
Pseudomonas spp.	11	18.3	Gram negative
Klebsellia spp.	2	3.3	Gram negative
Total	**60**	**100**	

To demonstrate the possible source of contamination, the distribution of bacterial isolates according to operating theatre were examined. The results showed that, most *Escherichia coli*isolates were from walls & floors(n=14) and most *Staphylococcus aureus* isolates were from walls & floors and Client bed. In addition, the most *Pseudomonas spp.* isolates were from sucker (n=5) while only two isolates from *Klebsellia spp*. were from client bed. These was from total type of bacterial isolation, Figure (1).

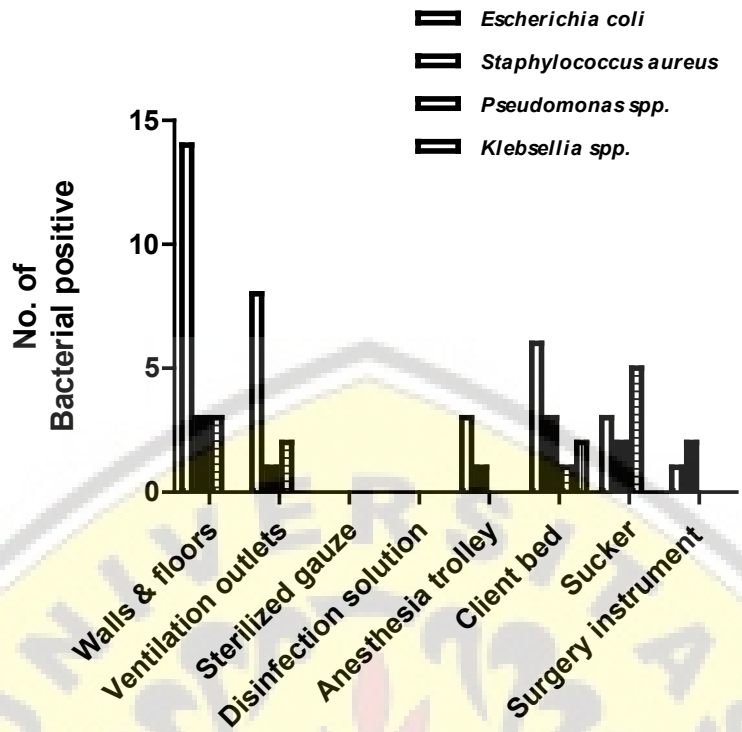

Figure (1) Number and type of isolates identified from the different operating theaters

The monthly distribution of positive cultures showed no clear pattern in different months. In general, there was a highest isolation rate was from March month (5.7%) followed by February month (4.1%), October and December months (3.1 and 3% respectively), while the low rate of bacterial isolates was in November month (2.08%). The difference in the isolation rate among these months was statistically significant P> 0.05. Table (3).

Table (3) Incidence of positive cultures from total number of samples obtained per month.

Month	No. examined	Bacterial positive	
		No.	(%)
October (2018)	128	4	3.1
November (2018)	288	6	2.08
December (2018)	300	9	3
January (2019)	386	11	2.84
February (2019)	311	13	4.1
March (2019)	296	17	5.7
Total	1709	60	3.5

One isolate from different bacteria were employed to test the inhibitory effect of the three disinfectants (Ioden, Minudes and incidine special spray solution) in three concentrations 5%, 10%, 15%).Table (4) showed that no growth of bacteria was observed in 15% concentration of Ioden solution. While only *Escherichia coli* and *Klebsiella spp.* were no growth in 10%. *Escherichia coli*, *Pseudomonas spp*. and *Klebsiella spp*. were no growth

in 15% concentration of minudes solution. All bacteria were no growth in 15% concentration of in incidine special spray solution, while in 10% concentration *Escherichia coli*, *Pseudomonas spp*. and *Klebsiella spp*. were no growth.

Table (4) Effect of disinfection solution on growth of bacteria.

Type of bacteria	Iodine Solution			Minudes Solution			Incidine special spray solution		
	5%	10%	15%	5%	10%	15%	5%	10%	15%
Staphylococcus aureus	+	+	-	+	+	+	+	+	-
Escherichia coli	+	-	-	+	+	-	+	-	-
Pseudomonas spp.	+	+	-	+	-	-	+	-	-
Klebsiella spp.	+	-	-	+	-	-	+	-	-

Hospital acquired infection and evolving bacterial resistance have become major public health concerns in Iraqi hospitals. Therefore, the present study was designed to evaluate the incidence of bacterial contamination of operating theatres in one of the busiest hospitals in Al Najaf, Iraq, Al Sadeer Hospital, and to identify the contaminating agents and their distribution within different theatres.

Throughout the study period, a total of 1709 swabs were collected from different sites of surgical theater. The results showed the overall isolation rate of bacterial positive from different sites of surgical theater was 3.5% However, these results are not surprising. In a study conducted in Al- Imam Ali Hospital in Baghdad to address bacterial contamination in the surgical theaters, the contamination rate was found to be 3.7% in 2001 and increased to be 4.0% in 2002 (Ensayef et al., 2009).

On the other hand, the highest isolation rate of bacterial from theater's walls & floors, Client bed and Ventilation outlets compared to other sites seem logical. A possible explanation for this might be that these sites exposed to contamination more than the other sites in theater, as well as, theater's staffs are usually enforced to clean the reachable sites with available antiseptics shortly before allowing the laboratory personnel to collect swabs.

Another important finding was that *Escherichia coli*, *Staphylococcus aureus* and *Pseudomonas aeruginosa* are the commonest microorganisms reported bacterial contaminating the operating theatres of the percentages were 58.3, 20 and 18.3 respectively. This result is in keeping with current study, which found *Escherichia coli*, *Pseudomonas aeruginosa* and *Staphylococcus aureus* are the commonest microorganisms reported by sixteen Iraqi health directorates during the first 6 months of 2018. Only few health directorates have recorded fungal contaminations, and none have reported anaerobic microorganisms. Therefore, greater efforts are needed to ensure our programmers of infection control should be extended to target these microorganisms. Whether these microorganisms are originated from the patients (endogenous risk factors) or from procedure-related (external risk factors) such as staff, instruments and consumers. In this study, it is interesting to note that there was not clear pattern in the incidence in different months during the period of study. This result also has presented in Ensayef et al., 2009 studywhich conducted in Al Imam Ali Hospital in Baghdad-Iraq. This may indicate that sterilization method are not efficient in our operating theaters and are putting patients at risk of postoperative infections. The inhibitory efficiency of disinfectants on bacterial contaminants depend of the mechanism of action of their active ingredient and the concentration employed. Consequently, the highest inhibitory effect of Ioden, minudes, incidine special spray solution in concentration of 15% in the present study probably related to its powerful surfactant effects on bacterial contaminants in this concentration. Therefore, selection of these disinfectants should be based on this a high concentration.

Conclusion

In conclusion, this study has shown that there was no clear pattern in the incidence in different months during the period of study. The most common contaminant species found in the different operating theatres (*Escherichia coli*, *Staphylococcus aureus* and *Pseudomonas aeruginosa*) had some relation to the kind of operation. This may indicate that sterilization method are not efficient in our operating theatres and that will be putting patients at risk of postoperative infections. Therefore, efforts should be made to ensure strict infection control practices in the operating theatre of Al-Sadeer hospital in Al- Najaf city. Moreover, selection of effective disinfectant should be based on it is active ingredient and concentration.

Vaginal pH as a Marker for Bacterial Pathogens and Menopausal Status

Nadia Abdul-Aziz Ibrahim

Gyne and Pediatrics Teaching Hospital, Al-Diwaniyah Health Office, Ministry of Health, Diwaniyah, Iraq

Abstract

The study had two objectives : (1) to confirm the elevations of vaginal PH expected in patients with bacterial pathogens in premenopausal women and (2) to examine the relationship of serum FSH and estradiol levels to vaginal PH in postmenopause patients without bacterial pathogens. Vaginal PH was determined by universal indicator PH paper in 182 patients seen in Al-Zahara`a Hospital in Najaf city for routine speculum examination. None of the patients were pregnant. Measurements were made of serum levels of follicle – stimulating hormone and estradiol for 81 patients and vaginal culture were taken for all 182 patients. Vaginal PH was correlated with vaginal cultures and serum follicle – stimulating hormone and estradiol levels by use of statistical analysis. Vaginal PH was elevated in all premenopausal patients with documented bacterial pathogens. Serum estradiol levels showed an inverse and serum follicle – stimulating hormone levels a direct statistical correlation with vaginal PH in postmenopausal patients.

Keywords: *Vaginal pH, bacterial pathogens, menopausal status.*

Introduction

In an area of increasingly managed care physicians are continually urged to curb the use of expensive, "high–tech" diagnostic tools[1]. In response, we must develop new " low – tech " diagnostic tools that are also cost effective. This article describes preliminary studies of acost – effective " low – tech " diagnostic tool. Despite the important implications for women's health and reproduction, little is known about the mechanisms that control and regulate vaginal pH. The prevailing lactobacillus – Doderlein theory postulates that the acidic vaginal luminal pH is produced by cohabituating Doderlein lactobacilli that produce Hydrogen peroxide and secret proton, in to their immediate environment.[1] Anew hypothesis for the regulation of vaginal ph proposes that the luminal vaginal pH is determined by active proton secretion by vaginal epithelial cells through the coordinated action of Ion transport mechanisms located in the apical cell membrane . The active net proton secretion occurs constitutively throughout a woman's life but the degree of acidification is estrogen dependant, mostly through the involvement of estrogen receptors[2]. The vaginal pH, as applied to two conditions, vaginitis and menopause. Vaginitis is the most prevalent disorder for which women seek medical assistance [3,4] . In the presence of vaginitis, an elevated vaginal pH > 4.5 may characterize various conditions such as : Bacterial vaginosis, Trichomoans vaginalis, group B streptococcus, or other pathogenic organisms . The diagnosis of trichomonal vaginalis and yeast or candidal infections is fairly straightforward, the diagnosis of bacterial infections of the vagina has undergone an erratic course . However, in the absence of vaginitis, an elevated vaginal pH may reflected low circulating estrogen levels (i.e, oestradiol < 40 pg/ml) or in adequate response of atrophic vaginal epithelium to oestrogen replacement therapy[(5)] . The most widely reported such disorder is bacterial vaginosis[3,4]. The use of vaginal pH, amine whiff testing, wet mount, and Gram's stain examination of the vaginal discharge[(6)] in some combination are among at least seven diagnostic sets of criteria that have been used for diagnosis (Nugent's, spiegel's and Amsel's Diagnostic criteria's) [7]. However, an elevated vaginal pH (5.0 to 6.5) in a normally estrogenized patient is almost always associated with bacterial vaginosis[(3,4,8,9)] these indirect measures reflect an attempt at cost containment and speeding diagnosis by eliminating culture which other wise would be the

gold standard for the diagnosis of vaginitis or vaginosis . Although anaerobic organisms are considered the most prevalent in bacterial vaginosis, the presence of Gardnerella vaginalis is not currently considered to be pathognomonic for this disorder because G.vaginalis has been reported to be present in high percentages in the vaginas of asymptomatic individuals [10]. Although hydrogen peroxide – producing lactobacilli are reduced in number, G.vaginalis secmingly antecedes the Increased numbers of anaerobic organisms in the development of bacterial vaginosis[11].

Methodology

The present study was carried out on 182 patients, 101 pre menopause and 81 post menopause women who were selected randomly from women attending the Gynecology out patient clinic of Al-Zahra'a hospital in Al Najaf city . History was taken from all the patients, including : name, age, parity, gynecological history involving the past menstrual history (onset of menarchae, regularity, duration and frequency of the period), contraception, vaginal discharge and dysparonea, past medical, family and social history. Pelvic examination also was been done to all the patients by inspection and steril non – lubricating speculum bright light .Exclusion criteria from the study were: pregnancy, vaginal medications, and hormonal replacement therapy . An informed consent was obtained from each omen prior to their enrollment in the study . Vaginal pH . Was measured with universal Indicator pH strip after insertion of a non lubricated sterial vaginal speculum, the strip was applied directly to the lateral vaginal wall at the outer third of the vagina until it become wet . colour change of the strip was immediately compared with colorimetric scale and the measurement recorded . Care was taken to avoid cervical mucouse and blood, known to affect vaginal pH . Blood samples were obtained by venipuncture within 1 hour of vaginal pH test and assayed for serum FSH and estradiol levels were determined by Eliza technique and reported in milli international units per milliliters (mlU/ml) and pictogram per milliliter (pg/ml), respectively. The typical level of FSH in post menopausal women is > 20 mlU/ml[(14)]. Women were considered to be menopausal if oestradiol value was < 40 pg/ml[(19)].

Statistical Analysis: Predictive value table were generated by standard techniques [(20)] . two issues are involved in the assessment of any diagnostic test : Disease present or absent and diagnostic test result positive or negative (table 1) . TP, True positive; FN, False negative; FP, false positive; TN, true negative. Positive predictive value =TP/(TP+FP); false –positive rate = (100% - positive predictive value); Negative predictive value = TN/(FN+TN); False – negative rate = (100% - Negative predictive value); Efficiency = (TP+TN)//All.It is customary to define certain rates as applied to data categorized in this manner . The predictive value of apositive or negative test result is defined as the number of true – positive or true – negative tests divided by all positive or negative tests, respectively . False – negative rates are calculated by subtracting the respective predictive value of positive or negative test result from 100% . The sensitivity of a test is defined as the number of true – positive test result divided by all who had the disease . The specificity of a test is defined as the number of true negative test results divided by all who did not have the disease . The efficiency of a test result is defined as the sum of all true – positive and true – negative result divided by all who had the test .

Result

We have four age group of premenopausal women correlated to their vaginal pH their bacterial pathogen. The mean pH of three subgroups growth of aerobic bacterial organisms was significaulty higher than that obtained in patients with either normal flora or yeast infection . There was no significant difference in vaginal pH among the three sub group with bacterial pathogens, and there was no significant difference between the pH in patients with yeast infection and those with normal flora . All 80 patients with positive culture results were asymptomatic apart from thirteen patients were symptomatic . The symptomatic patients retained after appropriate antibiotic treatment and all had a normal vaginal pH after therapy . When examined in the predictive value formate (table 3), an elevated pH > 4.5 was 95% sensitive 100% specific, and 95% efficient for the presence of aerobic pathogen (excluding yeast) in pre menopausal women. In assessing the status of the vaginal ecosystem the hydrogen Ion concentration (pH) of the vagina is perhaps the most significant predictor of its status and that " three simple procedures can be performed in the office to characterize the vaginal ecosystem : pH determination, whiff test and microscopic examination of Gram stained vaginal discharge[(6)] . There are three of the following four criteria needed for the diagnosis of bacterial vaginosis : pH > 4.5, Clue cells, positive potassium hydroxide, and homogenus discharge [(3,6)] . Platz. Christensen et al. have stated : " the occurrence of clue cells and an increased pH of

the vaginal fluid were utilized as indications of BV[21] . The clinical consequences of an elevated vaginal pH have been recently amplified, Hillier et al. reported that bacterial vaginosis is associated with preterm delivery of low – birth – weight in fants, independent of other recognized risk factors . Women with avaginal pH > 4.5 and a Gram stain score > 7 on a scale of 0 to 10 were considered to have bacterial vaginosis[5,7] . Ernest et al.[22] reported that among 115 women at high risk for a low birth weight infant those with a mean vaginal pH > 4.5 had a three fold increased risk of premature rupture of the membranes compared with those with a mean pH ≤ 4.5 . These articles, along with a study by krohn et al.[9] . and the current American collage of obstetricians and Gynecologists technical bulletin[3] on vaginitis, all stress the pivotal importance of the vaginal pH level for the diagnosis of bacterial vaginosis . This study supports the fact that recovering potentially pathogenic bacteria from the vagina result in an elevated vaginal pH (5.0 to 6.5)[3,4,8,9,22] . In menopausal women two factor may influence vaginal pH, menopausal status and the presence of potentially pathogenic organisms [23]. Cultures were obtained to adjust for estradiol status and culture results . There fore it is not surprising that the false – positive rate were high . However, the false – negative rates were 0%, demonstrating that vaginal pH is still useful . this is supported with caillouette et al. study [5] . The observation that the presence of G.vaginalis precedes the development of bacterial vaginosis warrants consideration of it's treatment even in asymptomatic individuals . If G.vaginalis were eradicated, perhaps the numbers of Individuals who have bacterial vaginosis and it's associated disorders could be reduced . For this reason alone vaginal pH should become a routine test during most speculum examinations [5] . patients during serum estradiol transition or menopause and patient who have become noncompliant as a result of side effects of Hormonal replacement therapy could do self testing for vaginal pH . This could become as a routine as self – testing of urine and blood for diabetes, breast self examinations, or self testing of blood pressure for hyper tension . The goal is to achieve patient cooperation and compliance, resulting in a vaginal pH of 4.5, with relief of menopausal symptoms and side effects . In normal fertile women, lactobacilli maintain the normally acidic vaginal pH that protect the vagina against colonization by potential uropathogens through several mechanisms . First, the maintenance of a low pH is of direct importance as reported by Stamey et al. [24] . Who observed that colonization of the vaginal introitus with E-coli is rarely noted at a vaginal pH below 4.5 . Second, some strains of lactobacilli produce hydrogen peroxide that prevent vaginal colonization with uropathogens [25] . Finally, fragments of lactobacillus cell walls prevent the attachment of E-coli to epithelial cells, perhaps by blocking potential sites of attachment [26] . Hence, exclusion of vaginitis is essential for the vaginal pH to reflect the state of the menopausal vagina . In the current study, both vaginal pH and serum FSH showed similar sensitivity (p = 0.516) in predicting oestradiol levels < 40 pg/ml .

		≤ 4.5	> 4.5	
Less than 50 yrs	21	3(14.29)	18(85.7)	10
51-60 yrs	38	2(5.26)	36(94.7)	3
More than 60	22	0(0)	22(100)	1

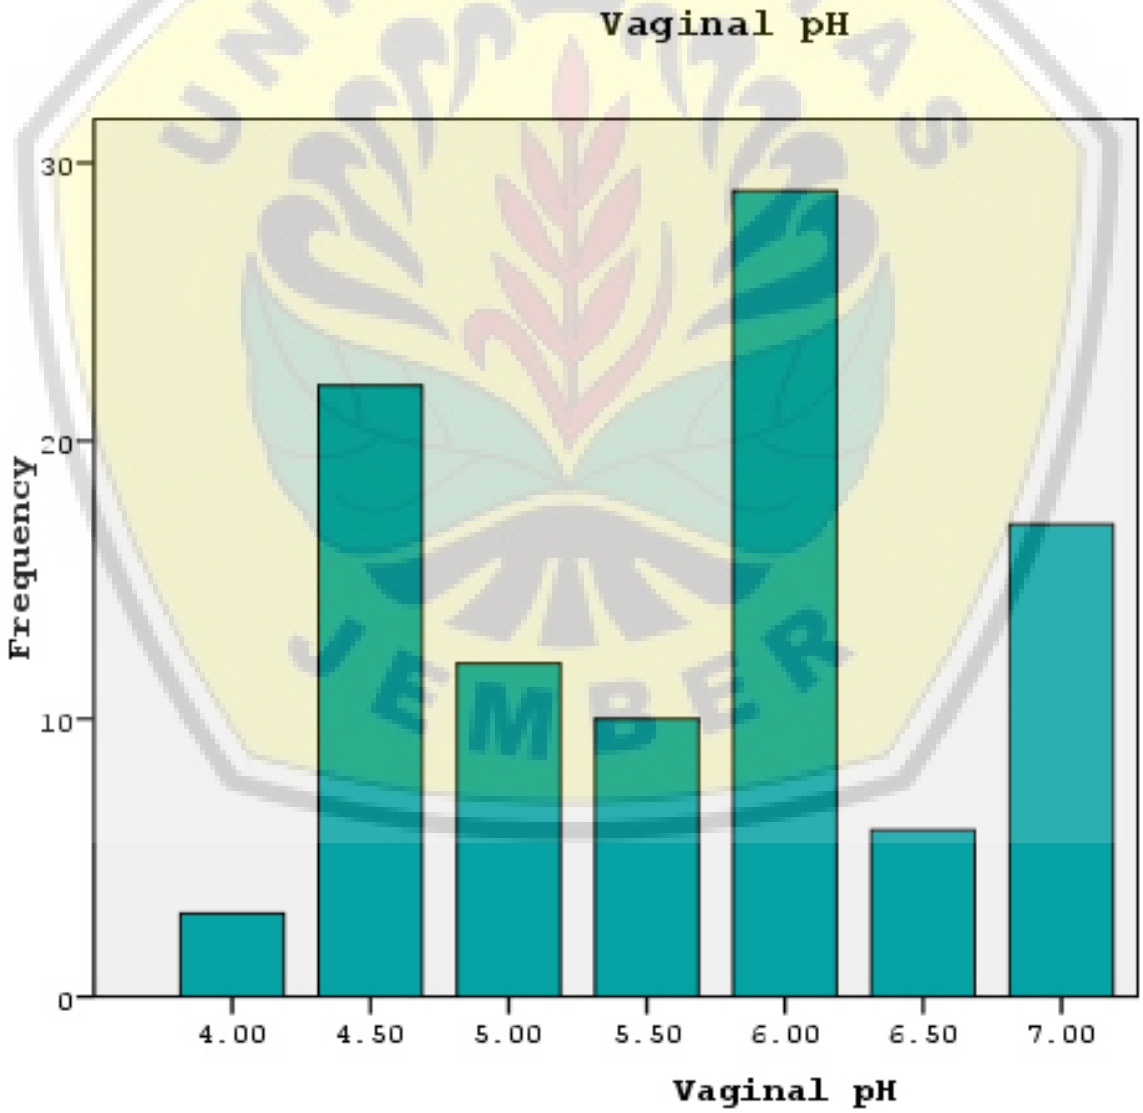

Figure (1) Frequency of Vaginal pH of premenopausal women

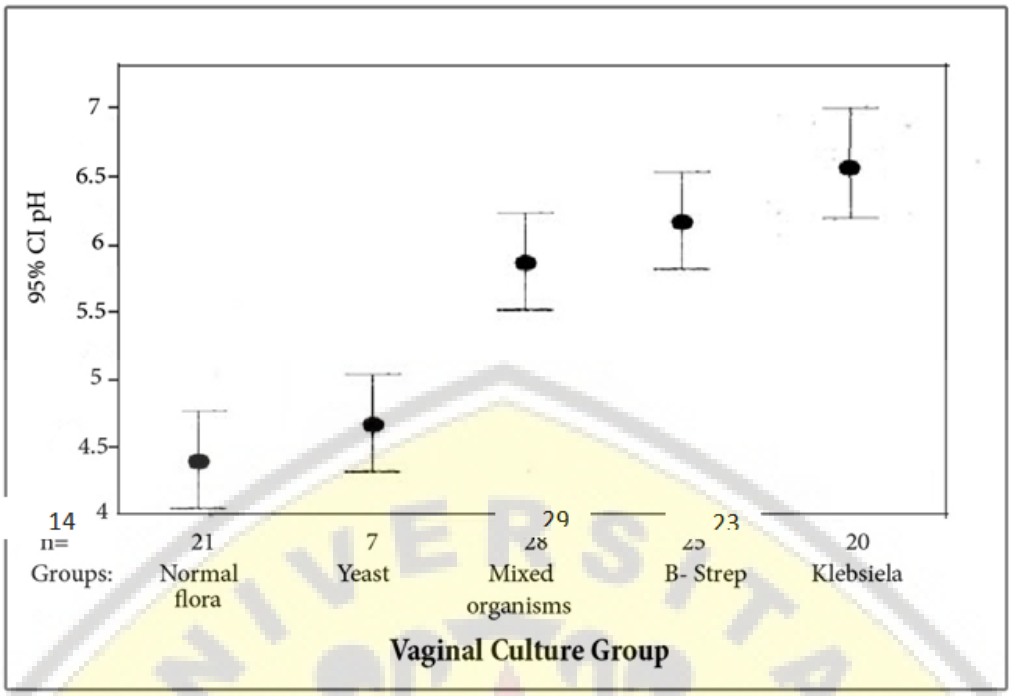

Figure (2) One hundred one premenopausal patient who had vaginal PH determinations and vaginal cultures to confirm relationship of vaginal PH to bacterial pathogens.

Conclusion

Measurement of vaginal pH is simple, low cost effective, and inexpensive for screening purpose . A vaginal pH of 4.5 is consistent with a pre menopausal serum estradiol level and the absence of bacterial pathogens . An elevated vaginal pH in the 5.0 – 6.5 range suggest a diagnosis of either bacterial pathogen or decreased serum estradiol . In patients with an elevated pH in pre menopausal period vaginal culture should establish the diagnosis . In the absence of bacterial pathogens ., a vaginal pH of 6.0 to 7.5 is strongly suggestive of menopause .

Comparison between the Effect of Normal and Nanoparticles of ZnO Against Different Types of Bacteria Isolated from Patients with Acne

Juman Khaleel Al-Sabbagh[1], Aseel Abd Al-redha[2], Manal A. Mohammad[2]

[1]University of Kerebala/Veterinary College–Microbiology Department, Iraq,
[2] University of Karbalaa–College of Dentistry, Iraq

Abstract

This study aims to clarify the antimicrobial behavior of ZnO nanoparticles contrary to Gram-positive and Gram-negative bacteria isolated from patients with acne . The effects of concentration of normal and nanoparticles of ZnO were detected by using microbiological experiments like well agar diffusion method . These tests were performed following standard method; and the concentration studied of normal particles were 5, 10, 15, 20 mg/ml,while the concentration of nanoparticles were 3.12, 6.25, 12.5, 25, 50 mg/ml. Out of 72 patientssuffered from skin infection; 60 only give positive results for bacterial growth, whose ages range between (18- 23) years old . And the swabs were collected and transformed for microbiology lab at 20 min approximately. The bacteria isolated,distributed to (16) for each of *Staphylococcus epidermidis* and *Staphlococcus aureus*, (10) for each of *Propionibacterium acnes* and *Pseudomonas aeroginosa,* And *Acinetobacter baumanii* and *Proteus mirabilis* have (4) isolates for each one. The results revealed that, the antibacterial action of ZnO nanoparticles, have more effectiveness than normal particles at all except for *S. epidermidis* which show susceptibility and inhibition zone with the lower concentration of ZnO NaPs .

Keywords: *ZnO nanoparticles, Acne, Antibacterial agents*

Introduction

Acne is a chronic disease may be due to inflammatory infection of the pilosebaceous elements of the tissues, and follicles of hair in the skin, containing an oil gland, that is caused, improvement of sebum production due to androgen-induction, transformed keratinization, infectious agents, and bacterial settlement of hair follicles on various sites in the body like, face, chest, back, and neck [1]. In teenagers, acne affects that lead to facial scarring may reaches nearest 20% and, acne may continue to the adulthood, with injurious sequelae on less consideration[2]. The clinical signs of acne consist of seborrhea, inflammatory abrasions, non-inflammatory lesions and scarring with several levels [3]. Although the significant roles in the severity of illness,due to history of the family and initial colonization with bacterial types, and precisely which prompts acne and how treatment regimen affects, the progression of the disease remain unclear . Diet as well as have been involved, but its role not confirmed certainly yet[4]. The availability and diffusion of the oxygen is the challenge within the follicle unit to the cells beneath; that lead to provide a perfect anaerobic environment for *Proprionibacterium acnes* growing and obliging their metabolism; Furthermore, the supplements and nutrients as a fatty acids because of the sebum overproduction; induce the bacteria to reproduce rapidly in the pilosebaceous constituent [5]. By receptors, specifically the Toll like receptor 2 and 4, White blood cells can recognize the lipoproteins of these foreign pathogens and that lead to induction keratinocytes to produce interleukin 6 and 8, and enhance erythematous inflammation; as well as white blood cells create an erythematous pustule as a

University of Kerebala/Veterinary College–Microbiology Department, Iraq

results of influence of inflammatory mediators and their affect against the pathogenic agents; and after a period of time, the immune response the lesions are healing and the skin as possible as return to normal[6].

Materials and Method

72 swabs were collected from patients with acne, from the students of university for a period of two months . The patient's age ranged from (19 - 24 years). only 60 patients show positive results for bacterial infection . The specimens are generally collected from patients with acne by sterile swab. Those specimens were collected under decontaminated conditions to prevent any possible contaminated situation . The swabs are taken from acne after sterilization the skin by alcohol. Tubes containing normal saline are used transfer the specimen and maintain it moisture, until taken to laboratory or immediately transfered to the laboratory during 30 minutes after placed in its cover. Blood agar, nutrient agar, chocolate agar and MacConkey's agar used to inoculation in aerobic and anaerobic conditions, and incubated for 24hrs. at 37°C. The concentration studied of normal particles were (5, 10, 15, 20 mg/ml), while the concentration of nanoparticles were (3.12, 6.25, 12.5, 25, 50 mg/ml) . By cork poorer we make pore in agar plates and put the solution of the normal and nanoparticles of ZnO products in it, incubation time usually longed for an overnight at 37ºC. The inhibition zones were measured using a caliper. Chemical route has been used to synthesis of (ZnO NaPs). Mercaptoethanol used as molecules for surface capping to maintain the stability of the particle size Analysis by x-ray photoelectron spectroscopy and infra- red spectroscopy to confirm presence of ZnO particle with capping molecules. Nanoparticles of ZnO ranged from 2 to 7 nm . The logical utilize mercabtoacetamide as appropriate reagents in the assurance of some metal particles is well-established. Because of the nearness of nitrogen, Sulfur and oxygen molecules at appropriate positions, N-alkyl-2-mercaptoacetamides are accounted for to carry on as monofunctional bidentate ligands and furthermore indicate linkage isomerism in their complexes. In the vast majority of the metal buildings, these ligands are accounted for to carry on as N,S reinforced or O, S-fortified ligands. Notwithstanding, some edifices have additionally been accounted for in which these ligands are reinforced through N and O particles with metals. Notwithstanding above, these ligands are accounted for to exist in following two conformational isomeric structures. ZnO as an economical n-sort and commendable semiconductor involved with has coordinate and wide hole of band of 3.37 eV at room temperature. Also, vitality about 60 meV restricted by a huge free - exciting . ZnO NaPs solidified as three forms : hexagonal wurtzite, cubic zinc blend, and the infrequently watched cubic rock salt; hexagonal wurtzite represent the most The stable structure at room temperature.

Results and Discusion

In this study, a total 0f 72 swabs obtained from patients suffering from acne, from the students of university in Karbalaa/Iraq during a period of two months . The patient's age ranged from (19 - 24 years). Only 60isolates of different bacteria were obtained as shown in Table (1) .The large group of microorganism universally cause acne and skin infection is the gram-positive bacteria . *S. aureus* seemed is the greatest pathogenic of the staphylococci,The high isolation frequency of *S. epidermidis* may belongs to establishment of these bacteria deeply inside the duct or also on the surface of the skin; also Ghodsi stated importance of these bacteria to avoid colonization by other pathogens and in maintain the balance of skin's micro flora. In opposite to other Gram positive bacteria and *P.acnes*, *S. aureus* and *S. epidermidis*can produce highly active antimicrobial components; and the lactic acid produced by *S. epidermidis* can be ferment by *P.acnes* to from acetic acid and propionic acid. *P.acnes* play a role in the progress of acne because it living away from skin's surface deeply in pores and follicles. Using a sebum, by products of metabolism and cellular debris for energy and nutrients; so highly active sebaceous glands manufacture a high sebum and obstruct a follicle, causing *P. acnes* bacteria to grow and reproduce. Four isolates of *Acinetobacter* had been isolated, and when compared by other studies we found that; these bacteria were broadly dispersed in population; and extensively spread in environment and can sometimes be cultivated from skin infections. Morever, the isolation of *Proteus mirabilis* from patients with severe form of acne has been demonstrated.

