Preface

A Conference on the extended use of Basic Science was hosted by the Faculty of Mathematics and Natural Science (FMIPA), at CDAST building, Universitas Jember in 26-27th day of September 2016. This conference is intended to promote further developments of basic science for their tangible applications, especially health, environment, energy and biotechnology.

The conference posed the question “what biological, chemical, physical, geological, mathematical, statistical, medical, agricultural and other basic science field changes must be made in order to ensure better live quality in term of health, environment, energy and biotechnology. FMIPA was fortunate to welcome researchers, educators and engineers from various backgrounds representing a variety ways to extend the application of basic science in which safety, environmental friendly and energy efficiency were being pursued. More than two hundred contributors from fifty five different institutions presented the theory, methodology and application of the field and thus the 1st IBSC 2016 was very rich as the proceeding in this volume.

The major theme that emerged from the conference which was conducted by Faculty of Mathematics and Natural Science, Universitas Jember, and The Ministry of Technology and Higher Education (KEMENRISTEKDIKTI), Republic of Indonesia, was that basic science must extend in very fundamental way if high live quality is to become a stable standard of health, environment, energy and biotechnology. Ramkrishna Ramaswamy in his very inspiring talk, present the complexity and simplicity in biological systems; while Agus Salim discussed the big data of biostatistics with stressing on the quantity does not equal quality; Manabu Abe report the design and synthesis of a new Cromophore, and Bambang Sugiharto address the regularisation of sucrose-phosphate synthesis from sugarcane, and many more expert discus the application of basic science for improving live quality.

Having introduced the 1st IBSC 2016, we will introduce the 2nd Conference of basic science (The 2nd IBSC) in near future. This collaboration and link will be maintain. Hand in hand researcher, expert, educator and other professional in basic science is needed to improve live quality.

