ABSTRACT

This research aim to know the influence of family earnings, family head education, and sum of the family member to poorness in Sub district Jelbuk of Jember Regency. This research use analyze method the doubled linear regresi by *level of significance* ($\alpha = 5\%$). The result of research indicate that the regression coefficient (b_1) is 0,192 this means that family earnings have the positive influence, the value of regression coefficient (b_2) is 2003,267 this means that education of family head have the positive influence, and the value of regression coefficient (b_3) is 25272,9 this mean that sum of the family member have the negative influence to poorness. The examination of independent variable influence to variable dependen by using F test obtained the value of probabilitas F_{hitung} is 0,000 this mean that level of significant ($\alpha = 5\%$) this means that free variable of family earnings, education of family head and sum of the family member by together have the influence which significant to variable trussed that is poorness.

The t test used to know the influence of each independent variable by parsial to variable dependen, what its influence is significant or not. Family earnings (X_1) have the value of t-statistic probability is 0,000 smaller than $\alpha = 0,05$ meaning that X_1 have the influence which significant to Y, family head education (X_2) have the value of t-statistic probability is 0,036 smaller than $\alpha = 0,05$ meaning that X_2 have the influence which significant to Y, and sum of the family member (X_3) have the value of t-statistic probability is 0,000 smaller than $\alpha = 0,05$ meaning that X_3 have the influence which significant to Y. This value of R_2 represent the index determination that is percentage of influence contribution by together among X_1 , X_2 , and X_3 , to Y is 0,821 or 82,1 %, and residu is 17,9 % influenced by other factor which is not analyzed in this research.

Keyword : *earnings , education, sum of the family member, and poorness*