The effect of natural ZnO and ZnO NaPs on the bacteria isolated: In this study we used different Concentration of natural ZnO and ZnO NaPs . All Conc. of natural ZnO shown negative results with all isolates of *S. aureus* . While these bacteria appear sensitive in Conc. (25 and 50 mg/ml) of ZnONaPs . The results illustrated in the figure 2. The isolates of *A. baumanii*

and *P. mirabilis* approximately gave the similar results . They appear resist to natural ZnO . While only the conc. of ZnO NaPs 50 mg/ml kills the bacteria with 23 and 24mm of inhibition zones respectively, as the figure 3 . *P. acnes* and *P. aeroginosa* approximately give the nearest results and at the conc. 12.5, 25, and 50 mg/ml of ZnO NaPs; appear sensitive while against natural ZnO these bacteria show resistance against all Conc. prepared . Fig (3). Different types of bacteria can be efficiently affected by nanoparticles of ZnO and studies listed that, more smaller the particles in size, more effective in controlling and shedding the microorganisms. And Sunada displayed that, greater efficiency. A very wide range of microorganisms are significantly affected by nanoparticles of ZnO, by a different mode of actions such as accumulation of these particles within cell membrane or cytoplasm; and its size are highly influence on their mode of action; besides less is known about their toxicity and function at all; and many future researches are needed about that. Different concentrations of these particles with various types are studied and the inhibition developed at about 60 percent against *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Streptococcus pyogenes* and *Bacillus subtilis*. On the other side, In lesser concentration, many bacteria can be significantly growing and developing, and these nanoparticles recorded to be non-toxic to these bacterial species; because of that, these bacteria expected to metabolize and digest Zn^{2+}.In our study, *Staph. epidermidis* give bizarre results because the bacteria show susceptibility and inhibition zone with the lower concentration of ZnO NaPs; while with higher concentration of these particles the bacteria appear more resist and the inhibition zone narrowed than with the high concentration with these nanoparticle ions. The results illustrated in the figure 4. Some of bacterial species developed mechanisms to protect their cells from metal ions or extra metal ions by efflux and influx pump mechanisms to preserve stable concentration of these ions intracellularly; Zn^{2+} ions are from these ions; and numerous bacterial species have involved the genes responsible for transporting zinc ions including *Staphylococcus aureus, Streptococcus pneumoniae, Haemophilus influenzae,, Synechococcus* spp., *B. subtilis* and *Escherichia coli*. *zntA* and *zntR* genes recorded to be involved in In *Staphylococcus aureus*, and ZntA protein act as a transmembrane protein, that is responsible for the efflux of zinc ions and cobalt ions, while ZntR encodes for regulatory protein of Zn ions responsiveness. So the expectation is that; if the bacteria detect higher concentration of ZnO NaPs, they transport it out of the bacterial cell by efflux pump to protect the bacterial cell from damaging by high concentrations of these particles . And reach to the steady state as soon as possible to maintain the cell properties and characteristics.

Table (1): Prevalence of bacteria associated with acne .

Number of swabs	Number of isolates		Negative growth
72	Gram Positive Bacteria	Gram Negative Bacteria	12(17%)
	42(58%)	18(25%)

Conclusion

In the future, lotions and ointments of ZnO nanoparticle preparations may be employed for external uses for acne and some skin infection, mouthwashes, and surface layers as antibacterial agents to avoid colonization, attachment, formation biofilms and spreading of the bacteria in indwelling medical devices.

Detection Some Pathogenic Bacteria Causing UTI in Type 2 Diabetic Patients and Determine Some Resistance Genes in Escherichia coli by PCR in Kirkuk City

Asma Samea Afram[1], Wafaa Abdulsahib[2]

[1]Department of Biology, College of Science, Kirkuk University, Iraq,
[2]Microbiologists, Iraqi Ministry of Health, Iraq

Abstract

Determine some types of bacteria that cause urinary tract infection among type 2 diabetes mellitus patients. A cross-sectional study was carried out among 210 patients selected by using non probability sampling (purposive sampling). According to study findings females were 64.3% of the study sample, most of them were an elderly age, 26.2% of them had positive urine culture and Escherichia coli was the most common cause of UTI and then Klebsiellapneumoniae and Staphylococcus aureus. Sensitivity tests were done to determine resistance of bacteria to antibiotic that used in this study and determine some of the resistance genes in E. coli. The gyrA gene and dfrA1 gene are found in resistance isolates of E. coli to Nalidixic acid and Trimethoprim respectively.

Keywords: *Urinary Tract Infection, Type 2 Diabetes Mellitus, Resistance genes, PCR.*

Introduction

Urinary tract infections are more common, more severe, and carry worse outcomes in patients with type 2 diabetes mellitus. They are also more often caused by resistant pathogens. Various impairments in the immune system, poor metabolic control, and incomplete bladder emptying due to autonomic neuropathy may all contribute to the enhanced risk of urinary tract infections in these patients.(1)

Type 2 diabetes mellitus is a heterogeneous group of disorders characterized by variable degrees of insulin resistance, impaired insulin secretion, and increased glucose production. Patients with type 2 diabetes mellitus are at increased risk of infections, with the urinary tract being the most frequent infection site.(2,3) Factors that were found to enhance the risk for UTI in diabetics include age, metabolic control, and long term complications, primarily diabetic nephropathy and cystopathy.(4)

The spectrum of UTI in these patients ranges from asymptomatic bacteriuria (ASB) to lower UTI (cystitis), pyelonephritis, and severe urosepsis. Serious complications of UTI, such as emphysematous cystitis and pyelonephritis, renal abscesses and renal papillary necrosis, are all encountered more frequently in type 2 diabetes than in the general population. (5, 6)

Objectives of the Study

1. To isolate strains of bacteria that causes urinary tract infection among type 2 diabetes patients.
2. To identify the sensitivity and resistance of this bacteria to antibiotics.
3. The study also aimed at the identification of specific genes in E. coli responsible for resistance to Nalidixic acid and to Trimethoprim using the PCR technique.

Methodology

The study population included (210) patients with type 2 diabetes mellitus selected by non-probability sampling method (purposive sampling) in teaching Azadi hospital and Kirkuk general hospital.

The researcher explain the study and the objective to the patients and take their oral consent to participate in

the study, then collect general information and the mid-stream urine specimen from the patients.

GUE: Urine specimen was centrifuged at 3000 rpm for 5 minutes. The supernatant then was decanted and the sediment suspended in the remaining urine. A single drop then transferred to a clean glass slide and cover slip was applied to direct microscopic examination for examination of pus cells, erythrocytes, crystals, bacteria and epithelial cells. Detection of pyuria was more readily determined by finding of >10 leukocytes of centrifuged urine.

Urine Culture: The recommended procedure uses a calibrated plastic or metal loop to transfer 1 µl of uncentrifuged urine to the culture medium (MacConkey agar with crystal violet and non-selective blood agar). The inoculated plates were incubated overnight at 37°C.

Diagnosis of bacteria by:

1. Morphological Examination
2. Gram Stain
3. Biochemical Tests: (Catalase test, Oxidase Test, Coagulase test, Carbohydrates Fermentation and Gas Production, Citrate Utilization Test, Urease (Christensen's) Production Test, Mannitol Motility Test, Indole Production test).
4. API 20 E (Analytical Profile Index System)
5. Vitek 2 System
6. Antimicrobial Susceptibility Test (Kirby-Bauer disc diffusion technique)
7. Polymerase Chain Reaction (PCR) and Gel Electrophoresis

Antimicrobial susceptibility testing: All of the Enterobacteriaceae isolates were tested for susceptibility to some antibiotic including Ampicillin, (Amoxicillin and Clavulanic acid), Cefoxitin, Ceftriaxone, Cefepime, Imipenem, Gentamicin, Amikacin, Tetracyclin, Doxycyclin, Chloramphenicol, Azithromycin, Nalidixic acid, Ciprofloxacin, Trimethoprim and Nitrofurantoin by standard disk diffusion method on Mueller Hinton agar medium.

DNA extraction and polymerase chain reaction (PCR): Genomic DNA of all resistance isolates of E. coli was extracted using Wizard genomic DNA Purification kit (Promega, USA) as stated by manufacturer instruction. PCR reaction was performed to amplify gyrA gene in Quinolone resistant determining region (QRDR), and dfrA1 gene, to detect Nalidixic acid and Trimethoprim resistance respectively, using specific primers in table (I). Reaction condition was initiated by pre-denaturation at 95 ºC for 5 min followed by 30 cycles (95 ºC for 30 sec; 60 ºC for 30 sec; 72 ºC for 30 sec) and final extension cycle (72 ºC for 7 min) for gyrA gene, and the same condition except annealing temperature was at (55 ºC for 30 sec) for dfrA1 gene. Bands on Agarose gel were visualized using Gel imaging system.

Results and Discusion

Table (1): Distribution of the study sample by their general information

Variables		No.	%
Gender	Female	135	64.3
	Male	75	35.7
	Total	210	100.0
Age by years	(28-35)	7	3.3
	(36-43)	26	12.4
	(44-51)	44	21.0
	(52-59)	67	31.9
	(60-67)	50	23.8
	(68-75)	13	6.2
	(76-83)	1	0.5
	(84-91)	2	1.0
	Total	210	100.0

No. = number, %= percentage

This table indicates that female (64.3%) more than male, (31.9%) of patients ages were between (52-59) years

Table (2): Results of Urine Culture of the patients with type 2 Diabetes mellitus

Results of Urine Culture	No.	%
Negative	155	73.8
Positive	55	26.2
Total	210	100.0

No. = number, %= percentage

The results of urine culture indicate that 155 (73.8%) of patients had negative urine culture, 55 (26.2%) of them had positive results.

Table (3): Types of Bacteria Present in the Urine Culture

Types of bacteria	No.	%
Escherichia coli	24	39.3
Klebsiellapneumoniae	10	16.4
Pantoeaagglomerans	4	6.56
Proteus mirabilis	2	3.28
Acinetobacterbaumannii	2	3.28
Klebsiellaoxytoca	1	1.64
Pseudomonas aeruginosa	4	6.56
Staphylococcus aureus	8	13.1
Staphylococcus saprophyticus	2	3.28
Enterococcus faecalis	2	3.28
Streptococcus agalactiae	2	3.28
Total	**61**	**100.0**

No. = number, %= percentage

According to 55 (26.8%) of a positive culture of urine, the most type of bacteria found in positive culture were E. coli (24) (39.3%) followed by Klebsiellapneumoniae (10) (16.4%) and then Staphylococcus aureus (8) (13.1%).

Table (4): Antimicrobial susceptibility testing for E. coli

Variable	AMP	AMC	CX	CRO	CPM	IMI	CN	AK	TE	DXT	C	AZM	NA	CIP	TMP	F
Resistant	24	24	15	15	11	-	2	1	18	14	2	10	15	9	16	3
Sensitive	-	-	7	9	13	24	20	22	4	8	19	14	3	14	8	21
Intermediate	-	-	2	-	-	-	2	1	2	2	3	-	6	1	-	-
Total	**24**	**24**	**24**	**24**	**24**	**24**	**24**	**24**	**24**	**24**	**24**	**24**	**24**	**24**	**24**	**24**

R = Resistant, S = Sensitive, I = Intermediate, AMP = Ampicillin, AMC = (Amoxicillin and Clavulanic acid), CRO = Ceftriaxone, CPM = Cefepime, IMI = Imipenem, CN = Gentamicin, AK = Amikacin, TE = Tetracycline, DXT = Doxycyclin, C = Chloramphenicol, AZM = Azithromycin, NA = Nalidixic acid, CIP = Ciprofloxacin, TMP = Trimethoprim, F = Nitrofurantoin, CX = Cefoxitin

This table indicates that most of E. coli had resistant to Ampicillin, (Amoxicillin and Clavulanic acid), Cefoxitin, Ceftriaxone, Tetracycline, Doxycyclin, Nalidixic acid and Trimethoprim, and it was sensitive to Cefepime, Imipenem, Gentamycin, Amikacin, Chloramphenicol, Azithromycin, Ciprofloxacin and Nitrofurantoin.

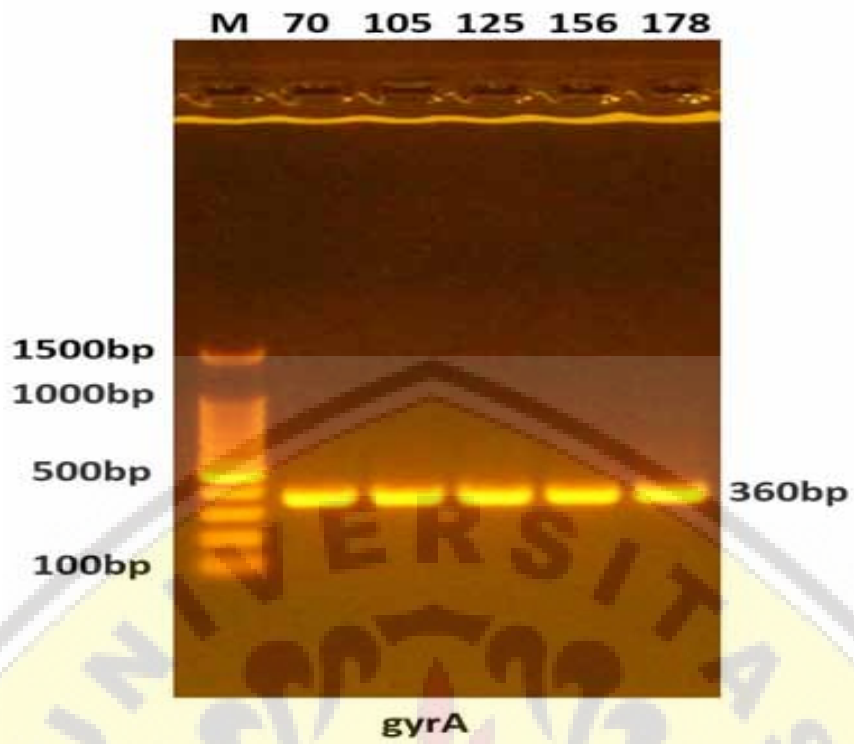

Figure 1. Presence of gyrA gene of Escherichia coli samples were fractionated on 1% Agarose gel electrophoresis stained with Eth.Br. Lane1:100bp DNA marker.

In Escherichia coli, resistance to quinolones frequently occurs through mutation in gyrA gene.

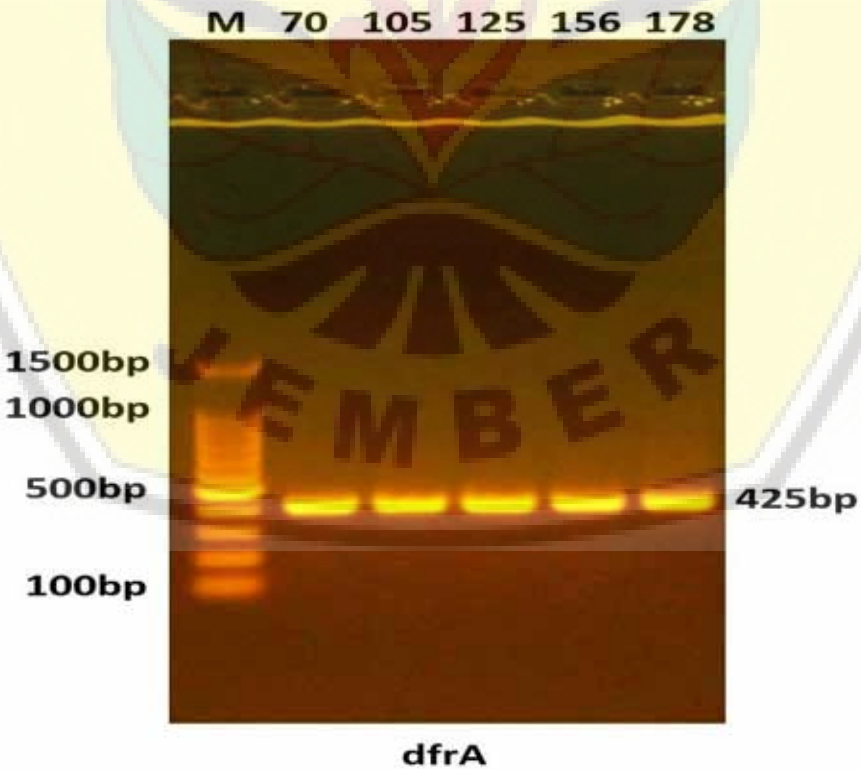

Figure 2. Presence of dfrA gene of Escherichia coli samples were fractionated on 1% Agarose gel electrophoresis stained with Eth.Br. Lane1:100bp DNA marker. E. coli are resistant to Trimethoprim by dfrA gene.

Conclusion

Females were more than males and most of patients were an elderly age. Quarter of the study sample had a positive urine culture. Escherichia coli were the most common causative agent of urinary tract infection then followed by Klebsiellapneumoniae and Staphylococcus aureus. There are some genes responsible of resistance of E. coli to Nalidixic acid and Trimethoprim.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Biology, College of Science, Kirkuk University and all experiments were carried out in accordance with approved guidelines.

Association of Ile 462 Val(rs1048943) Polymorphism of CYP1A1 Gene and Uterine Leiomyoma

Lamees Talib Tajuldeen[1], Haydar Hashim Alshalah[2], Nadia Mudher Al-Hilli[3]

[1]M.B. Ch.B.,M.Sc. Clinical Biochemistry, Ministry of health, Babylon health directorate, Hilla,, Iraq, [2]F.I.C.M.S. Chemical Pathology, [3]F.I.C.O.G. Obstetrics & Gynecology, University of Babylon, College of Medicine, Hilla, Iraq

Abstract

Uterine leiomyoma (UL) is a benign tumourarising from the myometrium of the uterus consisting of cells of smooth muscle, fibroblasts and is saturated with extra cellular matrix (ECM), (i.e., collagen, proteoglycan, fibronectin). The exact cause for this benign tumour is unknown. Previous studiespointing to an association of single nucleotide polymorphism (SNP) for the development of uterine leiomyoma. Aim of study: To find if there is an association betweenCYP1A1 gene polymorphism Ile462Val(rs1048943) and uterine leiomyoma development in Iraqi Arabian women from Babylon province.The study included 238 white Iraqi Arabian subjects, 118 women with uterine leiomyoma (cases) and 120 (controls). Genotyping ofCYP1A1gene(rs1048943) single nucleotide polymorphisms were carried out by PCR–RFLP. BsrDIrestriction enzyme was used for digestion ofCYP1A1 gene amplification product followed byagarose gel electrophoresis. Data were analyzed by various statistical analyses.CYP1A1gene(rs1048943) polymorphism revealed significant negative association with uterine leiomyoma development inIraqi Arabian women, women with heterozygous over dominantTC genotype in comparison to (TT+CC),exhibit significant negative association with uterine leiomyoma development, (odd ratio =0.32,C.I.95% = 0.18-0.56, p-value =0.0001).CYP1A1gene(rs1048943) polymorphismis negatively associated withuterine leiomyoma development inIraqi Arabian women.

Keywords: *Uterine leiomyoma, CYP1A1 gene, Ile462Valpolymorphism.*

Introduction

Uterine leiomyoma (UL) is a benign smooth muscle tumour, originating from themyometrium of the uterus[1], consisting of cells of smooth muscle, fibroblasts and is saturated with extra cellular matrix (ECM), (i.e., collagen, proteoglycan, fibronectin)[2,3].Genetically, it arise from a single progenitor cell asabnormal cellular clones[4]. The certain risk factors involved in developing uterine leiomyoma are:increased age among premenopausal women, black women in comparison to white, first degree relatives having leiomyoma, early age of menarche, null parity and oral contraceptive use before age of seventeen[5].Leiomyoma commonly classified according to their location into three groups:subserosal, intramural, and/or submucosal[6]. Symptoms of uterine leiomyoma might be of gastrointestinal, urinary and gynaecological problems[7]. Previous studiespointing to an association for theinvolvement of single nucleotide polymorphism (SNP) for the development of uterine leiomyoma[8]. In the present study, we investigate the association between CYP1A1gene Ile462ValSNPs and uterine leiomyoma in Iraqi Arabian women who were clinically diagnosed as UL. CYP1A1 gene is responsible for forming Cytochrome P450, family, subfamily A, polypeptide [9,10], a member of the cytochrome P450 superfamily of enzymes in humans (11)CYP1A1 enzyme involved in the catabolism of estrogen as well as in carcinogens metabolic activation [12,13]. Since UL is an estrogen-responsive tumour[14].Estrogen metabolism may affect UL by the effect of estrogen and its metabolites that having the same estrogenic activity, or by the effect of formation of reactive estrogenic catecholthat may cause oxidative damage[15]. Polymorphisms of genes that forming enzymes involved in estrogenmetabolism may lead to differential susceptibility to UL[16].

Subjects and Method

The study involved 238 white Iraqi Arabian subjects from Babylon province, 118 women with uterine leiomyoma (cases) and 120 (controls), who attended Health Centers, Private Clinics of Gynecology and Obstetrics, and Al-Hilla Teaching Hospital. The practical side of thestudy covered the period from 27th of February 2017 to 19thof May 2018. Online Sample Size Estimator (OSSE) was used to calculate sample size of the genetic study[17]. Diagnosis was made by ultrasound (U/S). EDTA- anticoagulant tubes were used to collect venous whole blood samples from women and stored in deep freeze -20˚C until DNA extraction. Extraction of DNA was from whole-blood samples using Favor Prep Blood Genomic DNA Extraction Mini Kit (Taiwan). Amplification was achieved by using specific primers then digestion with restriction enzyme, the primer sequence used for PCR amplification of CYP1A1 gene Ile462Val (A/G) (rs 1048943) was revealed in table (1). The primer sequence of CYP1A1 gene (rs 1048943) was used according to Jain et al (18).

Table 1: The primers sequence used for PCR amplification of CYP1A1 gene (rs 1048943).

Gene	Polymorphism (rs number)	Primer Sequence	Amplified Product (bp)
CYP1A1	Ile462Val (A/G) (rs 1048943)	F-5′-CTGTCTCCCTCTGGTTACAGGAAGC-3′ R -5′-TCCACCCGTTGCAGCAGGATAGCC-3′	204

Amplification reactionvolumes were: master premix of Biolabs (England) 10 µl (2x), Forward primer 1 µl (10 pmol/µl), Backward primer 1 µl (10 pmol/µl), DNA 2 µl (20-30 ng/µl) and molecular grade water 6 µl.The PCR thermocycling protocol for CYP1A1 gene amplification was presented in table (2).

Table 2: Thermocycling conditions protocol for CYP1A1 gene amplification.

Step	Temperature	Duration	Cycles number
Initial denaturation	94	5 minute	1
Denaturation	94	30 minute	35
Annealing	62	30 minute	
Extension	72	30 minute	
Final Extension	72	5 min	1

The PCR product (204 bp) of CYP1A1 gene (rs 1048943) was digested with the restriction enzyme BsrDI from BioLabs (New England), Incubation temperature (65 0 C) for 5-15 minute and can incubate overnight. The product of digestion ofCYP1A1 gene then separated by (3%) agarose gel electrophoresis technique and visualized on UV transilluminator.

Statistical Analysis: Microsoft Excel 2010 software was used to express values as mean ± standard deviation (SD), percentage (%). Statistical Package for the Social Sciences (SPSS) software version 22.0 was used to compare groups means by using two tail student t-test and the means differences were considered significant when the probability (P-value) was (> 0.05). Chi-square test was used to calculate odds ratios. Theparameters genetic associations were determined by the aid of online software SNPStats[19].

Results

Association Between Clinical Characteristics and Study Subjects: Association between clinical characteristics and the two studied groups were demonstratedin table (3).The mean age ± SD(year) was(42.30 ± 7.37) for cases and (39.20 ± 8.30) for control group, they were matched in age (p-value= 0.11). A significant association of early age of menarch

(year) with uterine leiomyoma (12.34 ±1.31) compared with that of control group (13.25 ±1.13) was revealed in the present study (p-value= 0.001).Regarding parity a significant association of null parity was demonstrated with uterine leiomyoma women (30.51%)compared with that of control group (5%) (p-value= 0.000001).

Table 3: Association between clinical characteristics and study subjects.

Variables	Cases No.=118	Controls No.=120	P-value
Age (year) Mean ± SD	42.30 ± 7.37	39.20 ± 8.30	0.11
Age of menarche (year) (mean ±SD)	12.34 ±1.31	13.25 ±1.13	0.001
Parity No. (%)	Null (0)	36 (30.51%)	6 (5%)	0.000001
	1-3	36 (30.51%)	54 (45%)	
	≤4	46 (38.98%)	60 (50%)	

PCR-RFLP Genotyping Analysis: The PCR product of CYP1A1 gene polymorphism (rs1048943) was digested by BsrDIrestriction enzyme. The products of digestion were analyzed by agarose gel electrophoresis. This enzyme will cut the product only if the T allele of (rs 1048943), present. Results revealed one band (204 bp) for those with CC, two bands (149,55 bp) for those with TT and three bands (204,149,55 bp) for those with TC figure (1).

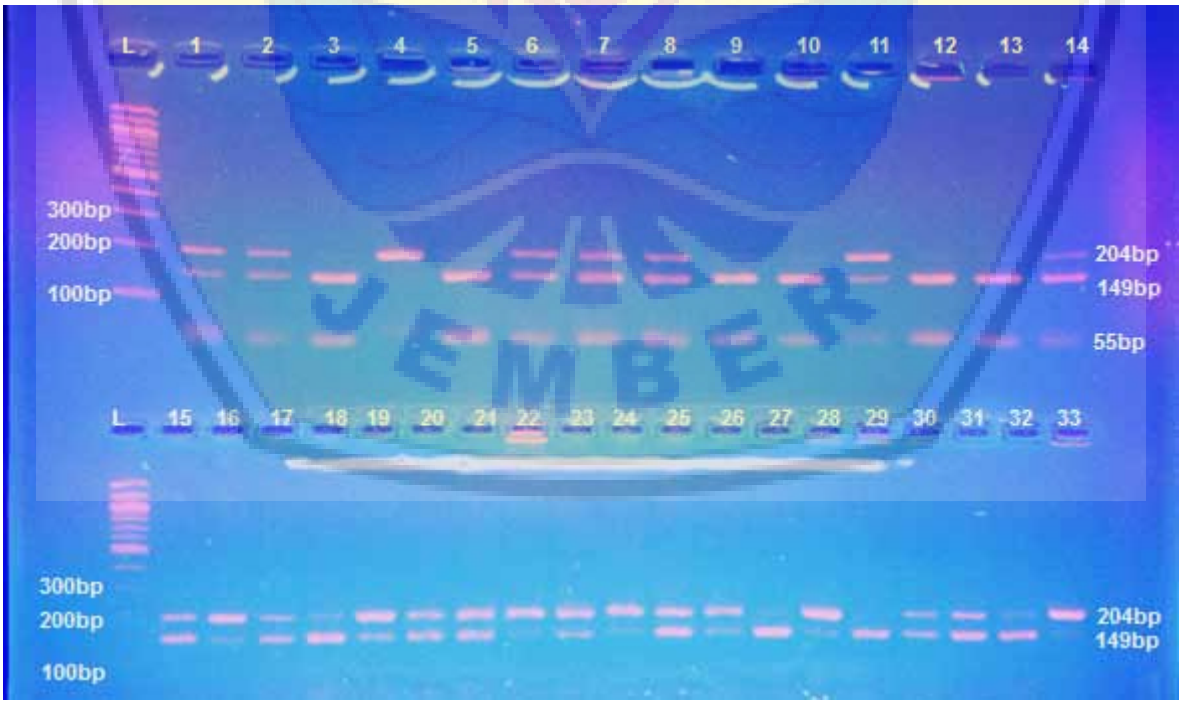

Figure 1: Agarose gel image of PCR-RFLP assay for the genotyping of CYP1A1 polymorphism (rs1048943), Lane L: 100 bp step ladder, Lanes 3,5,9,10,12,13,18,27,29 and 32 : T/T genotype, Lanes 4,16,22,28 and 33:C/C genotype, 1,2,6,7,8,11,15,17,19,20,21,23,25,26,30,and 31: T/C genotype.

Alleles and Genotypes Association of CYP1A1Gene Polymorphism (rs1048943) with Uterine Leiomyoma: No significant difference was demonstrated (p-value=0.25) between alleles frequencies among women with uterine leiomyoma (cases) and control group.

Table 4: Results of alleles frequencies and association of CYP1A1 gene polymorphism (rs1048943) among women with uterine leiomyoma and control group.

	Control (no.=120)		Cases (no.=118)		OR (95% CI)	P-value*
Allele	Number	Ratio	Number	Ratio		
T	132	0.55	142	0.60	1.236(0.859-1.779)	0.25
C	108	0.45	94	0.40	0.809(0.562-1.164)	

However, no positive or negative association were found between T and C alleles frequencies and uterine leiomyoma (odd ratio=1.236,C.I.95% = 0.859-1.779, p-value=0.25) (odd ratio=0.809,C.I.95% = 0.562-1.164, p-value=0.25) respectively as demonstrated in table (4).The association of each genotypes frequencies of CYP1A1 gene polymorphism (rs1048943) among women with uterine leiomyoma and control group under different models of inheritance was demonstrated in table(5).

Table 5: Results of genotypes frequencies and association of CYP1A1 gene polymorphism (rs1048943) among women with uterine leiomyoma and control group.

Model	Genotype	Control no. (%)	Case no. (%)	OR (95% CI)	P-value*
Codominant	T/T	18 (15%)	38 (32.2%)	1.00	0.0003
	T/C	96 (80%)	66 (55.9%)	0.33 (0.17-0.62)	
	C/C	6 (5%)	14 (11.9%)	1.11 (0.36-3.35)	
Dominant	T/T	18 (15%)	38 (32.2%)	1.00	0.0016
	T/C-C/C	102 (85%)	80 (67.8%)	0.37 (0.20-0.70)	
Recessive	T/T-T/C	114 (95%)	104 (88.1%)	1.00	0.053
	C/C	6 (5%)	14 (11.9%)	2.56 (0.95-6.90)	
Overdominant	T/T-C/C	24 (20%)	52 (44.1%)	1.00	0.0001
	T/C	96 (80%)	66 (55.9%)	0.32 (0.18-0.56)	

A significant difference was revealed between the three inherited genotypes of CYP1A1 gene polymorphism (rs1048943) (p-value=0.0003) among patients with leiomyoma and control group. The TC genotype had a significant negative association with uterine leiomyoma when compared with TT genotype, (odd ratio = 0.33,C.I.95% = 0.17-0.62, p-value=0.0003) andthis revealed that TC genotype considered as protective genetic factor against uterine leiomyoma. The association of each genotype with uterine leiomyoma was further tested under different models of inheritance. The (TC+CC) genotypes had a significant negative association with uterine leiomyoma,(odd ratio=0.37, C.I.95%= 0.20-0.70, p-value=0.0016) and this revealed that women with (TC+CC) genotypes collectively in comparison to TT genotype considered as protective genetic factors against uterine leiomyoma. While women with over dominant heterozygous TC genotypes were shown a significant negative association with uterine leiomyoma, (odd ratio=0.32,C.I.95% =0.18-

0.56, p-value= 0.0001). The results revealed that women would be protectable from uterine leiomyoma, if carry over dominant heterozygous TC genotype in comparison to (TT+CC). Uterine leiomyoma consider a tumour of premenopausal women, increased age among premenopausal women is a risk factor for leiomyomas[20]. The variance in prevalenceof uterine leiomyomabetween premenopausal and postmenopausal women is explained by the variance in hormonal status during these two period [21].Early age of menarche is also a risk factor forUterine leiomyoma and other hormonally mediated conditions such as endometrial and breast cancer[22,23]. There may be direct effects from each additional year of hormonal stimulation, but the association could also arise from early-life factors that cause both early menarche and adult disease[24].The result of significant association of null parity with uterine leiomyoma agreed with other studies that reveal an inverse association was detected between parity and UL risk, Baird and Dunson have demonstrated in their study that women who have pregnancies that are (>20 weeks) have reduced the risk of developing myomas[25], this result was approved by previous studies[26,27]. Regarding alleles and genotypes association of CYP1A1 gene polymorphism (rs1048943) with uterine leiomyoma, results revealed no significant difference was demonstrated between alleles frequencies among women with uterine leiomyoma(cases) and control group. However, no positive or negative association were found between T and C alleles frequencies and uterine leiomyoma. This result was in accordance with few studies, those studies conducted on, African Americans and white Americans women in 2006 and Iranian women in 2014 and 2016[15], and was discordance with studies conducted on chines women in 2008 and 2014, and in Egyptians women in 2011[30].The TC genotype had a significant negative association with uterine leiomyoma when compared with TT genotype, and this revealed that TC genotype considered as protective genetic factor against uterine leiomyoma.The association of each genotype with uterine leiomyoma was further tested under different models of inheritance. The results revealed that women would beprotectable from uterine leiomyoma, if carry over dominant heterozygous TC genotype in comparison to (TT+CC). These variances in results may be due to different genetic backgrounds or heterogeneity effect of specific gene polymorphisms in various populations.This result did not mean that CYP1A1 gene polymorphism do not have role in development of uterine leiomyoma, but the reason behind our result may be due to small sample size that this study had been carried out or might be the effect of different races and ethnicity on the relation of CYP1A1 gene polymorphism with uterine leiomyoma. Also, larger sample size was needed to investigate the role of gene-environmental interactions in the development of uterine leiomyoma.

Conclusion

In conclusion, the present study reveal no significant positive association between CYP1A1 gene Ile462Val polymorphism (rs1048943) and uterine leiomyoma risk, this result was in accordance with Gooden study in2006, Mortezaee et al. study in 2014 and Salimi et al. study in 2016, and was discordance with Ye et al. study in 2008, El-Shennawy et al. study in 2011 and Shen et al. study in 2014.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Ministry of health, Babylon health directorate, Hilla,, Iraq and all experiments were carried out in accordance with approved guidelines.