Table of Contents

PREFACE	iii
TABLE OF CONTENTS	v
BIOLOGY	1
COMMUNITY STRATEGY FOR MANAGING TROPICAL FOREST RESOURCES IN THE AREA OF CAGAR ALAM PULAU SEMPU (NATURE RESERVE OF SEMPU ISLAND)	2
BIOREDUCTION ADSORBENT (BIOSORBENT): RECOVERY TECHNOLOGY OF HEAVY METAL POLLUTION (CADMIUM/ Cd) IN POLLUTED LAPINDO WATER SOURCES USING BACTERIA AND DURIAN LEATHER.....	7
COMPARATIVE STUDY OF THE MANAGEMENT OF VANAME SHRIMP (LITOPENAEUS VANNAMEI) BASED ON DEMOGRAPHIC FACTORS AT MOLANG BEACH TULUNGAGUNG.....	10
ANALYSIS OF THE INFLUENCE OF PUBLIC PARTICIPATION IN THE MANAGEMENT OF RESOURCES SUSTAINABLE WATER MALANG DISTRICT.....	13
CONSERVATION COCCINELLA SP. AS PREDATOR OF GREEN PEACH APHID MYZUS PERSICAE SULZER ON POTATO INTERCROPPING	16
THE EFFECT OF MYCORRHIZAL INOCULANT AND COMPOST OF VOLCANIC ASH ON GROWTH AND YIELD OF CHILLI (CAPSICUM ANNUM L.).....	19
THE POTENTIAL OF ARTHROPODE DIVERSITY FOR ECOTOURISM DEVELOPMENT IN WONOREJO MANGROVE ECOSYSTEM, SURABAYA.....	23
THE EFFECTS OF WATER FRACTION OF BITTER MELON (MOMORDICA CHARANTIA) LEAF EXTRACT IN MAMMARY GLAND DEVELOPMENT OF BALB/C MICE (MUS MUSCULUS) WITH HISTOLOGICAL AND MOLECULAR BIOLOGICAL ANALYSIS OF PROTEIN APPROACHES.....	27
COMPETITIVENESS AND POTENTIAL OF SHEEP LIVESTOCK AS SOURCE INCREASING INCOME AND PROVIDER OF MEAT ANIMAL IN NORTH SUMATRA	30
MORPHOLOGICAL AND PHYSIOLOGICAL CHARACTERS OF CASSAVA (MANIHOT ESCULENTA CRANTZ) WHICH WET TOLERANT	32
THE EFFECT OF SOY TEMPEH FLOUR EXTRACT ON VAGINA HISTOLOGICAL STRUCTURE OF SWISS WEBSTER OVARIECTOMIZED MICE (MUS MUSCULUS)	36
THE TOXICITY OF SEEDS EXTRACT OF ANNONA SQUAMOSA L., LEAVES EXTRACT OF TERMINALIA CATAPPA L. AND LEAVES EXTRACT OF ACACIA NILOTICA L. ON THE MORTALITY OF Aedes Aegypti L. LARVAE	39
ELEPHANTOPUS SCABER AND SAUROPLUS ANDROGYNUS REGULATE MACROPHAGES AND B LYMPHOCYTE CELLS DURING SALMONELLA TYPHI INFECTION.....	42
THE EFFORT TO INCREASE PRODUCTION OF SUPER RED DRAGON FRUIT (HYLOCEREUS COSTARICENSIS) BY ARTIFICIAL POLLINATION.....	45
EVALUATION OF ZONATION OF THE MANGROVE CONSERVATION AREAS IN PAMURBAYA	47
INPUT OF NUTRIENT (NITROGEN AND PHOSPHORUS) FROM THE CATCHMENT AREA INTO RAWAPENING LAKE OF CENTRAL JAVA	50
RELATIONSHIP BETWEEN WATER QUALITY AND ABUNDANCE OF CYANOPHYTA IN PENJALIN RESERVOIR	52
HEMATOLOGICAL CHARACTERISTIC OF THE FEMALE ASIAN VINE SNAKE (Ahaetulla prasina BOIE, 1827).....	57
HIGHLY SPESIFIC BACILLUS CEREUS-PHAGES ISOLATED FROM HOSPITAL WASTEWATER IN BANYUMAS REGENCY.....	60
BIOSYNTHESIS SILVER NANOPARTICLE USING FRESH WATER ALGAE.....	65
EFFECT OF SAPONIN-PODS EXTRACT ACACIA (ACACIA MANGIUM) TO HEMATOCRIT, HEMOGLOBIN AT TILAPIA (OREOCHROMIS NILOTICUS)	67
EFFECT OF DISSOLVED NUTRIENT CONCENTRATION (NITRATE AND ORTHOPHOSPHATE) ON ABUNDANCE OF CHLOROPHYTA IN PENJALIN RESERVOIR BREBES REGENCY.....	70
THE ANATOMY OF CAROTENE BIOSYNTHESIS IN BETA VULGARIS L., VAR. RUBRA USING SCAN ELECTRON MICROSCOPE.....	74
OPTIMIZATION OF YOGURT FERMENTED MILK PRODUCTS WITH THE ADDITION OF NATURAL STABILIZER BASED ON LOCAL POTENTIAL OF TARO STARCH (COLOCASIA ESCULENTA)	77
PTERIDOPHYTES OF ALAS PURWO NATIONAL PARK AND THEIR MEDICINAL POTENCY	80
GENETIC VARIATION OF Aedes Aegypti (DIPTERA : CULICIDAE) BASED ON DNA POLYMORPHISM.....	83
THE EFFECT OF SOY TEMPEH FLOUR EXTRACT TO UTERINE HISTOLOGY OF OVARIECTOMIZED MICE	85
MATING BEHAVIOUR OF CROCIDOLOMIA PAVONANA F.....	88
AGRICULTURE	91
THE DEVELOPMENT OF SUSTAINABLE RESERVE FOOD GARDEN PROGRAM’S VIDEO IN MALANG CITY.....	92
EFFECT OF MEDIUM COMPOSITIONS ON THE GROWTH OF RICE (ORYZA SATIVA L. CV. CIHERANG) CALLUS.....	97
BLOOD FIGURE OF RAMBON CATTLE FED FORMULATED CONCENTRATE CONTAINING SOYBEAN CAKE, POLLARD AND CORN OIL COMBINE WITH UREA XYLANASE MOLASSES CANDY	101
STRATEGIES FOR DEVELOPMENT OF BEEF CATTLE FARMING BASED ON INNOVATION TECHNOLOGY AND FEEDING PROGRAM TO MEET SELF SUFFICIENCY IN MEAT.....	103

