**ABSTRACT**

Basic concept of burn treatment and assessment is used in same way between adult and children. Major Differences between adults and children: large body surface area, thin skin, higher basal metabolic rate, small physiologic reserve and the different social & emotional development are considered to monitor assessment and treatment in burn children. There is a higher burn incidence of pediatric burn than adult with scald as majority of cause. Suspicion of child abuse is also considered when burn is cause by non-accidental injury and have special pattern of burn.

*Keyword: Pediatric burn, burn injury*