Evaluation of Adolescents with Chronic Illness Knowledge and Attitudes about Health Promotion in Baghdad City: A Cross-sectional Study

Ali M. Abood[1], Mohammed F. Khalifa[2]

[1]Graduate Nurse Specialist, Ministry of Health and Environment, [2]Professor of Community Health Nursing, College of Nursing, University of Baghdad

Abstract

Objective(s): To evaluate adolescents with chronic illness knowledge and attitudes about health promotion and to compare between them with respect to their knowledge and attitudes about health promotion in Baghdad City.A cross-sectional design is employed to evaluate adolescents with chronic illness knowledge and attitudes about health promotion and to compare between these adolescents' knowledge and attitudes about health promotion for the period of November 3rd 2018 to April 8th 2019. Purposive, non-probability, sample of (137) adolescent is recruited for the present study. An evaluation tools are constructed for the purpose of the study. Reliability and validity of the study instrument is determined through pilot study. Data are collected through the use of constructed questionnaires and the application of the interview technique as means for data collection. Data are analysed through the application of descriptive statistical data analysis approach of total scores and range and inferential statistical data analysis approach of analysis of variance. The study indicates that that most of the early age adolescents have fair level of knowledge about health promotion and most of the middle and early age groups have good level of knowledge about health promotion.

Keywords: *Adolescents, Chronic Illness, Knowledge, Attitudes, Health Promotion.*

Introduction

In fact, increasing data indicate that adolescents with chronic conditions are engaged to the same extent or even more in health-risk behavior compared with their healthy counterparts. Further, there is evidence that health-risk behavior tend to cluster together. Due to this, young people with chronic conditions have double disadvantage during their adolescence. Moreover, adolescents with disabilities are less exposed to protective factors and children with chronic conditions are more exposed to bullying, have fewer contacts with peers and more emotional problems than healthy counterparts. Furthermore, a study in a recent past indicated an association between chronic conditions in children and lower family socioeconomic status, compared to healthy peers[1]. Chronic conditions in adolescents are associated with few protective factors and clustered health-risk behavior. The combination of chronic conditions and low numbers of protective factors are often hazardous and associated with an increased risk of clustered health-risk behavior[2]. The promotion of a healthy personality is the essential foundation for the prevention, treatment, and rehabilitation of chronic disease: an unhealthy personality is a major contributor to vulnerability to chronic disease, poor compliance with treatment, and poor outcomes. Health-promoting behaviors could serve as a major strategy to optimize long-term outcomes for adolescents with chronic disease. The associations assessed from a positive perspective of knowledge, attitudes, and practice model would potentially cultivate health-promoting behaviors during adolescence [3]. Based on the early stated evidence, the present study aims at evaluating the adolescents with chronic illness knowledge and attitudes about health promotion.

Methodology

A cross-sectional design is employed to evaluate adolescents with chronic illness knowledge and attitudes about health promotion and to compare between these adolescents' knowledge and attitudes about health promotion for the period of November 3rd 2018 to April 8th 2019. Purposive, non-probability, sample of (137) adolescent is recruited for the present study in Baghdad. All adolescents, who have participated in the study, have signed consent form for the purpose of ethical consideration. Evaluation tools are constructed for the purpose of the study. Internal consistency reliability is determined when split-half techniques is employed and computation of Cronbach alpha correlation coefficient of (r=0.87) for the adolescents knowledge about health promotion internal scale and (r=0.88) for the adolescents attitudes internal scale which are indicating that the measures are adequately reliable and content validity of the study instruments is determined through panel of (10) experts in the area of the research and through pilot study. The study instruments are rated and scored as 3 for I know, 2 for uncertain and 1 for I do not know of the knowledge scale and 3 for agree, 2 for uncertain and 1 for disagree of the attitudes scale. Data are collected through the use of constructed questionnaires and the application of the interview technique as means for data collection. Data are analysed through the application of descriptive statistical data analysis approach of total scores and range and inferential statistical data analysis approach of analysis of variance.

Results and Discusion

Results of such evaluation indicate that most of the early age adolescents have fair level of knowledge about health promotion and most of the middle and early age groups have good level of knowledge about health promotion**.** Results out of this table indicate that most of the adolescents age group have developed fair level of knowledge about health promotion for nutrition.Results out of this table reveal that most of the adolescents have fair level of knowledge about health promotion for social support.Results out of this table indicate that most of the adolescents' age groups have fair level of knowledge about health promotion for health responsibility.Results out of this table depict that most of the adolescents' age groups have fair level of knowledge about health promotion for life appreciation.Results out of this table present that most of the adolescents' age groups have fair level of knowledge about health promotion for exercise.Results out of this table reveal that most of the adolescents' age groups have fair level of knowledge about health promotion for stress management.Results out of such analysis indicate that there is significant difference between the adolescents relative to their attitudes toward health promotion. Analysis of such overall evaluation indicates that early age adolescents have acquired fair level of knowledge about health promotion but middle and late adolescents have obtained good level of knowledge about health promotion (Table 1 through 7). Interpretation for such findings reveals that adolescents of all age groups have demonstrated fair level of knowledge with respect to nutrition; social support; health responsibility; life appreciation; Exercise; and stress management. These findings provide evidence that these adolescents are not fortunate to acquire sufficient degree of knowledge to be efficiently aware and well-oriented to chronic illness.Knowledge is not the same as understanding. Knowledge is a mere accumulation of facts and data, while understanding requires a bit more. It demands insight, sensitivity, and intimacy with any given situation – and, sometimes, it necessitates people have borne a particular burden. There is a basic lack of understanding regarding the effects chronic illnesses have on the lives of those they affect. But such deficiency is recognized and it mustnot necessarily lead to discord and strife. People may have knowledge of my illness. Perhaps they can even define it, explain it, and list its symptoms, as well as they have the capability to even promote their health and maintain their wellness (Van Houten, 2017) [4].It has been noted that patient awareness of a chronic condition reinforces their capacity to self-manage that condition. Self-management, a pillar of chronic disease management, is unachievable if patients are unaware of their condition. Supporting patients to self-manage their chronic diseases can improve health outcomes, health promotion, wellness and quality of life measures [5]. Adolescents with chronic conditions are highly likely to encounter physical, social and psychological difficulties that can threaten their overall wellbeing and health. As any other adolescent, they need to be helped to tackle the non-medical determinants of their health through their understanding of the health promotion principles [6].A cross-sectional survey inspects the relationships between disease knowledge and health-promoting behaviors in adolescents with congenital heart disease. A total of (320) adolescent, with congenital heart disease that is aged (12-18) years, are recruited from pediatric cardiology outpatient departments. The findings of

this study offer new understandings into the role of disease knowledge in the health-promoting behavior of adolescents with congenital heart disease [7].With regard to their attitudes toward health promotion, the study findings provide truthful fair level of attitudes toward health responsibility aspect of health promotion and attitudes toward health promotion selected issues (Table 8 and 9).The National Center for Chronic Disease Prevention and Health Promotion has emphasized that establishing healthy behaviors to prevent chronic disease is easier and more effective during adolescence than trying to change unhealthy behaviors during adulthood (NCCDPHP, 2019)[8].Adolescents with chronic conditions are extremely expected to meeting series of problems that can influence their overall wellbeing and health. As any other adolescent, they require to be assisted to challenge the non-medical determinants of their health through their thoughtfulness of the health promotion values[6].A qualitative study is conducted to explore adolescent's attitudes to health and seeking help for health-related problems. Interviews are steered with five adolescents visiting a youth health clinic in Moss, Norway. The interviews are audiotaped, transcribed and analyzed according to systematic text condensation. The participants are two boys and three girls, ranging from (17-19) years of age. The study finds that all adolescentsincorporated psychological and social qualities in their view on health. Positive social connections with family and friends were the most important factors for good health for all participants. They all conveyed resistance to disclosing mental health issues, although this was recognized as the most important barrier for good health. Establishing a trusting relationship with a health care provider was necessary before disclosing mental health issues and receiving help. In this qualitative assessment of adolescent's attitudes to health and seeking help for health related problems, they found that their focus was on mental and social aspects of health, and that a trusting relationship with health care providers was necessary for the adolescent's to seek help within the health care system [9].Health-promoting behaviors could serve as a major strategy to optimize long-term outcomes for adolescents with congenital heart disease. The associations assessed from a positive perspective of attitudes would potentially cultivate health-promoting behaviors during adolescence. A cross-sectional survey examines the relationships between disease attitudes and health-promoting behaviors in adolescents with congenital heart disease. A total of (320) adolescent, with congenital heart disease that is aged (12-18) years, are recruited from pediatric cardiology outpatient departments. The findings of this study provide new insights into the role of disease attitudes in the health-promoting behavior of adolescents with congenital heart disease[7].Analysis for such comparison offers significant findings that all adolescents demonstrate differences in their knowledge (Table 10) and attitudes (Table 11) about health promotion. This evidential finding can be interpreted in a manner that as far as these adolescents with chronic illness get older, their knowledge and attitudes about the concern of health promotion is well-oriented, motivated and increased, as well as improved. The comparison adds additional evidence that middle age and late age adolescents with chronic illness have reserved better knowledge and developed well-oriented attitudes about health promotion along with their experience of chronic illness.

Table (1): Overall Evaluation of Adolescents' Knowledge about Health Promotion (N=137)

Age Groups	n	Poor (59-98)	Fair (99-138)	Good (139-177)
1. Early Age	38	0	25	13
2. Middle Age	54	0	18	36
3. Late Age	45	0	12	33

N= Sample Size; n= Single Group Size

Table (2): Overall Evaluation of Adolescents' Knowledge about Health Promotion for Nutrition

Age Groups	Poor (6-10)	Fair (11-14)	Good (15-18)
1. Early Age	0	32	6
2. Middle Age	0	40	14
3. Late Age	0	29	16

Table (3): Overall Evaluation of Adolescents' Knowledge about Health Promotion for Social Support

Age Groups	Poor (7-12)	Fair (13-17)	Good (18-21)
1. Early Age	0	33	5
2. Middle Age	0	39	15
3. Late Age	0	29	16

Table (4): Overall Evaluation of Adolescents Knowledge about Health Promotion for Health Responsibility

Age Groups	Poor (8-13)	Fair (14-18)	Good (19-24)
1. Early Age	0	36	2
2. Middle Age	0	41	13
3. Late Age	0	31	14

Table (5): Overall Evaluation of Adolescents Knowledge about Health Promotion for Life Appreciation

Age Groups	Poor (8-13)	Fair (14-18)	Good (19-24)
1. Early Age	0	37	1
2. Middle Age	0	41	13
3. Late Age	0	30	15

Table (6): Overall Evaluation of Adolescents Knowledge about Health Promotion for Exercise

Age Groups	Poor (5-8)	Fair (9-11)	Good (12-15)
1. Early Age	0	32	6
2. Middle Age	0	42	12
3. Late Age	0	29	16

Conclusion

The study concludes that the study confirms that the older the adolescents, their knowledge and attitudes about the interest of health promotion convert well-oriented, motivated and increased, as well as improved. However, their knowledge dramatically maintained and attitudes affectedly changed.

Evaluation of Continuing Nursing Education Programs at Health Directorates in Baghdad Governorate

Mustafa K. Mansoor[1], Mohammed F. Khalifa[2]

[1]Graduate Nurse Specialist, Ministry of Health and Environment,
[2]Professor of Community Health Nursing, College of Nursing, University of Baghdad

Abstract

Objective(s): To evaluate continuing nursing education programs at health Directorate in Baghdad Governorate and to compare between hospitals at these directorates with respect to the programs. A descriptive design, using the evaluation and comparative approaches, is employed to evaluate continuing nursing education programs at health directorates in Baghdad Governorate for the period of November 3rd 2018 through May 30th 2019. Purposive sample of (120) staff nurse is selected from these health directorates in Baghdad Governorate. Self-report evaluation tool is constructed for the purpose of the study. Reliability and validity of the evaluation tool are determined through pilot study. Data are analyzed through the application of descriptive statistical data analysis approach of mean, total score and range and inferential statistical data analysis approach of analysis of variance. There is no significant differences between general, specialized, pediatrics and private hospitals at all health directorates relative to the evaluation of the continuing nursing education programs. The study concludes that the continuing nursing education programs have experienced good level of overall evaluation at Medical City, Al-Karkh and Al-Russafa Health Directorates. The continuing nursing education programs have experienced good level of overall evaluation in general, specialized, pediatric and private hospitals.

Keywords: *Evaluation, Continuing Nursing Education Programs, Baghdad Governorate.*

Introduction

Continuing education in nursing is a planned activity directed towards meeting the learning needs of the nurse following basic nursing education, exclusive of full time formal post basic education[1]. Continuing nursing education (CNE) refers to courses specifically for nursing professionals, aimed at keeping them up-to-date with the latest health knowledge. CNE ensures professional development and enables re-licensure and certification points in several Pacific countries. CNE also expands nurses' knowledge, skills and attitude while contributing to their career development[2]. Based on the early stated evidence, the present study ought to evaluate the Continuing Nursing Education Programs at Al-Karkh, Al-Russafa and Medical City Health Directorates in Baghdad Governorate.

Methodology

A descriptive design, utilizing the evaluation and comparative approaches, is engaged to evaluate continuing nursing education programs at health directorates in Baghdad Governorate for the period of November 3rd 2018 through May 30th 2019. Purposive sample of (120) staff nurse is nominated from these health directorates in Baghdad Governorate. All staff nurses, who have participated in the study, have signed a consent form for ethical consideration purpose. Self-report evaluation tool, of (6) aspects and (47) item, is constructed for the purpose of the study. Internal consistency reliability is obtained for the study instrument through the use of split-half technique and the computation of Cronbach alpha correlation coefficient of (r= 0.87) and content validity of the evaluation tool is

determined through panel of (10) expert and the conduct of a pilot study. Data are collected through the utilization of the study instrument and the interview technique as means of data collection. Data are analyzed through the application of descriptive statistical data analysis approach of mean, total score and range and inferential statistical data analysis approach of analysis of variance.

Results

Table (1): Overall Evaluation of the Continuing Nursing EducationPrograms

Health Directorate	Poor (46-76)	Fair (77-107)	Good (108-138)
1. Medical City	1	4	35
2. Al-Karkh	1	4	35
3. Al-Russafa	1	3	36

Results out of this table indicate that evaluation of most continuing nursing programs at all Health Directorates in Baghdad Governorate is good.

Table (2): Analysis of Variance for the Differences between General Hospitals

Descriptives

Hospitals

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound

Such analysis reveals that there are no significant differences between private hospitals relative to the evaluation of continuing nursing education programs.

Part I: Discussion of the Overall Evaluation of the Continuing Nursing Education Programs: The overall evaluation of the continuing nursing education programs at the Health Directorates in Baghdad Governorate indicate that the programs have experienced good levels of evaluation (Table 1). Such finding can be interpreted in a manner that these programs have qualified the standardized features for their evaluation.A study was done, In Korea, to develop a measurement tool for evaluation of continuing nursing education programs and to verify its validity for effective management and quality of education programs. The draft of the evaluation measurement is developed from consultation with professionals, focus group interviews targeting groups of nurses, and individual interviews with education program planners. After (6) professionals examined content validity, 46 items were retained. A pilot-survey is conducted to confirm the time required to complete the questionnaire and the level of understanding of general content and each item in the questionnaire. Construct validity is verified through exploratory factor analysis of data from a survey with (44) items completed by (452) nurses and (59) education program planners. The final evaluation measurement for continuing nursing education programs consisted of (6) evaluation factors and (36) evaluation items. The (6) evaluation factors include identifying program goals and target groups, program planning, performance, operation and management, program outcomes, and program effectiveness. The study concludes that the evaluation measurement for continuing nursing education programs developed in this study is considered suitable to utilize as an evaluation measurement of the quality of continuing education programs for nurses[3]. Recently, Continuing Nursing Education (CNE) has been debated as an important process in learning due to the unexpected growth in professional knowledge, rapid changes in the healthcare system and the changes in nurses' roles. Continuing Nursing Education (CNE) within the Nursing Practice Environment (NPE) is important in determining issues associated with unsafe practice, unproductiveness or incompetent nurses. A descriptive correlational study was designed to determine the best practice initiative in NPE whereby 395 (94.3%) nurses participated. This study showed that the highest mean score was 2.91 on 'Nursing Foundations for Quality of Care' of which 314

(79.5%) nurses highly agreed that CNE programs are the most important. The study concludes that CNE program is the best practice initiative and it is recommended that CNE will encourage lifelong and transformational learning in the nursing career[4]. Continuing nursing education (CNE) has become essential for the assurance and improvement of quality patient care. CNE includes self-education and directed training activities designed to acquire new knowledge further to that which is acquired through the basic nursing education. It is a process that begins with the end of studies and lasts for the entire life of the individual. A descriptive correlational study investigates the motivating factors for participation of nurses in continuing nursing education (CNE) and their perceptions about the necessity for programs in CNE. The Participation Reasons Scale (PRS) is completed by (475) nurses working in three hospitals in Athens and the Peloponnese region and the socio-demographic data of participants are recorded. The study shows that the majority (62.3%) of the sample showed positive perceptions and attitudes about CNE programs which are based on real needs. Subjects rated all five factors (dimensions) of the PRS as "moderately important" in high percentages, specifically: "Professional improvement and development" 98.9%, "professional service" 91.8%, "collegial learning and interaction" 82.6%, "personal benefits and job security" 91.0%, "professional commitment" 88.4%. "Professional commitment" recorded the highest mean score (4.95±0.744). "Professional improvement and development" correlated positively with "collegial learning and interaction" ($r=0.229$; $p<0.001$) and "personal benefits and job security" ($r=0.115$; $p=0.015$). The study concludes that motives and personal professional attitudes exert a significant effect on the participation of nurses in CNE programs[5]. Continuing nursing education and the application of new knowledge to practice are increasingly important means to improve patient care in today's health environment. The willingness and ability to transfer knowledge, skills, and attitudes are critical to improving patient outcomes. Evaluating the effectiveness of continuing nursing education does not always include behavioral change and patient health outcomes. A qualitative analysis of open-ended evaluation questions from continuing nursing education activities was conducted. The aim was to evaluate learners' intentions to change their practice resulting from their learning and their perceived barriers to implementing practice changes. Results revealed the multiple, interconnected challenges involved in translating new learning into practice[6]. Continuing education (CE) is increasingly critical for nurses to keep abreast of rapid changes in patient care due to advancements in knowledge and technology. A cross-sectional study, of (2727) hospital-employed Chinese nurses from ten general hospitals, is conducted to explore Chinese nurses' perceptions on continuing education, how best CE practices meet their learning needs, and the motivation and barriers nurses face in completing CE from September to October 2010. Nurses' perceptions on CE, as well as motivational and preventive factors in CE were assessed. The study results indicate that the majority of nurses (97.3%) attended CE activities in the last twelve months. More than (92.2%) of the nurses were familiar with the value of CE. Nurses expected CE activities to take place within a five-day period and to consist of 2h per activity. The major factors that motivate nurses to participate in CE are the desire to gain and update their knowledge of the newest nursing development and procedures, to improve their practical skills and comprehensive qualities, to maintain professional status and to receive an academic degree. Factors that hindered nurses' participation in CE included time constraints, work commitments, a lack of opportunity, cost of the courses and previous negative experiences with CE programs. The study concludes that Chinese nurses consider CE an extremely important measure to further develop their professional competency. Nurses' actual expectations for CE and the motivation and barriers for participation in CE from nurses' individual, family and hospital perspective must be taken into the account in order to make CE programs more effective[7]. Continuing education program is any extension of opportunities for reading, study and training to any person and adult following their completion of or withdrawal from full time school and/or college program[8]. Continuing education benefits for nurses include: Staying current in evidence based practices in order to provide safe and quality patient care. Many organizations include continuing education in their employee performance evaluations, professional and personal satisfaction. The findings out of the comparison between the continuing nursing education programs at general, specialized, pediatric and private hospitals at these health directorates demonstrate that these hospitals are employing almost the same quality continuing nursing education programs relative to all standardized features of their accreditation (Table 2 through 5). Unfortunately, no supportive empirical evidence is available in the literatures to support these findings.

Conclusion

Based on discussion and interpretation of the study findings, the study can conclude that: The continuing nursing education programs have experienced good level of overall evaluation at Medical City, Al-Karkh and Al-Russafa Health Directorates. The continuing nursing education programs have experienced goodlevel of overall evaluation at general, specialized, pediatric and private hospitals. Staff nurses have all benefited out the continuing nursing education programs. So, the differences in their demographic characteristics have no influence on the evaluation of these programs.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Ministry of Health and Environment and all experiments were carried out in accordance with approved guidelines.

The Link between Locus of Control Orientation and Patients' Adherence to Medication After Chronic Obstructive Pulmonary Disease

Abbas F. Moussa[1], Diaa K. Abd-Ali[1]

[1]Adult Nursing, University of Kufa. Faculty of Nursing, Iraq

Abstract

The main cause of disease is tobacco smoking. Symptoms of the disease gradually appear from age 40 and above, and men are more likely to be effect with the disease than women around the world. The study focused on the relationship between awareness of the locus control orientation and of patients' adherence to medication and in making appropriate decisions that avoid complications of disease and reduce the risk factors. A Descriptive Correlational Design is used through the present study in order to determine link between locus of control orientation and patients' adherence to medication after chronic obstructive pulmonary disease. From October, 17th, 2018 to June, 13th, 2019. A Non- Probability (Accidental Sample) of (104) patients with chronic obstructive pulmonary disease. The study is conducted in Al-Najaf Al-Ashraf City's hospitals. The study instrument is adopted and developed by the researcher to investigate the study phenomenon. The study results indicate that there is a direct and high significant and positive correlation between locus of control orientation and adherence to medication. The study concludes that there is a correlation between locus of control orientation and patients' adherence to medication after chronic obstructive pulmonary disease

Keywords: *Locus of control orientation, adherence to medication, chronic obstructive pulmonary disease.*

Introduction

Chronic Obstructive Pulmonary Disease is a major health problem that affect a millions of people worldwide [1]. The prescription of medication refers to a cornerstone in the management of chronic obstructive pulmonary disease (COPD). Furthermore, the effect of the prescription of medications is threated by many factors, one of the factors is the patients' mal-adherence [2]. Chronic Obstructive Pulmonary Disease (COPD) it is one of the most dangerous diseases affecting the respiratory system globally. It is classified as the fifth most dangerous disease in the world. It is difficult to determine the real number of deaths worldwide. And the COPD is a deadly disease that causes human disability [16]. Chronic Obstructive Pulmonary Disease COPD is a common disease that causes death or disability and can be prevented or treated. It is characterized by severe symptoms such as difficulty breathing and tightness of respiratory tracts resulting from physiological changes in the lungs[4-7]. COPD it often caused by a number of chemical and/or biological causes, and there are a different risk factors that may influence the incidence of COPD such as smoking, age, gender, …etc. the most common symptoms of COPD are frequent coughing, sputum production and dyspnea. All of these symptoms are results from the physiological changes in the lungs [21]. Statistics from the United States showed more than 24 million people in the adult population who were diagnosed with chronic obstructive pulmonary disease (COPD), the third-largest cause of death in the United States, according to the National Heart and Lung Institute According to these statistics, the mortality rate of other diseases is declining, as opposed to the proportion of deaths related to chronic obstructive pulmonary disease. Some studies showed that five percentage suffer from COPD disease, where nearly fourteen million cases of COPD affected are documented. Most of these patients suffer from chronic bronchitis and emphysema [12] . As

previously mentioned that emphysema and chronic bronchitis are among the group of chronic obstructive pulmonary disease (COPD). They are also very similar to the signs and symptoms that overlap a lot. So, the lack of air passing through the bronchi and bronchi, causing severe breathlessness, is occurs under the roof of chronic obstructive pulmonary disease (COPD) but were excluded for the lack of physiological similarity of the disease. These include bronchial asthma and cystic fibrosis [12]. One of the qualities of good personality is the locus of control and the ability to control the actions are very useful in cases of chronic diseases and contributes to the sense of control and health behavior, through learning and change behavior towards positive results to reach the person to cross the threshold of disease, that the actions of people depend on internal control And external control of their actions and attitudes to the participation of others and collective learning and influence. The goal of this internal control sense of control is the adherence to medication that enable the patient to heal or reduce complications[24].

Methodology

Design of the Study: A Descriptive Correlational Design is used through the present study in order to determine the link between locus of control orientation and patients' adherence to medication after chronic obstructive pulmonary disease**.** The period of the study is from October 17, 2018 to June 13, 2019.

Ethical Considerations and Administrative Agreements: The researcher obtained an approval from the Faculty of Nursing/University of Kufa to conduct the study, permission is obtained from the ethical committee in Faculty of Nursing, and this is one of the most basic principles before conducting the study, to protect the participant and or researcher rights. In addition, an official permission is obtained from the Ministry of Planning/ Central Council for Statistics in order to accept the study questionnaire. Another approval is obtained from Al-Najaf Al-Ashraf Health Directorate, Al-Sadder Medical City, AL-Hakeem General Hospital and The Middle Euphrates Teaching Hospital, In order to collect the data. And finally, subjects' agreement also obtained from the patients themselves after the researcher explained the purpose of the study to them; seeked informed consent and offered a respect to participants' confidentiality as well as making the participation voluntary, to answer the questionnaire's items.

Setting of the Study: The study is conducted in Al-Najaf Al-Ashraf City, Al-Najaf Al-Ashraf Health Directorate (Al-Sadder Medical City, AL-Hakeem General Hospital and The Middle Euphrates Teaching Hospital).

Sample of the Study: A Non- Probability (Accidental Sample) of (104) patients with chronic obstructive pulmonary disease. Those patients are already diagnosed with chronic obstructive pulmonary disease and had already use the medication and they visit the hospitals for treatment or follow or both the study sample was selected from medical world, medical consultations, medical emergency department and the intensive care unit. These places are the most places receive a patients with chronic obstructive pulmonary disease.

Sample Size: The researcher used the power analysis method (Cohen's method) to determine the study sample size. This method can be used through its factors which include: power, effect size, and level of significance. Power is an essential factor to determine an acceptable sample size for descriptive correlational study. Power is the ability of the study to discover the relationships between dependent and independent variables. The minimum acceptable power's level for nursing studies is 80%, and the greater the power, the larger the sample size that is needed. The effect size was determined based on three levels of effect size: large effect (0.10), moderate effect (0.30), and small effect (0.50). The significance level or alpha (α) for this study was 0.05, because 0.05 means that the accepted chance of being wrong is only 5% of the time or less after infinite repeated sampling [2, Grove et al., 2013). Therefore, based on the following factors (power = 90, α = 0.05, and effect size = 0.30), the adequate sample size that was needed for this study was a minimum of (n =99). However, to increase sample size that was needed to increase the power of the study, the researcher increase the sample size to (104) to increase the power of the study to reach 99%.

The Study Instrument: An assessment tool is adopted and developed by the researcher to investigate the phenomena. The final study instrument consists of four parts: demographic data, clinical data, locus of control orientation measurement scale and adherence to medication scale (Morisky medication adherence scale)

Reliability of the Study Instrument: Reliability is concerned with the consistency and dependability

of a study instrument to measure a variable of interest. Determination of reliability of the questionnaire is based on the internal consistency reliability/Alpha Cronbach technique. The reliability determined through the use of SPSS software version 25.

Data Collection: The data has been collected through the utilization of the developed questionnaire after the validity and reliability are estimated, and by means of a structured face to face interview technique with the subjects who were individually interviewed, by using the Arabic version of the questionnaire and they were interviewed in a similar way, by the same questionnaire for all those subjects who are included in the study sample. The data collection process has been performed from 30th December 2018, to 1st March 2019. The time (20-25) minutes to complete the interview.

Results:

Table (1): Clinical Data of the Study Sample

Clinical Data	Rating and Intervals	Frequency	Percentage
Disease Duration Since Diagnosis/ Years	1 – 3	27	26.0
	4 – 6	23	22.1
	7 – 9	25	24.0
	10+	29	27.9
Mean= 7.5			
Do You Receive an Education about Importance of Adherence to Medication	Yes	61	58.7
	No	43	41.3
The Source of Received Knowledge Education	Nurse	15	25
	Doctor	46	75
Smoking	Yes	90	86.5
	No	12	11.5
	Stop Smoking	2	1.9
Type of Smoking	Hookah	4	3.8
	Cigarette	86	82.7
Duration of Smoking/Years	4 – 6	4	3.8
	7 – 9	13	12.5
	10+	73	70.2
Mean = 22.37			
How Many Cigarette	1 – 10	8	7.7
	11 – 20	25	24.0
	21 – 30	16	15.4
	31 – 40	24	23.1
	41+	17	16.3
Total		**104**	**100.0**

Table (1) shows that the mean duration of disease is (7.5) years. In addition, the study results indicate that more than half of the study subjects are received health education about the important of the adherence to medication (58.7%), and the physician is the dominant health education providers (75%). Regarding smoking the study results indicate that (86.5 %) of the study subjects are smokers, (82.7%) of them are cigarettes smokers, and they smoke 11-20 cigarette/day (24%), since 10 years ago (70.2).

Table (2): Overall Assessment of patients' Adherence to Medication

Level of Adherence	Frequency	Percentage	Mean of Score	Assessment
Good	15	14.4	1.6741	Fair Adherence
Fair	60	57.7		
Poor	29	27.9		
Total	104	100.0		

Good (mean of scores from 2.34-3), fair (mean of scores from 1.67-2.33), poor (mean of scores from 1-66) cut off point (0.66), mean of score (2).

Table (4.4) shows that the more than half of the study subjects are fairly adherence to medication (57.7%) with a statistical mean of score (1.671).

Table (3): Analysis of Variance (ANOVA) of the Patients' Adherence to Medication According to their Educational Level

Educational Level	N	Mean	Std. Deviation	F	P-value
Doesn't Able to Read and Write	42	1.9266	0.35060	1.187	0.321 NS.
Able to Read and Write	27	1.9309	0.37040		
Primary School Graduate	9	1.7666	0.41360		
Intermediate School Graduate	16	1.7684	0.32416		
Preparatory School Graduate	7	2.0672	0.45201		
Post Graduate	3	2.0924	0.45121		
Total	**104**	**1.9038**	**0.36845**		

N=104, F (ANOVA) test, NS. (Non-significant at p-value more than 0.05).

Table (4.7) shows that there is a non-significant difference in the patients' adherence to medication according to their educational level. Additionally, with respect to the statistical mean, the mean differences indicate that the patients' adherence to medication increased as the educational level increased.

Table (4): Association between Patients' Locus of Control Orientation and their Clinical Data (n=104)

Clinical Data	Rating and Intervals	LOC Orientation		Chi-Square Value	Df	P-Value
		Moderate Orientation	High Orientation			
Disease Duration Since Diagnosis/Years	1-3	24	3	4.48	3	0.21 NS

Discussion

COPD is a major health problem that affect a millions of people worldwide. The prescription of medication refers to a cornerstone in the management of chronic obstructive pulmonary disease (COPD). Furthermore, the effect of the prescription of medications is threated by many factors, one of the factors is the patients' mal-adherence. Overall Assessment of the Study Subject's Locus of Control Orientation toward Adherence to Medication are moderately oriented toward adherence to medication.[4] conducted the study result about Correlates of health locus of control among patients diagnosed with chronic disease their results indicate subjects are moderately oriented toward adherence to medication.

Overall Assessment of patients' Adherence to Medication are fairly adherence to medication. [9] their study conduct about "Patient adherence in COPD". Their results study indicate that more than half of patients are moderately adhering to medication.[20] and Leong et al, (2004) conducts a studies about adherence to medication. Their results conducts that the study sample had a low level of adherence to the medication. Regarding these results, can be confirmed that there is a positive relationship that the greater the orientation and the locus of control in patients increased adherence to medication. The study result indicate that there is a direct and high significant and positive correlation between locus of control orientation and adherence to medication.[22] conducted a study about "Correlation between compliance regimens with health locus of control in patients with chronic diseases" their study results indicate that there is a direct significance and positive correlation between the adherences to medication with internal health locus of control in patients with chronic diseases. In addition, the patients with high locus of control had controlled the progression of disease and control of complications. The study result indicate that there is a high significant association between adherence to medication and level of education. While there is a non-significant associated between adherence to medication and other demographical data. [7] conducts a study about "Associations between patient factors and medication adherence" their results indicate that there is a high significant association between adherence to medication and level of education. The study result indicate that there is a non-significant associated between patient's adherence to medication and their clinical data.

Conclusion

The incidence of chronic obstructive pulmonary disease (COPD) is increase as the patients' age increased. Chronic obstructive pulmonary disease (COPD) occurs mostly in male compare with female. Smoking is the one of risk factors of chronic obstructive pulmonary disease. The study confirms that there is a deficient in the patients' adherence to medication after chronic obstructive pulmonary disease. There is a significant impact of the level of education on patients' adherence to mediations. The patients' age, educational level, residence, and socio-economic status, affect their locus of control orientation.