FOOD TECHNOLOGY	106
MODIFICATION OF BEAN SPROUT AND UREA MEDIA TO SPIRULINA PLATENSIS CULTURE	107
COLLAGEN FROM SEA CUCUMBER (STICHOPUS VARIEGATUS) AS AN ALTERNATIVE SOURCE OF HALAL COLLAGEN	111
DEVELOPMENT OF NEW PRODUCT "COCOA SPIRULINA AS FUNCTIONAL FOOD"	114
THE PROTEIN AND WATER CONTENT OF TEN VARIATIONS OF THE FEED CASSAPRO OF YEAST TAPE	120
MEDICAL, DENDTISTRY, AND PUBLIC HEALTH	123
EFFECT OF POMELO (CITRUS GRANDIS) ETHANOLIC EXTRACT ON ATHEROSCLEROTIC PLAQUE FORMATION	124
CLINICAL MANIFESTATION OF ORAL TUBERCULOSIS	127
IDENTIFICATION OF DERMATOPHYTES BY MULTIPLEX-POLYMERASE CHAIN REACTION, POLYMERASE CHAIN REACTION-RESTRICTION FRAGMENT LENGTH POLYMORPHISM ITS1-ITS4 PRIMERS AND MVAI, AND POLYMERASE CHAIN REACTION (GACA) ₄ PRIMER	132
IMPACT PSYCHOLOGICAL AND PSYCHO-PHYSICAL WORK DISTRESS ON TOOTH MOBILITY IN RAT MODEL	136

AUTHOR INDEX **358**

The Study of Electrical Conductance Spectroscopy of The Inner membrane of Salak

Wenny Maulina¹

¹Biophysics Division: Physics Department, Faculty of Mathematics and Natural Sciences, Jember University, Jember, Indonesia,
 e-mail: wenny@unej.ac.id

Abstract— Main objective of the present work was to investigate mechanism transport of the inner membrane of salak (*Salacca edulis*) using electrical conductance measurements. The inner thin membrane obtain after removing the outer cover of salak has been found to record electrical conductance when it separates two different concentration of electrolyte solution; NaCl, MgCl₂ and CaCO₃. Conductance values were measured for each concentration at different temperature. The temperature range studied is between 303 K and 333 K at 5 K intervals. The normal behaviour of these conductance shows that the values increase smoothly with increase in concentration. The magnitude follow the order Mg²⁺ > Na⁺ > Ca²⁺. The increase of temperature makes mobilisation of the ions was rapidly during the measurement of conductance.

Keywords— inner thin membrane, salak, conductance.

INTRODUCTION

The membrane is essentially a barrier, which separates two phases and restricts transport of various chemicals in a selective manner. A membrane can be homogeneous or heterogeneous, symmetric or asymmetric, solid or liquid; it can carry positive or negative charges or can be neutral. Transport through a membrane can be affected by convection or by diffusion of individual molecules, and induced by the chemical gradient or electrical gradient. A Membrane should have some basic requirements, such as high flux of the product; good mechanical strength for supporting the physical structure; and good selectivity for the desired substances. Membranes can be either dense or porous. There are various types of membrane processes: a) Microfiltration (pore sizes ranging from 0,1 to 10,0 μm); b) Ultrafiltration (0,001-0,1 μm); c) Reverse Osmosis (0,0001-0,001 μm); and d) Conventional Filtration (10-100 μm). Membranes consist of two types: biological membrane and synthetic membrane [1-2]. Focus on this study is biological membrane i.e. the inner membrane of Salak.

Salak (*Salacca edulis*) also known as snake fruit belongs to Arecaceae family. This palm is native in Indonesia and Malaysia. Nevertheless, cultivation of salak palm can also be found in Thailand and Philippines recently. Salak fruit is a good source for dietary fibres and carbohydrate. It also contains valuable bioactive antioxidants such as Vitamin A, Vitamin C and Phenolic compound. However, salak has a short shelf life of less than a week. Salak that stored in the room temperature could not be consumed after the day of 14 after harvesting. It is because rapid ripening and degradation of the bioactive ingredients. Numerous studies have been conducted to analysis thermo-physical properties and transport properties of fruit, such as garlic, pumpkin, grapes, apple and orange skin. Several mathematical models have been proposed for the evaluation of transport behaviour by either applying theoretical (Fick's law), semi-theoretical and empirical modelling [3]. Meanwhile, the theoretical models may not able to explain the exact mechanism of transport but it often gives good estimation by incorporating some values into the model parameters. Electrical measurements provide the opportunity to address this case.

Generally, electrical properties of the fruit were studied in order to develop a rapid and non-destructive assessment method or to characterize its ripening. Electrical properties are important in the cognitive aspect, especially to find out responses of the fruit to electric fields of variable frequency. Behaviors of the electrical properties are related to the nature of the material (composition, structure), conditions of the material (temperature, frequency), and the age or maturity stage of the material. Utilization of electrical measurements because simple, low cost, and quick assessment of product quality [4].

