ABSTRACT

Background: The role of traditional Birth Attendants (TBAs) among rural communities is still a highly regarded one. The intention of this study was to know whwthwr thw game simulation method was more effective.

Methods: The design of this study was “The non random pre test – post test design. The sample was divided into four group. One groups was assigned to become the second the treatment group who was given the stimulation method, the second was given the lecture method and the others two were the groups with no treatment. This study was execute in the areas of Kemuning Lor, kamal, Darsono, Biting, Arjasa, Candijati at Arjasa Community Health Center, Jember District.

Result: The result of this study showed that : 1) There is a significant different of knowledge before and after simulation; 2) There is also a significant different of knowledge after simulation and lecture; 3) There is also a significant of knowledge of the groups with no treatment and the groups who were given simulation significant difference before and after simulation. But there is no significant difference between the stimulation group and those who were lectured. About referrals, observation showed that the group who were given simulation have higher level than the group who were lectured.

Conclusion: The game simulation method was more effective to increase knowledge and behavior of traditional Birth Attendants (TBAs) for organization and empowerment in health care system of community health nursing services.