Serum Zinc Level in Children with Relapsing Nephrotic Syndrome

Jasim Mohammed Hashim[1], Khadum Abd Alhussein Jabur[2]

[1]Professor, Al-Sadder and AL-Zahra teaching Hospitals, The Ministry of Health and Environment of Iraq, Iraq,
[2]Al-Sadder and AL-Zahra teaching Hospitals, The Ministry of Health and Environment of Iraq, Iraq

Abstract

Zinc as a second trace element of human body plays an important role in numerous function. Abnormality in the metabolism of zinc in renal problem especially nephrotic syndrome is well documented. We aim in this study to measure the serum zinc level in children with relapsing nephrotic syndrome.A hospital based case control study that conducted at nephrology clinic at Al-Sadder and AL-Zahra teaching Hospitals for period between 1stJanuary 2013 to end of October 2013 . A total of 60 pediatric patients with relapsing nephrotic syndrome were included in this study. They were divided in two groups,(30) patients constituent ofgroup A (patients with infrequent relapsing) and (30) patients constituent group B (patients with frequent relapsing). Control group consist of 32 healthy children. Serum zinc was measured by atomic absorption spectrophotometery.patients aged 2-14 years, boys were 40 and girls were 20. The mean age of patients was 7.5 years. The Mean serum zinc level in group B (frequent relapse) (58.45 µg/dl) that was significantly lower than that of group A (infrequent relapse) (61.58 µg/dl) and control group (89.64 µg/dl) respectively

Keywords: *Frequent relapses. Nephrotic syndrome. Zinc.*

Introduction

Nephrotic syndrome was primarily a pediatric disorder and was 15 times more common in children than adults. The incidence was 2-3/100,000 children per year; and the majority of affected children will have steroid-sensitive minimal change disease.[1] The nephrotic syndrome was caused by renal diseases that increase the permeability across the glomerular filtration barrier. It was classically characterized by four clinical features, but the first two are used diagnostically because the last two may not be seen in all patients:

1. Nephrotic range proteinuria (Urinary protein excretion greater than 50mg/kg per day) or 40 mg/ m^2 per hour.
2. Hypoalbuminemia (Serum albumin concentration less than 2.5 g/dL(25g/L))
3. Edema
4. Hyperlipidemia[1]

Risk Factors for Relapse in Childhood Nephrotic Syndrome[2]:

1. Cold and infections. Cold and infections are the most common cause of relapse of nephrotic syndrome. If left untreated, illness conditions will become even worse. Children and adolescents are still in the growth period and many of their tissues and organs are still immature. Compared with adults, children patients have weak immune system and they are more susceptible to be attacked by various viruses, bacteria which often cause the proteinuria, hematuria, swelling to reoccur.
2. Poor compliance. Different from adult patients, small children usually do not understand why they need to take so many bitter drugs and the importance to have the right dosage on schedule. Often the reduction of dosage or stopping taking the prescribed medicines often cause relapse of illness. Therefore it is very important that parents should supervise the children to have medicines at the right time and with the right dosage.

Proper treatment is very important to prevent relapse of nephrotic syndrome in children. Hormones and immunosuppressant are effective at relieving symptoms

but cannot solve the root problems, that is why patients often become dependent on these drugs and illness often relapse when the dosage is reduced or the drug is stoped. Often these drugs have some side effects and harms to the kidneys if taken for long time, that is why nephrotic syndrome will continue to become worse after each relapse.[3]

Infection is an important cause of morbidity and mortality in nephrotic children. Patients with steroid sensitive nephrotic syndrome (SSNS) have increased susceptibility to bacterial infections and various infections may result in relapses or steroid resistance or may trigger the onset of disease[4].Relapses in SSNS often follow infections of upper airway or gastrointestinal tract and cellulitis. It is estimated that 52–70% of relapses among children in developing countries chiefly follow the upper respiratory tract infection[(5,6)]. Common infections associated with either onset of disease or in the course of disease are acute upper and lower respiratory infections (ARI) including pneumonia with or without empyema, skin infections including impetigo and cellulitis, acute watery or invasive diarrhea, urinary tract infections (UTI) and primary peritonitis[9]. Studies have shown that use of prophylactic antibiotics, immunoglobulins replacement therapy, vaccination against streptococci pneumoniae, thymosin as immuno-modulating agent, use of Chinese medicinal herb (TIAOJINING) and zinc supplements may have a role in prevention of these infections[12]. However, in a recent Cochrane Database of Systemic Review, it has been concluded that there is no strong evidence for any of above interventions for prevention of infection in nephrotic syndrome[7]. Though pneumococcal peritonitis and cellulitis are decreased with use of pneumococcal vaccine and antibiotics but these infections are still responsible for 1.4-10% of mortality and repeated relapses in more than 80% of cases, requiring high dose steroids and hospitalization[5]. A high frequency of infections in children with nephrotic syndrome (38–83%) has been reported from developing countries like India, Pakistan & Bangladesh in different studies[8]. Studies from developing countries have also suggested that increasing the maintenance dose of steroid from alternate day in a child with remission to daily during the episode of mild infections can prevent relapse[(8, 9)]. Thus a strong suspicion regarding infections in a nephrotic child is important not only for treatment but also to prevent infection associated relapse.

Zinc was an essential trace element. Zinc intake was closely related to protein intake; where diet rich in proteins stimulate zinc absorption as a result, it was an important component of nutritionally related morbidity worldwide.[10]

The usual oral intake of zinc was approximately 4 to 14 mg/day; the recommended dietary allowance (RDA) was 8 mg/day for children ages 9 to 11 years; [21]. Primary dietary sources of zinc include animal products such as meat, seafood, and milk. Ready-to-eat cereal contains the greatest amount of zinc consumed from plant products[11].

Approximately 10 to 40 percent of dietary zinc was absorbed in the small bowel;absorption was inhibited by the presence of phytates and fiber in the diet that bindto zinc, as well as dietary iron, cadmium,calcium, copper and phosphorus in high amounts[22]. Approximately 0.5 to 1.0 mg/day was secreted in the biliary tractand excreted in the stool. Zinc circulates at a concentration of 70 to 120 mcg/dL with 60 percent loosely bound to albumin and 30 percent tightly bound to macroglobulin. Urinary excretion typically ranges from 0.5 to 0.8 mg/day. The primary stores of zinc include the liver and kidney. Most of the body zinc stores are intracellular where zinc was bound to metalloproteins.[11]

Relapses in steroid-sensitive nephrotic syndrome (SSNS) often follow infections of the respiratory or gastrointestinal tract. Based on data that zinc supplements reduce the risk of infections, we examined the efficacy of such supplements in reducing relapse rates in the patient.[18]

Materials and Method

This was a hospital based case control study on samples at nephrology clinic at Al-Sadderand AL-Zahra teaching. Hospitals for period between 1st January 2013toend of October 2013 as following.

Sample Size: A total of 60 pediatric patients age 2-14 years with relapsing nephrotic syndrome were included in this study, male were 40 and female were 20. They were separated into two groups: Group A(infrequent relapsing),30 children, where there were 20 males and 10 females(relapse once time during 6 months since diagnosis of disease). Group B (frequent relapsing), 30 children, where there were 20 males and 10 females (relapse two or more during 6 months since diagnosis of disease).These patients were compared with 32 healthy children called"control group", where there were 17 males and 15 females.

For both groups and control, blood samples were collected to measure the serum zinc concentration level by using Spectrophotometer.

Zinc Measurement . This occur by spectrophotometry where zinc reacts with chromogen present in reagent forming coloured compound which colour intensity proportional to the zinc concentration present in sample.

In fasting state 3 ml of blood was drawn with plastic syringe from each nephrotic and control subject . After centrifugation at 3000 rpm for 10 minutes, separated sera were kept frozen at -70°C. Haemolysed sera were taken out of the study. Serum zinc was measured by atomic absorption device model Carl Zeiss Jena (Jena, Germany) Model AAS3 flame atomic absorption spectrometer. A cut-off value of 70 µg/dl - 115 mg/dl was used for serum zinc, samples below 70µg/dl was regarded as low (hypozincemia) .After collecting data, statistical analysis was performed by SPSS 16.0.2. Values were presented as means ± 2 SD. Differences were considered significant at P <0.05. . Laboratory observer and data analyzer had not any idea about the relationship of samples to patients or normal subjects. The study was approved by the local research and the ethics committee in the hospital and the college, parents consent was taken.

Results

We made the statistical analyses to correlate the different conditions groups (Control, A, and B). These different conditions were divided according to the historical background of the patients (frequent and infrequent relapsing) in the mentioned hospitals during the lifetime of the disease (nephrotic syndrome).

Table 1: The Samples Sizes for Each Group.

Variables	Group Symbol	Sample Size		Total
		Male	Female	
Control	control	17	15	32
Infrequent Relapsing	A	20	10	30
Frequent Relapsing	B	20	10	30

Table 2: Mean Serum Zinc Concentration for Males and Females in all groups studied

Groups	Sex	Mean, mcg/dl	Standard Deviation	Standard Error	P-Value
Control	Male	92.159	17.25	4.18	*0.209
	Female	86.787	19.46	5.025	
A	Male	62.095	4.07	0.91	**0.214
	Female	60.55	5.26	1.66	
B	Male	58.45	6.60	1.47	***0.498
	Female	58.46	5.97	1.888	

Table 3: Statistical Analyses to Correlate the Different Groups.

Variables	Sample Size	Mean	Standard Deviation	P-Value
Control	32	89.64	18.223	<0.001
A	30	61.58	4.469	
Control	32	89.64	18.223	<0.001
B	30	58.45	6.286	
A	30	61.58	4.469	0.028426
B	30	58.45	6.286	

In this study The Mean serum zinc level in group B (frequent relapse) (58.45 µg/dl) that was significantly lower than that of group A (infrequent relapse) (61.58/ dl) and control group (89.64 µg/dl) respectively . P-value <0.001 these finding can be explained by Mild zinc deficiency is believed to result in a reduced production of Th1 cytokines, resulting in Th2 cytokine bias[13, 14]. In contrast, zinc supplementation is proposed to augment gene expression for IL-2 and IFN-γ, thereby restoring the Th1 immune response[15]. Since the Th1–Th2 cytokine imbalance is also believed to result in relapses of SSNS.So this results support the findings that suggest the patients with SSNS receiving supplementation with RDA of zinc show a trend towards fewer relapses and higher likelihood of remission. The response was better in the frequent relapsers[16,17]. The Mean serum zinc level of group A (infrequent relapse) is also low (61.58/dl),this finding can explained by The increase urinary zinc excretion in children with NS (whether in relapse or in remission) was attributed as a cause for low serum zinc level by many authors who reported a positive correlation between urinary zinc and protein excretion in their studies.[18,19,20,21]. Also Several studies demonstrated low blood or serum zinc levels among children with NS compared to that of the control groups.[16,18] This study certifies insignificant difference corresponding to sex in all groups of patients studied .This result was also stated by[22].

Conclusion

Hypozincemia can occur in chronic renal problem like nephrotic syndrome. The low level of serum zinc mainly found in those with frequent relapses there is no effect of sex on mean serum level in all group studied.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Al-Sadder and AL-Zahra teaching Hospitals, Iraq and all experiments were carried out in accordance with approved guidelines.

Prevalence of Intestinal Parasites among Children in Khanaqin City East of Diyala/Iraq

Noora Dhyaaldain Abed

College of Education for pure science, Iraq.

Abstract

The current study was carried out during the period between November/2018 and March/2019. The study was aiming to investigate the types and proportions of intestinal parasites among children who visited the primary health care center in the city of Khanaqin - Diyala governorate. The total number of specimens examined, during the course of study, was 805 stool specimens. These specimens were taken from children in the age range 1-10 years, and direct smear was the method used for the investigation of the intestinal parasites existence. The results showed that 156 children were infected with intestinal parasitic infections. These infections were categorized as four types of Protozoa and one type of intestinal Helminthes. The incidence ratio of intestinal parasitic infection was 19.373%, where the percentages of parasites considered in the current study have found to be 62.179% for the *Entamoebahistolytica* followed by 12.820% for the *Giardia lamblia*, 12.820 of *Entamoebacoli*, and 3.205% for the *Iodomoebabutschillii*. Moreover, the study has reported one type of Helminthes represented by the *Entrobiusvermicularis* with occurrence ratio of 6.410%.

Keywords: *Intestinal parasite, Entamoebahistolytica, Protozoa, Helminthes, Giardia lamblia.*

Introduction

Intestinal parasite (IP) is one of the most widespread pathogens in the world, it infects around 3.5 billion persons a year, the majority of them are children[1]. This type of infection represents an endemic disease worldwide, especially in the tropic and subtropical regions[1]. It is mainly represented by Protozoa and Helminthes[3], and they are transmitted by water and contaminated food[4]. However, the infection can also be transmitted from person to person by Oral-Fecal[5]. Apparently, all age groups are susceptible to IP infection, however the infection is likely to increase among children, especially those who are living in overcrowded, poor and rural communities that do not meet health care requirements [6,7]. For children, IP infections may cause many critical heath issues. It results in iron deficiency, anemia, growth delay, weight loss, abdominal pain, dyspepsia and many health and physical issues[8]. Generally, literature review has revealed wide prevalence of IPs. In a study conducted by[9] on a number of primary schools in Al-Khalis district/Diyala province, wide spread of many types of IPs, among children, was reported, and the effect of some environmental factors on the infection was recorded.In another study, an increase in the incidence of IPs infection among families with low educational levels was reported[10].In the same context, another study was indicated high incidence ratio of intestinal parasites infections among children in rural areas, and attributed the reason to the lack of services and scarcity of good drinking water[11]. In the same way, several other studies conducted by[12, 13] have indicated the spread of intestinal parasites among children in Baghdad. They have also pointed out some important aspects that could contribute to the spread of infections. Furthermore[3], conducted a study in Dohuk – Kurdistan/ Iraq and reported the types and extent of existence of IPs among children.

Material and Method

During the period between November 2018 and March 2019, 805 stool samples were collected and inspected to investigate the types and prevalence of

intestinal parasites among children in Khanaqin city. The samples were taken from children who visited the primary health care sector due to suffering from gastrointestinal diseases, intestinal colic, and diarrhea cases. The samples were initially collected from the children's stools and kept in clean, perfectly sealed and dry plastic containers to keep the sample hydrous, as well as to prevent dryness. A questionnaire was then prepared to collect the required information from the children's parents. The collected information included child's sex, age, living area, number of family members, and the drinking water source (tap or filtered water).Collected stool samples were then subjected to laboratory test to investigate the presence of parasites (Trophozoites, Cyst, and Ova). 156 infected cases with intestinal parasites Protozoa and Metazoa were isolated.

The laboratory test consisted of two method:

A. Gross Examination: Before conducting the microscopic test, the samples were examined with necked eyes. The purpose of this examination was to check the status of the stool samples in terms of the texture, color, and odor. Mostly, liquid stool contains trophozoites, while the cyst is predominantly found in the full-formed stool. Diarrhea caused by *Entamoedahistolytica* are normally recognized by its pong, and the existence of blood or mucus which are the evidence of the presence of amoebic infection. However, the existence of *Giardialamblia* in the stool is recognized by the yellowish-green color, oily texture, and the mucus. On the other hand, in case of infection with helminthes, the stool mostly be in its full-form unless co-infection.

B. Direct Smear Method: This method was implemented by preparing a clean slide, before a drop of the physiological solution (0.9%) table salt was placed on one side of the slide. Then, small amounts of the stool sample were taken from different places of the sample using a wood stick, and one of them was mixed with the physiological solution. On the other side of the slide, a drop of iodine solution was placed and thoroughly mixed with another small amount taken from the same stool sample. After that, the slide was covered with the slide cover.

Subsequently, the microscopic slides were examined using a microscope with magnification force of (40x, 10x).

Results

The results obtained from the present study showed that children in Khanaqin were infected by a number of IPs during the period between November 2018 and March 2019. A total of 805 stool samples were collected from children and tested in the primary health care sector in Khanaqin city. The children were suffering from gastrointestinal diseases and diarrheal diseases, they were clinically examined by specialist doctor before laboratory tests were made to investigate the presence of IPs infection. The results revealed that 156 children were infected, which represents total infection percentage of 19.378%. From the total number of infected cases, 70 infections were for females which represent 44.871%, and 86 infections were for males which represent 55.128% as shown in Table (1).

Table 1. Percentage of IPs infection between the studied samples for both sexes.

Infection percentage	Number of infected females	Infection percentage	Number of infected males	Infection percentage	Number of parasitic infections	The total Number of examinees
44.871%	70	55.128%	86	19.378%	156	805

The study, also, showed that children were infected with 5 types of the IPs. Out of these 5 types, 4 belong to protozoa which are *Entamoadahistolytica*, *Giardia Iamblia*, *Entamoeba coli*, and *Iodooebabutchillii*. Table (2) shows that *E.histolyti*ca was in the first place with highest incidence of parasitic infection, it has infected 97 children which represent 62.179%. In the second place, the *Giardia lamblia* comes with total number of infections of 59 that is 37.820%, followed by *E. coli* which infected 20 children with infection percentage of 12.820%, and then *Iodomoebabutchillii* 5 infected cases which represents 3.205%. Moreover, the study showed some infections with helminthes, 10 children were diagnosed to be infected with *Entrobiusvermicularis* which is 6.410%.

Table 2. Types of IPs and the number and ratio of infections for each them during the study period.

Type of parasite	Number of infections	Percentage by the parasite
Entamoebahistolytica	97	62.179%
Giardia lamblia	59	37.820%
Entamoeba coli	20	12.820%
Entrobiusvermicularis	10	6.410%
Iodomoebabutschillii	5	3.205%

The results given in Table 3 confirm the presence of some bilateral intestinal parasitic infections which means that the children were simultaneously infected with two different types of IPs. These infections were characterized as; *Giardia lamblia* with *E. coli* in 12 infected cases which is 7.629% of the total number of infections, followed by *Entamoebahistolytica* with *Entrobius vermicularis* 10 cases representing 6.410% of the infections. Moreover, the *Entamoebahistolytica* with *Entamoeba coli* were found in 8 infections which is 5.128% of the total cases. The minimum recorded infection incidence ratio was 3.205% which represents 5 infections caused by *Giardia lamblia* with *Iodomoebabutschillii*.

Table 3. Co-infections with IPs among the investigated samples.

Co-infection type	Number	Infection occurrence rate
E.histolytia + E.coli	8	5.128%
Giardia lamblia + E.coli	12	7.692%
E.histolytia + Entrobiusvermicularis	10	6.410%
Giardia lamblia + Iodomoebabutschillii	5	3.205%

Table 4 shows the incidence ratio of IPs infection among the children categorized according to their sex and age group. It has been found that highest infection incidence ratio was among children in the aged between 5-10 years old which represents 47.435%. The infected cases were divided into 40 infected males (54.1%), and 34 infected females (45.94%). Infants' infections come in the second place with 48 infected cases representing a percentage of 30.769%. Out of the 48 infections, 27 were for males and 21 for females which are respectively signify 56.3% and 43.8%. However, the lowest infection incidence ratio was in children under the age of 5 years. The total number of infections was 34 and the infection incidence ratio was 21.794%, 19 were males and 15 were females representing 55.9% and 44.11% respectively.

Table 4. Percentage of IPs infection according to age groups.

Age group	Number of infections	Infection percentage	Number of infected males	Infection percentage	Number of infected females	Infection percentage
Infants	48	30.769%	27	65.3%	21	43.8%
Below 5-years	34	21.794%	19	55.9%	15	44.11%
5-10 years	74	47.435%	40	54.1%	34	45.94%

Table (5) shows the incidence ratio of intestinal infection categorized according to living area (city center, district, and village). The results revealed that the highest ratio of infection was among the children who live in villages. The whole number of infections were 87, (55.769%) split into 44 males (50.6%) and 43 females (49.7%). Districts come in the second place after the villages with total number of infections of 43 cases (27.564%), the males share was 31 cases (72.1%) while the females share was 21 cases (27.9%). Finally, city center cames in the last place with minimum number of infections. The study recorded 26 infected case in the city center, which signifies occurrence ratio of 16.666%. Out of these cases, the number of males were 11 and females were 15 which denote occurrence ratio of 42.3% and 57.7% respectively.

Table 5. Percentage of IPs infection according to living area.

Living area	Number of infections	Infection percentage	Number of infected males	Infection percentage	Number of infected females	Infection percentage
City center	26	16.666%	11	42.3%	15	57.7%
District	43	27.564%	31	72.1%	12	27.9%
Village	87	55.769%	44	50.6%	43	49.4%

The study has also investigated the relation and occurrence ratio of children's infection with intestinal parasites and the drinking water source. The study has observed increment in the number of infected children who depend on tap water as a drinking water source. The number of infected children were found to be 92, (58.974%) compared to 64, (41.025%) for children who used to drink filtered water, as given in Table 6 below.

Table 6. The relationship and percentage of the infection with intestinal parasites and the source of drinking water.

Drinking water source	Number of infections	Infection percentage
Tap water	92	58.974%
Filtered water	64	41.025%

Discussion

This study has been conducted in the primary care sector in the city of Khanaqin-Diyala. The study was targeting children who visited the pediatric care department and were complaining from gastrointestinal diseases and diarrhea. The study considered children from different living areas, that relatively vary in the social environmental and economic conditions, to make it possible to relate the prevalence of the disease to the living conditions of those areas. Current study disclosed that the total incidence of the intestinal parasite infection was 19.778%. This is lower than what was reported by[15] and[3] who have reported infection incidences ratio of 24% and 22.27% respectively. However, the result presented here is higher than that of[16] and[17] who reported occurrence ratio of 14% and 17.4%, respectively. Current study revealed that the highest infection occurrence ratio was with *E. histolytica* (62.179%). This conforms with what was recorded[19], who reported increase in this parasite compared to the rest of Protozoa. The second was the *Giardia lamblia* which was the reason behind 37.820% of the infections. This result is very comparable with what has been reported by[6] where the existence ration of *Entamoebahistolytica* and *Giardia lamblia* have been shown to be 66.8% and

36.8% respectively. The most common reason behind the wide spread of the of IPs infections is attributed to their direct transmittance to humans by taking food and water contaminated with contagious stages, and due to the superior ability of the Cyst to transmit the infection and to resist the environmental conditions[20]. Though, flies play more significant role because they represent a *vector host* for the infection. The present study has also shown infections with *Entrobiusvermicuralis* (6.410%), which is relatively lower than what[21], as he has pointed that the infection occurrence ratio as 24.9%. The *Entrobiusvermicuralis* was the most common intestinal worm among children. This was ascribed to the large number of children within the same family, their participation in blankets, clothing and sleeping places, as well as the lack of health and social awareness, and the low educational level of the parents[22]. Further, the study has also recorded many cases of co-infections with IPs. 35 cases were recognized representing 22.43%. This finding conforms with number of studies found in the literatures that recorded many co-infections with IPs.

Conclusion

The results showed that 156 children were infected with intestinal parasitic infections. These infections were categorized as four types of Protozoa and one type of intestinal Helminthes. The incidence ratio of intestinal parasitic infection was 19.373%, where the percentages of parasites considered in the current study have found to be 62.179% for the *Entamoebahistolytica* followed by 12.820% for the *Giardia lamblia*, 12.820 of *Entamoebacoli*, and 3.205% for the *Iodomoebabutschillii*. Moreover, the study has reported one type of Helminthes represented by the *Entrobiusvermicularis* with occurrence ratio of 6.410%.

Phylogenetic Profile of Staphylococcus Aureusmec A and ICA a Genes Associated with UTI Patients

Ahmed A.R. Abbas[1], Saad S. Hamim[2]

[1]Ministry of Health-Thi-Qar Health Office, Iraq,
[2]Pathological Analysis Department, Science College, Thi-Qar University, Iraq

Abstract

The latest years indicated an upsurge in the urinary tract infections (UTIs) occurrence instigated by *Staphylococcus aureus* at the ward of urology. A total of 50 *S. aureus* isolate from UTI patients during the period from August to December 2018 at the AL-Hussein Teaching Hospital in Nassyriah City, Southern Iraq were assayed to find the presence of *mec* A & *ica* A genes by Polymerase Chain Reaction technique. Selection of six PCR products of *mec* A and *ica* A genes named primarily (No 1, No 2, and No 3 for each gene) was done and further exposed to the partial sequencing of DNA to aid the targeted genes for following up their probable relation amongst the global records of Genbank and local isolates. The phylogenetic tree that was created by MEGA 6.0 version software showed closed different molecular relationships among the local *S. aureus* isolates with similar ones around the world of *mec* A (No.1-No.3) which were closely related to NCBI-BLAST *S. aureus* strain MRSA 365325 (MH798858.1) at total genetic changes (0.0005-0.0025%). while, *ica* A gene in local *S. aureus* human urine isolate (No.1-No.3) showed close interrelation to the NCBI-BLAST *S. aureus* strain Pn2301 (FJ004990.1) at the total genetic changes of about 0.2-1.0%.

Keywords: *Staphylococcus aureus, Urinary tract infections,Gene sequencing, Virulence factors.*

Introduction

Urinary tract infections (UTIs) are triggered by microorganisms' growth and presence anywhere in the urinary tract. This might be the only most communal bacterial infection in humans[1]. In unindustrialized countries, the UTI infections indicates the utmost significant health problem's effects in the population of all age groups [2]. Since the pathogens appearance along with the up surging antimicrobial agent's resistance, it has become challenging to treat the UTI. It occurs much more frequently in females than males due to the proximity of the urethra to the anus[(3,4).] Its yearly global occurrence is of nearly 250 million [5]. From most common pathogens are associated with UTIs Staphylococcus, particular *S. aureus*which is a major human pathogen and a widespread contaminant in hospitals. Though, in several patients, the *S. aureus* isolation from the sample of urine is frequently subordinate to the escalating Staphylococcal bacteremia somewhere else for example endocarditis cases. Likewise, the ascending colonization of urinary tract and infections are instigated by *S. aureus*[6].

The foremost *S. aureus* pathogenicity is linked to its capability of a number of virulence factors' production, most specifically extracellular factors as well as toxins' synthesis, adherence ability and biofilm formation on host surfaces and lastly causing a resistance to the phagocytosis [7]. Moreover, the pathogenic bacteria's molecular typing comprising *S. aureus* can be beneficial to support the controlling measures of infections, for suspected outbreaks' investigation and nosocomial transmission prevention [8]. The recent study targeted the investigation of molecular characterization of genes*ica* A and *mec* A in various isolates of *S. aureus* from patients of UTI in the city of Nassyriah.

Materials and Method

Samples Collection, Isolation and Identification: Current research utilized 50 total *S. aureus*isolates that were collected from the UTI patients in AL- Hussein Teaching Hospital in Nasiriyah City, Southern Iraq from August to December 2018. Identification of all *S. aureus* isolates was done depending on Gram's stain; Mannitol

salt agar (MSA), cultural characteristic and conventional biochemical tests[9]. API system as well as Vitek2 compact (BioMerieux, France) was used to confirm the diagnosis of bacteria. A latex agglutination test was used as per the manufacturing (Remel,UK) company's directions to serologically diagnose the proteins A for all *S. aureus*isolates.

Antibiotic susceptibility test for S. aureus isolates: The total isolates of *S. aureus* were exposed to the susceptibility of antibiotics with the help of disc diffusion procedure [10]. Moreover, the interpretation and measurements of diameters of inhibition zone were carried out conferring to [11].

Detection of *mec* A and *ica* A genes by Polymerase chain reaction: *S. aureus* isolates were exposed to the identification of methicillin*mec*A & biofilm *ica* Agenes by conventional PCR technique using specific primer pairs (Table 1). The amplification was conducted in a thermal cycler(BioRad, USA) that has been automated as follows: with one cycle, the initial denaturation stage was done at 95°C for five minutes. Whereas, amplification with 30 cycles was executed by following conditions: 30 seconds denaturation at 95°C, 30 seconds annealing at 58 and 59 °C, one minute extension at 72 °C and lastly five minutes final extension at 72 °C. These conditions were designed by the researcher in this study.

DNA sequencing: The *S. aureus* six PCR products were dispersed into three *ica*A & *mec* A genes that were selected for further sequencing. The sequencing of each genes' reverse and forward primers was done in Macrogen, Korea outside of Iraq. While Basic Local Alignment Search Tool analysis (BLAST) led to the algorithm of BLAST by (www.ncbi.nlm.nih.gov/BLAST) site. The sequences of samples labelled as (No1, No2 and No3 for *mec* A - No1, No2, and No3 for *ica* A) were further aligned, edited & related with reference sequences by using Unweighted Pair Group Method with Arithmetic Mean (UPGMA tree) with MEGA6 software. Thus, MEGA 6.0 version was used to construct the every gene sequences' phylogenetic tree.

The PCR primers were designed online and provided by (Macrogen, Korea) using NCBI Gene Bank and primers 3 plus as follows (Table 1).

Table 1: Primer sequences of mec A and ica A genes in S. aureus.

Gene	Primer Sequences(5'-3')		Product size (bp)
mec A	*F	TGGCAGACAAATTGGGTGGT	215
	*R	TGAAGCAACCATCGTTACGGA	
ica A	F	CTTGCTGGCGCAGTCAATAC	213
	R	GCGTTGCTTCCAAAGACCTC	

*F: forwared, *R: reverse, T: thymine, C: cytosine, G: guanine, A: adenine

Results and Discussion

Phenotypic characterization of *S. aureus* isolates: Sex hundred urine samples were collected from complaints of UTI patients at AL-Hussein Teaching Hospital. The finding of the present study showed that 380 (63.67%) isolates recorded positive growth. While 220 samples (36.33%) showed no significant growth. The present results agreed with [12] who reported (57.9%) positive urine culture and (39.3%) were showed no growth. Our study was non compatible with [13], which showed (41.6%) positive culture. Specimens showed a positive culture as *S. aureus*on MSA, biochemical test and API-20 *Staph*. In addition, Vitek2 system and serological diagnosis were used in the present study to confirm the diagnosis. All isolates gave positive results for all tests which recorded a total percentage of *S. aureus* infection with 13.15%. These results of *S. aureus* agreed with the results of the study of [14] who found *S. aureus* isolate from UTI were (13.71%). The results of the present study were incompatible with [15] where was *S. aureus* accounted for only 0.5% of all isolates.

Detection of *mec* A and *ica* A genes: The present study tried to shed light on the prevalence of two of *S. aureus* virulence factors while molecularly detecting

the biofilm of *ica* A gene and of methicillin (*mec* A) gene extracted from the patients of UTI from Nassyriah City, Southern Iraq. The entire fifty *S. aureus* isolates from UTI patients were precisely recognized as per former methodologies utilized for DNA extraction while agarose gel electrophoresis was used to identify the results. Molecular detection of the two selected genes among all *S. aureus*isolates showed that 95/100 amplified *mec* A gene, having the molecular weight of roughly 215 bps (Figure 1,2). Amplification of*ica*A gene showed the positive results by all *S. aureus*isolates for the targeted gene having an approximate 213bp molecular weight (Figure 3). Despite the ongoing debate about the role of different *S. aureus* virulence factors, a lot of reports tends to believe that the resistance mechanism against methicillin includes the acquisition of the *mec* A gene, a determinant of penicillin-binding protein has lowered affinity for the β-lactams where to play a major role in *S. aureus*pathogenesis [16]. Recent results disagree with the result of [17] showing that 68 isolates 75 % of MRSA had*mec* A gene. While, it agreed with local study performed by [18] that recorded a complete percentage of the target gene 100 % in all MRSA isolates. The present results agree with the results of various research works for instance from Iran [19], Iraq [21] and Egypt [20] who revealed that all MRSA isolates had*mec*A gene. The outcomes of recent study differ with the studies showing a different percentages of *mec* A gene in *S. aureus*isolates [22,23]showed a percentage of 90.9% and 71.5%, respectively. These variations may be due to many factors, such as the sources and amount of clinical samples used, geographic distribution, and the sensitivity of different techniques used. However, the variability of this gene distribution among *S. aureus*, globally, continue to be dissimilar and this is obviously, reflected by different reports around the world. On the other hand, for identification and confirmation of biofilm producing strains, the present research subjected these strains to PCR for determination of *ica* A gene. Results confirmed that staphylococcus biofilm-producing strains showed positivity for the gene *ica* A. These result is in agreement with those of [24, 25,26,27] whom reported that all biofilm synthesizing strains contained *S. aureus* which designated a significant *ica* A genes role as virulence markers for infections of *Staphylococcus* related to the urinary tract infections. In this study, there was a highly significant association between *ica* A gene presence in *S.aureus*strains and resistance to various antibiotics. The results of our study do not agree with [26] that reported in their study that 72% of the isolated MDR *Staph*. strains carry the*ica* A. From the previous results, we can conclude the great correlation between biofilm formation and *ica* A gene presence in *S.aureus*. Furthermore, there is a great correlation between MDR *S. aureus* and *ica* A gene carriage. MDR isolates of *S. aureus*usually carry *ica* A gene has the capability for the formation of strong biofilm while giving the higher antibiotic resistance a contribution. Thus, a rapid diagnosis is significant for these strains and to administer prophylactic antibiotic and for eliminating planktonic bacteria before they can form a biofilm.