Transport processes through biological membranes, as well as in many synthetic membranes, are important because of their potential use in different separation processes. Studies on the conductance of electrolyte

solution through such polymeric networks are related to the ions transport through the pores. Extensive research work related to the conductance and diffusion of electrolyte solution through ion-exchange or porous membrane has been reported by different workers. Studies of the biological membrane are necessary to interpretation the mechanism of transport occurring in the biological system [5]. The purpose of the present paper is to report the conductance studies of the inner thin layer membrane of Salak with different electrolyte concentration and various temperatures. The observing of mechanism transport through this membrane has been calculated by using conductance spectroscopy.

METHODS

The inner thin layer membrane was separated manually from the outer of Salak. The membrane was thoroughly washed with deionised water to remove any adsorbed. It was always kept in the wet condition to avoid any disturbance arise due to the entrapped air within the pores and also to prevent the crack in dry condition. The membranes were cut into rectangular small piece and attached at a chamber. A chamber was filled with a different concentration solution. Solutions of different concentrations were prepared with analytical grade NaCl, MgCl₂ and CaCO₃ by using distilled water. Platinum electrode used to the electrical connections to the spectroscopy. Conductance measurements were carried out with an LCRmeter Hitester 5322-50. Conductance values were measured for each concentration at different temperature. The variation of concentration electrolyte solution were 0,1 mM, 1 mM, 10 mM, and 100 mM, respectively. The temperature range studied is between 303 K and 333 K at 5 K intervals.

RESULTS AND DISCUSSION

Based on the result of conductance spectroscopic measurements indicated that the inner membrane of salak as a semipermeable membrane. It is evidence by some specific ions could selective transport through the membrane. The nature of variations of conductance with concentrations for different electrolytes at room temperature, are shown in Fig 1. The common trend found for all the electrolytes is that the membrane conductance increases almost linearly with increase in concentration. The magnitude follow the order Mg²⁺ > Na⁺ > Ca²⁺. After certain concentrations, these two different concentrations may have a tendency to balance each other.

The increase in conductance of CaCO₃ is not too significant. Because of ion Ca²⁺ has been prevented from passing through the membrane. At this time, membrane shrinkage occurs due to the exclusion of water within the pores, showing steady conductance values. The linear correlation indicates that the inner membrane of Salak is able to respond various changes in increasing concentrations toward values of conductance that through the membrane.

Fig 1. Plot of conductance of different electrolytes through the inner membrane of Salak at room temperature

The effect of temperature on the membrane conductance is shown in Fig 2 represents the specific conductance values for MgCl₂ solutions of different concentrations in the temperature range 303-333 K at 5K intervals. The linear regression with a negative slope shows a correlation between Conductance and Temperature. The increase of temperature makes mobilisation of the ions was rapidly during the measurement of conductance.

By applying the Arrhenius equation in its basic form, where is:

$$G = G_0 \exp(-dU/kT) \quad (1)$$

ln G values of an various electrolyte are plotted against 1/T. Fig 3 shows the plots of the different electrolytes at the concentration of 100 mM. The smooth linear plots suggest that there may be no abrupt irreversible change in the membrane structure within the concentration and temperature range studied [5].

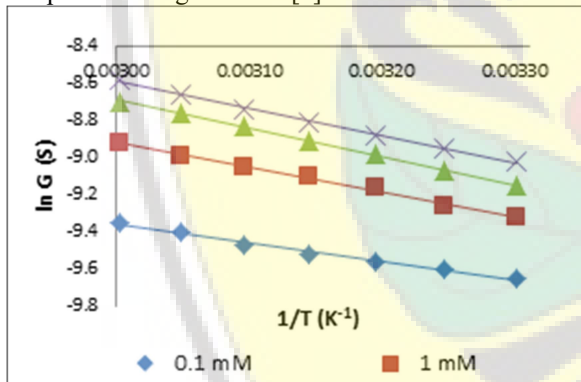

Fig 2. Plot of conductance of various concentration MgCl₂ through the inner membrane of Salak at different temperatures (303-333 K)

Fig 3. Arrhenius plots of ln G at one of the concentrations (100 mM) against 1/T at different electrolytes through the inner membrane of Salak

CONCLUSION

The inner membrane of Salak indicated as a semipermeable membrane. The normal behaviour of conductance shows that the values increase smoothly with increase in concentration. The slope shows correlation between changes of temperature with a conductance as a mechanism transport ion through the inner membrane.