Sequencing Analysis: The PCR products of six isolates of *S. aureus* were sequestered from the urine & were further referred to the South Korean Company Macrogen to sequence the partial gene *mecA* and *icaA*. While, these were further blasted in contrast to the *S. aureus* standard strains in NCBI to record these bacteria in NCBI data to obtain the accession number of each gene of isolate in the NCBI-Genbank. Moreover, the specific selected three molecular & phenotypic methicillin isolates were exposed to the sequencing of particle DNA for *mec*A gene. To discover the potential genotypic variations, the files of FASTA format comprising of local strain sequences were utilized for evaluating the molecular association amongst the Nassyriah City isolates of Southern Iraq and Genbank submitted universal sequences. Thus, the local urine isolates No.1 and No.3 of *S. aureus* strain revealed an association with the NCBI-BLAST *S. aureus*strain MRSA 365325 (MH798858.1). The Phylogenetic tree shows that the study isolates on the *mec* A gene appeared in the tree as a single tone and the closest genetic group is (MH106551.1, and MH798858.1) from Pakistan, and Italy respectively, at total genetic changes (0.0005-0.0025%) (Figure 4). On the other hand, the present study investigate the phylogeny analysis of other three *S. aureusica* A sequences. As shown in Fig. 5, the local urine isolate of *S. aureus*Number 1 into Number 3 represented a close relation with the NCBI-BLAST. The icaA gene marker was related to the *S. aureus* local isolate which was further correlated to the *S. aureus*strain of gene Pn2301 and partial gene sequence (FJ0049901) of NCBI-BLAST as well as the *S. aureus* ATCC 6538 *S. aureus* strain (CP020020.1) from India and Germany respectively, at total genetic changes (0.2-1.0%).

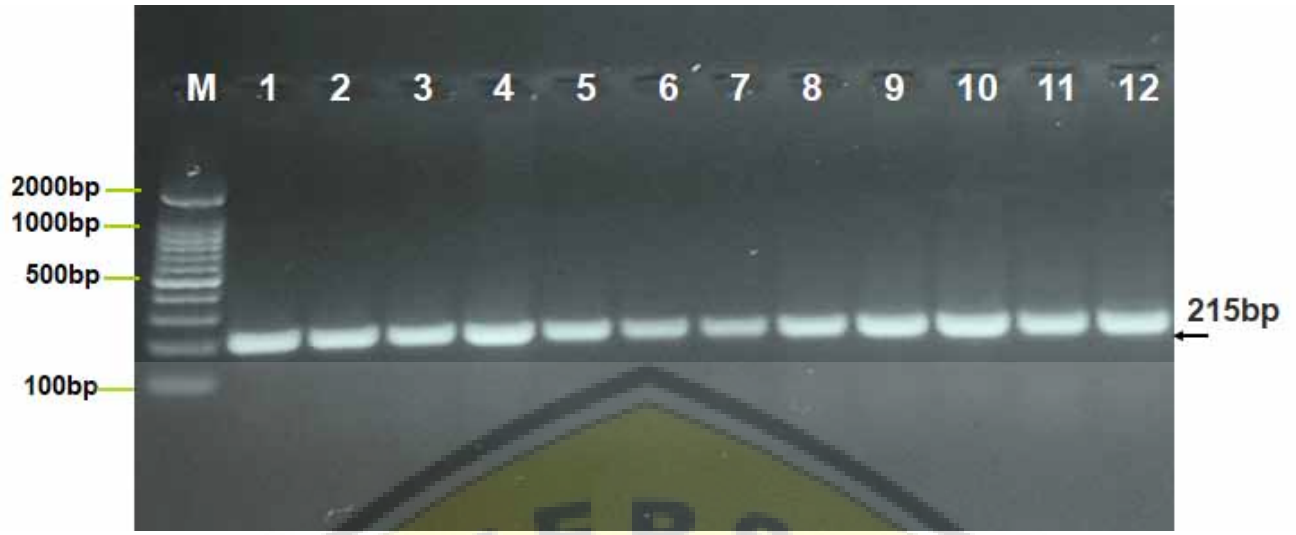

Figure (1): Agarose gel electrophoresis image that shows the PCR product analysis of methicillin antibiotics resistance *mec*A gene in positive isolates of *S. aureus*. Where M represents the marker (100-2000bp), lane (1-12) positive *S. aureusmec*A gene at (215bp) PCR product size.

Figure (2): In positive isolates of *S. aureus,* the methicillin antibiotic resistance *mecA* gene PCR product analysis has been shown in image of agarose gel electrophoresis. However, M is the Marker having 100-2000 bp while, 1-32 lanes of positive *S. aureusmec*A gene at (215bp) PCR product size. With the exception, two strain was negative for *mec* A gene (isolate 26,27).

Figure (3): The image of Agarse gel electrophorosis presented the analysis of the product of PCR in isolates of *S. aureus* for formation of *ica* A gene biofilm. M represents the Marker ladder with 100-2000bp while lane 1-12 showed positive *S. aureus* isolates with *ica* A gene having 213bp of product size.

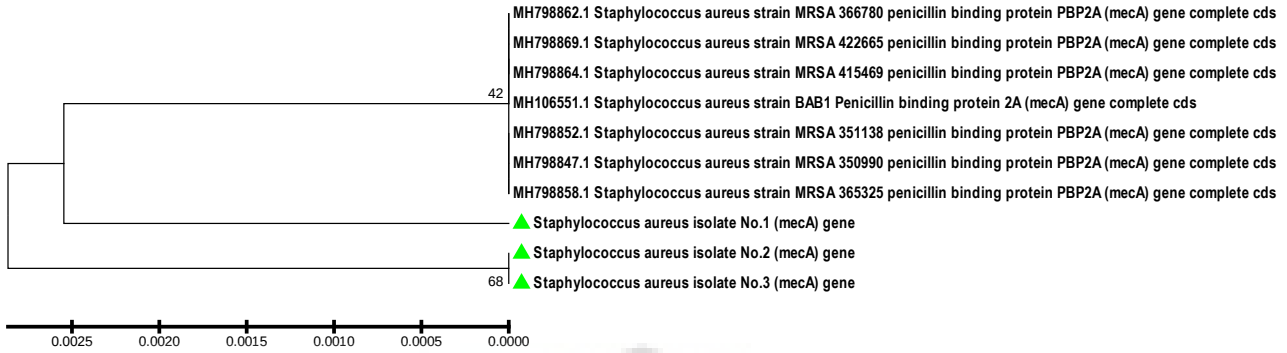

Figure (4): The sequences No. 1-No.3 of urine isolates of local *S. aureus*' phylogenetic diversity indicated a closed relatedness with the *S. aureus* NCBI-BLAST strain MRSA 365325 (MH798858.1) at total genetic changes (0.0005-0.0025%).

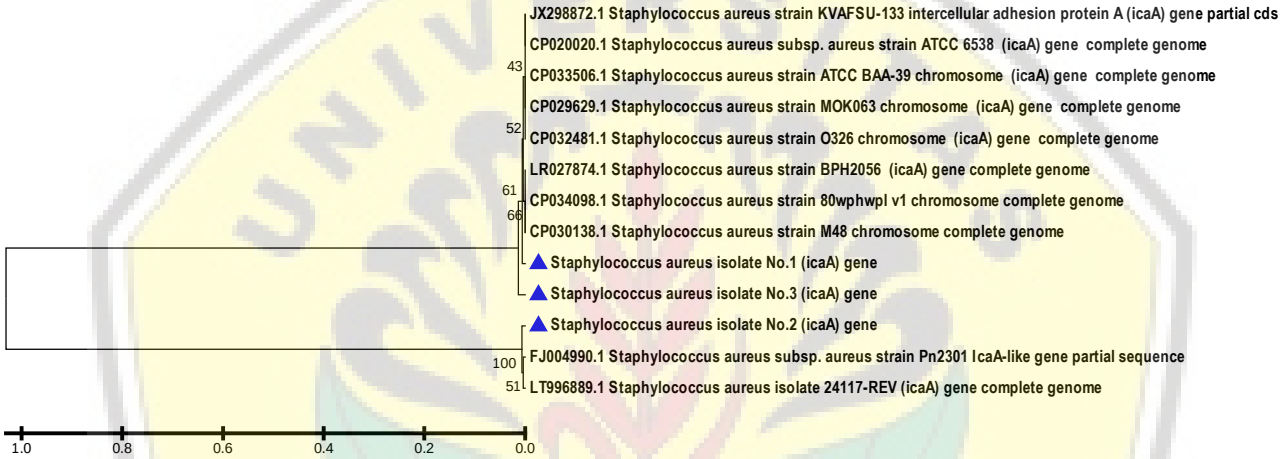

Figure (5): Phylogenetic diversity of the locally *S. aureus* urine isolate sequences (No.1 - No.3) revealed a close relationship with *S. aureus*strain Pn2301 (FJ004990.1)of NCBI-BLAST at total genetic change of (0.2-1.0%).

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Ministry of health-Thi-Qar health office, Iraq and all experiments were carried out in accordance with approved guidelines.

Effectiveness of an Instructional Program on Quality of Bowel Cleanliness and Anxiety for Patients Undergoing Colonoscopy at Baghdad Teaching Hospitals

Zahraa K. Idan[1], Khalida Alwan Mansour[2]

[1]Ministry of Health, Medical City, High Health Institute,
[2]Prof. Adult Nursing Department, College of Nursing, University of Baghdad

Abstract

Introduction: Bowel preparation is inadequate in a large proportion of colonoscopies, leading to multiple clinical and economic harms. While most patients receive some form of education before colonoscopy, there is no consensus on the best approach.

Objectives: The aim of the study was to investigate effectiveness of instructional program on patients undergoing colonoscopy, and determine the association between demographic variables (age, sex, marital status, level of education, occupation and residence) with quality of bowel cleanliness and anxiety status.

Methodology: A quasi-experimental design study is complete through the use of pre-test and post-test methodology for the case and control groups, from the period of, 7th October 2018 to the 28th June 2019. A purposive (non- probability) sample of (60) patients who attendto endoscopy unit, at Al-Kindey Teaching hospital in Baghdad city .the sample is divided into two groups (30) patients are assigned to the case group who were exposed to the instructional program, and the remaining (30) patients as assigned to the control group who were not exposed to the instructional program. The researcher has constructed a questionnaire which composed of three parts, the first part is concerned with the self-administration related to socio-demographic characteristic, the second part is concerned with the clinical information of the patient, and the third part measure effectiveness of the instructional program through the use of the Boston Bowel Preparation Scale: (BBPS) to measure the quality of bowel preparation and Hamilton Anxiety Rating Scale (HAM-A) to measure the patient Anxiety.

Results: The study findings indicate that the implementation of the instructional program had a positive effect on patients undergoing colonoscopy procedure, through measuring the quality of bowel preparation during procedure by the Boston Bowel Preparation Scale, there are highly significant differences between the case and the control group. In addition, the result has revealed statistical significance between the case and control groups, when measuring the patient anxiety pre and post instructional program.

Keywords: *Effectiveness, Instructional Program, Quality of Bowel cleanliness, Anxiety.*

Introduction

Colonoscopy is an invasive procedure in medical practice for a variety of gastrointestinal indications, It is performed more and more frequently due to their clear diagnostic benefits and therapeutic application advantages. It is a procedure may be both diagnostic and therapeutic, also currently considered the gold standard for the investigation of large bowel pathology.[1] In a colonoscopy, uses a long, flexible, narrow tube with a light and tiny camera at one end is inserted into the rectum and slowly guided into the colon to permit visualization of the entire colon from the rectum to the lower end of the small intestines. The scope bends to allow the physician to move it around the curves in the bowel. A biopsy can be taken through a tiny instrument passed through the scope. The physician may also

pass a laser, heater probe, or electrical probe or inject medication through thevarious ways includes of the physician may prescribe a laxative for two nights before the examination and a fleet's or saline enema until the return is clear at the morning of the test. The patient maintains a clear liquid diet starting at the day before the procedure, the preparation for a colonoscopy usually involves three day sofa clear liquid diet and a laxative the night before the procedure. The patient is positioned on the left side, An IV line is started, oxygen is applied, {Bibliography}presence of comorbidities, the indication for colonoscopy and the ability to understand and follow instructions appropriately. Successful completion of the preparatory procedure according to instructions has been shown to be an independent predictor of high-quality preparation.[2,3,4,,1] Colonoscopy is the primary method for evaluating the colon, but effective diagnostic and treatment depends on the quality of the technique. Insufficient preparation reduces the quality of the procedure, increases the risk of complications, decreases the rate of detection of adenomas, extends the exploration and induces a new application for endoscopy in a shorter time than recommended in the guidelines clinical practice.[5] Patients undergoing procedures such asesophagoduodenoscopy EGD or colonoscopy are often anxious .High levels of anxiety may result in more difficult and painful procedures. In one study, patients who listened to music reduced their anxiety score statistically more than patients who did not. Music is a noninvasive nursing intervention that can decrease anxiety before GI procedures.[6-12]

Material and Method

A quasi-experimental design study was carried out to meet the objectives and goals of the study and conduct on patients undergoing colonoscopy at Baghdad Teaching Hospitals. The period of the study was initiated from, 7th October 2018, to the 28th March 2019, The sample is divided into two groups which are (30)patients as a case group who exposed to the instructional program and (30) patient as a control groupwhoshare the same criteria of selection for the study group and are not exposed to the instructional program, the instruments was constructed; the questionnaire is composed of (3) parts:

First Part: The demographic data, which as (age, gender, marital status, level of education, home address, and income).

The Second Part: The clinical information of the patient: it is including medical history, chronic diseases, treatment of the patient, number of defecations, does the patient take laxatives, history of suffering, smoking, and alcohol and others.

The Third Part: Instrument of measuring effectiveness of the instructional program.. It is composed of The Boston Bowel Preparation Scale: (BBPS).[7] To measure the quality of bowel preparation, And Hamilton Anxiety Measuring Rating Scale (HAM-A).[8] To measure the Anxiety.

The Boston Bowel Preparation Scale(BBPS) is a 9-point standardized rating scale developed at Boston University Medical Center/United States of America(USA) that has been attracting worldwide attention. The BBPS assesses bowel preparations during withdrawal of the colonoscopy, after all cleansing maneuvers have been adequately performed. The BBPS addresses (3) individual colonic segments: the right colon(RC), the transverse colon(TC), and the left colon(LC). Each segment is given a score from (0 to 3), and then the (3)individual scores are summed for a total score of (0–9) points. The BBPS has been the most thoroughly validated scale for assessing bowel preparation quality.

n = number of patients, Frq. = frequency, % = percentage, $\bar{x}$ = Mean, SD = standard deviation, ID = Iraqi dinar χ^2 = Chi-Square test, N.S = Non Significant at P >0.05, Out of com = out of comparison

The results of table 1 revealed that high percentage (36.7%) of patients in the case group at age group (30-39) years, while the high percentage (30%) of patients in the control group at age group (20-29 years), More than half of patient (53.3%) of patients in the case group were males, and More than half of patient (56.7%) of patients in the control group were females. Related to marital status (60%) of patients in the case group and (80%) of patients in the control group were married. More than one third (36.7%) of patients in the case group had a bachelor's degree and while (26.7%) of patients in the control group had a bachelor's degree. No statistical significant differences were observed with regard to sociodemographic characteristic between two groups at (p>0.05) when analyzed by chi-square test.

Table (2): Distribution of the Patients Undergoing Colonoscopy (Case and Control Group) by Clinical Data

Variables	Classification	Case Group n = 30 patients		Control Group n = 30 patients		X^2 & Sig
		Freq	%	Fre.	%	
do you take Medication	Yes	13	43.3	9	30	X^2=2.11, value =..043 (Sig)
	No	17	56.7	21	70.0	
Type of medication	treatment of diabetes	3	10.0	1	3.3	X^2=17.353[a], p. value =.298 (N.S)
	treatment of hypertension	4	13.3	5	16.7	
	diabetes & hypertension	6	20.0	3	10	
Previous taking of laxatives	Yes	0	0.0	6	20.0	X^2=2.69, value=.012 (S)
	No	30	100.0	24	80.0	
Number of defecations	Once every 2 - 3 days	8	26.7	9	30.0	X^2=10.288[a], value=.328 (N.S)
	1-3 daily	4	13.3	11	36.7	
	4-6 daily	10	33.3	6	20.0	
	7-9 daily	8	26.7	4	13.3	
Duration of problems	1 year & less	26	86.7	27	90.0	X^2=6.923[a], p.value=.031 (S)
	2 years -4 years	4	13.3	2	6.7	
	More than 4 years	0	0.0	1	3.3	

n = number of patients, F= frequency, %= percentage, $\bar{x}$ = Mean, SD= standard deviation., χ^2= Chi-Square test, N.S = Non Significant at P >0.05, Out of com =out of comparison

Table (2) revealed that the high percentage (56.7%) of patients in the case group and (70%) of patients in the control group don't take medication. According to type od medication (20%) of patients in case group and (10%) of the control group taken medication for diabetes and hypertension. All patients in the case and (80%) of patients in the control group were don't have had laxatives. More than third (33.3%) of patients in the case group and (36.7%) of patients in the control group their number of defecations was ranges from (4-6 daily)and (1-3) daily respectively. Majority (86.7%) of patients in the case group and (90%) of patients in the control group they have been suffering from symptoms since 1 year & less, All 100% of patients in the case group and the control group they did not take any information by nurse. (73.3%) of patients in the case group and (63.3%) of the control group have chronic disease. Forty percent of patients in the case group and (33.3%) of patients in the control Smoking cigarettes, all participant in the case and the control group don't take alcohol

No statistical significant differences were observed with regard clinical characteristic between two groups at ($p>0.05$) when analyzed by chi-square test.

Table (3): Distribution of Quality of Bowel cleanliness of Patients Undergoing Colonoscopy by Boston Bowel Preparation Scale: (BBPS) Pre and Post Instructional Program for the Case and the Control group.

Boston bowel preparation scale	Case n=30	Control n=30	t-test	P. value	Sig
	Mean ± sd	Mean ± sd			
LC	3.00 ± .00	2.03± .71	7.370	.000	H.S
TC	2.86 ± .34	1.60 ± .72	8.647	.000	H.S
RC	2.50 ± .62	1.16 ± .83	6.989	.000	H.S

n=number of sample, S.d = Standard Deviation, t- test = Independent t- test,,d.f: degree of freedom, Sig.: Significance H.S. = high significant at P< 0.01,The BBPS addresses 3 individual colonic segments: TC(transverse colon), LC. (left colon), RC (the right colon), Each segment is given a score from 0 to 3, 0 = Inadequate, 1 = Poor, 2 = Good, 3 = Excellent or adequate. Prediction scale used for bowel preparation as adequate if BBPS score ≥2 in all 3 segments.

The results of table (3) revealed that the arithmetic mean for BBPS score of the case group was (3), (2.03) and (2.86) for the left colon, the transverse colon and the right colon respectively. That explains the scale for bowel preparation as excellent and good, or adequate. While the arithmetic mean for BBPS score of the control group was (1.60), (2.50) and (1.16) for the left colon, the transverse colon and the right colon respectively. That explains the scale for bowel preparation are poor for the left colon and the right colon and adequate or good for the transverse colon.

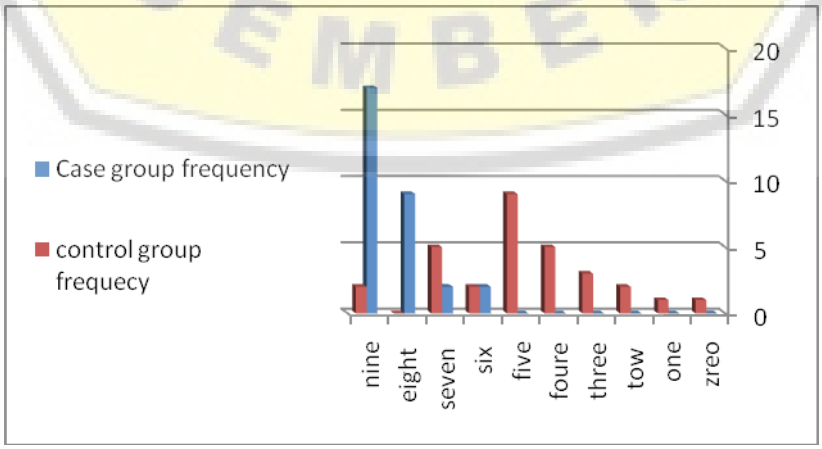

Figure (1): Patients Responses during colonoscopy procedure according to Total Score of Boston Bowel Preparation Scale to the Quality of Bowel Cleanliness for Case and Control group.

The figure shows that majority (86.7%) of the case group score was range from eight and nine score and all cases under 6 score. While the control group high percentage 21 (70%) of them their score was less than 6 score.

Table (4) Comparison Between total score of Patients Anxiety by (Hamilton Anxiety Scale (HAM-A) Pre and Post Instructional Program for the Case and the Control group.

	Period	Case group n= 30	Control group n= 30	t-test case & control pre	t-test case & control post
		Mean± S.d	Mean± S.d		
Hamilton Anxiety Scale	Pre	41.76 ± 7.62	39.96 ± 7.54	t = .919, d.f = 58, p.value = .362, sig = (N.S)	t-13.660-, d.f = 58, p.value = .000 sig = H.S
	Post	15.93±3.62	35.20 ± 6.81		
	t- test pre and post	t = 20.481, d.f = 29, p.value = .000, sig = (H.S)	t = 9.324, d.f = 29, p.value = .000, sig = (H.S)		

n=number of sample, S.d = Standard Deviation, t- test = Paired Samples t test and independent t- test,,d.f: degree of freedom, Sig.: Significance H.S. = high significant at P< 0.01, N.S: Non-Significant at p>0.05. The Hamilton score <17= mild severity, 18–24= mild to moderate severity, 25–30 =moderate to severe.

Table (4) showed an arithmetic mean for Hamilton Anxiety Rating Scale. Although a highly statistically significant difference from the pre to post procedure for both the case and the control group of Patients Undergoing. Colonoscopy, the effectiveness of instructional program was clearly observed from the table, there are such significant differences were not observed in the pre instructional program for the case and control group, p. value was (0.362). While a highly statistically significant difference from post procedure for the case and the control group the p. value is (0.000).

In the same line with the study findings, a study reported that more than half of the patients of the study sample were male. and the mean age was (59.5±13 years). Also, Shieh et al. (2013), revealed that more than half of the patients in the case group and in the control group were men. The mean age of patients in the case group was (46.1 ± 10.9) years, and in the control group was (52.8 ± 14.3 years).[13] The present study revealed that most of patients in the case group and in the control group were married This result support with finding of the study found that married adults were more likely to participate in colorectal cancer screening colonoscopy than the non-married, and inviting both members of a couple together further increases screening uptake.[14] To decrease a patient's anxiety during invasive procedures like colonoscopy, various approaches have been used to distract the patient's attention, such as instructional booklet, information, video, listening to music and encourage self-confidence, various preparatory education programs have been developed[1,17,18]

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Faculty of Dentistry, University of Babylon, Hillah city, Iraq and all experiments were carried out in accordance with approved guidelines.

Effect of Sensory Perceptual Informational Program on Patients' Anxiety Levels Before Cardiac Catheterization

Wid L. Meseer[1], Arafat Hussain Al-Dujaili[2]

[1]Mental Health Nursing/Faculty of Nursing/University of Kufa,
[2]Assisst. Professor/MB.CH.B FICM. MRCP Sych./Faculty of Medicine/University of Kufa/Arafat

Abstract

Informing and educating patients are important for preparing them for the medical procedures both physically and psychologically. Consultation and education before cardiac catheterization are reported to decrease patients' worries and fears, reduce the need for analgesics after the intervention by decreasing pain, prevent post-operative complications such as nausea and vomiting, and shorten hospital length of stay by enhancing recovery time after the procedure.

Objectives: To assess patients' anxiety levels before cardiac catheterization, to determine the effect of the sensory perceptual informational program on patients' anxiety levels through comparing patients' anxiety score before and after the program, and to find out the relationship between patients' anxiety levels and their demographic and clinical data.

Results: The study results indicate that the majority of the study sample are 54 years old and more (40.9 %), are male (68.2 %), within secondary school (51.5%), have barely sufficient monthly income (48.5 %), urban residents (69.7 %), married (90.9 %) and retired (42.4%). Also about (62.1%) of the patients are exhibit moderate level of anxiety before the application of the program. While (69.7%) of the patients are exhibit non or mild level of anxiety after the application of the program.

Introduction

Coronary Artery Disease (CAD)considered as the most common cause of demise in both men and women. CAD happen initially due to build-up of plaque into the arteries of the heart which nourish blood to the heart muscle. When the arteries become tighten from plaque, there is a deficiency of blood circulating to the heart muscle which can cause irreversible disrupt[1]. According to World Health Organization, about 18 million deaths take place due to cardiovascular disease in 2008 and this value has been rated to extent 23 million by 2030[15]. Management of ischemic heart disease can be pharmacological, or surgical (consisting of myocardial revascularization when cardiac catheterization indicates severe obstructive lesion), or vascular (angioplasty), and this depending on the patient's clinical state and the phase of coronary artery occlusion[6]. Cardiac Catheterization (Cardiac Cath or Heart Cath) is a technique applied to checks heart functions. A long, thin, and hollow tube called a catheter is entered into a blood vessel that reaches to the heart. Cardiac Cath is a painless procedure which is utilized in the diagnosis and treatment of different cardiac defects and health problems[1]. In the United State, about 2 million heart patients undergoing cardiac catheterization every year, and this number is increasing because this diagnosis method is valid and accurate, which like other critical procedures causes stress and anxiety in patients[8]. Anxiety is distinguished by symptoms such as palpitation, perspiration, tremor, difficulty in breathing or smothering sensation, chest pain or harassment, and/or stomach pain. Anxiety stimulates the sympathetic nervous system to remarkable different physiological responses, such as tachycardia, sweating, increased oxygen exhaustion, increased blood

pressure, which can worsen the advancement of the patient. In addition, anxiety can have passive impact on patient's clinical outcomes such as refuse the patient for treatment and lack tolerance to pain before, during and after the catheterization procedure[6]. The extent of anxiety in patients with coronary artery diseases before angiography is significantly higher than those without this disease. The relationship between anxiety and cardiovascular system (CVS) is known since the first studies on individuals so called irritable cardiac disease. Tachycardia and palpitation as a consequence of severe terror and anxiety affined issues, has turn into a focus of importance in studies that study the activity of CVS[1].

Methodology

Design of the Study: A pre-experimental design (one group pretest-posttest design) used to study the effect of the sensory perceptual informational program on patients' anxiety levels before cardiac catheterization, from the period of 16th September, 2018 to 1st July 2019.

Setting of the Study: The study is conduct in Al-Najaf City/AL-Najaf Center for Cardiac Surgery and Trans Catheter Therapy.

Sample of the Study: A non-probability (purposive sample) consist of 66 patients are diagnosed with ischemic heart disease and scheduled for cardiac catheterization.

Method: The final copy consists of the following parts:

Part I: Patient's demographic data form consists of (7) items, which include age, gender, level of education, socio-economic status, residence, marital status and occupational status.

Part II: Patient's clinical data form consists of (7) subparts, which include: **a**- diagnosis: angina, myocardial infarction, ventricle septal defect, patent ductus arteriosus, atherosclerosis, and dysrhythmia. **b**- duration, **c**- type of catheterization: include diagnostic and therapeutic, **d**- due suffer from**:** (respiratory disease, renal disease, thyroid disease, stroke, and other). **e**- due suffer from psychiatric disorder, **f**-medications**,** **g**- receiving of health instructions regarding cardiac catheterization**.**

Part III: Which include from Beck Anxiety Inventory Scale that consist from 20 items.

Results

Table (1): Summery Statistics of the Study Sample Demographic Data

Demographic Data	Rating And Intervals	Frequency	Percent
Age/years	33-39	6	9.1
	47-53	26	39.4
	54-60	27	40.9
	61 And More	7	10.6
Gender	Male	45	68.2
	Female	21	31.8
Residency	Rural	20	30.3
	Urban	46	69.7
Marital status	Single	6	9.1
	Married	60	90.9
Levels of education	Does not read and write	14	21.2
	Read and write	6	9.1
	Primary school	6	9.1
	Secondary school	34	51.5
	College and more	6	9.1

Demographic Data	Rating And Intervals	Frequency	Percent
Occupational status	Governmental	7	10.6
	Free job	6	9.1
	Retired	28	42.4
	Jobless	25	37.9
Economic status	Sufficient	21	31.8
	Barely sufficient	32	48.5
	Insufficient	13	19.7

Table (1) illustrates the demographic distribution of the study sample. The study results indicate that the majority of the study sample are 54 years old and more (40.9 %), are male (68.2 %), within secondary school (51.5%), have barely sufficient monthly income (48.5 %), urban residents (69.7 %), married (90.9 %) and retired (42.4%).

Table (2) Summery Statistics of the Clinical Data for the study Sample

Clinical Data	Rating And Intervals	Frequency	Percent
Diagnosis	Angina	14	21.2
	Atherosclerosis	6	9.1
	Dysrhythmia	20	30.3
	Myocardial infarction and Angina	20	30.3
	Ventricular septal defect and patent ducts arteriosus	6	9.1
Duration/years	3 And Less	32	48.5
	4-7	14	21.2
	16 And More	20	30.3
Suffering from chronic diseases	Diabetes mellitus	15	22.7
	Hypertension	26	39.5
	Diabetes mellitus and hypertension	25	37.8
Psychiatric clinic	No	66	100.0
Psychiatric medications	No	66	100.0
Medications	None	6	9.1
	Atorvastatin, Metformin, Candesartan, and Plavix	7	10.6
	Captopril, Plavix	7	10.6
	Glibengmaid, Captopril	7	10.6
	Glibengmaid, Losartan, Aspirin, Metformin, Aspirin	6	9.1
	Inderal	7	10.6
	Insulin, Plavix	6	9.1
	Isoptin	7	10.6
	Isoptin, Verapamil	6	9.1
	Valsartan, Atorvastatin, Metoprolol, Aspirin, Cardizin, Plavix	7	10.6

Clinical Data	Rating And Intervals	Frequency	Percent
Instruction	Yes	39	59.1
	No	27	40.9
Sources	Physician	26	39.4
	Nurse	6	9.1
	Another sources	7	10.6

Table (2) illustrates the clinical data of the study sample. The study results indicate that the majority of the study sample are diagnosed with dysrhythmia (30.3%), while those with myocardial infarction and angina (30.3%). The duration of disease since diagnosis per years is 3 and less (48.5%). While the highest percentage of study sample are hypertensive (39.5%). While the study sample don't suffer from psychiatric disorder and don't taken psychiatric medications (100%). (10.6%) of patients that taken Captopril, Plavix, (10.6%) Glibenglmaid, Captopril, (10.6%) Inderal, (10.6) Isoptin, and (10.6%) Valsartan, Atorvastatin, Metoprolol, Aspirin, Cardizin, Plavix.and(59.1%) are receiving health instructions and the physician is the dominant source of the received instructions (39.4%).

Table (3) Assessment of Patients' Anxiety levels for the Study Sample before and after the Applications of the Program

Periods of measurement	Anxiety Levels	Frequency	Percentage	Mean	Overall Assessment
Pre-test	Sever	4	6.1	1.78	Moderate
	Moderate	41	62.1		
	Non or Mild	21	31.8		
	Total	66	100.0		
Post-test	Sever	0	0.0	1.54	Non or Mild
	Moderate	20	30.3		
	Non or mild	46	69.7		
	Total	66	100.0		

Table (3) shows that the (62.1%) of the patients are exhibit moderate level of anxiety before the application of the program. While (69.7%) of the patients are exhibit non or mild level of anxiety after the application of the program.

Table (4) Mean Difference (paired t-test) between the Patients' Anxiety levels before and after The Application of The Program

Main domain	Periods of measurement	Mean	N	Std. Deviation	t-value	d.f.	p-value
Patients' anxiety	Pre-test	1.7818	66	.38865	4.508	65	0.001 HS
	Post-test	1.5447	66	.22823			

Table (4) illustrate that there is a high significant differences between the patients' anxiety levels before and after the application of the program at p-value less than (0.01).

Table (5) Relationship between Patients' Anxiety Levels (post-test) and their Demographic Data

Demographic Data	Rating And Intervals	Anxiety Levels		Total	Sig.
		Moderate	Non or Mild		
Age/years	33-39	1	5	6	X^2 (5.306) d.f. (3) p-value (0.151) NS
	47-53	12	14	26	
	54-60	6	21	27	
	61 And More	1	6	7	
Total		20	46	66	
Gender	Male	14	31	45	X^2 (0.044) d.f. (1) p-value (0.84) NS
	Female	6	15	21	
Total		**20**	**46**	**66**	
Residency	Rural	8	12	20	X^2 (1.278) d.f. (1) p-value (0.258) NS
	Urban	12	34	46	
Total		20	46	66	
Marital status	Single	1	5	6	X^2 (0.581) d.f. (1) p-value (0.446) NS
	Married	19	41	60	
Total		**20**	**46**	**66**	
Levels of education	Does not read and write	1	13	14	X^2 (17.551) d.f. (4) p-value (0.002) HS
	Read and write	0	6	6	
	Primary school	1	5	6	
	Secondary school	18	16	34	
	College and more	0	6	6

	Therapeutic	19	34	53	
Total		**20**	**46**	**66**	
Receiving health instructions	Yes	19	20	39	X^2 (15.307) d.f. (1) p-value (0.001) HS
	No	1	26	27	
Total		**20**	**46**	**66**	

Table (6) shows that there is a high significant relationship between patients' anxiety levels (post-test) and their diagnosis, and the receiving health instructions at p-value less than (0.01). While there is non-significant relationship with other clinical data at p-value more than (0.05).

Discussion

Anxiety is described as an uncomfortable feeling of dread that is a response to extreme or prolonged periods of stress, stress is associated with negative situations [13]. Individuals undergoing cardiac catheterization and related procedure are likely to experience elevated anxiety pre-procedurally, with highest anxiety levels occurring in the waiting period immediately prior to the procedure [7].In daily practice it is observed that patients do not understand clearly information given by the healthcare team due to stress and anxiety. In this context of waiting and anxiety, relatives are also stressed and share feelings and uncertainties with the patients, thus turning the situation more complex for the nursing team, since these experiences are mainly witnessed by nurses. In face of this situation, nurses should get the best information available to deliver a better care, thus diminishing the stressing factors to reduce patients' and relatives' anxiety [10]. Anxiety had impacts on the patients' physiological reactions, therefore, nurses need to identify anxiety in the patients and try to reduce it by using proper method[9]. The present study conducts to use the sensory perceptual informational program as non-pharmacological strategies to reduce patients' anxiety levels before cardiac catheterization. This chapter presents the discussion of the study results with an appropriate rationale and articles based support. And it organized as follow: In the present study the highest percentage of patients are at the age group of (54-60). [4] studied "the effect of age and previous surgery experience on pre-operative anxiety", their study results indicate that older patients typically would be expected to have low level of anxiety. This result may come because that the heart diseases are most common occurs among individuals with an advanced age compared with young individuals. Regarding the patients' gender, the present study results indicate that the male is the dominant gender for the study sample.[3] studied" pre-operative anxiety in patients undergoing different type of surgery", the study results indicated that the majority of the study sample are males. The heart disease most

common occurs among males compared with females and this may because that males are facing many risk factors related to heart disease such as smoking, psychological stress more than females. The current study revealed that the majority of the study sample are with secondary education level, barely sufficient economic status, are married, and retried, also the study results indicate that the majority of the study sample are urban resident. This result is supported by[14] who reported that the individual with low educational level, low economic status and married were more label to expose to accidental cardiac disorder, this results were agree with our finding which pointed on high percentage of the sample are within secondary education, majority are married and retried also the results showed that the high percentage were city resident. Also[11] studied "assessment of patients' knowledge regarding lifestyle changes after ischemic heart diseases", their study result shows that the most frequent age is 60 years old, are males, within primary school, most of the subjects are present with sufficient to some extent socio-economic status, and regarding the residency most of patients are urban resident.

Conclusion

The study concludes that the sensory perceptual informational program is an effective tool in improving the patients' anxiety levels before cardiac catheterization. And this conclusion is proved through the statistical approaches that show that there is a significant decreasing in the anxiety levels after the application the program. So, there is no enough evidences to accept the null hypothesis. Otherwise, the alternative hypothesis is accepted.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Faculty of Nursing/University of Kufaand all experiments were carried out in accordance with approved guidelines.

Impact of Stroke on Patients' Health Status at Middle Euphrates Neuroscience Center in Al Najaf -City

Muntadher Salah Razzaq Al-Naffakh[1], Diaa Kareem Abd-Ali[1], Hawra'a Ghannam Abdul-Hussien Al-Nassar[1]

[1]University of Kufa, Faculty of Nursing, Iraq

Abstract

Stroke is a major cause of mortality worldwide and commonly occurs among elderly, and between all the neurologic diseases of adult life, stroke ranks first in frequency and importance.

Methodology: A descriptive cross-sectional study was adapted to assess the impact of stroke in the current study to achieve the early stated objectives, the study started from February 10th 2019 to May 22nd 2019. A non-probability (purposive) sample of (92) patients who found in Middle Euphrates Neuroscience Center.

Results: The results show that the most of participant age groups are more than 50 years old (93.5%), and (60.9%) of them are females, also(58.7%) of the subjects are illiterate. And (69.6%) of them had barley sufficient monthly income, (72.8%) of the participants are living in urban areas. The majority of the study sample (85.9%) are married,while after stroke, the results show that the most of study sample(96.7%)have no change in their marital status. Concerning occupational status,about (53.3%) are housewives, while (50%) of the participants lost their job after stroke. The results also show that the all patients are affected by stroke, three-quarter of them arehighly affected and the fourth quarter are moderately affected, because the health institutions lack many specialist rehabilitation centers and physiotherapists.

Conclusion: The study confirmed that all patients involved were affected by the stroke .

Keywords: *Impact, Stroke, Patient, Health Status.*

Introduction

Stroke is a major cause of mortality worldwide and commonly occurs among elderly, and between all the neurologic diseases of adult life,stroke ranks first in frequency and importance ([1] .More than 13.7 million new strokes each year. Worldwide, 1/4 people over age 25 will have a stroke in their lifetime, almost 60% of all strokes each year are in people under the age of 70 years, it occur 52% of in men and 48% in women each year [2]. Someone in the US has a stroke every 40 seconds on average. In 2016, stroke accounted for about 1 of every 19 deaths in the US and died of stroke every 3 minutes 42 seconds. In 2016, there were 5.5 million deaths attributable to cerebrovascular disease worldwide (2.7million deaths from ischemic stroke and 2.8 million deaths from hemorrhagic stroke). According to 2016 data, Eastern Europe, East Asia, and parts of Southeast Asia, Central Asia, and sub-Saharan Africa had the highest rates of stroke mortality. Age-standardized prevalence rates of stroke were higher in Eastern Europe and East Asia [3]. Stroke, a leading cause of disability, is usually a major life event. The ultimate goal of stroke interventions is to improve the health-related quality of life (HRQOL) of survivors ensuring that they are enabled to fulfil their roles and purpose in life after the event[4]. Stroke is one of the main causes of death and functional inability worldwide . In the last decade, the global incidence of stroke has increased by 20% in low- and middle income countries such as Brazil . Stroke is the third most common cause of death in developed countries and the main cause of death in Latin America[5]. Unfortunately, many stroke survivors are left with a range of physical, cognitive, and behavioral deficits that limit their ability to regain premorbid functioning across a number of

lifestyle domains. Even survivors of mild stroke can be left with negative psychosocial outcomes in the form of reductions in quality of life (QOL) that extend beyond positive motor recovery outcomes. Quality of life is a multidimensional construct that consists of subjective perceptions of physical and mental functioning and associated feelings of well-being. Because stroke survivors can experience a range of impairments that differ in severity, many report significant reductions in post stroke QOL.5 Such decreases in QOL have been reported in stroke survivors as many as five years post-stroke.Reductions in QOL are associated with changes in both physical and mental functioning and well-being[7]. Worldwide, cerebrovascular accidents (stroke) are the second leading cause of death and the third leading cause of disability. Stroke, the sudden death of some brain cells due to lack of oxygen when the blood flow to the brain is lost by blockage or rupture of an artery to the brain, is also a leading cause of dementia and depression. Globally, 70% of strokes and 87% of both stroke-related deaths and disability-adjusted life years occur in low- and middle-income countries. Over the last four decades, the stroke incidence in low- and middle-income countries has more than doubled. During these decades stroke incidence has declined by 42% in high-income countries. On average, stroke occurs 15 years earlier in – and causes more deaths of – people living in low- and middle-income countries, when compared to those in high-income countries. Strokes mainly affect individuals at the peak of their productive life. Despite its enormous impact on countries' socio-economic development, this growing crisis has received very little attention to date[8].

Method and Materials

Design of the Study: A Descriptive cross-sectional study was adapted to assess the stroke impact in the current study to achieve the early stated objectives, started from February 10th 2019 to22th May 201219.

Setting of the Study: The study is conducted in Al-Najaf City/Al-Najaf Al-Ashraf Health Directorate Middle Euphrates Neuroscience Center**.**

Sample of the Study: A Non-probability (purposive) sample of (92) patients who found in the Middle Euphrates Neuroscience Center for treatment or follow up or both. The selection of sample size based on statistical power analysis with a statistical power more than 90%.

Criteria for Including the Sample within each Stratum (Ischemic and Hemorrhagic Stroke Patients):

1. All participants are medically diagnosed as (mild to moderate by stroke).
2. The age of the all participants is 20 – 60 years old.
3. All participants are from Iraqi Nationality.
4. Alert patients, free from any change in the level of consciousness.
5. Free from renal failure, or undergoing hemodialysis or peritoneal dialysis.
6. Free from cancer or undergoing chemotherapy.
7. Free from psychiatric disorders.

Study Instrument: A questionnaire was adopted by the researcher to measure the variables of interest. the final study instrument consisting three parts:

Part I: Patients' Demographic Data.

Part II: Medical History.

Part III: Impact of stroke: The third part consist of instrumental Stroke impact Scale (AHA).

Data Collection: The data were collected through the use of Arabic version of the questionnaire and by means of interview with patients inAl-Sadder Medical City, at theMiddle Euphrates Neuroscience Center**.** The data collection process lasted six weeks . The interview technique took about 15-20 minutes for each subject.

Validity of the Instrument: A content validity of the study instrument conducted through a group of experts who have more than 10 years of experience in nursing field.

Statistical Analysis: The data were analyzed through the application of the descriptive and inferential data analysis method, included:

- Frequency, percentage, and mean of scores.
- Chi-square.
- Alpha Cronbach for the reliability of questionnaire (Internal consistency).

Study Results and Findings:

Table (1) Patients' Demographic Data

Demographic data	Rating and intervals	Frequency	Percent
Age/years	35 - 39	1	1.1
	40 - 44	4	4.3
	45 - 49	1	1.1
	50+	86	93.5
Gender	Male	36	39.1
	Female	56	60.9
Level of Education	Illiterate	54	58.7
	Read and write	14	15.2
	Primary school	13	14.1
	Intermediate school	6	6.5
	Secondary school	3	3.3
	Institute or college	2	2.2
Monthly Income	Insufficient	16	17.4
	Barley sufficient	64	69.6
	Sufficient	12	13.0
Residency	Rural	25	27.2
	Urban	67	72.8
Marital Status before Stroke	Single	3	3.3
	Married	79	85.9
	Widowed	10	10.9
Marital Status after Stroke	No change	89	96.7
	Divorced	2	2.2
	Separated	1	1.1
Occupation before Stroke	Governmental employee	4	4.3
	Free job	13	14.1
	Retired	11	12.0
	Disable	1	1.1
	Housewife	49	53.3
	Jobless	14	15.2
Occupation after Stroke	No change	29	31.5
	Change the job	17	18.5
	Lost the job	46	50.0

Table (**3.1**) shows that the most of participants age groups are more than (50 years old), considered as the highest percentage (93.5%) among the study sample. Regarding gender of the study sample, the study indicate that (60.9%) are females, also this table present that the majority of the sample (58.7%) are illiterate. The results indicate that (69.6%) of the subjects had barley sufficient monthly income, (72.8%) of them are living in urban residential areas. The majority of the study sample (85.9%) are married before getting stroke,while after stroke, the results show that the most of study sample (96.7%) have no change in their marital

status. Concerning occupational status,about (53.3%) of the study sample were housewives before stroke, and after stroke(50%) of the study have change in their occupational status.

Table (2) Study Sample Past Medical History

Clinical Data	Rating and intervals	Frequency	Percent
Type of Stroke	Ischemic	74	80.4
	Hemorrhagic	18	19.6
Side of Stroke	Right	49	53.3
	Left	43	46.7
Duration of the Disease/months	6	35	38.0
	7 - 12	50	54.3
	13 - 18	1	1.1
	19 - 24	2	2.2
	25+	4	4.3
Complications	Yes	38	41.3
	No	54	58.7
Associated Diseases	DM	11	12.0
	DM and ischemic heart diseases	3	3.3
	DM, ischemic heart disease, and hypertension	1	1.1
	DM, ischemic heart diseases and heart failure	1	1.1
	DM and hypertension diseases	23	25.0
	DM, hypertension, and heart failure	2	2.2
	DM, hypertension, and renal disease	4	4.3
	DM, heart failure, and renal disease	1	1.1
	Ischemic heart disease	5	5.4
	Ischemic heart diseases and hypertension	3	3.3
	Ischemic heart disease and renal disease	2	2.2
	Hypertension	30	32.6
	Hypertension and renal disease	1	1.1
	Heart failure	1	1.1
	Other disease	4	4.3
Smoking	Yes	15	16.3
	No	77	83.7
Duration of Smoking/years	1-3	8	8.7
	4 - 6	6	6.5
	7+	1	1.1
	Total	15	16.3
Amount of Smoked Packs	1	8	53.3
	2	4	26.7
	3	1	6.7
	5	1	6.7
	6	1	6.7

Table (2) shows that the majority of the study sample (80.4%) have ischemic stroke. Regarding to the affected side of the body, the results reveal that the majority of the study subjects (53.3%) were with right side affected. In regards to duration of the disease, the results show that the majority of the participants (54.3%) have duration of disease that ranges from (7-12) months. Concerning the complications of stroke, the results show that more than half of the subjects (58.7%) have no complications. In addition, most of study sample(32.6%) has hypertension. Regarding the smoking, the results show that most of the study sample (83.6%) are not smoking.

Table (3) The Overall Assessment of the Impact of Stroke on Patients' Health Status

Main domain	Levels of effect	Frequency	Percent
Overall assessment of impact of stroke on patients' health status	Moderate Effect	23	25.0
	High Effect	69	75.0
	Total	92	100.0

Table (4) Relationship between the Patients' Health Status and their Demographic and Clinical Data

Demographic And Clinical Data	Chi-Square Value	D.F.	P-Value
Age/Years	9.054	3	.029 S
Gender	2.190	1	.139 NS
Level of Education	5.590	5	.348 NS
Monthly Income	15.000	2	.001 HS
Residency	.018	1	.892 NS
Marital Status	.249	2	.883 NS
Occupation	15.721	5	.008 HS
Type of Stroke	.829	1	.363 NS
Side of Stroke	.713	1	.398 NS
Duration of the Disease	2.811	4	.590 NS
Complications	1.494	1	.222 NS
Associated Diseases	25.942	14	.026 S
Smoking	.664	1	.415 NS

Table (4) shows that there is a significant relationship between the impact of stroke on patients' health status and their (age, monthly income, occupation and associated diseases) at p-value less than 0.05, while there is a non-significant relationship with the other demographical and clinical data at p-value more than 0.05.

Discussion

The study results show that the most frequent age group is (more than 50 years old). This result agrees with [3], they found that the (more than 50 years old) is the dominant age group of the study sample. Furthermore. there is a physical vulnerability relates to the phenomenon of age that makes the individuals risky for many diseases and health problems such as HTN, obesity, dyslipidemia, DM, and CVA. Concerning the gender, the study results reveal that the majority of the subjects are females. This result agrees with [11] in their study they found that the dominant gender is female. Regarding the level of education, the results show that the majority of the study subjects are illiterate. This result agrees with[9,11,12] in their study results which indicate that the most participants are illiterate. Concerning the socio-economic status, most of the study participants are presented with sufficient to some extent socio-economic

status. This result agrees[14], in their results which indicate that the majority of the study participants' monthly income is barley sufficient .Concerning residency, the study results indicate that the study subjects are urban residents. This result agrees with[14], in their results that indicate that the majority of the subjects are urban residents rather than the countryside or in big cities. Regarding marital status, the study results show that the majority of the study sample are married. These results agree with [15], whose results indicate that the majority of the study subjects are married. While after stroke, the results show that the most of the study sample have no change in their marital status. Regarding occupational status, the results show the highest percentage of the study subjects are housewives before stroke and after stroke half of the study subjects have change in their occupational status. These results agree with [9] whose results indicate that the majority of the study subjects are housewives. The changes in the ability of patient to working after stroke, he/she had a little improvement in health status and need long rehabilitation period. Regarding patients' clinical data, the study results reveal that the most of patients are diagnosed with ischemic stroke.

CONCLUSION

Based on the study results and discussion, the study concluded the following: The study confirmed that all patients involved were affected by the stroke. The study indicate that three-quarter of participants are severely affected, while the left quarter of them are moderately affected. There is a significant relationship between the impact of stroke and patients' age, monthly income, occupation, and associated disease.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the University of Kufa, Faculty of Nursing, Iraq and all experiments were carried out in accordance with approved guidelines.

The Effect of Task- Based Learning Strategy on the Achievement and Moral Competence on the Ecology and Pollution text book for Biology Department

Ali Raheem Mohammed[1], Zainb Yaseen Abd Oun[1]

[1]*Department of Education and Psychology Sciences, College of Education, University of Al-Qadisiyah, Iraq*

Abstract

The aim of this study is to identify the impact of the task-based learning strategy on the Achievement and Moral Competence on the Ecology and Pollution text book for Biology Department. To achieve the objectives of the research, the experimental design of two groups (experimental and control) was used. The research also identified the students of the third stage in the Department of Life Sciences/College of Education for Girls/University of Kufa for the academic year 2018-2019. The sample of the research was 46 students with 23 students In the experimental group and (23) students in the control group, the two research groups were statistically compensated in the variables (the end grades of the first course of the environment and the practical pollution, the age of time, intelligence test,ethical efficiency scale). The results showed positive impact of the task-based learning strategy on moral competence and achievement. Therefore, the researcher recommends using task-based learning to teach environmental and practical pollution. The researcher suggests conducting studies of various stages and subjects to determine the impact of the task-based learning strategy in motivation, multiple intelligences and others.

Keywords: *Achievement, Moral Competence, Pollution.*

Introduction

University stage has its own features in which the person reaches to mental, psychological maturity that enable him/her to learn skills and acquire information in a better way. In this stage, moral concepts of evil and good are formed, tendency to discussion and self- confirmation. As a result of what the researchers note during teaching the third stage, the students are careless for the scientific materials and lack of interaction. The students think that the scientific materials are merely information that should be memorized to pass the test. Consequently, this leads to clear decrease of apprehending the materials and moral commitment towards environment and disregard of this information in their daily life. The main reason of such case is the method of teaching that depend on dictation and memorization and do not give students the chance to practice and apply what they learnt. Moreover, the inability to apply such ideas is due to unavailability of materials or limited time and does not develop thinking skills, discussion, decisions- taking and develop moral behaviors to deal with environment and preserve it[16]. So, it is necessary to search for modern strategies that we could use to overcome such difficulties. When we use task- based learning strategy, it will help students to express their views, overcome the inability to use discussion because they think that learning process is a positive interaction between the learners on one side, and between scientific content on the other side. In addition to offer educational assignments that help discussion and cooperation in the learning environment and human's relation to environment surrounding especially awakening the student's moral responsibility towards environment and identify their tasks.To the researchers'

knowledge, the study of the effect of task- based learning strategy on the achievement and moral competence has not been tackled before in Iraq. So, the study problem is: Active learning has a social and cooperative aspect that it allows to divide students into small groups during events and activities. As a result of such activities, the students will have a system of values that support them to deal with others or surrounding environment in a way to create people who are able to challenge mistaken concepts regarding dealing with environment[42] Modern education is responsible of preparing an educated student who has the ability to take right decisions in all fields of life in a changeable society. The educational system seeks to develop the student's balanced personality in respect to mental, physical, social and moral aspects to cope with the modern trends of teaching method. These method stress the importance of active learning, develop teaching method at the university, where interactive learning is the alternative for learning through listening. Interaction and dialogue are necessary for learning in which tasks require concentration on the concepts. The increase of student's achievement is important as a result of understanding the information through interaction and cooperation among small groups and the ability to solve problems and decision- taking. The results of previous studies have referred to the efficiency of task- based learning on building up learning environment depends on interaction and enable learners to communicate between themselves. The importance of task- based learning strategy is evident since it is one of the most effective method of teaching that focuses on the learner. The learner is the hub of educational process. The task given for the student is a kind of chance for him based on his/her abilities and understanding of information and he/she will be able to express his/her ideas and views towards the class to avoid intellectual stagnation that inflicts students when taught by dictating the learners [6].

Methodology

First: experimental design and the study methodology: The experimental design is "a scheme and work programmer of how to implement the experiment" (Kirk, 2012, p. 24). Also, it is " the basis of experiment structure, which depends on the experimental elements that define the experiment touchstones and reflect its variables"[40] Since the study includes two dependent variables and one independent variable, the experimental approach of partial control (experimental group and control group) of posttest is chosen.

Population and sample of the study: The study population consists of all the students of 3rd stage, dept. of biology, university of kufa for the academic year 2018-2019. The sample consists of (127) students distributed on five groups (A, B, C, D and E). The researcher identifies randomly two groups (B and C) that include (46) students to be the study sample. Group (B0 is selected randomly to represent experimental group that is taught according to (task-based learning strategy) and group (C) is the control group that is taught according to the regular method.

Control of experiment Equivalence: It means to test two groups in the same conditions and surrounding circumstances of the experiment except the effect of independent variable that is wanted to test its effect.

Though the researchers have chosen the two groups randomly, the possibility of non- equivalency of the two groups is something probable. So, they have made some equivalence procedures that emerged due to the properties of the sample. The affected variable may be influenced by the individuals' features, and the researchers supposedly to conduct their experiment without any differences between experimental and control groups except the use of independent variable with the experimental and control groups; the two equivalent groups[18].

The two groups have equivalence in age, intelligence, previous achievement in practical pollution and environment, and moral competence of environment.

The Study Requirement

Identify Scientific Materials: The scientific material is of the second semester that the researcher will teach in the textbook of practical pollution and environment in cooperation with the teachers of the subject[1] at the department of biology, college of education, Kufauniversity. The material is limited to ten topics each one includes an experiment. The topics are: environmental pollution, dust pollution, insecticide pollution, oxygen, pollution by alga, water treatment, water acidity, soil texture, size of space of soil and soil color.

Educational aids, Equipment, Tools and Materials: Several educational aids are used to help researchers teaching their materials, which depend on modern teaching method. Laboratory in particular depends on many aids and tools that the students use

to implement experiments. The tools include: (LCD, test tubes, fungicide and chemical pesticides, optical microscope, filter paper, sensitive balance, petri dishes, one-liter beaker, seeds of some plants, O_2 meter, PH meter and water samples).

Preparation of teaching plans: The researchers have prepared (10) teaching plans for the experimental group that is taught according to task- based learning strategy and (10) teaching plans for the control group that taught according to the regular method (lecture and discussion method). Then, the plans are presented for a group of arbitrators and method of teaching science and teachers of biology. In light of their remarks, the plans become applicable for the study.

Preparing Study Tool: The present study requires preparation of dependent variables including achievement test, which consists of (47) items. Item difficulty, discrimination items, effectiveness of destruction for the objective item and reliability of the test are applied.

The two researchers depend on all the required characteristics to build up tests to measure educational and psychological sciences.

Procedures of experiment procedures: The two researchers started the experiment on 19th Feb., 2019 and ended on 14th May 2019. The experiment takes (10) weeks during the second semester. The researcher follows the following:

Teaching Study Groups: The experimental and control groups are taught according to the designated method, and one of the researchers teaches the groups for two hours per week for each group.

Applying the study tools:

After teaching the experiments in the lab., the researcher applies the following:

- Moral competence scale: applied on Tuesday 7th May 2019 on two groups, the first includes B2 group and the second consists of C2 group.
- Achievement test: applied on Sunday 14th May 2019. The students are informed about the test before two weeks. The researcher receives assistance from the teacher of science, an instructor of the dept. of education and psychology in addition to two readers.

Results and Discussion

Results of achievement variable: To ensure the first null hypothesis "there are no differences of statistical significance at the level (0.05) among the mean of the scores of experimental group who studied according to regular method in the test of the Ecology and Pollution text book," the mean of the scores of the two groups is got as shown in the table (1).

Table (1) Means of the two groups in the achievement test

Group	Class	Students No.	Mean	Standard deviation	Freedom degree	T- value		Significance at (0.05)
						Calculated	Tabular	
Experimental	B	23	59. 26	9. 18	44	2.71	2.021	Significant
Control	C	23	52.04	8.9				

It is shown in the table that the mean of the scores of the experimental group is (59. 26) and standard deviation is (9.18) while the mean of the control group scores is (52.04) and standard deviation (8.9). By using two equal independent samples T- test, the calculated T- value is (2.71) and it is higher than the tabular value (2.021) at the level (0.05) and freedom degree (44). Based on this result, null hypothesis is not accepted since there are differences of statistical significance at the level (0.05) among the mean of the first group scores who studied the Ecology and Pollution text book by using task-based learning strategy and the scores of the second group who studies according to the regular method in the achievement test in favor for the experimental group. So, alternative hypothesis is accepted.

The results show that there are differences of statistical significance in this variable between the two groups in favor for the experimental group. The researcher explains the result as the following:

- The effect of task- based learning strategy on teaching the Ecology and Pollution text book to acquire and understand information through active learning environment.
- Discussion and dialogue among the students to understand scientifically the components of scientific content, realize the relations between information then link them especially for the students of weaker level or who feel shy to ask questions.
- Create a healthy atmosphere of discussion to find out a solution of a problem for the group members during the task stage and suggest solutions, cooperate with students to evaluate proposed solutions and amend them to acquire scientific materials.
- The continuous feedback has contributed to develop achievement in the subject of practical course of environment and pollution.
- Each student has a file to keep what she has done and her results to identify the basic elements for each subject, which increase achievement.

[21]study shows the effect of active- based learning strategies on developing achievement and performance of science teachers and newly graduated teachers.[21]

[14]study shows that the use of task- based learning is effective in achievement and the tendency towards collective work among students of secondary stage.[1]

Results

To ensure the second null hypothesis "there are no differences of statistical significance at the level (0.05) among the mean of the scores of the post scale of the students of the experimental group who studied according to task- based learning strategy and the students of the control group who studied moral competence according to regular method"

The researchers have calculated the mean of the score of the two groups on the scale of the moral competence as shown in table (2).

Table (2) Means of the two study groups of moral competence

Group	Class	Students No.	Mean	Standard deviation	T- value		Significance at (0.05)
					Calculated	Tabular	
Experimental	B	23	192.08	12.4	3.07	2.021	significant
Control	C	23	181.73	10.4			

Conclusion

Task- based learning strategy has an effect on achievement when compared with the regular method. Task- based learning strategy has an effect on increasing efficient moral performance to deal with the environment. Planed teaching within task- based learning strategy of the practical materials in the laboratories contribute to raise understanding and efficient behavioral and moral performance to deal with the environment. The possibility to apply task- based learning on teaching different sciences during the university stage and use similar strategies of active learning.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Education and Psychology Sciences, College of Education, University of Al-Qadisiyah – Iraq and all experiments were carried out in accordance with approved guidelines.

Phylogenetic Analysis of *oprL* and *oprIgenes* in Pseudomonas Aeruginosa Isolated from Otitis Media Patients

Zahraa A. Fadhel[1], Saad S. Hamim[1]

[1]*Pathological Analysis Department, Science College, Thi-Qar University, Iraq*

Abstract

The present study aimed to detect *oprL* and *oprI* genes in *Pseudomonas aeruginosa* that isolated from Otitis media patients whom consulting the Ear, Nose, and Throat (ENT) Department in AL-Habboubi Teaching Hospital in Nassyriah City, Southern Iraq. During the period from August 2018 to January 2019 and drawing the comprehensive phylogenetic tree to know the evolutionary history of these genes. The molecular study, which used the Polymerase chain reaction technique revealed the existence of *oprL* and *oprI* genes in 58/65 (89.23%) and 61/65 isolates (93.85%), respectively. Five samples for every gene were sent to performing DNA sequencing. The DNA sequence analysis shown some variants distributed in several samples, this lead to occupied several positions on the comprehensive phylogenetic tree. The ten isolates of *P. aeruginosa* (assigned five isolates for every gene of *oprL* and *oprI*) which they granted the recording numbers in the NCBI databases (MN022280, MN022281, MN022282, MN022283, MN022284 for *oprL* gene and MN022290, MN022291, MN022292, MN022293, MN022294 for *oprI* gene).The phylogenetic tree was constructed by using the Clustal Omega tool and the Clustal output data were visualized by using Figtree tool.

Keywords: *Pseudomonas aeruginosa, oprL, oprI, DNA sequencing, phylogenetic tree.*

Introduction

Otitis media (OM) is a term for inflammation of the middle ear and the tympanic membrane that often follows acute upper respiratory tract inflammation [1]. The pathogenesis andtheetiology of Otitis media are multiple including infections, allergy, genetic, racial, environmental, social factors, and eustachian tube dysfunction [2]. Clinically, Otitis media (OM) covering a broader range of illnesses including acute otitis media (AOM), chronic suppurative Otitis media (CSOM), and Otitis media with effusion (OME)[3]. Otitis media are highly prevalent worldwide, and resulting in complications often continued in the next stages of age[4]. The middle ear is the most part of the ear exposed to infection because it is open through the auditory canal that reaches the pharynx, Which provides access air to the middle ear, and achieves the balanced pressure on the tympanic membrane, so the infectious factors coming from the nasal cavity and larynx via the Eustachian tube to reach the middle ear[5]. *Pseudomonas aeruginosa* is an opportunistic pathogen that causes clinically important infections in immunocompromised patients like cancer or AIDS patients. It also implicated with ear infections, cystic fibrosis patients, eye infections and urinary tract infections[6]. *P. aeruginosa* is causing deep-seated and gradual devastation of the middle ear and mastoid structures through producing toxins and enzymes.[7] This bacterium often causes acute otitis media in patients that have tympanostomy tube otorrhea and also it is often more detected in sub-acute cases than acute otorrhea[8,9]. It is the most bacteria isolated from Chronicsuppurative Otitis media[10]. Peptidoglycan-associated lipoprotein (*oprL*) and Outer membrane lipoprotein I (*oprI*) are peptidoglycan (secretory pumps) linked to the outer membrane protein in *P. aeruginosa*. The two genes are responsible for the intrinsic resistance to the antibiotics in *P.aeruginosa*[11,12]. *oprL* mass (17.898 Da) is Part of the Tol-Pal system has an important role in the outer membrane invagination during the cell division and is significant for preserving the outer membrane integrity. Tol-Pal system consists of five core proteins are inner membrane proteins (TolA, TolQ, and TolR), periplasmic protein TolB and outer membrane protein Pal. These proteins form a network linked the outer and

inner membranes and the peptidoglycan[13]. With regard to *oprI* has mass (8.835 Da)[14].

Materials and Method

Samples Collection: A total of 210 of middle ear swab samples were collected from (OM) patients attending to the ENT Department in AL-Habboubi Teaching Hospital in Thi-Qar province, Iraq. Which includes both males and females of different ages. During the period from August 2018 to January 2019. These samples were taken by the ENT physicians via using a sterile cotton swab. It was ascertained that the patient did not take antibiotics for three days before taking the sample.

Isolation and Identification: Only 65 samples were a positive culture of *P. aeruginosa*. These samples culturing on blood agar, MacConkey agar, and Cetrimide agar. Also diagnosed with different biochemical tests, including Oxidase test, Catalase test, Gram staining, IMVIC tests, hemolysis in blood agar, smelling, and phenotypic characteristics and confirmed by API-20 NE system and Vitek-2 compact[15].

Polymerase Chain Reaction: All *P. aeruginosa* isolates grew in Brain-heart infusion broth and incubated at (37°C) for 24 hours. The genomic DNA was extracted according to the manufacturer's company instruction (Sintol, Russia). Gel electrophoresis was performed under 1% and 2% agarose concentration and 100 volts for one hour. The primers used in this study (Table1). The amplification temperature for initial denaturation at 94°C for 5 min. followed by 35 cycles of denaturation 94°C for 30 sec., annealing 56°C for 30 sec., and elongation step 72°C for 1min., and final extension with 5 min. at 72°C. PCR mixture consists of (8 µl) of Master mix, (1 µl) Forward primer, (1 µl) Reverse primer, (7.5 µl) dd H_2O, (2 µl) DNA template, and (0.5 µl) $Mgcl_2$. The total volume of the PCR mixture was (20µl).

Table 1: Sequences of PCR primers and the molecular size of the PCR product.

Reference	Product (bp)	Sequences of Primers	Gene	
(16)	860	CGCGTCGAGCTGAAGAAGTA	F	oprL
		CGGGATCAGCGAAGGTTCTT	R	
	312	TGCAGCAACTCTACCCAAGG	F	oprI
		GGTTTCTTTGGAGTGGCTGC	R	

DNA Sequencing: The PCR product for five samples for each gene (Named S1, S2, S3, S4, and S5) were sequenced for (forward and reverse) primers based on the instruction manuals of the sequencing company (Macrogen, Korea). Only clear Chromatographs that obtained from ABI sequence files were further analyzed, ensuring the annotation and variations are not because of PCR or sequencing artifacts. By comparing observed DNA sequences of local bacterial isolates with the retrieved neighboring DNA sequences of the NCBI Blastn engine.

After that, the sequencing results of PCR products for each sample were submitted for further analysis. Edited, aligned, and analyzed as long as with the sequences in the reference database using BioEdit Sequence Alignment Editor Software Version 7.1 (DNASTAR, USA). The observed variations in every isolate sequence were numbered in PCR amplicons and in its corresponding position in the reference genome.

The Comprehensive phylogenetic analysis

In the present study, A specific comprehensive bacterial tree was generated based on the protocol done by [17]. The bacterial variants that observed were compared with their neighbor homologous reference sequences, by using NCBI-BLASTn server [18]. After that, the blast results of the observed variants were combined and aligned together by using a (Clustal Omega based tool). A full comprehensive tree, including the observed variants in our study, was visualized as a polar cladogram by using Figtree tool, (http://tree.bio.ed.ac.uk/software/figtree/). Lastly, bacterial sequences for every classified phylogenetic species-group in the inclusive tree were colored appropriately.

Results

PCR amplification results showed the existence of the *oprL* in 58/65 (89.23%) isolates. Whereas, *oprI* found in 61/65 isolates (93.85%) (Figure 1 & Figure 2).

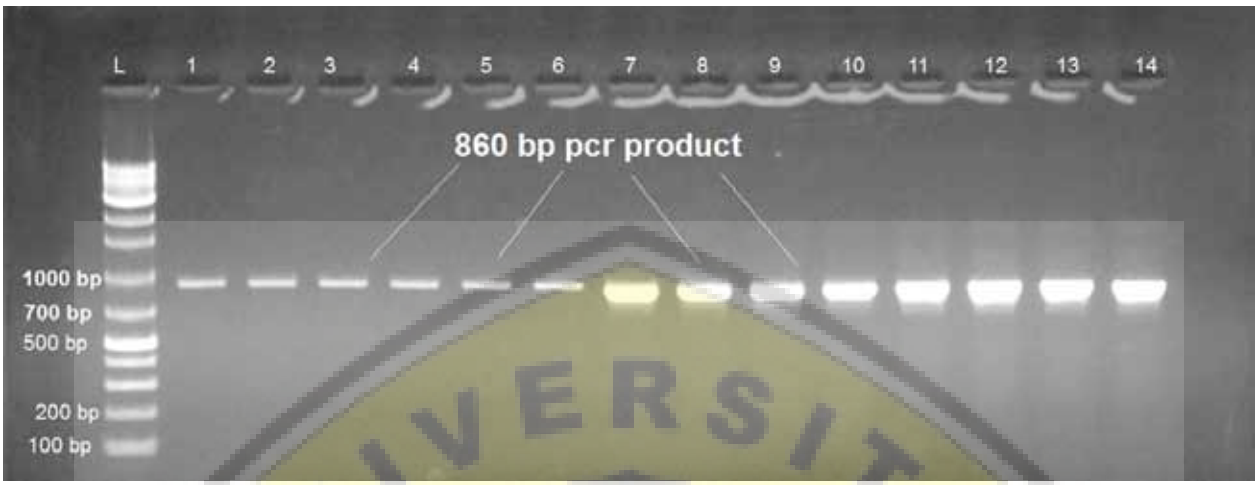

Figure 1: Agarose gel Electrophoresis of *oprL* gene 860 bp of PCR Product (L: DNA Ladder10000 bp, Agarose:1%, volt: 100v, Lanes 1-14 represent bands of *Pseudomonas aeruginosa* isolates).

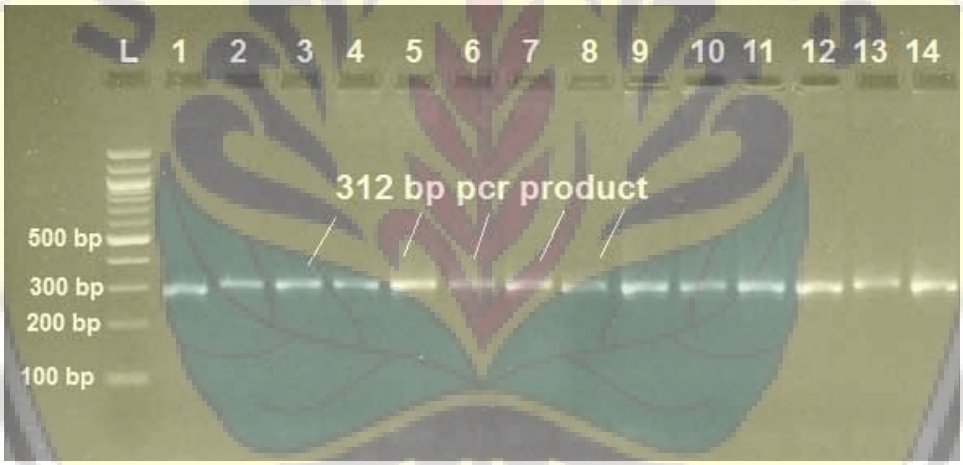

Figure 2: Agarose gel Electrophoresis of *oprI* gene 312 bp of PCR Product (L: DNA Ladder 100 bp, Agarose: 2%, volt: 100v, Lanes 1-14 represent bands of *Pseudomonas aeruginosa* isolates).

DNA Sequencing Results: In the present study, five samples were included that had shown to amplify approximately 860 bp and 312 bp genetic sequences in *P. aeruginosa* genome. The sequencing results revealed that the exact identity after performing NCBI blastn for these PCR products. NCBI BLASTn engine shown about 99% sequences of similarities between thelocal samples sequence and the reference sequences. The DNA sequences of *oprL* gene and *oprI* were compared with the retrieved DNA sequences (GenBank acc. no. CP032541.1, CP039749.1), respectively. The alignment results of the *oprL*(860 bp) samples showed the presence of twelve variants occurred in this position distributed in several samples in comparison with the referring reference DNA sequences. While the alignment results of the *oprI* gene revealed the presence of one variant in this position in comparison with the referring reference DNA sequences.

Discussion

A phylogenetic tree can be constructed to demonstrate the bacterium's situation in the evolutionary order dependent on base contrasts between species. This method is rapid and extremely exact and analysis of a

countless number of available programs and databases[19]. The current study revealed the prevalence *oprL* gene in 58 isolates and *oprI* gene in 61 isolates (89.23%), (93.85%) respectively. A previous study showed *oprL* gene *oprI* gene found at the same percentage (54.5%) in Otitis media [16]. A previous study found the *oprI* gene prevalence was (47.4%) in samples that isolated from active chronic otitis media [20]. These results came very differently from our results. The existence of these genes in bacteria enhances resistance to different environmental condition and antibiotics.A result of finding these genes in most isolates in our study can be used in rapid diagnosis of *P. aeruginosa*. But some studies referring to although the sequencing of the entire genome of *P. aeruginosa* has been completed, the diagnosis by using these genes, high sensitivity, and low specificity because the genomes of the closest relatives organisms have not completed. The presence of false-positive reactions among other species during PCR assay of these genes refers that they may contain some similar sequences of these in their genomes [21]. Thus, the use of a single gene in the molecular diagnosis of *P. aeruginosa* may contain the same polymorphisms that making the biochemical identification of this organism complicated [22].With respect to the phylogenetic tree of *oprL*gene,Though the five studied bacterial isolates had located in four distinctive positions within this tree, with concerning all phylogenetically analyzed isolates, no deviation from *P. aeruginosa* species was observed within this comprehensive tree. This fact is observed in a currently generated comprehensive phylogenetic tree almost all the observed sequence-related species have belonged to *P. aeruginosa* species. However, the currently constructed tree has one exception represented by the presence of other species within the same genus (*Pseudomonas* genus) which is *Pseudomonas flourescens*. The phylogenetic profile results revealed the five local isolates occupied several locations in the tree. S1, S2 occupied a neighboring position beside CP032541.1 and similar to sequence this strain. CP032541.1 (PGN5) strain isolated in Huntington, West Virginia (WV), USA., With concern S3 located between CP037925.1 (AES1M) and CP030861.1 (HS9) strain. CP037925.1 strain isolated from the sputum of cystic fibrosis patients in Melbourne, Australia. CP030861.1strain isolate in Shanghai, China. While S4 located between CP012001.1 (DSM 50071) and CP008749.1 (PAO1H2O) strain. CP008749.1 strain isolated from water in Bluefield, WV, USA.. With respect to S5 taken position near CP029097.1 (AR439) strain and CP015648.1. CP015648.1 (M8A4) strain isolated from crude oil residual water in Colombia. This *oprL*-based comprehensive tree provided additional inclusive tool about the high ability of *oprL* fragment to efficiently identify *P. aeruginosa* isolates. Our phylogenetic results showed a very high specificity of *P. aeruginosa* identification with *oprL*- based PCR - phylogenetic protocols. In the present study, with concerning to the *oprI* amplicons all the five studied bacterial variants had occupied two distinctive positions in this tree. The noteworthy, the construction of *oprI*–based comprehensive tree had detected a powerful ability of this amplicon to precisely identify of analyzing *P. aeruginosa* samples. S1 occupied position different from other local samples. It is located beside CP038661.1 (AJ D 2) strain. This strain isolated from the rhizosphere of cotton in India. With regard to other isolates (S2, S3, S4, and S5) located on one level on the comprehensive tree. That occupied position between CP022001.1 (Pa1207) and CP017293.1 (PA83) strain. CP022001.1strain isolated from blood children with bacteremia in Mexico city. With respect to CP017293.1 strain PA83 isolated from a human in Germany.

Conclusions

The present study highlighted the role of *Pseudomonas aeruginosa* resistance factors in Otitis media patients in Nassyriah City, southern Iraq. Moreover, the importance of the Phylogenetic analysis in the epidemiology and finding the relationship and similarity between the local isolates and other global isolates in Genbank.

Effect of Bio-Fertilization and Foliar Spraying in the Mustard Seed Content Brassica Alba L. from Some Fatty Acids

Madeha H. Hussain[1], Jassim J. Jader[2], Ali S. Hassoon[2]

[1]Department of Pharmacy, Medical Institute Tech. Mansour/Middle Tech. University, Iraq,
[2]Department of Soil and Water Techniques, Al-Musaib Tech. College/Al-FuratAl-Awsat Tech. University, Iraq

Abstract

The field experiment was carried out in the fields of one of the agricultural in the district of Mahaweel in the province of Babylon during the agricultural season 2016-2017 to study the effect of bio-fertilization and foliar spraying in the content of mustard seeds from some fatty acids. The factorial experiment was applied in accordance with the randomized complete blocls design (RCBD) with three replicates. The experiment included two factors: the first factor is the bio-fertilization of the mycorraiza fungi (without addition, addition of the mycorraiza) and the second factor is the foliar spray with PRO.SOL solution in three concentrations (0, 5, 10) Ml/l.Fatty acids were estimated (Eruic acid,Oleic acid, Linoleic acid, Palmitic acid, Stearic acid α-Linolenic (Using HPLC, the results showed that bio-fertilization and foliar spraying increased the seed content of fatty acids by the superiority of treatment T 5 on all other treatments and gave the highest rates of Palmitic (179.21) µg/ml, Stearic (132.01) ug/ml and Eruic (225.19) ug/ml and Oleic (140.03) ug/ml and linoleic (77.20) ug/ml and α-linolenic (178.95) ug/ml.

Keywords: *Mustard, Bio fertilization, foliar spraying, fatty acids HPLC.*

Introduction

Brassica alba L. is one of the most important medicinal and oil crops in the world. It belongs to the Brassicaceae family, which contains about 350 genus and 3500 species and is one of ten important economic families.[1] Ranks fifth among the world's most important oil crops after soybeans, sunflowers, and field pistachios and cotton[2]. Mustard has great medicinal importance as there are many chemical studies on the seeds of white mustard seed, which included clinical studies to support the medical application of mustard oil, and formed derivatives (allylisothiocyanate)Which amounts to 60-92%, which is an important component in stopping cancer and is considered an antioxidant compounds (Antioxidant),White mustard is used medicinally in the pharmaceutical industry and for treatment of many diseases such as rheumatism treatment and tranquility, as well as its use as a laxative, analgesic for angina, cough, abdominal and chest pain, prevents atherosclerosis and hypertension, treats gout, It has been proven to treat cerebral palsy, headache, dizziness, tonsillitis, narrowing of the respiratory tract, used as a neurosurgery, treatment of stomach pain, lung congestion, cracking of hands, fear and enlargement of lymph nodes. As well as to improve appetite and digestion, softens the intestines, expels the gases, and the saliva of the saliva and the skin and numb the nerves of the skin to remove the feeling of pain in its place [3,4]. The importance of bio-fertilizers has been increased as a supplement to agricultural operations, the widespread use of which has reduced the collateral damage resulting from the use of fertilizers and chemical pesticides. Bio-fertilizers have received widespread attention in recent years due to cheap prices and environmentally friendly fertilizers,It works to improve plant growth by releasing growth-promoting substances and increasing the readiness of some major elements such as phosphorus and micronutrients, thereby

increasing plant growth rather than maintaining soil fertility. The protection of certain pathogens as well as their role in improving water relations and increasing the tolerance of the host to drought. It also works to improve the soil building through the release of chlorine, which works to maintain soil and increase the soil's ability to retain water [5,6]. The importance of foliar spraying is that it provides the plant with its various nutrient requirements during the various stages of growth[7] and from the common foliar fertilizers, which contains the major nutrients (N, P, K), as well as containing many elements The addition of these elements to the soil lead to sedimentation and lack of use, especially in the soils of our country Iraq[8].

The objective to study the effect of bio-fertilization and foliar spraying in the content of mustard seeds from some fatty acids and their estimation using HPLC.

Materials and Method

The field experiment was carried out in the fields of one of the agricultural in the district of Mahaweel in the province of Babylon during the agricultural season 2016-2017 to study the effect of bio-fertilization and foliar spraying in the content of mustard seeds from some fatty acids and their estimation using HPLC. The factorial experiment was applied in accordance with the randomized complete block design (RCBD) with three replicates. The experiment included two factors: the first factor is the bio-fertilization of the mycorraiza fungi (without addition, the addition of the mycorrhiza) and the second factor is the foliar spray with PRO.SOL solution in three concentrations (0, 5, 10) Ml/l.Random samples were taken from the soil before planting in depth (0-30 cm) for the purpose of knowing the physical and chemical soil properties (Table 1), which shows the soil characteristics. The soil was prepared and its plowing was orthogonal plowing and was cleaned and settled and then divided into three replicates each of 6 experimental units with an area of(2 x 3) m^2. The seeds were planted on 5/11/2018 by placing three seeds in each seedbed, 10 cm between seeds bed and 2 cm deep For small size seeds,After that, all the soil and crop service operations were carried out, such as spawning, weeding, irrigation, fighting, and others. The mycorrhiza *Glucusmosseae*, which is produced in the laboratories of the Agricultural Research Department of the Ministry of Science and Technology, was added to a mushroom vaccine of 35 g per jour in the treatment along the lines of cultivation foliarspraying ProSol is produced by ProSol International and is a fully soluble fertilizer containing a balanced ratio of major nutrients and an important group of micronutrients such as zinc, manganese, boron, and others. Spray paper fertilizer on vegetative parts in the early morning and in three installments after the first month Of agriculture and repeated spraying every month. The mixture of fatty acid were separated on m FLC(Fast Liquid Chromatographic) on reversed phase 3 µm particle size, (50 x 2.0 mm I.D) C-18DB column, separation occurred on liquid chromatography Shimadzu 10AV-LC equipped with binary delivery pump model LC-10A Shimadzu, the eluted peaks were monitored by Shimadzu SPD 10A vp Detector at 215 nm,the data were recorded on shimpack C-R8A integrator (Shimadzu,koyota, Japan). The optimum separation condition as follow

Column: FLC (Fast Liquid Chromatographic) column, 3 µm particle size, (50 x 2.0 mm I.D) C-8DB column

The mobile phase was: acetonitrile: tetrahydrofuran (THF):,0.1 % phosphoric acid in THF (50.4:11.6: 38, V/V) detection: UV set at 215 nm the flowrate of 1.5 ml/ min. temp: 40 C.

The sequences of the eluted fatty acids standard were as follow, each standard was 25ug/ml

The HPLC separation profile revealed the presence of various chromatographic peaks in the studied mustard seeds sample extract. The assayed of the separated compounds representing the major detected peaks and summarizing the obtained data for each of the detected chromatographic peak are discussed below. Quantitative determination of fatty acids was done by comparison the peak area of authentic standard with that of sample peaks under the same optimum separation condition, by using the following equation:

Concentration of sample µg/ml = [(Area of sample / Area of standard) × conc. of standard x dilution Factor]

Results and Discusion

The results of Table (4) show that bio-fertilization and foliar spraying resulted in an increase in the content of mustard seeds of fatty acids. The bio-fertilization of the Mycorraizafungi led to increased fatty acids in mustard seeds. The treatment of T1 gave the highest rates of all measured fatty acids is Palmitic acid (*(166.93* µg/ ml, Stearic (121.14) ug/ml,Eruic (219.63) ug/ml, Oleic

(128.21) ug/ml and Linoleic (68.94).While the control treatment was given to the lowest of all measured fatty acids. This may be due to the fact that bio-fertilization increases the efficiency of nutrient absorption due to the infection of Mycorrhizaby means of fungus that extends far deeper into the soil than the root hairs, and its absorption efficiency is better than root hairs, The fungal infection leads to increased chlorophyll, plastids, activity and mitochondria, improving the nutritional status of the plant and thus increasing the active substance. These results were consistent with the results(10) and what he found (11).As for the effect of foliar spraying it has led spraying a concentration of T3 10 ml/letter higher rates of acid oils measured compared not spray To treatment T1, as given treatment T3 higher rates which Palmitic reached (169.25) µg/ml and Stearic (119.86) ug/ml and Eruic (217.93) ug/ml and Oleic (123.52) ug/ml and Linoleic (63.10) ug/ml and α - linolenic (161.67), ug/ml and may be attributed largely to foliar spraying content of major nutrients and micro led to increased vegetative growth and reflected this positively increase metabolic outcomes and outputs of the secondary active compounds including fatty acids, these results agreed with his findings (12)(13)(14)interaction between bio-fertilization and foliar spraying increased the content of mustard seeds from fatty acids, if treatment T 5 was highest compared to all other treatments, Palmitic was 179.21 µg/ml, Stearic (132.01) ug/ml, Eruic (225.19) ug/ml and Oleic (140.03) ug/ml and linoleic (77.20) ug/ml and α-linolenic (178.95) ug/ml.

Table (1) Physical and chemical properties of soil

Character	pH	Ec	N Mg.kg-1	P Mg.kg-1	K Mg.kg-1	Organic Matter (%)	Soil separators			Texture
							Sand gm.kg-1 soil	Loamy gm.kg-1 soil	Clay gm.kg-1 soil	
Value	7.6	2.5	35	14.28	16.2	0.75	446	403	151	Sand loamy

Table(2): The Retention Time and the area of fatty acids

Seq	Subjects	Retention time minute	Area	Concentration
1	Palmetic C16:1	2.67	148513	25ug/ml
2	Stearic acid C18:0	3.48	215419	25ug/ml
3	Erucic acid	4.83	182735	25ug/ml
4	Oleic C18:1 omega 9	5.74	190503	25ug/ml
5	Linolenic C18:2 omega 6	6.04	166361	25ug/ml
6	α -Linolenic C18:2 omega 3	8.0	165643	25ug/ml

Table(3): Treatments used through the study

Treatments	Type of Treatments
Control To	Without Treatments
T1	addition of the mycorrhiza
T2	foliar PRO.SOL 5 ml/letter
T3	foliar PRO.SOL 10 ml/letter
T4	Mycorraiza + foliar PRO.SOL 5 ml/letter
T5	Mycorraiza + foliar PRO.SOL 10 ml/letter

Table (4): Concentration of fatty acid extracted from mustard seeds oils in µg/ml in different samples

Treatments	Palmitic acid	Stearic acid	Erucic acid	Oleic acid	Linolic acid	α -linolenic acid
Control To	161.30	110.30	213.59	115.90	55.03	152.45
T1	171.51	121.14	219.63	128.21	68.94	165.23
T 2	166.93	114.60	215.07	119.12	59.12	157.44
T3	169.25	119.86	217.93	123.52	63.10	161.67
T 4	176.18.	128.15	222.84	135.98	72.91	172.13
T 5	179.21	132.01	225.19	140.03	77.20	178.95

Conclusion

In light of the results of the study obtained, we can conclude that the bio-fertilization of the Mycorrhiza and foliar spraying by PRO.SOL has had an effect in increasing the content of mustard seeds of fatty acids.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Pharmacy, Medical Institute Tech. Mansour/Middle Tech. University, Iraq and all experiments were carried out in accordance with approved guidelines.

Evaluation of the Performance of Language Students Applied in the Use of Communication Skills

Aqeel Abdul Hamza Husein[1], Arif Hatam Hadi[1], Safaa Obaid Hussein[2]

[1]Prof., [2]Assist. Prof., University of Babylon–College of Basic Education, Iraq

Abstract

This study was conducted at the University of Babylon – college of Basic Education, the aim of evaluating the performance of the Arabic language studnetses in the faculties of basic education was to use communication skills in body language. The researcher adopted the descriptive approach to achieve the objective of the study, the sample of the study was randomly selected from the applied students as it reached (40) applied and applied, distributed to (34) schools, prepared researcher research tool (note form) with the skills of body language consists of (8) key skills, and derived from (20) sub-skill, and then presented to a group of arbitrators agreed to (17) skill, the researcher applied the tool to the research sample himself and then the data were treated statistically by using Pearson correlation coefficient, weighted mean, square (Ka 2), and centimeter weight. The study found that the performance of Arabic language proficiency in communication skills non-verbal in varying proportions, and lack of interest in the application of the Arabic language in practical application.

Keywords: *Calendar, performance, applied, Arabic language, communication skills, body language.*

Introduction

The task that has emerged from other languages with its long history, and its intellectual and literary wealth, and its civilization, which brought the old humanity with its modernity [1], this language has been linked to the Arabism's life as a link closely related to the roles of its ancient and modern history. [2]as the teacher is the key to the educational process, and the leader of the society on which he depends on the upbringing of his children, the teacher is no longer a mere communicator of knowledge, but the education of generations is a mental, moral and physical education [3]. The teacher is no longer just a teacher but a learner of knowledge and learner has an important role in the process of education and directing these processes[4]. The evaluation has an important role in all educational process, because it includes students, teachers and curricula teaching aids, and the evaluation process is based on collecting information under which decisions are made [5] and that the process of communication is of great importance in the educational process . It is based mainly on what is going on between the teacher and the pupils in educational situations [6], the communication either be verbal or non-verbal, verbal communication refers to words that are used in communication, while nonverbal refers to the communication that is produced by other means of words such as (eye, hand, facial expressions, head movement, distance or acoustic stimuli, and silence), the language of the body as a non-verbal communication means to show the person feelings, ideas and attitudes towards others through physical movements, so we find teachers practice the body language on a large scale and routinely according to the situation, It is widely known signals, put the finger on the lips to ask for silence, raise the hand shoulder level to understand it stops, and winking means a signal for something common to the two persons, the use of eyes that can communicate effectively[6], and the smile to indicate the approval of something, the use of body language does not only affect students' study

University of Babylon–College of Basic Education, Iraq

of educational materials but also in their imagination and feelings. One of the objectives of colleges of basic education is that prepare teachers who are teaching tasks for future generations, in three aspects according to their programs; These aspects are the exact specialist aspect, the general cultural aspect, and the professional educational aspect. The application material falls within the qualification of the teacher in the professional side, this is the material through which the student's success can be measured in all aspects of qualification in the institution of his preparation[7], However, this article did not take its right in the programs of teacher preparation, noting the existence of weakness in the importance of implementation, duties and concept of students applied, As well as lack of experience in this area, and weak scientific and professional preparation of students applied in the light of the current program, and shorten the time allotted for practical application as it is not sufficient to apply the principles and educational foundations received by the student applied and learned through scientific and educational courses. As well as their lack of sufficient verbal and motor communication during classroom performance[8]. Some specialists and educational supervisors noticed it closely through their frequent visits to students from the College of Basic Education, there is a clear weakness in their level in general and in communication skills in particular [9], and based on the above the problem of research crystallized through the researcher's sense in the presence of a need to undertake a scientific study assessment of the skills of communication in the body language of the applied students.

Study Questions and Objectives:

1. What communication skills in body language are required for the students of the Department of Arabic Language at the Faculty of Basic Education?
2. What is the level of performance of the Arabic language faculty of basic education in the use of communication skills in body language?

The Importance of Studying:

1. The theoretical side: The fortification of cognitive balance study contribute to providing information on body language and use in educational institutions, and therefore its importance for students applied, and an incentive to them should be known and used in educational institutions, to transform into a scientific and systematic practices.
2. The applied importance: The importance of this study stems from the importance of teacher performance and the conduct of educational behavior and educational role interactive within the educational attitudes and paid students to the positive interaction, and all this requires development and innovation in the number of teachers' program academically, educationally and professionally, and this study on the subject of skills communication in body language in Arabic was few.

1. **Evaluation:** "An organized process to collect and analyze information, and it involves a valuable judgment, requires prior identification of educational goals, and achieves the fundamental purpose of providing important and useful information to educational decision makers." (Makhail, 2017, p. 153)
2. **The Performance:** "A work, or an act or the behavior of the author, which is the result of collection processes practiced by the teacher, which are related to specific knowledge, skills, concepts, attitudes and values, and differ from teacher to teacher depending on the different background.

Definition of Performance Procedural: It is what the student applied from the Department of Arabic language in the colleges of basic education, as communication skills in the sub-body language, contained in the observation form which was organized by the researcher, while teaching Arabic language branches during the period of practical application in primary schools.

3. **Non-verbal communication skills:** "It is a communication that does not use words or words, but through other method such as the use of the signal in multiple areas, and may be the most famous use in the body language and its various expressions.

Define non-verbal communication skills procedurally: All that is related to gestures, signals and body language, which is intended to convey the meanings, facts and ideas and explain them to the students of the primary stage without the use of words and words**.**

The theoretical framework of the study:

The concept of the evaluation: The concept of the evaluation depends on improvement, modification and development. Evaluation means judging objects

or individuals to show the pros and cons and to review the validity of the basic assumptions on which the organization of work is based and developed.

Performance Evaluation: Since assessment means making a diagnostic judgment to identify and strengthen points, and identify the difficulties faced by the teacher and help him to overcome, it is a continuous process, Therefore, the teacher needs a continuous assessment to improve the level of performance, by establishing consistent criteria for that evaluation, to develop all the potential of teachers to provide many opportunities for continuous learning and achievement of excellence and excellence in the performance of the individual teacher and performance through the school, and aims to evaluate teacher performance to the insight of the teacher's status, and clarify the aspects of his superiority and weakness, to be fully aware of his condition, as well as to recognize the extent of his competence in explaining the article or the course he is studying, and his ability to communicate information to his students.

Non-verbal communication skills (body language): The education in the classroom is based not only on verbal communication skills, but there are non-verbal skills of communication has importance, they are frequent as verbal skills and are often associated with them too. these skills are used extensively in the classroom, it is one of the important method in the behavior of classroom management, communication skills in body language are spoken in the classroom through facial expressions, vocal gestures, body movements, gestures, signals, touch, time, lips, head movement, spatial distance, and dress [11],these non-verbal expressions are factors that help to focus the attention of students, and works to increase the clarity of the message that comes to the students through the words spoken.

Data Analysis Method: The researcher used statistical means that employ the statistical package spss, to display data and analysis, including Pearson correlation coefficient and percentage and weighted mean and the square Ka (Ka 2) and the equation Cooper.

Results and Discusion

This part of the research shows the use of nonverbal communication skills through the behavior of students in the educational situation, based on the data obtained by the researcher through the observation form to monitor these skills by the study sample. The results were presented through the frequency and percentage of the response for the following questions:

What are the communication skills in body language required for the students of the Department of Arabic Language in the colleges of Basic Education.

In order to answer this question, the skills of communication in body language were monitored in the daily learning quotas in the educational situation of the Arabic language. In order to answer this question, communication skills were monitored in the daily learning quotas in the educational situation of the Arabic language. The duration of registration in each study session (45) minutes, the researcher observed the direct behavior in the language of the body performed by the application in the educational situation, and then the data was unloaded from the observation form to be calculated repetitions and percentages of each behavioral paragraph in body language in the educational session.

Table 1. Calculate repetitions and percentages of each behavioral paragraph in body language in the educational session

Main Skills	No.	Sub Skills	Duplicates at sample	Percentage
Using the hand	1	Indicates the spruce to involve the student in something.	37	8%
	2	He moves his hand in a round shape as an expression to encourage the pupil to keep talking.	30	6%
	3	Shaking the index finger to the right and left is an expression of disapproval of something.	1	0%
Facial expressions	1	Smiling to the student who provides a valid idea for the purpose of notification of approval.	38	10%
	2	He uses the gestures of frown and eyebrows and look at the students for their feelings of dissatisfaction with what comes out of them.	11	3%

Main Skills	No.	Sub Skills	Duplicates at sample	Percentage
Head usage	1	Shaking his head to the bottom as an expression of approval and continuation.	37	8%
	2	He points his head down to ask his student to sit down	20	4%
Usage the eye	1	He opens his eyes strongly to show the exclamation point.	20	4%
	2	He distributes his insights among the students to attract their attention.	39	12%
The body movement	1	Improves the selection of the places in which they move among the students, and select the appropriate places to stand before them.	37	9%
	2	He approaches some unobserved students with the intention of drawing their attention and adjusting their behavior.	25	4%
Parallel language	1	Raise sound and reduce it according to the needs of educational situations and classroom management.	26	5%
	2	Improves the organization of the appearance and show his elegance in order to achieve better interaction with students.	39	12%
Time Management	1	Improves the distribution of the lesson time between the paragraphs of the lesson and its procedures.	20	3%
	2	Refers to the importance of a topic or point, detailing the explanation about it.	30	6%
Silence	1	Improves the use of silence in places that attract students' attention.	5	2%
	2	Silent to give the student an opportunity to think about the answer and to express opinion about it, and does not interrupt during the answer.	20	4%
Total Duplicates			**435**	**100%**

Interpreting Skill Results (Hand Use): The main skill included three sub-skills (ie, the sphincter to involve the pupil in a particular order), with a percentage (37%), while the percentage of skill (moving his hand in circular form to encourage the pupil to continue talking), And the percentage of skill (shaking the index finger to the right and the left as an expression of disapproval) (1%). This result indicates that the Arabic language users used these skills in a varied and acceptable manner.

Conclusion

The study found that the performance of Arabic language proficiency in communication skills non-verbal in varying proportions, and lack of interest in the application of the Arabic language in practical application.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the University of Babylon – college of Basic Education**,** Iraq and all experiments were carried out in accordance with approved guidelines.

The Effectiveness of (Hands and Minds) Model in the High-Level Thinking Skills among Fourth-Grade Students in Biology

Marwa Taemuh Earibi Alqizi[1], Ghadah Shareef Abdulhamza Al-Sheikh[1], Amnih Kazim Murad[1]

[1]*University of Babylon, College of Basic Education, Babylon, Iraq*

Abstract

The research aims to identify the effectiveness of (hands and minds) the model in the high-level thinking skills of students in the fourth grade of biology material, to verify the objective, the researcher put the zero hypothesis that states: There was no statistically significant difference at the significance level (0.05) between the average scores of the experimental group students who will study according to the (hands and minds) model and the average score of students of the control group who will study based on the standard method of testing high-level thinking skills, in order to achieve this, her experience was applied in the second half of the academic year (2018-2019), The research sample consisted of (60) female students of the fourth grade of science in Al-Khansaa secondary school, and it has been randomly distributed to two groups (30) students in each group, the two groups were equivalent in the following variables: temporal age, IQ test, the previous test information, test of high-level thinking skills in view of the behavioral objectives and the relative importance of the content, it has been prepared An achievement test consisting of (50) paragraphs of multiple choice.

Keywords: *Model (hands and minds), high-level thinking skills.*

Introduction

What is really unfortunate in the educational process is the low level of achievement of students in scientific subjects, especially biology, and this is due to the actual reality of their teaching which is still stagnant, as it is based on diction, tutoring and conservation, the memorization of the student, resulting in the neglect of educational activities, lack of student interaction, and reduction[1] of participation within the classroom and this affects negatively[4] on the student's thinking as he does not grow and does not stimulate his higher thinking skills, thus, his educational achievement is reduced in biology, which is a natural science and the old that teaches everything related to living organisms, as it is interested in studying the stages of life organisms from birth until the end of their lives, are directly related in various fields of life, as well as the science that is combined with other sciences, such as pharmacy,[2] medicine, chemistry in the pharmaceutical industry, and determine the source of vegetarian or animal or other, and to pay this medication in proportion with the biological and functional makeup of this object. Diwan (2018) has noted that is one of the sciences that we need in our daily lives it is an important and necessary science which defines our bodies as organs, cells and vital functions, it also identifies us with living things and plants and what is around us in the surrounding environment, the origin of the word "Biology" Greek consists of two sections (I) and Bio which means life and the second (logy) meaning science or study. This must be the biology teacher is very knowledgeable about the subject and has a high teaching ability to deliver the material to the minds of learners, as well as possess the ability to develop stimulate skills and

e--mail: marwa.alqizi@gmail.com

grasp the principles and biological concepts, because the process of teaching biology is not an easy task, it is a complex need to employ mental and manual skills in the way in which both the teacher and the learner play an important role, the fact that biology is the most applied concepts, which requires a manual effort and my mind, and this requires the method and models of teaching to meet their requirements, the dimensions of this problem must be worked out by reviewing the strategies and models of teaching used in the educational situation, and looking forward to the use of strategies and models of alternative teaching and modern development of high-level thinking skills in the student and change the cycle from the passive recipient to the active interaction, and hence the present study in the experiment of a modern model (the model of hands and minds), which belongs to the structural theory, which depends on the interaction of students with others a and that the role of the teacher is guidance and guidance, and depends on the idea that learning is a positive process, and accordingly the students should be active learners, and demonstrate their understanding rather than treat them as empty vessels that hurt the teacher knowledge within, it is based on the activation of a specimen the five senses of the student by thinking and working and appeared this model by French physicist Georges Charpak in 1996 as a project for the development of science and technology through the scientific method of inquiry. The study aimed to identify the effect of the use of the model (hands and minds) in the development of academic achievement and the trend toward science in intermediate school students. The study was applied to (126) students and the experimental method was adopted with partial control of two equal groups. They divided the students into two groups, According to the model (hands and minds)[6], and another officer studied in the traditional presentation method, and the researcher to find the equivalence between the two groups and used the researcher in the study of achievement and a measure of the trend, the researcher found a difference of statistical significance between the average scores of students of the two groups of research and for the total Experimental.

Methodology

Experimental design for research: The researcher used experimental design with partial control of two equal groups, one experimental and the other control.

Table 1. Experimental design with partial control of two equal groups, one experimental and the other control.

Groups	Equivalence	Independent Variable	The Variable Dependent	The Test
Experimental	1- Age is calculated by months 2 - The test of intelligence (Otis Lennon) 3 - Previous achievement in biology 4. Test previous information	(hands and minds) Model	Achievement	The test of achievement
Control		The ordinary method		

The research community and its sample: The research community represents all fourth grade students in schools (secondary and high school) official government day of the Directorate General of Education in the province of Babylon for the academic year (2018 - 2019), which its fourth grade scientific classrooms are not less than two divisions, and the sample of the research the researcher chose (Al-Khansaa secondary) In the center of the province of Babylon randomly to conduct the research, and after selecting the researcher (Al-Khansaa mix secondary school) to apply the experiment, she found that it includes three divisions of fourth scientific grade (A, B, C), the researcher selected a (30) female students who will study in accordance with (model of hands and minds) in the same way, the researcher randomly selected division (B)to represent the control group and the number of female students (30) who study according to (the normal method).

Equivalence of the two research groups: The researcher conducted a statistical equivalence between the experimental and control groups in some variables that affect the results of the experiment although the researcher chose the two groups in the random drawing

method, and that the students of the research sample from the social and economic center are very similar and they study in one school, but she made sure to parity with the following variables : The chronological age calculated by months, grades of the first semester, the intelligence test, test previous information in biology), the researchers compared the two groups in the above variables the results are as follows:

Table (2). Results of the T-test for the grades of the students of the two research groups

Variable	Group	Size of the sample	SMA	Standard deviation	The degree of freedom	Absolute Value		Level of significance at 0.05
						Calculated	Scheduled	
Age calculated by months	Experimental	30	166.66	18.16	58	1.34	1.67	Not statistically significant
	Control	30	165.30	17.80				
Marks of the first semester	Experimental	30	53.60	245.62	58	0.57	1.67	Not statistically significant
	Control	30	51.30	180.36				
IQ test	Experimental	30	40.76	42.38	58	0.33	1.67	Not statistically significant
	Control	30	41.30	37.45				
Achievement test for high level thinking skills	Experimental	30	5.03	4.24	58	0.13	1.67	Not statistically significant
	Control	30	4.96	3.13	58			

Adjusting Exotic Variables: Although the researcher investigated the equivalence of the two sets of research in some variables that are believed to affect the course of the experiment, they tried to avoid the effect of some extraneous variables in the course of the experiment. Some variables and how to control them are as follows: Accidents Accompanying Experience: Search for any emergency condition or accident obstruction, Experimental Extermination: No case of interruption or transfer of any student throughout the experiment, Sample selection: The two groups were randomly selected and the two groups were confirmed. The maturity factor: My research groups are also close to mine The effect of the experimental procedures: The researcher worked to limit the effect of experimental procedures that could affect the dependent variable during the course of the experiment.

The explorative application for the achievement test :It includes the following:

The first survey application: It was applied to a group of fourth grade students who were not in the research sample. The number of female students was 30 students. The purpose of this study was to know the clarity of the instructions and the guidance of the test and the comprehension and clarity of the test paragraphs for the students and to calculate the time required for the test. Out of each student, by calculating the arithmetic mean of time, it was found that the time needed to answer all the test paragraphs was (47) minutes.

Second survey application: It was applied to a sample of (100) female students in the fourth grade of scientific non-research sample, and the purpose of the analysis of the statistical achievement test paragraphs, namely the difficulty of paragraph, discrimination paragraph, the effectiveness of the wrong alternatives.

The statistical analysis of the test scores: The test scores were analyzed as follows:

The difficulty of the paragraph: The statistical analysis of the test paragraphs found that the coefficient of difficulty of paragraphs ranged from (0.35 to 0.54), so the test paragraphs are all good and difficult to appropriate.

The discrimination of paragraph: Means the possibility of items or paragraphs to detect individual differences of students and the test items are valid if the coefficient of discrimination of items is (0,20) and above, and the value of the coefficient of discrimination of the test scores between 0,26 0, 63). Thus, the test scores are characterized by a good and appropriate discrimination coefficient.

The effectiveness of wrong alternatives: The researcher conducted a statistical analysis (27% higher and 27% lower) to find the effectiveness of the alternatives ranging from (-0.37 to -0.51).

Test stability: Means that the test scores match once again, that is, it indicates the balance and stability of the students' grades in the test.

Method of finding the stability of the test:

The method of half-fragmentation: This method is one of the most used method, because it avoids the disadvantages of some other method in order to obtain two images of the test, the researcher divided the paragraphs of the test into individual, even paragraphs, choose the answers of students sample exploratory and adult (100), by extracting Pearson correlation coefficient between the scores of individual and even matrices, the stability coefficient was obtained by (0.87). Since the half-stability coefficient of the test does not measure the total homogeneity of the test (because it is only half constant) correction using the Spearman coefficient, whereas amounting to (0.93) and is a good stability coefficient from the point of view specialists.

The Keord -Richardson Method: The **Keord-Richardson** equation was applied according to the grades of the female students. The researcher found that the test stability value is (0.85) and thus is a good value and suitable so the test is constant.

The application of the testing tool: The experimental and control groups were informed of the date of application of the test before a week of its implementation. It was applied after the completion of teaching the specific material for the two research groups at one time and the researcher supervised the application of the test.

The statistical means: The researcher used the T-test equation for two independent samples to make the parity between the experimental and control groups in the following variables: (the age of time calculated by months, the students' half-year achievement in biology, the intelligence test (Otis Lennon, the previous information test) Pearson correlation equation The researcher used the equation to correct the correlation coefficient between the test parts (individual and even vertebrates) after being extracted by the Pearson correlation coefficient.

Results and Discusion

Table 3. The superiority of the experimental group on the control.

Groups	No. of students	SMA	Standard deviation	The degree of freedom	T-Value		The level of significance at 0,05
					Accounted	Scheduled	
Experimental	30	32.80	28.23	58	4.31	2	Statistical function
Control	30	27.06	24.68				

It is clear from the previous table that the experimental group is superior to the control group in the achievement test for high level thinking skills, so there is a statistically significant difference between the mean scores of the experimental group who study biology according to the model (hands and minds) . The study, which studies the same subject in the usual way in the collection test in favor of the experimental group, is consistent with the previous studies, which confirmed the superiority of the experimental group studied according to the (hands and minds) model on the control group, studied based on usual way, and this is what is clear to us that the teaching on the specimen (hands and minds) had a positive impact in understanding the information and scientific facts and solve the problems they experience the students and this will raise their grades. The results

showed the superiority of the experimental group that studied the biology according to the (hands and minds) model, as it had a positive effect in raising the level of achievement among the students, and attributed the reason to: Teaching using the (hands and minds) model raised the interest of students and gave them the opportunity to participate and exchange views and easy to learn what is given to them with the help of their colleagues, and this has reflected positively on the level of achievement. Teaching according to the (hands and minds) model make students more active and vital in the classroom as a result of the involvement of the five senses and thinking, ie, activating hands and minds in the form of activities and practical experiences. Teaching according to the (hands and minds) model on the role of the student from the recipient of the information to the actor, participation and productive, ie, make the student the focus of the learning process after it was centered teacher. Teaching the use of the (hands and minds) model increased the confidence of students themselves and their views, through the generation of ideas and discuss them, which enabled them to understand deeply and retain information and reduced the process of forgetting, which reflected the level of student achievement in a positive manner. Teaching using the (hands and minds) model stimulated the thinking skills of students and helped them to research, discovery and investigation, in addition to adding to the lesson a kind of fun and suspense, because it encouraged collective participation and cooperation between students and information biology from theory to practical applied and this makes the studying more attractive to students and this raises the level of achievement of them.

Conclusion

In the light of the results of the research, the following conclusion was reached: The effectiveness of the model (hands and minds) in the high level of achievement compared to the normal way.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the University of Babylon, College of Basic Education, Babylon, Iraq and all experiments were carried out in accordance with approved guidelines.

The Impact of the Representation Strategy for Development of the Concepts and its Effects on the Mental and Emotional Aspects of the Students

Mutlaq Musa Salman Al-Krititi[1], Riyadh Hataf[1], Asaad Al-Najjar[2]

[1]Asst. Prof., [2]Asst. Prof., University of Babylon–College of Basic Education

Abstract

The aim of this study was to find out the effect of the documentary representation strategy in acquisition the study relied on the experimental approach as a methodology for conducting research which includes an independent variable (the representation strategy, the usual method) and a dependent variable (acquisition of concepts), a partial experimental design was adopted to set the search variables, before starting the experiment, reward the researcher with the two research groups for the purpose of obtaining close and objective results with the following variables (The chronological age calculated by months, the first grade grades in the rules, parental achievement, former teacher test), the researcher prepared the implementation requirements of plans, objectives and tests for the two research groups, after completing the experiment, the researcher applied the research tools to the two research groups, after correcting the students' answers, each student received data for the experimental group and the control, if the data were processed statistically by two independent samples and showed, the experimental group, which was studied according to the DTP strategy, surpassed the control group which were studied in the usual way in the variable concept acquisition.

Keywords: *The strategy of documentary representation, acquisition of concepts, grammar of the Arabic language.*

Introduction

The world today is witnessing remarkable progress in all fields the follower of the educational process finds that there has been a remarkable transformation has emerged in the last quarter of the twentieth century on studies related to learning and education[1], after psychologists and educators focused on the principles of behavioral theory in their interpretation of the processes of learning and education became in the early seventies that they focus on the principles of (the cognitive constructivism theories)[2]. The behavioral theory interprets the learning process as measurable observation responses, strengthened through practice and promotion, in which cognitive constructivism views this process as internal mental processes, it is expressed by the ability of the learner to visualize, understand, absorb, retrieve and use the information presented in similar situations. In other words, knowledge remains in the mind through mental processes[3]. Therefore, the rules have an importance and a preference for the language and it features the evaluation of its validity, its pillars, the axis of its linguistic systems, and the wall that protects the Holy Quran and Sunnah from any attempt. Where the researcher believes that today we need to codify our science and ideas in Arabic language [4] is empty from the grammatical mistakes of the past and the present in the future, this will be achieved only by learning Arabic grammar based on this, the researcher believes that there is a need to activate the teaching method of Arabic grammar by using modern strategies that take into account the student's positive participation in the educational situation and make it the center of education in keeping with the basics of

University of Babylon–College of Basic Education, Iraq

active learning within the classroom without ignoring the role of the teacher, as a key to the success of the educational process. Therefore, the educational system becomes more positive when it focuses on a range of modern strategies such as a prototyping strategy as this strategy helps the student in the acquisition of grammatical concepts using the structural plan and this is confirmed by Ozil in his cognitive theory of information, ideas, concepts and facts, except from the educational or social medium, provided that education is meaningful so that it is stored in memory[5], it is logical that the researcher used this strategy to help students to acquire grammatical concepts and retention because grammatical concepts are one of the most important bases for the construction of grammatical rules, so we find men of education emphasize the importance of learning and teaching concepts whereas Gagne and Bissis (1974) believed that the acquisition of the concept makes learning possible because it frees the learner from adhering to a particular emotion as well as helping him to think at a higher level of sensory perception. The teacher must rely on several method and method to measure the acquisition of the concept through the application acquisitions of concept such as distinction between positive and negative examples of the concept and the ability of the learner to determine the verbal[6] significance of the concept (definition) and its application in educational situations The present research aims at finding out the effect of the strategy of representation in the acquisition of grammatical concepts among middle school students. The structural approach is the latest in the teaching of science and knowledge. This trend has emerged as a result of the transformation of a president in the educational research during the past two decades of time. The researchers in education have shown this transformation significantly[7]. They focused on how the meanings of concepts in the learner are formed in a cognitive structure that integrates with the previous. The constructivism of the intellectual doctrines that formed a revolution in research and application within the framework of human studies and method of dealing with knowledge and acquisition[8].

Steps of teaching the strategy of documentary representation: Through the researcher acquainted with the literature and educational studies, which talk about the strategy of representation of the documentary that is centered around three levels and was defined as procedural: -

- **The virtual level:** It is all that can be seen by the naked eye of scientific phenomena through conducting a practical experience or watching a video or the presentation of images and therefore depends on the interpretation of physical characteristics in terms of shape, color, size and other characteristics.
- **The symbolic level:** It is the conversion of what was seen at the virtual level, ie, the use of this information by summarizing the subject and installed on the blackboard.
- **The partial level:** It is to conduct the evaluation process in general and then make a final editorial summary in a short way to match the time in the classroom.

The advantages of the digital representation strategy:

Through the researcher's application of the strategy, he found several advantages of this strategy:

1. Encouraging the student enthusiasm to learn for practical applications and the possibility of being represented in minutes.
2. The student can move between the thinking levels of Johnston.
3. Developing the student's ability to build accurate and scientifically sound concepts.
4. Expand the new concept of students by applying the concept in new positions in the life of the learner daily.
5. Encourage students to go beyond the concept by offering additional examples or problems related to the concept.
6. Increase the skills of students and their abilities to self-learning and investigation and problem solving and decision-making and to reach a stage where they feel that learning them meaningful and not just memorization and memorization of information.

Methodology

It includes a presentation of the procedures followed to achieve the objectives of this research in terms of adopting the appropriate method, the appropriate design, the research community, the method of selection of the sample and the method of parity of the two groups and a presentation of the research requirements, tools and how to apply them.

Experimental Design: Since the aim of the research was to identify the effect of teaching on the strategy of (representation) as an independent variable in the acquisition of grammatical concepts for students as a dependent variable, the researcher adopted experimental design with partial control in two equal groups (experimental study according to the strategy of representation and a female examiner according to the usual method).

The Research Community: The current research community includes students of the second grade intermediate of Day school of the General Directorate of Education in Babil Governorate / Hashemia Sub-Department of Education for the academic year (2018-2019).

The Research Sample: The researcher chose the random sample of the study. Al-Rahman School which consisted of four divisions. Two random groups were also chosen to represent the experimental group and the control group. To achieve the objectives of the study, as in Table (1).

Table (1) Represents the number of students in the experimental and control groups before and after exclusion:

Division	Groups	Before exclusion	Excluded	After exclusion
A	Experimental	43	3	40
G	Control	46	4	42
Total		**89**	**7**	**82**

The researcher ruled out the students who have failed as they have previous educational experience in the subjects to be studied during the experiment and this affects the accuracy of the results of the experiment, although the researcher has excluded them from the results only.

The equivalence of the two research groups :

Prior to actual teaching, the researcher conducted an equalization of the students of the two research groups statistically in a number of variables that would affect the safety of the experiment, the accuracy of its results is as follows:

The students' chronological age is calculated in months, the academic achievement of parents, the achievement of mothers, the grades of students in the first semester of the academic year 2018/2019 in the grammar of the Arabic language.

Adjusting the extraneous variables: Despite parity procedures by the researcher between the two research groups, the researcher tried as much as possible to avoid the effect of some extraneous variables in the confidentiality of the experiment, and then in its results here are some of these variables and how to adjust them .

Experimental Extermination: There was no interruption of students in the two current research groups throughout the trial period.

Experiment and Accident Attempts: Experiences may be experienced natural or abnormal accidents during experimentation cause obstruction of the experiment . It will have an effect on the dependent variable next to the independent variable, and no experiment has been experienced . The current research into any incident impeding its progress so the effect of this factor could be avoided.

The Sample Selection: Randomly selected and both groups were checked.

The process related to the maturation: This factor had little effect in the current research, because the duration of the experiment was unified between the two research groups, as well as experimental design adopted by the researcher experimental design with partial adjustment, and on this basis, the resulting maturity and growth will return to students of my group search, effect of experimental procedures: The researcher worked to limit the effect of experimental procedures that can affect the dependent variable during the course of the experiment.

Setting Up Search Tools: The research materials are basic and according to which the research procedures are carried out, which is: (The educational material: The teaching material that the researcher is teaching was determined for the students of the research groups during the period of the experiment (the second semester) of the academic year (2018-2019) The first seven topics of grammar in the Arabic language book included the part to be taught to the second grade of intermediate school students.

The Behavioral Goals: The researcher formulated (69) goals in light of the general objectives of the content of the material to be taught during the duration of the experiment is distributed among the five levels of knowledge in the Bloom classification (recall, understanding, application, analysis, synthesis) . The researcher has presented a list of behavioral goals to selected experts of language specialists and teaching method, and in educational sciences to take their views and their suggestions regarding the validity of the formulation of the objectives and the extent to which they represent the subjects of the study content covered by the experience, Preparation of teaching plans: The researcher prepared a set of teaching plans for the experimental and control groups in the light of the subjects of the book to be taught to students, the number of teaching plans (7) plans for the experimental group according to the strategy of documentary representation and similar to the control group according to the usual method).

Research Tools: The current research requirements have a unified tool to measure the acquisition of concepts for intermediate second grade students in the Arabic Grammar for the experimental and control groups. Therefore, the researcher prepared a test to acquire the grammatical concepts of dimension (30) verbs.

The honesty of the test: The researcher was keen to be a true instrument, and to achieve the objectives of the research so I have used two types of honesty: honesty and virtual content validity, as the results showed that the apparent honesty obtained the proportion of agreement (80%) by arbitrators and specialists, The results showed that all the tests in the acquisition of grammatical concepts were statistically significant.

The stability of the test: midterm fragmentation The researcher used the Pearson correlation coefficient to extract the correlation coefficient between the individual and marital vertebrae for the testIt was corrected by Spearman-Brown equation, To calculate consistency in this method, the researcher adopted the sample of the survey sample which reached (100) answer sheets and then collected the individual paragraphs of each student on one hand And the matrimonial vertebrae on the other hand, the stability of the Pearson correlation coefficient (0.86) and the Spearman-Brown equation (0.93).

Test Stability:Midterm Retail: The researcher used the Pearson correlation coefficient to extract the coefficient of correlation between the individual and marital vertebrates for the test and was corrected with Spearman-Brown equation. To calculate stability in this method, the researcher adopted the sample of the survey sample which reached (100) answer sheets and then collected the individual paragraphs for each student on one side and the marital clauses on the other hand, Stability was obtained using Pearson correlation coefficient (0.86) and corrected by Spearman-Brown equation (0.93).

Application of the acquisition test: Before the end of the experiment by a week the researcher tested the students of the two research groups that there is a test to be conducted in the seven subjects studied for them, and supervised the researcher with the Arabic language teacher on the course of the test, and explained the researcher how to answer the paragraphs of the test before the students begin to answer.

The statistical means // The researcher used the T-Test for two independent samples: The researcher used the end-tit test for two independent samples in the parity between the experimental and control groups in the following variables: (students' age, grades of Arabic grammar in the half year of the current year, the final acquisition testing concepts)

The research Results and Discussion:

The hypothesis of the research: "There is no statistically significant difference at the level of (0.05) between the average score of students of the experimental group who study the Arabic grammar using the strategy of representation and the average score of students of the control group who study the same article in the usual way.

To examine the hypothesis of the research, the statistical averages and the standard deviations of the scores of the students of the two groups were extracted

in the test. Acquisition of the post-concepts in the Arabic grammar, and the results of the T-Test were extracted to reveal the significance of the differences between the averages. 0.05) between the experimental and control groups in the test of the acquisition of the grammatical concepts in the Arabic grammar and by reference to the arithmetic averages, note that these differences in favor of the experimental group. In this way, we reject the null hypothesis and accept the alternative hypothesis, which means that the strategy of documentary representation positively affects student achievement.

Conclusion

The researcher applied the research tools to the two research groups, after correcting the students' answers, each student received data for the experimental group and the control, if the data were processed statistically by two independent samples and showed, the experimental group, which was studied according to the DTP strategy, surpassed the control group which were studied in the usual way in the variable concept acquisition.

Financial Disclosure: There is no financial disclosure.

Conflict of interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the University of Babylon – college of Basic Education and all experiments were carried out in accordance with approved guidelines.

Evaluation of TSH, T3, T4 and Testosterone Concentrations in Women with Poly Cystic Ovary Syndrome (PCOS) in Babylon City-IRAQ

Reemabdul Raheem Mirdanalsaad

Department of Anatomy and Histology-College of Medicine–University of Babylon, Iraq

Abstract

Estimation of hormone concentrations TSH, T3, T4, and testosterone in women with polycystic ovary syndrome in Babylon city were carried out in this study. There was significant difference in body mass index (BMI) and age group distribution between cases and controls. P<0.05, while there was a statistical differences in fertility status between two studied groups. P<0.05. According to statistical analysis could been concluded that the level of T3, T4, TSH and testosterone were increased in polycystic ovary in comparison with healthy control group and there are a differences between patient and control group P<0.05.

Keywords: *TSH, T3, T4 and Testosterone, poly cystic ovary women.*

Introduction

PolyCystic Ovary Syndrome PCOS considered as one of the commonest endocrinopathies among women in reproductive period, which start from menarche till the menopause and commonly caused infertility around the world[1]. It can be considered as a syndrome involves reproductive, metabolic, and cardiovascular components leading to a lifelong health implications [2]This syndrome was initially mentioned in 1935, by Stein and Leventhal and since that it was considered as one of the most common cause of menstrual disturbance such asun-ovulation, oligo-menorrhea, menorrhagia, and common cause of infertility [3]. Despite PCOS being considered the most common endocrine disorder, the estimation of its prevalence is highly variable due to differences in the presentation of PCOS phenotypes [4]. Infertility is a recognizable feature of PCOS because of failure of ovulation accompanied by presence of multiple small follicles without effective ovulation. Polycystic ovaries are diagnosed on ultrasound by the presence of 12 or more follicular cysts which are less than 10 mm in size with enlargement of ovarian stroma. These changes may be present in women without endocrine abnormality [5]. So, these morphological changes of the ovaries must be distinguished from the other endocrines abnormality of hyperandrogenism and anovulation.[7,8,9]

Women with PCOS regularly require treatment for menstrual abnormality, clinical signs of hyperandrogenism, and inability to get pregnancy. [10] Menstrual abnormality commonly seen in PCOS include oligo-menorrhea, amenorrhea, or menorrhagia. 30% of women with PCOS will have typical menses and roughly 85–90 % of women with oligo-menorrhea have PCOS, also 30%–40% of women with complete amenorrhea will have PCOS[11]. The most common presentations of hyperandrogenism are acne and hirsutism, androgenic alopecia and voice hoarseness[12.13,14]. Huang reported hyperandrogenism to be present in approximately 75% of women with PCOS[15]. The other most important clinical presentation in PCOS is insulin resistance (IR), which supposed to be a vital part in the pathogenesis and long term sequelae of the condition. There is strong epidemiological proof that insulin resistance presence would increase the danger of CVD in PCOS women

independence of other cardiovascular aggravating factors[16]. About 35-50% of women with PCOS are obese [17] .Insulin resistance found in about 65–70% of women with PCOS, in 70–80% of obese (BMI >30) PCOS women and 20–25% of lean (BMI<25) PCOS women[18] . Raised serum levels of LH and testosterone hormone in association with low or normal levels of follicular stimulating hormones and abnormalities in the secretion of estrogen, described as an endocrine profile which may believed to be diagnostic of PCOS, both elevated level of the LH and insulin resistance are the most common endocrine abnormalities seen in PCOS women . The underlying genetic causes of high level of LH is still not known [19] .Insulin resistance in PCOS can be caused by a post binding deformity in insulin receptors signaling pathways, and higher insulin levels might raise the ovarian capacity for gonadotropins. Hyperinsulinemia might suppress the production of sex hormone–binding globulin (SHBG) on the liver which in turn stimulate androgen production and worsen features of hyperandrogenism[19,20,21,22]. An overview of PCOS pathophysiology. The Aim of the study are to Study the concentrated levels of some hormones in such as TSH, T3 T4, and testosterone in women with PolyCystic Ovary Syndrome in Babylon city

Materials and Method

Patients Groups: A total number of 50 women with PCOS are involved in this case control study. Patients are collected from outpatient and private gynecological clinics from different area of Babylon regardless the marital status, whom age ranged from 18-40 years in a period from March to December 2018. The PCOS diagnosis was depended on Androgen excess and PCOS society at 2006 criteria:

1. Oligo-ovulation and/or un-ovulation;
2. Biochemical signs and/or clinical signs of hyperandrogenism (signs of hyperandrogenism include hirsutism, alopecia or acne).
3. Appearance of polycystic ovaries on ultrasound (morphological changes of the ovaries was diagnosed using abdominal ultrasound).

Control Groups: A 50 fertile women were collected from primary health care centers in Baylon and who have regular menstrual cycle with no sign of hyperandrogenism and their age group between 18-40 years and subjected to ultrasound examination and have normal hormonal level and blood sugar was measured to exclude diabetes mellitus.

Collection of Blood Samples: For each patient (patient groups and control groups) 2-3 ml of blood were aspiration by syringe 5ml, serum was separated by centrifugation at 3000rpm/10 minutes, and kept in 10ºC until used and thawing of each frozen sample

Hormone Kits: The kits used in this study for estimation of TSH, T3, T4 and Testosterone concentrations were supplied by Spectrum co.,Netherlands,and the determination of hormone concentrations would done according to supplied company

Body mass index (BMI) was calculated as follows: weight (kilograms)/height2 (meters).

Statistical Analysis: Results were analyzed using the test T. test use of less significant difference (least significant differences) (LSD) at the level of significance ($P \leq 0.05$, $P \leq 0.01$ and $P \leq 0.001$) to show statistically differences.

Results and Discussion

This is a case control study involved 50 women with PolyCystic Ovary Syndrome PCOS. These were compared with age matched 50 apparently healthy controls. The basic characteristics of PolyCystic Ovary Syndrome PCOS women and control groups are shown in Table (1). There was significant difference in BMI and age group distribution between cases and controls. $P<0.0$. Tables 2-5 and fig 1 illustrate the levels of various hormones in women with PolyCystic Ovary Syndrome . According to statistical analysis could been concluded that the level of T3, T4 and testosterone were increased in comparison with healthy control group and there are a differences between patient and control group $P<0.05$. Polycystic ovarian syndrome is one of the most popular endocrine disorders in the humans. In fact, emphasis on its importance rise from increased prevalence of cardiovascular diseases and higher cardiovascular morbidity even in young and thin women with PCOS this may be partially due to low grade inflammation. Excessive amount of visceral or ectopic fat, a feature of most women with PCOS played an essential role in cardiovascular disorders, in addition to atherosclerotic changes.[16,17] Patients with PCOS are presented with low progesterone level as a result of oligo-ovulation or anovulation therefore the immune system could be overstimulated by excess estrogen leading to production of autoantibodies in those patients.[18]. It is a relatively

strong estrogen when compared to estrogens made by the body. Women who are overweight are at an increased risk of diseases that are known to be caused by elevated estrogen levels. Uterine cancer and breast cancer are more common in women who are overweight.[19] Women that are overweight are more likely to be diabetic. Women who are diabetic are more sensitive to estrogen than women who are not diabetic. Estrogen also increases weight gain and makes it more difficult to lose weight. Women who are overweight should not take standard synthetic estrogen replacement.[20] Women who are not at high risk for osteoporosis should avoid estrogen replacement. Estrogen has two FDA approved indications. One is the relief of hot flashes the other is the prevention of osteoporosis in high risk women.[21] Women that have a thin frame, and of North European decent with extremely fair skin, sedentary lifestyle, history of smoking and prolonged steroid use are at risk for osteoporosis.[22] It is found that administration of therapeutic human gonadotrophin hormones or FSH for induction of ovulation in infertile women may induce immunological reaction to these therapeutic agent leading to decrease their efficacy and induce anti-gonadotropin Ab or anti-FSH Ab formation and this immune reaction might range from mild and transient to severe immunological reaction.[23] The endocrinological abnormalities of PCOS begin after puberty. Despite These multifactorial pathophysiology, women with PCOS still have few interrelated attributes, including insulin resistance, hyperandrogenism, and modified gonadotropin elements.[24] Raised serum levels of LH and testosterone hormone in association with low or normal levels of follicular stimulating hormones and abnormalities in the secretion of estrogen, described as an endocrine profile which may believed to be diagnostic of PCOS, both elevated level of the LH and insulin resistance are the most common endocrine abnormalities seen in PCOS women . The underlying genetic causes of high level of LH is still not known.[4,15,20]

Table 1. Basic Subjects Characterise

	Cases (No=50)	Controls (No = 50)	p value
Age (Years) Mean ± S.D.	32.7 ± 1.3	18.4 ± 6.4	0.036
BMI (Kg/m^2) Mean ± S.D.	23.0 ± 4.5	18.0 ± 3.4	0.048
History of infertility: No (%)	40(80%)	45(90%)	0.0

Table 2. The concentration of T3 in menopausal women and control group. P<0.05

T3		
P Value	**Control**	**Menopausal women**
0.05	2.467	7.432

Table 3. The concentration of T4 in menopausal women and control group. P<0.001

T4		
P Value	**Control**	**Menopausal women**
0.001	19.840	31.762

Table 4. The concentration of TSH in menopausal women and control group. P<0.001

TSH		
P Value	**Control**	**Menopausal women**
0.001	11.658	22.977

Table 5: The concentration of Testosterone in menopausal women and control group. P<0.05

Testosterone		
P Value	**Control**	**Menopausal women**
0.001	15.78	20.244

Conclusion

There was significant difference in body mass index (BMI) and age group distribution between cases and controls. P<0.05, while there was a statistical differences in fertility status between two studied groups. P<0.05. According to statistical analysis could been concluded that the level of T3, T4, TSH and testosterone were increased in polycystic ovary in comparison with healthy control group and there are a differences between patient and control group . P<0.05.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of anatomy and histology -College of medicine –university of Babylon, Iraqand all experiments were carried out in accordance with approved guidelines.

Call for Papers / Article Submission

The editor invites scholarly articles that contribute to the development and understanding of all aspects of Public Health and all medical specialities. All manuscripts are double blind peer reviewed. If there is a requirement, medical statistician review statistical content. Invitation to submit paper: A general invitation is extended to authors to submit papers papers for publication in IJPHRD.

The following guidelines should be noted:

- The article must be submitted by e-mail only. Hard copy not needed. Send article as attachment in e-mail.
- The article should be accompanied by a declaration from all authors that it is an original work and has not been sent to any other journal for publication.
- As a policy matter, journal encourages articles regarding new concepts and new information.
- Article should have a Title
- Names of authors
- Your Affiliation (designations with college address)
- Abstract
- Key words
- Introduction or back ground
- Material and Methods
- Findings
- Conclusion
- Acknowledgements
- Interest of conflict
- References in Vancouver style.
- Please quote references in text by superscripting
- Word limit 2500-3000 words, MSWORD Format, single file

All articles should be sent to: **editor.ijphrd@gmail.com**

Indian Journal of Public Health Research & Development

CALL FOR SUBSCRIPTIONS

About the Journal

Print-ISSN: 0976-0245 **Electronic - ISSN:** 0976-5506, **Frequency:** Quarterly

Indian Journal of Public Health Research & Development is a double blind peer reviewed international Journal The frequency is half yearly. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, Public Health Laws and covers all medical specialities concerned with research and development for the masses. The journal strongly encourages reports of research carried out within Indian continent and south east Asia.

The journal has been assigned international standards (ISSN) serial number and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases.

Journal Title	Print Only
Indian Journal of Public Health Research & Development	**INR 9000**

NOTE FOR SUBSCRIBERS

- Advance payment required by cheque/demand draft in the name of **"Institute of Medico-Legal Publications"** payable at New Delhi.
- Cancellation not allowed except for duplicate payment.
- Claim must be made within six months from issue date.
- A free copy can be forwarded on request.
